◆操作注意事项 Operating Precautions

1、极性Polarity

电容器是具有正负极的固态铝电解电容，使用中不可反接，若接反，则电容会因为漏电流不断增大或短路而造成寿命缩短。

CAP is a solid aluminum electrolytic capacitor with positive and negative electrodes. Do not reverse the polarity when using. If it is used with the polarities reversed, its life may shorten because of increasing leakage current or short circuit.

2、禁止电路 Prohibited circuits

因为焊接及其它动作可造成电容的漏电流增加，电容器不可使用在下列电路中：

Since problems can be expected due to leakage current increasing during soldering and other processes, CAP cannot be used in the following circuits:

- 1)高阻抗电路 High impedance circuits;
- 2)耦合电路 Coupling circuits;
- 3)时间常数电路 Time constant circuits;
- 4)为提高耐电压而串联两个或多个电容于电路中

Connection of two or more capacitors in series for higher withstand voltage;

- 5)电路因漏电流过大而有坏的影响 Circuits to get bad influence by big leakage current

*除漏电流的波动上升外，电容的使用条件如在承认书中规定的高温 and 低温，温热和耐受性条件都会影响电容量。若电容作为时间常数电路使用，因其对电容量的变动的敏感性，电容量的改变会造成影响。若要将其作为时间常数电路使用，同时若因电压原因要串联多个电容，请联系敝司。

* In addition to the leakage current fluctuation above, the operational conditions such as characteristics at high and low temperature, damp heat and endurance stipulated in the specifications will affect the capacitance. The fluctuation of the capacitance may cause problem if it is used as a time constant capacitor, which is extremely sensitive to the fluctuation of the capacitance. Do not use it as a time constant capacitor. Additionally, please contact our company. for usage of two or more capacitor in series for voltage proof.

3、电压 Over voltage

电压若超过额定电压，即便只是一瞬间也可能造成短路

Over voltage exceeding the rated voltage may not be applied even for an instant as it may cause a short circuit.

4、突然充放电 Sudden charge and discharge

突然的充放电是不可取的（为了维持高的可靠性）。为防止突然的充放电造成电容短路或漏电增大，电路中应加上一个保护电路用以分流过大的电流。若瞬间电流超过10A或超过10倍允许纹波电流，要使用保护电路。在测试漏电流时请加上一个1kΩ的电阻用以充放电。

Sudden charge and discharge restricted (for maintenance of high-proof reliability). A protection circuit is recommended for when a sudden charge or discharge causes excessive rush current because this is a main cause of short circuits and large leakage current. Use protection circuits if the rush current exceeds 10A. The rush current exceeds 10×the maximum allowable ripple current of capacitor. Be sure to insert a protection resistor of about 1kΩ for charge and discharge when measuring the leakage current.

5、使用温度和纹波电流 Operating temperature and ripple current

如果电容器的使用温度超过了上限温度或是有过载纹波电流通过，则有较大可能使电容器寿命缩短，或漏电流增大，造成电容器失效。

If capacitor is used at a temperature higher than the upper category temperature, or excess ripple current flows through capacitor, there are high possibilities of life cycle reduction or leakage current increasing to cause capacitor defective.

6、漏电流 Leakage current

漏电流会因焊接条件而有些微的上升，加载直流电压可使电容自我修复，漏电流逐渐减小。

The leakage current of capacitor may increase slightly by soldering conditions. The application of DC voltage enables the capacitors to be repaired by itself and this leads the leakage current to be smaller gradually.

7、使用电压 Applied voltage

为了保证电容器的可靠性，加载到电容器上的电压最好小于其额定电压的80%。直流加交流电压的峰值应小于额定电压。

For the reliability of CAP, it is recommended that the voltage applied to CAP should be less than 80% of the rated voltage. Peak value of the the dc and ac voltage should not exceed its rated voltage.

◆ 标示 Marking

每个部品的表面或最小包装单位依下记事项不易消失的方法来标示。
