

Galvanic isolated octal high-side smart power solid state-relay

Features

Type	$V_{\text{demag}}^{(1)}$	$R_{\text{DS(on)}}^{(1)}$	$I_{\text{OUT}}^{(1)}$	V_{CC}
ISO8200B	$V_{\text{CC}} - 45 \text{ V}$	0.12 Ω	0.7 A	45 V

1. Per channel.

- Parallel input interface
- Direct and synchronous control mode
- High common mode transient immunity
- Output current: 0.7 A per channel
- Short-circuit protection
- Channel overtemperature protection
- Thermal independence of separate channels
- Common output disable pin
- Case overtemperature protection
- Loss of GND_{CC} and V_{CC} protection
- Undervoltage shutdown with auto-restart and hysteresis
- Overvoltage protection (V_{CC} clamping)
- Very low supply current
- Common fault open-drain output
- 5 V and 3.3 V TTL/CMOS compatible I/Os
- Fast demagnetization of inductive loads
- Reset function for IC output disable
- ESD protection
- IEC 61000-4-2, IEC 61000-4-4, IEC 61000-4-5 and IEC 61000-4-8 compliant
- UL1577 certification

Applications

- Programmable logic control
- Industrial PC peripheral input/output
- Numerical control machines
- Drivers for all types of loads (resistive, capacitive, inductive)

Description

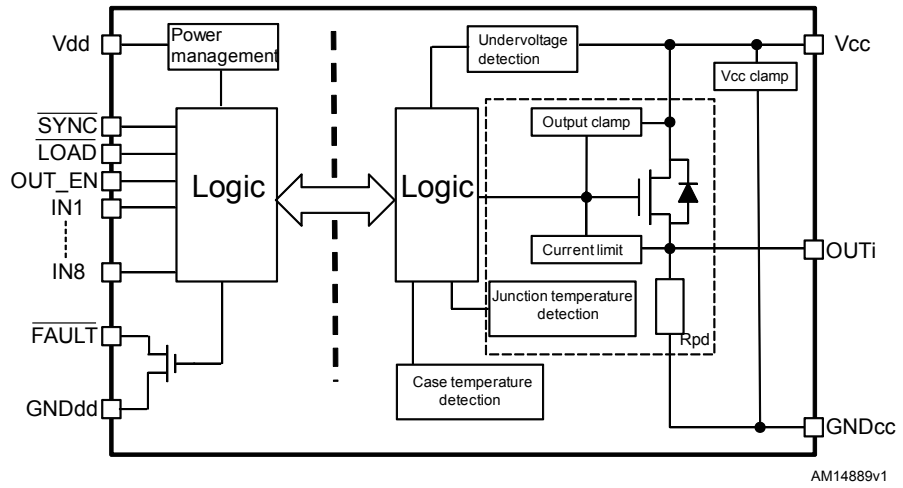

The ISO8200B is a galvanic isolated 8-channel driver featuring a very low supply current. It contains 2 independent galvanic isolated voltage domains (V_{CC} for the power stage and V_{DD} for the digital stage). Additional embedded functions are: loss of GND protection, undervoltage shutdown with hysteresis, and reset function for immediate power output shutdown.

IC is intended to drive any kind of load with one side connected to ground. Active channel current limitation combined with thermal shutdown, (independent for each channel), and automatic restart, protect the device against overload and short-circuit. In overload conditions, if junction temperature overtakes threshold, the channel involved is turned off and on again automatically after the IC temperature decreases below a reset threshold. If this condition causes case temperature to reach TCR limit threshold, the overloaded channel is turned off and it only restarts when case and junction temperature decrease down to the reset thresholds. Non-overloaded channels continue operating normally. An internal circuit provides an OR-wired non-latched common $\overline{\text{FAULT}}$ indicator signaling the channel OVT. The $\overline{\text{FAULT}}$ pin is an open-drain active low fault indication pin.

6 Functional description

6.1 Parallel interface

Smart parallel interface built-in ISO8200B offers three interfacing signals easily managed by a microcontroller. The $\overline{\text{LOAD}}$ signal enables the input buffer storing the value of the channel inputs.

The $\overline{\text{SYNC}}$ signal copies the input buffer value into the transmission buffer and manages the synchronization between low voltage side and the channel outputs on the isolated side.

The $\overline{\text{OUT_EN}}$ signal enables the channel outputs.

An internal refresh signal updates the configuration of the channel outputs with a f_{refresh} frequency. This signal can be disabled forcing low the $\overline{\text{SYNC}}$ input when $\overline{\text{LOAD}}$ is high.

$\overline{\text{SYNC}}$ and $\overline{\text{LOAD}}$ pins can operate in direct control mode (DCM) or synchronous control mode (SCM).

The operation of these two signals is described as follows:

Table 12. Interface signal operation (general)

$\overline{\text{LOAD}}$	$\overline{\text{SYNC}}$	$\overline{\text{OUT_EN}}$	Device behavior
Don't care	Don't care	Low ⁽¹⁾	The outputs are disabled (turned off)
High	High	High	The outputs are left unchanged
Low	High	High	The input buffer is enabled The outputs are left unchanged
High	Low	High	The internal refresh signal is disabled The transmission buffer is updated The outputs are left unchanged
Low	Low	High	The device operates in direct control mode as described in the respective paragraph

1. The outputs are turned off on $\overline{\text{OUT_EN}}$ falling edge and they are kept disabled as long as it is low.

6.1.1 Input signals (IN1 to IN8)

Inputs from IN1 to IN8 are the driving signals of the corresponding OUT1 to OUT8 outputs. Data are direct loaded on related outputs if $\overline{\text{SYNC}}$ and $\overline{\text{LOAD}}$ inputs are low (DCM operation) or stored into input buffer when $\overline{\text{LOAD}}$ is low and $\overline{\text{SYNC}}$ is high.

6.1.2 Load input data (LOAD)

The input is active low; it stores the data from IN1 to IN8 into the input buffer.

6.1.3 Output synchronization (SYNC)

The input is active low; it enables the ISO8200B transmission buffer loading input buffer data and manages the transmission between the two isolated sides of the device.

6.1.4 Watchdog

The isolated side of the device provides a watchdog function in order to guarantee a safe condition when V_{dd} supply voltage is missing.

If the logic side does not update the output status within t_{WD} , all outputs are disabled until a new update request is received.

The refresh signal is also considered a valid update signal, so the isolated side watchdog does not protect the system from a failure of the host controller (MCU freezing).

Figure 7. Watchdog behavior

6.1.5 Output enable (OUT_EN)

This pin provides a fast way to disable all outputs simultaneously. When the OUT_EN pin is driven low the outputs are disabled. To enable the output stage, the OUT_EN pin has to be raised. This timing execution is compatible with an external reset push, safety requirement, and allows, in a PLC system, the microcontroller polling to obtain all internal information during a reset procedure.

Figure 8. Output channel enable timing

6.2 Direct control mode (DCM)

When $\overline{\text{SYNC}}$ and $\overline{\text{LOAD}}$ inputs are driven by the same signal, the device operates in direct control mode (DCM). In DCM the $\overline{\text{SYNC}} / \overline{\text{LOAD}}$ signal operates as an active low input enable:

- when the signal is high, the current output configuration is kept regardless the input values
- when the signal is low, each channel input directly drives the respective output

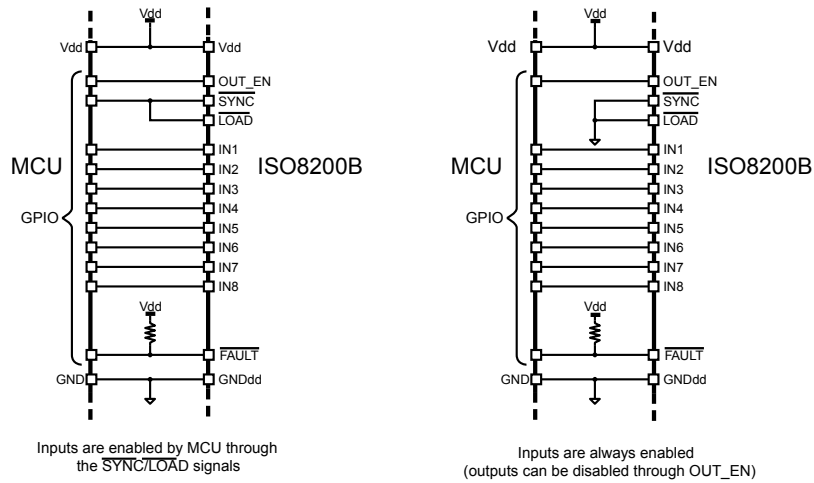

This operation mode can also be set shorting both signals to the digital ground; in this case the channel outputs are always directly driven by the inputs except when OUT_EN is low (outputs disabled).

Table 13. Interface signal operation in direct control mode

$\overline{\text{SYNC}} / \overline{\text{LOAD}}$	OUT_EN	Device behavior
Don't care	Low ⁽¹⁾	The outputs are disabled (turned off)
High	High	The outputs are left unchanged
Low	High	The channel inputs drive the outputs

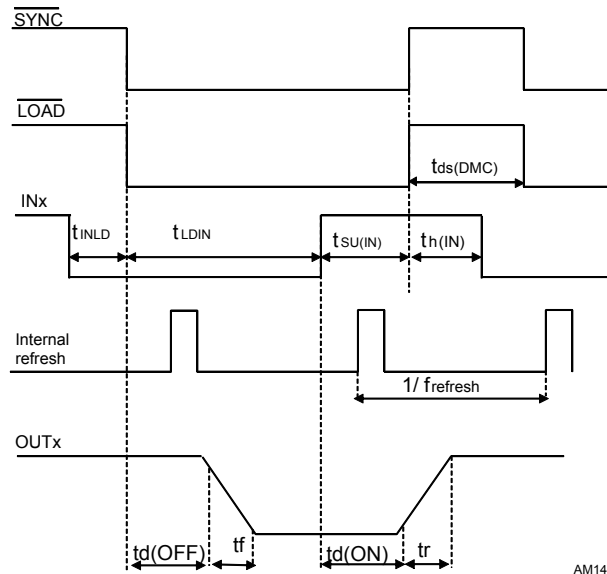

1. The outputs are turned off on OUT_EN falling edge and they are kept disabled as long as it is low.

Figure 9. Direct control mode IC configuration

AM14897v1

Figure 10. Direct control mode time diagram

AM14898v1

6.3 Synchronous control mode (SCM)

When $\overline{\text{SYNC}}$ and $\overline{\text{LOAD}}$ inputs are independently driven, the device can operate in synchronous control mode (SCM). The SCM is used to reduce the jittering of the outputs and to drive all outputs of different devices at the same time.

In SCM the $\overline{\text{LOAD}}$ signal is forced low to update the input buffer while the $\overline{\text{SYNC}}$ signal is high. The $\overline{\text{LOAD}}$ signal is raised and the $\overline{\text{SYNC}}$ one is forced low for at least $t_{\text{SYNC(SCM)}}$. During this period, the internal refresh is disabled and any pending transmission between the low voltage and the isolated side is completed. When the $\overline{\text{SYNC}}$ signal is raised the channel output configuration is changed according to the one stored in the input.

If the $t_{\text{SYNC(SCM)}}$ limit is met, the maximum jitter of the channel outputs is $t_{\text{jitter(SCM)}}$.

If more devices share the same $\overline{\text{SYNC}}$ signal, all device outputs change simultaneously with a maximum jitter related to maximum delay and maximum jitter for single device.

Table 14. Interface signal operation in synchronous control mode

LOAD	SYNC	OUT_EN	Device behavior
Don't care	Don't care	Low ⁽¹⁾	The outputs are disabled (turned off)
High	High	High	The outputs are left unchanged
Low	High	High	The input buffer is enabled The outputs are left unchanged
High	Low	High	The internal refresh signal is disabled The transmission buffer is updated The outputs are left unchanged
High	Rising edge	High	The outputs are updated according to the current transmission buffer value
Low	Low	High	Should be avoided (DCM operation only)

1. The outputs are turned off on OUT_EN falling edge and they are kept disabled as long as it is low.

Figure 11. Synchronous control mode IC configuration

AM14899v1

Figure 12. Synchronous control mode time diagram

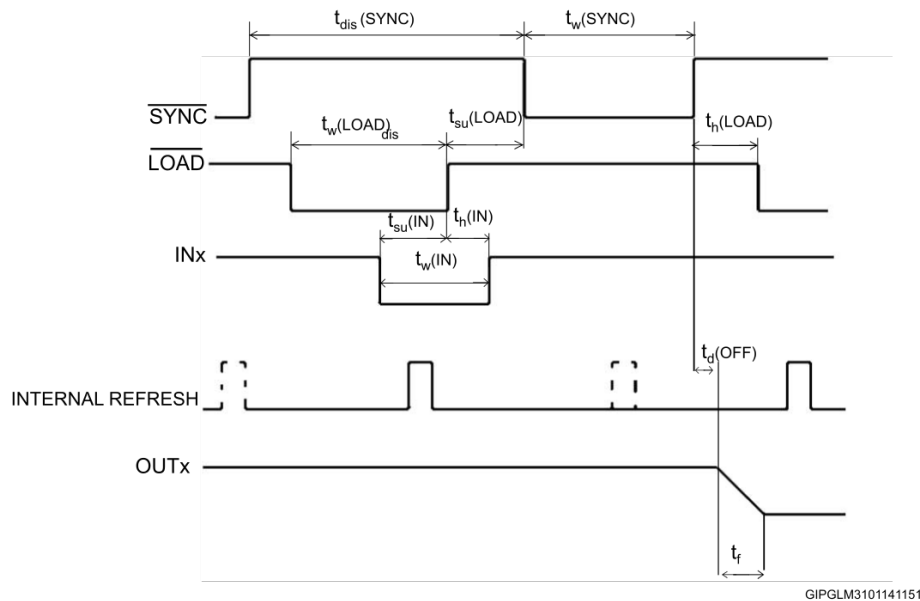

Figure 13. Multiple device synchronous control mode

6.4 Fault indication

The **FAULT** pin is an active low open-drain output indicating fault conditions. This pin is active when at least one of the following conditions occurs:

- Junction overtemperature of one or more channels ($T_J > T_{TJSD}$)
- Communication error

The communication error is intended as an internal data corruption event in the data transfer through isolation. In case of communication error the outputs are initially kept in the previous status and then reset (turned off) at the first communication error during data transfer of the refresh signal.

6.4.1 Junction overtemperature and case overtemperature

The thermal status of the device is updated during each transmission sequence between the two isolated sides. In SCM operation, when the **LOAD** signal is high and the **SYNC** one is low, the communication is disabled. In this case the thermal status of the device cannot be updated and the **FAULT** indication can be different from the current status.

In any case, the thermal protection of the channel outputs is always operative.

Figure 14. Thermal status update (DCM)

AM14902v1

Figure 15. Thermal status update (SCM)

AM14992v1

7 Power section

7.1 Current limitation

The current limitation process is active when the current sense connected on the output stage measures a current value, which is higher than a fixed threshold.

When this condition is verified the gate voltage is modulated to avoid the increase of the output current over the limitation value.

Figure below shows typical output current waveforms with different load conditions.

Figure 16. Current limitation with different load conditions

AM14996/r1

Figure 18. Thermal protection

8 Reverse polarity protection

Reverse polarity protection can be implemented on board using two different solutions:

1. Placing a resistor (R_{GND}) between IC GND pin and load GND
2. Placing a diode between IC GND pin and load GND

If option 1 is selected, the minimum resistance value has to be selected according to the following equation:

$$R_{GND} \geq V_{CC} / I_{GNDcc}$$

where I_{GNDcc} is the DC reverse ground pin current and can be found in [Section 3 Absolute maximum ratings](#) of this datasheet.

Power dissipated by R_{GND} during reverse polarity situations is:

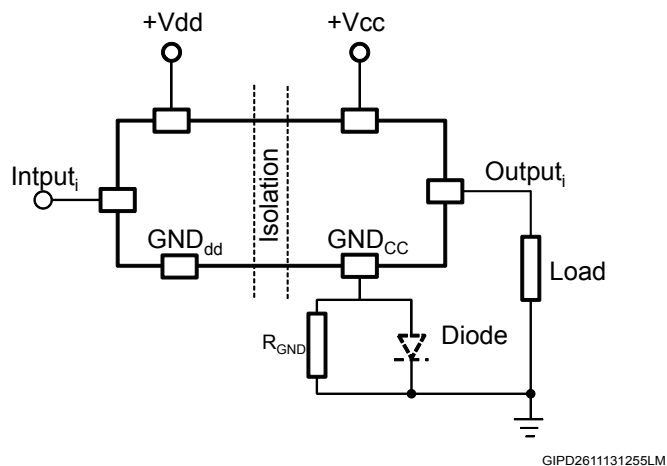

$$P_D = (V_{CC})^2 / R_{GND}$$

If option 2 is selected, the diode has to be chosen by taking into account $V_{RRM} > |V_{CC}|$ and its power dissipation capability:

$$P_D \geq I_S * V_F$$

Note: In normal conditions (no reverse polarity), due to the diode, there is a voltage drop between GND of the device and GND of the system.

Figure 19. Reverse polarity protection

This schematic can be used with any type of load.

9 Reverse polarity on Vdd

The reverse polarity on V_{dd} can be implemented on board by placing a diode between GND_{dd} pin and GND digital ground.

The diode has to be chosen by taking into account $V_{RRM} > |V_{dd}|$ and its power dissipation capability:

$$P_D \geq I_{dd} \cdot V_F$$

Note: In normal conditions (no reverse polarity), due to the diode, there is a voltage drop between GND_{dd} of the device and digital ground of the system.

Figure 20. Reverse polarity protection on V_{dd}

13 Ordering information

Table 20. Ordering information

Order code	Package	Packing
ISO8200B	PowerSO-36	Tube
ISO8200BTR	PowerSO-36	Tape and reel

Revision history

Table 21. Document revision history

Date	Revision	Changes
19-Oct-2012	1	Initial release.
01-Jul-2013	2	Updated <i>Figure 24: Footprint recommended data</i> and <i>Table 15: Footprint data</i> .
28-Oct-2013	3	Document status promoted from preliminary to production data. Added IEC bullet to features. Updated <i>Table 4</i> , <i>Table 6</i> , <i>Table 7</i> , and <i>Table 9</i> . Deleted table titled: "Insulation and safety-related specifications" and table titled: "Device immunity specifications". Changed <i>Table 10: IEC 60747-5-2 insulation characteristics</i> Changed <i>Figure 10</i> .
12-Nov-2013	4	Added to <i>Table 10</i> CLR and CPG parameters.
29-Nov-2013	5	Removed VIORM parameter from <i>Table 10</i> . Updated <i>Section 8: Reverse polarity protection</i> . Added <i>Section 9: Reverse polarity on Vdd</i> . Changed <i>Figure 19</i> . Added <i>Figure 20</i> .
24-Jan-2014	6	Changed <i>Figure 7</i> . Added note to <i>Table 3</i> . Added test conditions: $T_J = 125\text{ }^\circ\text{C}$ to <i>Table 4</i> . Added typ. and max. values of I_{dd} to <i>Table 5</i> . Added max. values of $t_d(\text{ON})$ and $t_d(\text{OFF})$ to <i>Table 7</i> . Added typ. and max. values of $t_{p(\text{OUT_EN})}$ to <i>Table 9</i> . Added $t_{\text{jitter}(\text{DCM})}$ value to <i>Table 9</i> .
03-Feb-2014	7	Updated <i>Figure 12</i> .
06-Feb-2014	8	Updated <i>Figure 12</i> and <i>Table 9</i>
22-Apr-2014	9	Updated EAS parameter in <i>Table 2</i> . Updated I_{PEAK} parameter in <i>Table 6</i> . Updated mechanical data.
03-Jul-2017	10	Updated features, Table 1. Pin description , Section 5 Electrical characteristics and Section 6.4 Fault indication .
17-Oct-2019	11	Updated features ,updated the name of the last Pin in Table 1 , updated Table 15 , added : Section 12.2 , Section 12.3 , Section 12.4 , updated Table 11 .

Contents

1	Block diagram	3
2	Pin connection	4
3	Absolute maximum ratings	6
4	Thermal data	7
5	Electrical characteristics	8
6	Functional description	13
6.1	Parallel interface	13
6.1.1	Input signals (IN1 to IN8)	13
6.1.2	Load input data (LOAD)	13
6.1.3	Output synchronization (SYNC)	13
6.1.4	Watchdog	13
6.1.5	Output enable (OUT_EN)	14
6.2	Direct control mode (DCM)	14
6.3	Synchronous control mode (SCM)	15
6.4	Fault indication	17
6.4.1	Junction overtemperature and case overtemperature	17
7	Power section	19
7.1	Current limitation	19
7.2	Thermal protection	19
8	Reverse polarity protection	22
9	Reverse polarity on Vdd	23
10	Conventions	24
10.1	Supply voltage and power output conventions	24
11	Thermal information	25
11.1	Thermal impedance	25
12	Package information	26
12.1	PowerSO-36 package information	26
12.2	Footprint recommended data	27
12.3	Tube shipment information	27

12.4	Tape and reel shipment information	28
13	Ordering information	31
	Revision history	32
	Contents	33
	List of tables	35
	List of figures.....	36
