

Description

The VN751PT is a monolithic device developed using STMicroelectronics' VIPower M03 technology, intended to drive any kind of load with one side connected to ground. Active VCC pin voltage clamp protects the device against low energy spikes. Active current limitation combined with thermal shutdown and automatic restart protect the device against overload. The device automatically turns off in case of ground pin disconnection. This device is especially suitable for industrial applications in conformity with IEC 61131-2 programmable controller international standard.

Features

- 8 V to 36 V supply voltage range
- Up to $I_{OUT} = 2.5$ A operating current
- $R_{DS(on)}$: 60 m Ω
- CMOS compatible input
- Thermal shutdown
- Shorted load protection
- Undervoltage and overvoltage shutdown
- Protection against loss of ground
- Fast demagnetization of inductive loads
- Very low standby current
- Compliance to 61000-4-4 IEC test up to 4 kV
- Open drain status output

7 Application schematic

Figure 8. Application schematic

8 Reverse polarity protection

A schematic solution to protect the IC against a reverse polarity condition is proposed.

This schematic is effective with any type of load connected to the outputs of the IC. The R_{GND} resistor value can be selected according to the following conditions:

Equation 1

$$R_{GND} \leq 600 \text{ mV} / (I_S \text{ in ON-state max.})$$

Equation 2

$$R_{GND} \geq (-V_{CC}) / (-I_{GND})$$

where $-I_{GND}$ is the DC reverse ground pin current and can be found in the absolute maximum rating section of the device datasheet.

The power dissipation associated to R_{GND} during reverse polarity condition is:

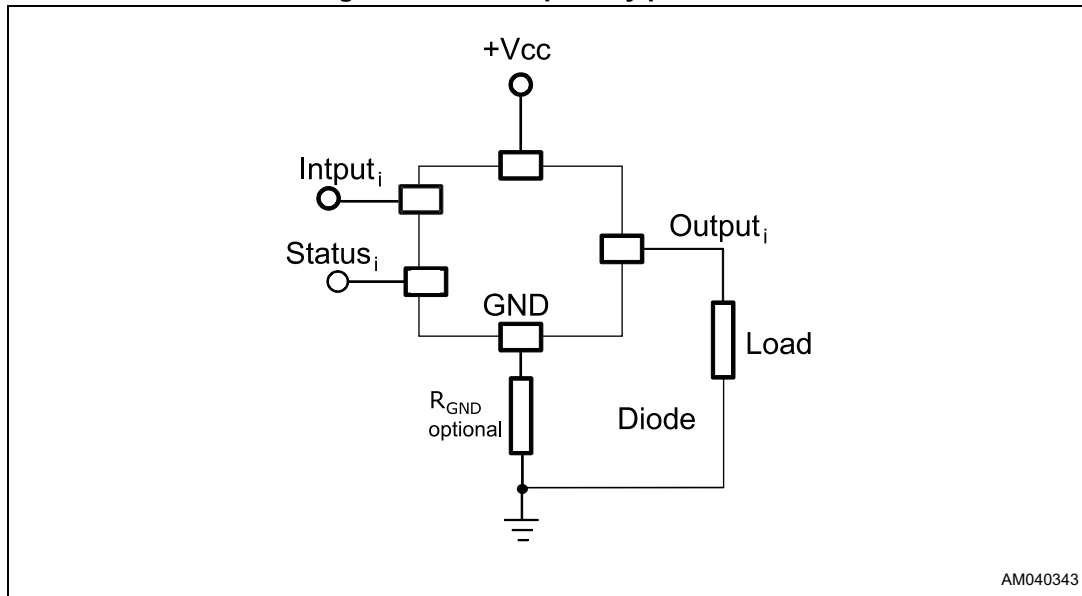

Equation 3

$$P_D = (-V_{CC})^2 / R_{GND}$$

This resistor can be shared by several different ICs.

In such case I_S value in [Equation 1](#) is the sum of the maximum ON-state currents of the different devices. Please note that if the microprocessor ground and the device ground are separated, the voltage drop across the R_{GND} (given by I_S in ON-state max. * R_{GND}) produces a difference between the generated input level and the IC input signal level. This voltage drop varies depending on how many devices are ON in case of several high-side switches sharing the same R_{GND} .

Figure 9. Reverse polarity protection

AM040343

9 Active VDS clamp

Active clamp is also known as fast demagnetization of inductive loads or fast current decay. When a high-side driver turns off an inductance, an undervoltage is detected on output.

The OUT pin is pulled down to V_{demag} . The conduction state is modulated by an internal circuitry in order to keep the OUT pin voltage at about V_{demag} until the load energy has been dissipated. The energy is dissipated both in IC internal switch and in load resistance.

Figure 10. Active clamp equivalent principle schematic

AM040344

Figure 11. Fast demagnetization waveforms

The demagnetization of inductive load causes a huge electrical and thermal stress to the IC. The curve plotted below shows the maximum demagnetization energy that the IC can support in a single demagnetization pulse with $V_{CC} = 24\text{ V}$ and $T_{AMB} = 125\text{ }^\circ\text{C}$. If higher demagnetization energy is required then an external free-wheeling Schottky diode has to be connected between OUT (cathode) and GND (anode) pins. Note that in this case the fast demagnetization is inhibited.

Figure 12. Typical demagnetization energy (single pulse) at $V_{CC} = 24\text{ V}$ and $T_{AMB} = 125\text{ }^\circ\text{C}$

10 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK® packages, depending on their level of environmental compliance. ECOPACK® specifications, grade definitions and product status are available at: www.st.com. ECOPACK® is an ST trademark.

10.1 PPAK package information

Figure 13. PPAK package outline^{(1), (2), (3), (4), (5)}

1. Burrs larger than 0.25 mm are not allowed on the upper surface of the dissipater (FRONT). On the lower surface (REAR) the maximum allowed is: 0.05 mm.
2. The side of the dissipater to be connected to the external dissipater must be flat within 30 micron.
3. The leads size is comprehensive of the thickness of the leads finishing material.
4. Package outline exclusive of any mold flashes dimensions.
5. Package outline exclusive of metal burrs dimensions.
6. Max. resin gate protrusion: 0.5 mm.
7. Max. resin protrusion: 0.25 mm.
