DAC908

SBAS109B – JUNE 2003

SpeedPLUS™ 8-Bit, 165MSPS DIGITAL-TO-ANALOG CONVERTER

FEATURES

- SINGLE +5V OR +3V OPERATION
- HIGH SFDR: 5.04MHz Output at 100MSPS: 67dBc
- LOW GLITCH: 3pV-s
- LOW POWER: 170mW at +5V
- INTERNAL REFERENCE:
  - Optional Ext. Reference
  - Adjustable Full-Scale Range
  - Multiplying Option

APPLICATIONS

- MEDICAL INSTRUMENTATION
  - Ultrasound (DBF)
- VIDEO, DIGITAL TV
- WAVEFORM GENERATION
  - Direct Digital Synthesis (DDS)
  - Arbitrary Waveform Generation (ARB)
- TEST INSTRUMENTATION
- COMMUNICATIONS

DESCRIPTION

The DAC908 is a high-speed, Digital-to-Analog Converter (DAC) offering an 8-bit resolution option within the *SpeedPlus* family of high-performance converters. Featuring pin compatibility among family members, the DAC900, DAC902, and DAC904 provide a component selection option to an 10-, 12-, and 14-bit resolution, respectively. All models within this family of DACs support update rates in excess of 165MSPS with excellent dynamic performance, and are especially suited to fulfill the demands of a variety of applications.

The advanced segmentation architecture of the DAC908 is optimized to provide a high Spurious-Free Dynamic Range (SFDR) for single-tone, as well as for multi-tone signals—essential when used for the transmit signal path of communication systems.

The DAC908 has a high impedance (200kΩ) current output with a nominal range of 20mA and an output compliance of up to 1.25V. The differential outputs allow for both a differential or single-ended analog signal interface. The close matching of the current outputs ensures superior dynamic performance in the differential configuration, which can be implemented with a transformer.

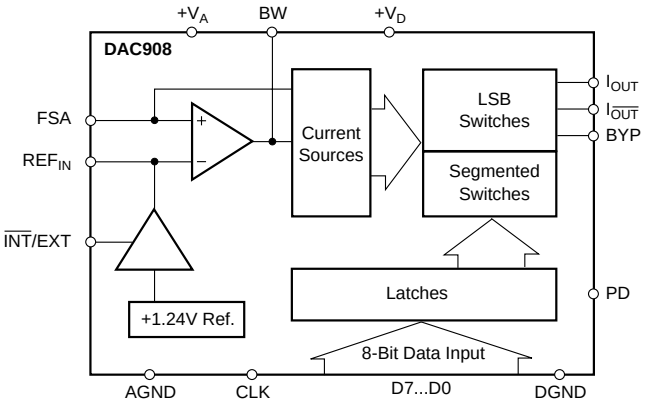
Utilizing a small geometry CMOS process, the monolithic DAC908 can be operated on a wide, single-supply range of +2.7V to +5.5V. Its low power consumption allows for use in portable and battery-operated systems. Further optimization can be realized by lowering the output current with the adjustable full-scale option.

For noncontinuous operation of the DAC908, a power-down mode results in only 45mW of standby power.

The DAC908 comes with an integrated 1.24V bandgap reference and edge-triggered input latches, offering a complete converter solution. Both +3V and +5V CMOS logic families can be interfaced to the DAC908.

The reference structure of the DAC908 allows for additional flexibility by utilizing the on-chip reference, or applying an external reference. The full-scale output current can be adjusted over a span of 2mA to 20mA, with one external resistor, while maintaining the specified dynamic performance.

The DAC908 is available in the SO-28 and TSSOP-28 packages.



Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

ABSOLUTE MAXIMUM RATINGS

$+V_A$ to AGND	–0.3V to +6V
$+V_D$ to DGND	–0.3V to +6V
AGND to DGND	–0.3V to +0.3V
$+V_A$ to $+V_D$	–6V to +6V
CLK, PD to DGND	–0.3V to V_D + 0.3V
D0-D7 to DGND	–0.3V to V_D + 0.3V
I_{OUT}, $I_{\overline{OUT}}$ to AGND	–1V to V_A + 0.3V
BW, BYP to AGND	–0.3V to V_A + 0.3V
REF_{IN}, FSA to AGND	–0.3V to V_A + 0.3V

Junction Temperature	+150°C
Case Temperature	+100°C
Storage Temperature	+125°C

ELECTROSTATIC DISCHARGE SENSITIVITY

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

PACKAGE/ORDERING INFORMATION

PRODUCT	PACKAGE	PACKAGE DRAWING NUMBER	SPECIFIED TEMPERATURE RANGE	PACKAGE MARKING	ORDERING NUMBER(1)	TRANSPORT MEDIA
DAC908U	SO-28	217	–40°C to +85°C	DAC908U	DAC908U	Rails
"	"	"	"	"	DAC908U/1K	Tape and Reel
DAC908E	TSSOP-28	360	–40°C to +85°C	DAC908E	DAC908E	Rails
"	"	"	"	"	DAC908E/2K5	Tape and Reel

NOTE: (1) Models with a slash (/) are available only in Tape and Reel in the quantities indicated (e.g., /2K5 indicates 2500 devices per reel). Ordering 2500 pieces of "DAC908E/2K5" will get a single 2500-piece Tape and Reel.

DEMO BOARD ORDERING INFORMATION

PRODUCT	DEMO BOARD ORDERING NUMBER	COMMENT
DAC908U	DEM-DAC90xU	Populated evaluation board without DAC. Order sample of desired DAC90x model separately.
DAC908E	DEM-DAC908E	Populated evaluation board including the DAC908E.

ELECTRICAL CHARACTERISTICS

At T_A = full specified temperature range, $+V_A$ = +5V, $+V_D$ = +5V, differential transformer coupled output, 50Ω doubly terminated, unless otherwise specified.

APPLICATION INFORMATION

THEORY OF OPERATION

The architecture of the DAC908 uses the current steering technique to enable fast switching and a high update rate. The core element within the monolithic DAC is an array of segmented current sources that are designed to deliver a full-scale output current of up to 20mA, as shown in Figure 1. An internal decoder addresses the differential current switches each time the DAC is updated and a corresponding output current is formed by steering all currents to either output summing node, I_{OUT} or $I_{\overline{OUT}}$. The complementary outputs deliver a differential output signal that improves the dynamic performance through reduction of even-order harmonics, common-mode signals (noise), and double the peak-to-peak output signal swing by a factor of two, compared to single-ended operation.

The segmented architecture results in a significant reduction of the glitch energy, and improves the dynamic performance (SFDR) and DNL. The current outputs maintain a very high output impedance of greater than 200kΩ.

The full-scale output current is determined by the ratio of the internal reference voltage (1.24V) and an external resistor, R_{SET}. The resulting I_{REF} is internally multiplied by a factor of 32 to produce an effective DAC output current that can range from 2mA to 20mA, depending on the value of R_{SET}.

The DAC908 is split into a digital and an analog portion, each of which is powered through its own supply pin. The digital section includes edge-triggered input latches and the decoder logic, while the analog section comprises the current source array with its associated switches and the reference circuitry.

DAC TRANSFER FUNCTION

The total output current, I_{OUTFS}, of the DAC908 is the summation of the two complementary output currents:

$$I_{OUTFS} = I_{OUT} + I_{\overline{OUT}} \quad (1)$$

The individual output currents depend on the DAC code and can be expressed as:

$$I_{OUT} = I_{OUTFS} \bullet (Code/256) \quad (2)$$

$$I_{\overline{OUT}} = I_{OUTFS} \bullet (255 - Code/256) \quad (3)$$

where 'Code' is the decimal representation of the DAC data input word. Additionally, I_{OUTFS} is a function of the reference current I_{REF}, which is determined by the reference voltage and the external setting resistor, R_{SET}.

$$I_{OUTFS} = 32 \bullet I_{REF} = 32 \bullet V_{REF}/R_{SET} \quad (4)$$

In most cases the complementary outputs will drive resistive loads or a terminated transformer. A signal voltage will develop at each output according to:

$$V_{OUT} = I_{OUT} \bullet R_{LOAD} \quad (5)$$

$$V_{\overline{OUT}} = I_{\overline{OUT}} \bullet R_{LOAD} \quad (6)$$

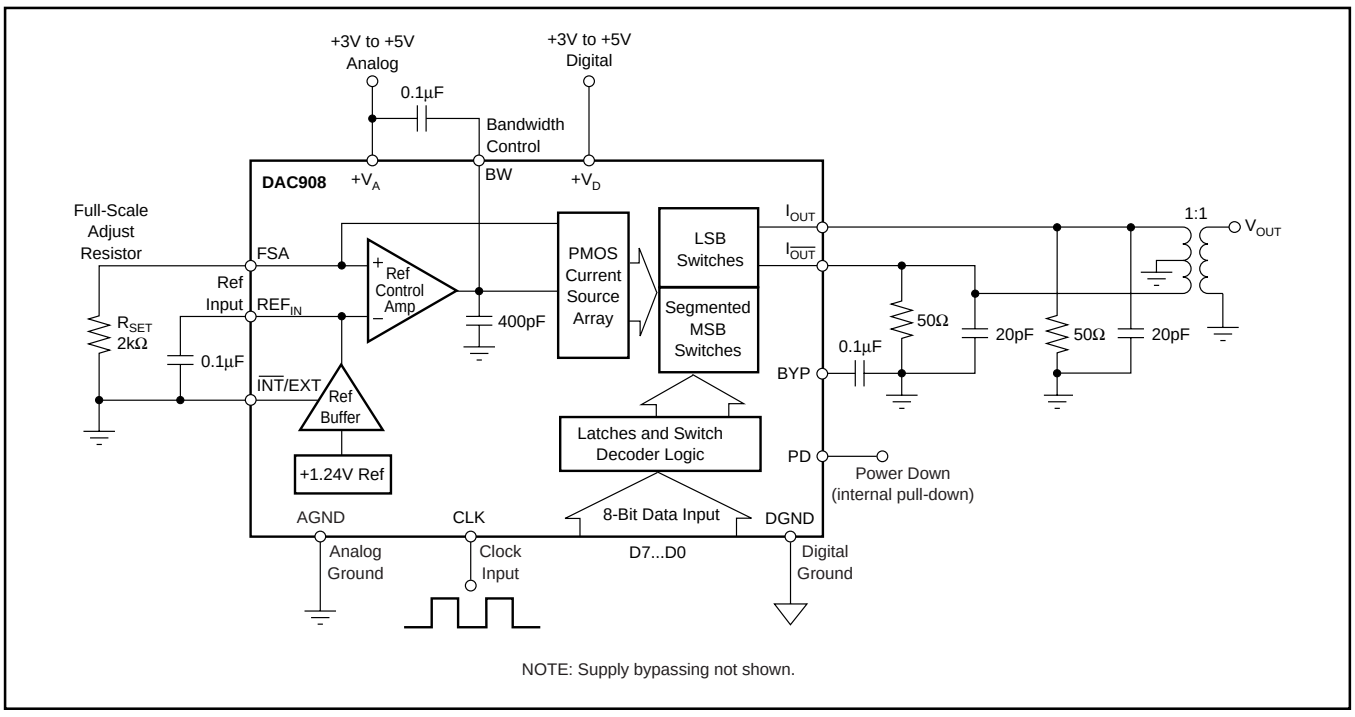

FIGURE 1. Functional Block Diagram of the DAC908.

The value of the load resistance is limited by the output compliance specification of the DAC908. To maintain specified linearity performance, the voltage for I_{OUT} and $I_{\overline{OUT}}$ should not exceed the maximum allowable compliance range.

The two single-ended output voltages can be combined to find the total differential output swing:

$$V_{OUTDIFF} = V_{OUT} - V_{\overline{OUT}} = \frac{(2 \bullet Code - 255)}{256} \bullet I_{OUTFS} \bullet R_{LOAD} \quad (7)$$

ANALOG OUTPUTS

The DAC908 provides two complementary current outputs, I_{OUT} and $I_{\overline{OUT}}$. The simplified circuit of the analog output stage representing the differential topology is shown in Figure 2. The output impedance of 200kΩ || 12pF for I_{OUT} and $I_{\overline{OUT}}$ results from the parallel combination of the differential switches, along with the current sources and associated parasitic capacitances.

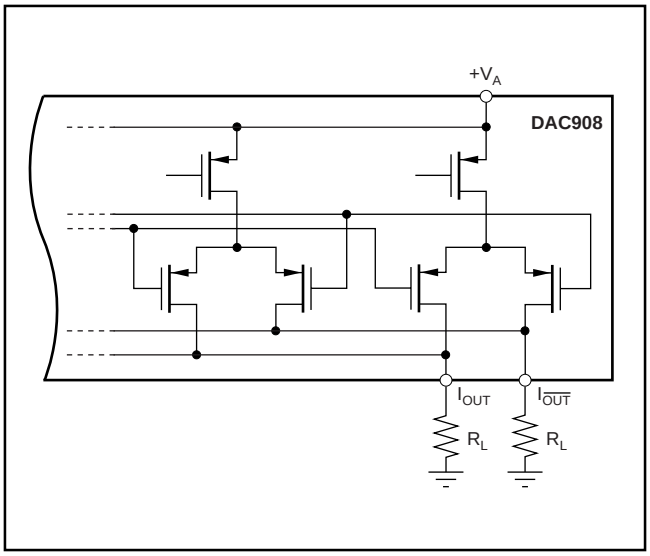

FIGURE 2. Equivalent Analog Output.

The signal voltage swing that may develop at the two outputs, I_{OUT} and $I_{\overline{OUT}}$, is limited by a negative and positive compliance. The negative limit of –1V is given by the breakdown voltage of the CMOS process, and exceeding it will compromise the reliability of the DAC908, or even cause permanent damage. With the full-scale output set to 20mA, the positive compliance equals 1.25V, operating with $+V_D$ = 5V. Note that the compliance range decreases to about 1V for a selected output current of I_{OUTFS} = 2mA. Care should be taken that the configuration of DAC908 does not exceed the compliance range to avoid degradation of the distortion performance and integral linearity.

Best distortion performance is typically achieved with the maximum full-scale output signal limited to approximately 0.5V. This is the case for a 50Ω doubly-terminated load and a 20mA full-scale output current. A variety of loads can be adapted to the output of the DAC908 by selecting a suitable transformer while maintaining optimum voltage levels at I_{OUT} and $I_{\overline{OUT}}$. Furthermore, using the differential output configuration in combination with a transformer will be instrumental for achieving excellent distortion performance. Common-mode errors, such as even-order harmonics or noise, can be substantially reduced. This is particularly the case with high output frequencies and/or output amplitudes below full-scale.

For those applications requiring the optimum distortion and noise performance, it is recommended to select a full-scale output of 20mA. A lower full-scale range down to 2mA may be considered for applications that require a low power consumption, but can tolerate a reduced performance level.

INPUT CODE (D7 - D0)	I_{OUT}	$I_{\overline{OUT}}$
1111 1111	20mA	0mA
1000 0000	10mA	10mA
0000 0000	0mA	20mA

TABLE I. Input Coding vs Analog Output Current.

OUTPUT CONFIGURATIONS

The current output of the DAC908 allows for a variety of configurations, some of which are illustrated below. As mentioned previously, utilizing the converter's differential outputs will yield the best dynamic performance. Such a differential output circuit may consist of an RF transformer (see Figure 3) or a differential amplifier configuration (see Figure 4). The transformer configuration is ideal for most applications with ac coupling, while op amps will be suitable for a DC-coupled configuration.

The single-ended configuration (see Figure 6) may be considered for applications requiring a unipolar output voltage. Connecting a resistor from either one of the outputs to ground will convert the output current into a ground-referenced voltage signal. To improve on the DC linearity an I-to-V converter can be used instead. This will result in a negative signal excursion and, therefore, requires a dual supply amplifier.

DIFFERENTIAL WITH TRANSFORMER

Using an RF transformer provides a convenient way of converting the differential output signal into a single-ended signal while achieving excellent dynamic performance (see Figure 3). The appropriate transformer should be carefully selected based on the output frequency spectrum and impedance requirements. The differential transformer configuration has the benefit of significantly reducing common-mode signals, thus improving the dynamic performance over a wide range of frequencies. Furthermore, by selecting a suitable impedance ratio (winding ratio), the transformer can be used to provide optimum impedance matching while controlling the compliance voltage for the converter outputs. The model shown in Figure 3 has a 1:1 ratio and may be used to interface the DAC908 to a 50Ω load. This results in a 25Ω load for each of the outputs, I_{OUT} and $I_{\overline{OUT}}$. The output signals are ac coupled and inherently isolated because of the transformer's magnetic coupling.

As shown in Figure 3, the transformer's center tap must be connected to ground to enable the necessary DC-current flow for both outputs. Some applications may require a solid termination, in which case a differential resistor, R_{DIFF}, may be inserted as shown. Note that this will reduce the available signal power by approximately one half.

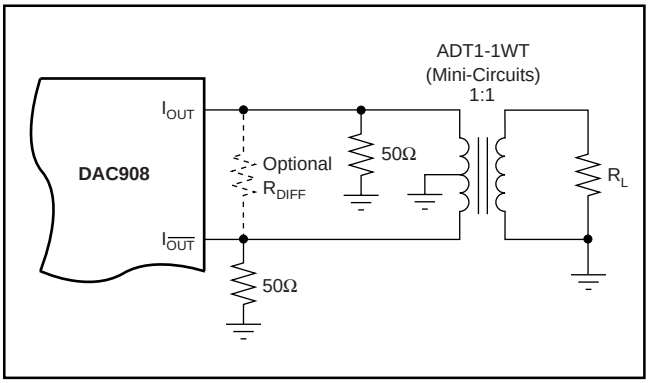

FIGURE 3. Differential Output Configuration Using an RF Transformer.

DIFFERENTIAL CONFIGURATION USING AN OP AMP

If the application requires a DC-coupled output, a difference amplifier may be considered, as shown in Figure 4. Four external resistors are needed to configure the voltage-feedback op amp OPA680 as a difference amplifier performing the differential to single-ended conversion. Under the shown configuration, the DAC908 generates a differential output signal of 0.5Vp-p at the load resistors, R_L. The resistor values shown were selected to result in a symmetric 25Ω loading for each of the current outputs since the input impedance of the difference amplifier is in parallel to resistors R_L, and should be considered.

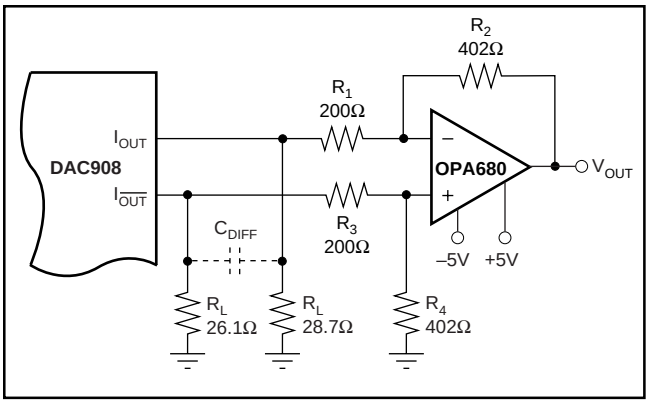

FIGURE 4. Difference Amplifier Provides Differential to Single-Ended Conversion and DC-Coupling.

The OPA680 is configured for a gain of two. Therefore, operating the DAC908 with a 20mA full-scale output will produce a voltage output of ±1V. This requires the amplifier to operate off of a dual power supply (±5V). The tolerance of the resistors typically sets the limit for the achievable common-mode rejection. An improvement can be obtained by fine tuning resistor R_4.

This configuration typically delivers a lower level of ac performance than the previously discussed transformer solution because the amplifier introduces another source of distortion. Suitable amplifiers should be selected based on their slew-rate, harmonic distortion, and output swing capabilities. High-speed amplifiers like the OPA680 or OPA687 may be considered. The ac performance of this circuit may be improved by adding a small capacitor, C_{DIFF}, between the outputs I_{OUT} and $I_{\overline{OUT}}$, as shown in Figure 4. This will introduce a real pole to create a low-pass filter in order to slew-limit the DACs fast output signal steps, which otherwise could drive the amplifier into slew-limitations or into an overload condition; both would cause excessive distortion. The difference amplifier can easily be modified to add a level shift for applications requiring the single-ended output voltage to be unipolar, i.e., swing between 0V and +2V.

DUAL TRANSIMPEDANCE OUTPUT CONFIGURATION

The circuit example of Figure 5 shows the signal output currents connected into the summing junction of the OPA2680, which is set up as a transimpedance stage, or I-to-V converter. With this circuit, the DAC's output will be kept at a virtual ground, minimizing the effects of output impedance variations, and resulting in the best DC linearity (INL). However, as mentioned previously, the amplifier may be driven into slew-rate limitations, and produce unwanted distortion. This may occur especially at high DAC update rates.

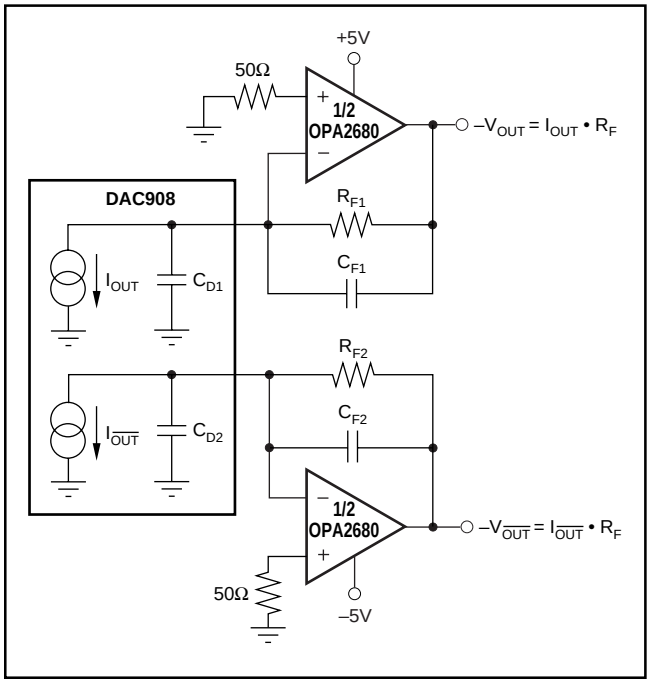

FIGURE 5. Dual, Voltage-Feedback Amplifier OPA2680 Forms Differential Transimpedance Amplifier.

The DC gain for this circuit is equal to feedback resistor R_F. At high frequencies, the DAC output impedance (C_{D1}, C_{D2}) will produce a zero in the noise gain for the OPA2680 that may cause peaking in the closed-loop frequency response. C_F is added across R_F to compensate for this noise-gain peaking. To achieve a flat transimpedance frequency response, the pole in each feedback network should be set to:

$$\frac{1}{2\pi R_F C_F} = \frac{\sqrt{GBP}}{4\pi R_F C_D} \quad (8)$$

with GBP = Gain Bandwidth Product of OPA

which will give a corner frequency f_{-3dB} of approximately:

$$f_{-3dB} = \frac{\sqrt{GBP}}{2\pi R_F C_D} \quad (9)$$

The full-scale output voltage is defined by the product of $I_{OUTFS} \bullet R_F$, and has a negative unipolar excursion. To improve on the ac performance of this circuit, adjustment of R_F and/or I_{OUTFS} should be considered. Further extensions of this application example may include adding a differential filter at the OPA2680's output followed by a transformer, in order to convert to a single-ended signal.

SINGLE-ENDED CONFIGURATION

Using a single load resistor connected to the one of the DAC outputs, a simple current-to-voltage conversion can be accomplished. The circuit in Figure 6 shows a 50Ω resistor connected to I_{OUT}, providing the termination of the further connected 50Ω cable. Therefore, with a nominal output current of 20mA, the DAC produces a total signal swing of 0V to 0.5V into the 25Ω load.

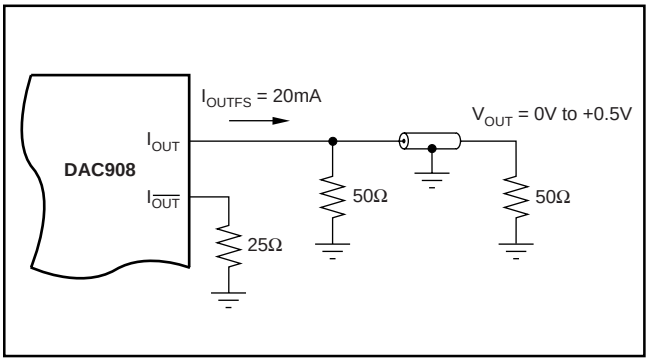

FIGURE 6. Driving a Doubly-Terminated 50Ω Cable Directly.

Different load resistor values may be selected as long as the output compliance range is not exceeded. Additionally, the output current, I_{OUTFS}, and the load resistor may be mutually adjusted to provide the desired output signal swing and performance.

INTERNAL REFERENCE OPERATION

The DAC908 has an on-chip reference circuit that comprises a 1.24V bandgap reference and a control amplifier. Grounding pin 16, $\overline{INT}$/EXT, enables the internal reference operation. The full-scale output current, I_{OUTFS}, of the DAC908 is determined by the reference voltage, V_{REF}, and the value of resistor R_{SET}. I_{OUTFS} can be calculated by:

$$I_{OUTFS} = 32 \bullet I_{REF} = 32 \bullet V_{REF} / R_{SET} \quad (10)$$

As shown in Figure 7, the external resistor R_{SET} connects to the FSA pin (Full-Scale Adjust). The reference control amplifier operates as a V-to-I converter producing a reference current, I_{REF}, which is determined by the ratio of V_{REF} and R_{SET}, as shown in Equation 10. The full-scale output current, I_{OUTFS}, results from multiplying I_{REF} by a fixed factor of 32.

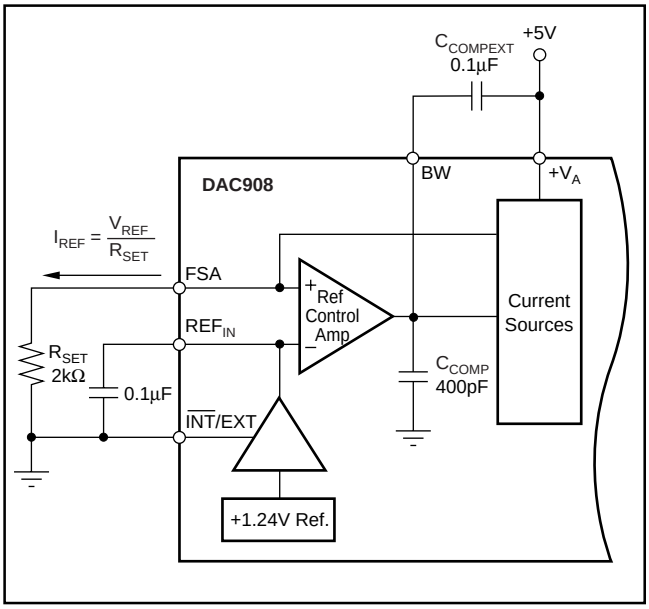

FIGURE 7. Internal Reference Configuration.

Using the internal reference, a 2kΩ resistor value results in a 20mA full-scale output. Resistors with a tolerance of 1% or better should be considered. Selecting higher values, the converter output can be adjusted from 20mA down to 2mA. Operating the DAC908 at lower than 20mA output currents may be desirable for reasons of reducing the total power consumption, improving the distortion performance, or observing the output compliance voltage limitations for a given load condition.

It is recommended to bypass the REF_{IN} pin with a ceramic chip capacitor of 0.1µF or more. The control amplifier is internally compensated, and its small signal bandwidth is approximately 1.3MHz. To improve the ac performance, an additional capacitor ($C_{COMPEXT}$) should be applied between the BW pin and the analog supply, $+V_A$, as shown in Figure 7. Using a 0.1µF capacitor, the small-signal bandwidth and output impedance of the control amplifier is further diminished, reducing the noise that is fed into the current source array. This also helps shunting feedthrough signals more effectively, and improving the noise performance of the DAC908.

EXTERNAL REFERENCE OPERATION

The internal reference can be disabled by applying a logic HIGH ($+V_A$) to pin $\overline{INT}$/EXT. An external reference voltage can then be driven into the REF_{IN} pin, which in this case functions as an input, as shown in Figure 8. The use of an external reference may be considered for applications that require higher accuracy and drift performance, or to add the ability of dynamic gain control.

While a 0.1µF capacitor is recommended to be used with the internal reference, it is optional for the external reference operation. The reference input, REF_{IN}, has a high input impedance (1MΩ) and can easily be driven by various sources. Note that the voltage range of the external reference should stay within the compliance range of the reference input (0.1V to 1.25V).

DIGITAL INPUTS

The digital inputs, D0 (LSB) through D7 (MSB) of the DAC908 accepts standard-positive binary coding. The digital input word is latched into a master-slave latch with the rising edge of the clock. The DAC output becomes updated with the following falling clock edge (refer to the specification table and timing diagram for details). The best performance will be achieved with a 50% clock duty cycle, however, the duty cycle may vary as long as the timing specifications are met. Additionally, the setup and hold times may be chosen within their specified limits.

All digital inputs are CMOS compatible. The logic thresholds depend on the applied digital supply voltage such that they are set to approximately half the supply voltage; $V^{th} = +V_D/2$ (±20% tolerance). The DAC908 is designed to operate over a supply range of 2.7V to 5.5V.

POWER-DOWN MODE

The DAC908 features a power-down function which can be used to reduce the supply current to less than 9mA over the specified supply range of 2.7V to 5.5V. Applying a logic High to the PD pin will initiate the power-down mode, while a logic Low enables normal operation. When left unconnected, an internal active pull-down circuit will enable the normal operation of the converter.

GROUNDING, DECOUPLING AND LAYOUT INFORMATION

Proper grounding and bypassing, short lead length, and the use of ground planes are particularly important for high frequency designs. Multilayer pc-boards are recommended for best performance since they offer distinct advantages such as minimization of ground impedance, separation of signal layers by ground layers, etc.

The DAC908 uses separate pins for its analog and digital supply and ground connections. The placement of the decoupling capacitor should be such that the analog supply ($+V_A$) is bypassed to the analog ground (AGND), and the digital supply bypassed to the digital ground (DGND). In most cases 0.1uF ceramic chip capacitors at each supply pin are adequate to provide a low impedance decoupling path. Keep in mind that their effectiveness largely depends on the proximity to the individual supply and ground pins. Therefore, they should be located as close as physically possible to those device leads. Whenever possible, the capacitors should be located immediately under each pair of supply/ground pins on the reverse side of the pc-board. This layout approach will minimize the parasitic inductance of component leads and pcb runs.

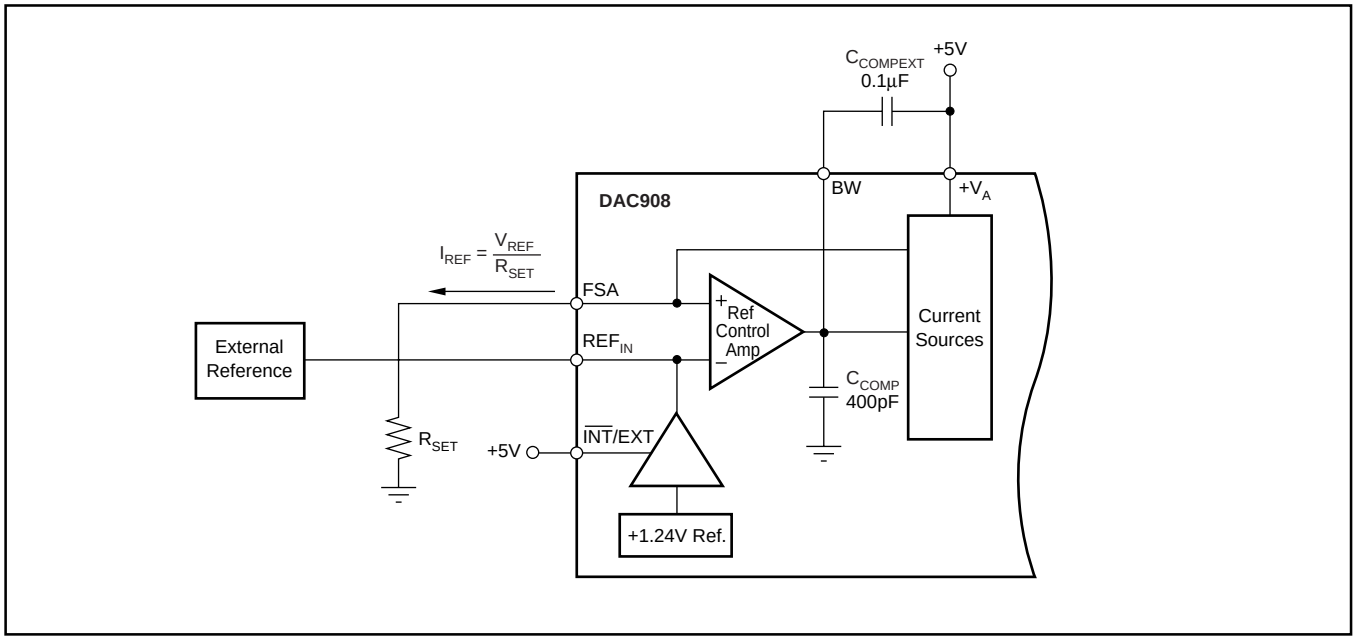

FIGURE 8. External Reference Configuration.

Further supply decoupling with surface mount tantalum capacitors (1uF to 4.7uF) may be added as needed in proximity of the converter.

Low noise is required for all supply and ground connections to the DAC908. It is recommended to use a multilayer pc-board utilizing separate power and ground planes. Mixed signal designs require particular attention to the routing of the different supply currents and signal traces. Generally, analog supply and ground planes should only extend into analog signal areas, such as the DAC output signal and the reference signal. Digital supply and ground planes must be confined to areas covering digital circuitry, including the digital input lines connecting to the converter, as well as the clock signal. The analog and digital ground planes should be joined together at one point underneath the DAC. This can be realized with a short track of approximately 1/8" (3mm).

The power to the DAC908 should be provided through the use of wide pcb runs or planes. Wide runs will present a lower trace impedance, further optimizing the supply decoupling. The analog and digital supplies for the converter should only be connected together at the supply connector of the pc-board. In the case of only one supply voltage being available to power the DAC, ferrite beads along with bypass capacitors may be used to create an LC filter. This will generate a low-noise analog supply voltage that can then be connected to the $+V_A$ supply pin of the DAC908.

While designing the layout, it is important to keep the analog signal traces separate from any digital line, in order to prevent noise coupling onto the analog signal path.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
DAC908E	ACTIVE	TSSOP	PW	28	50	RoHS & Green	NIPDAU	Level-2-260C-1 YEAR	-40 to 85	DAC908E	Samples
DAC908E/2K5	ACTIVE	TSSOP	PW	28	2500	RoHS & Green	NIPDAU	Level-2-260C-1 YEAR	-40 to 85	DAC908E	Samples
DAC908U	ACTIVE	SOIC	DW	28	20	RoHS & Green	NIPDAU	Level-2-260C-1 YEAR	-40 to 85	DAC908U	Samples
DAC908U/1K	ACTIVE	SOIC	DW	28	1000	RoHS & Green	NIPDAU	Level-2-260C-1 YEAR	-40 to 85	DAC908U	Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

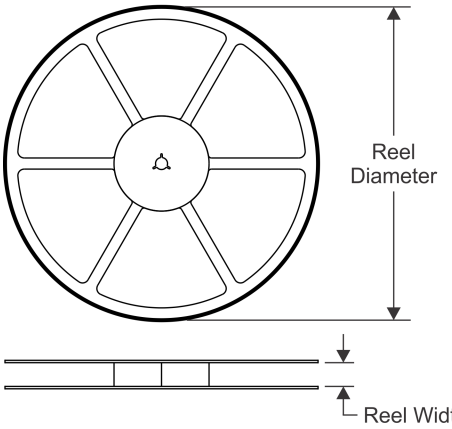
(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals.
TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

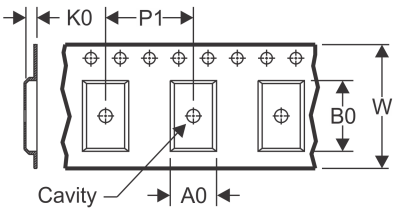
In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TAPE AND REEL INFORMATION

REEL DIMENSIONS

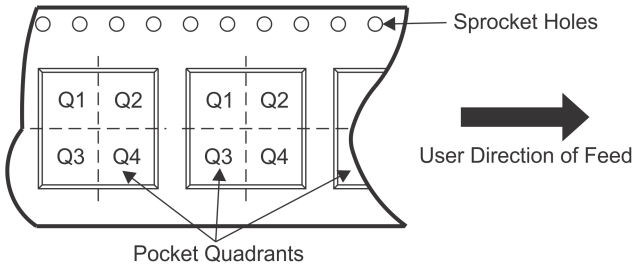


TAPE DIMENSIONS



A0	Dimension designed to accommodate the component width
B0	Dimension designed to accommodate the component length
K0	Dimension designed to accommodate the component thickness
W	Overall width of the carrier tape
P1	Pitch between successive cavity centers

QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE



*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant
DAC908E/2K5	TSSOP	PW	28	2500	330.0	16.4	6.9	10.2	1.8	12.0	16.0	Q1

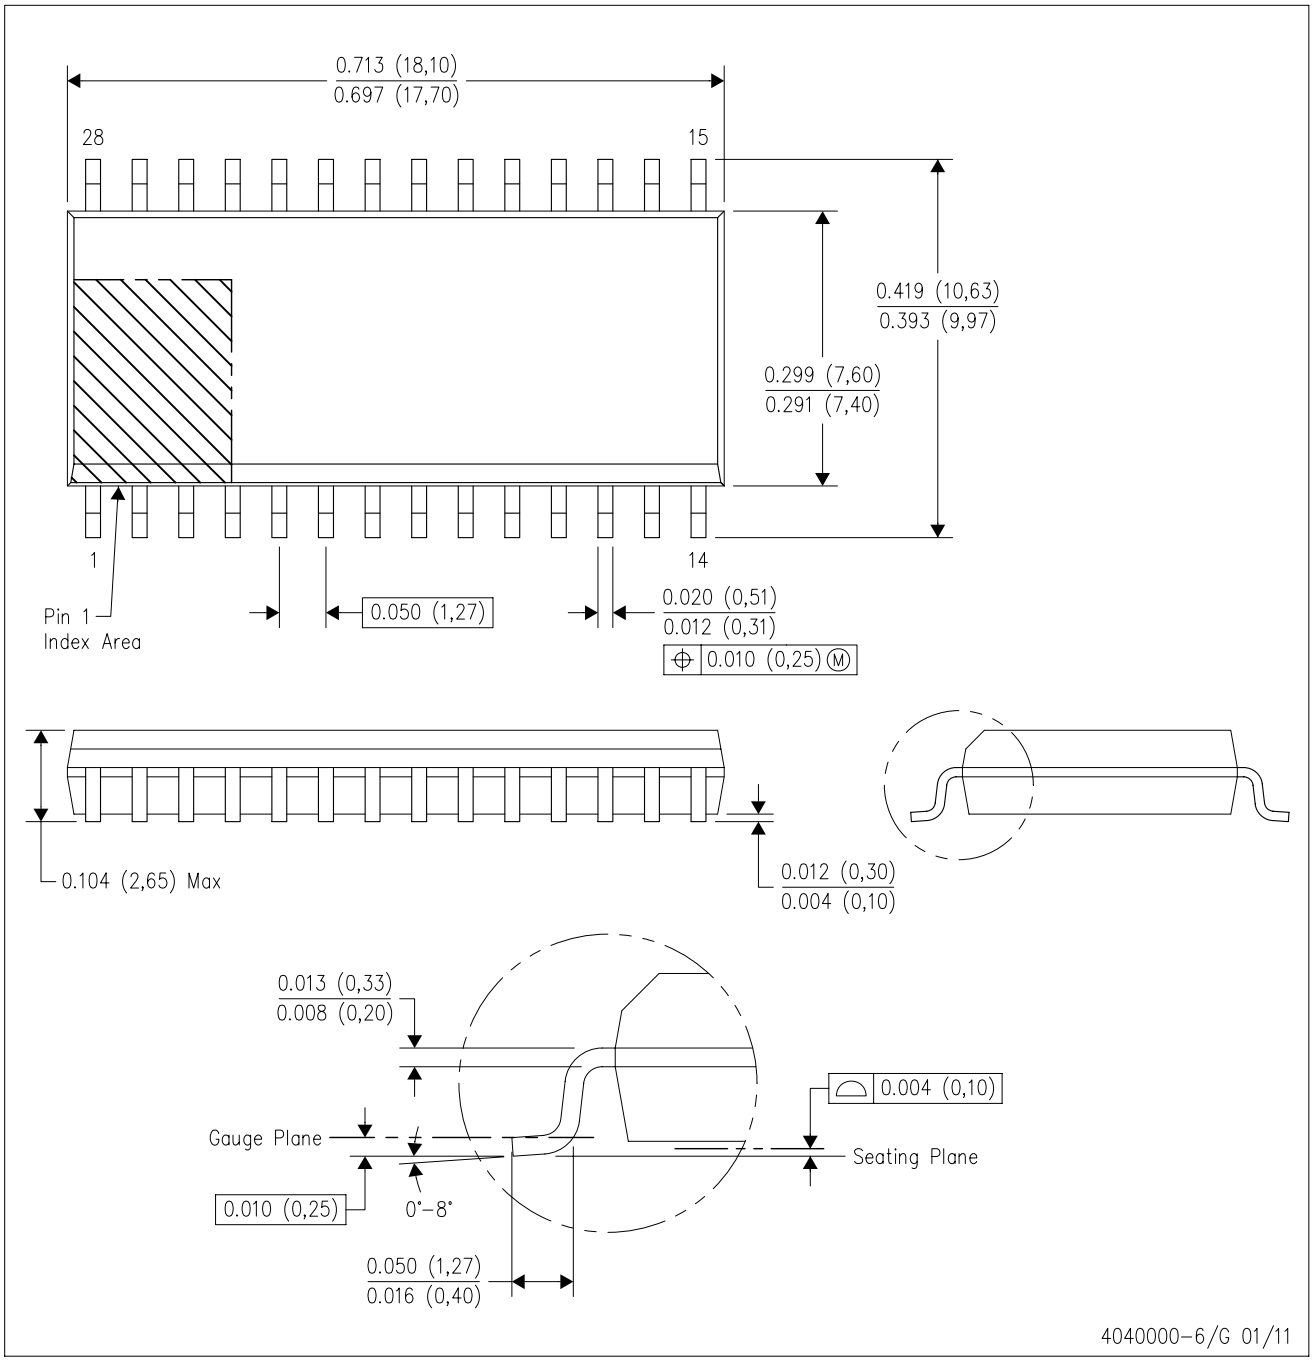
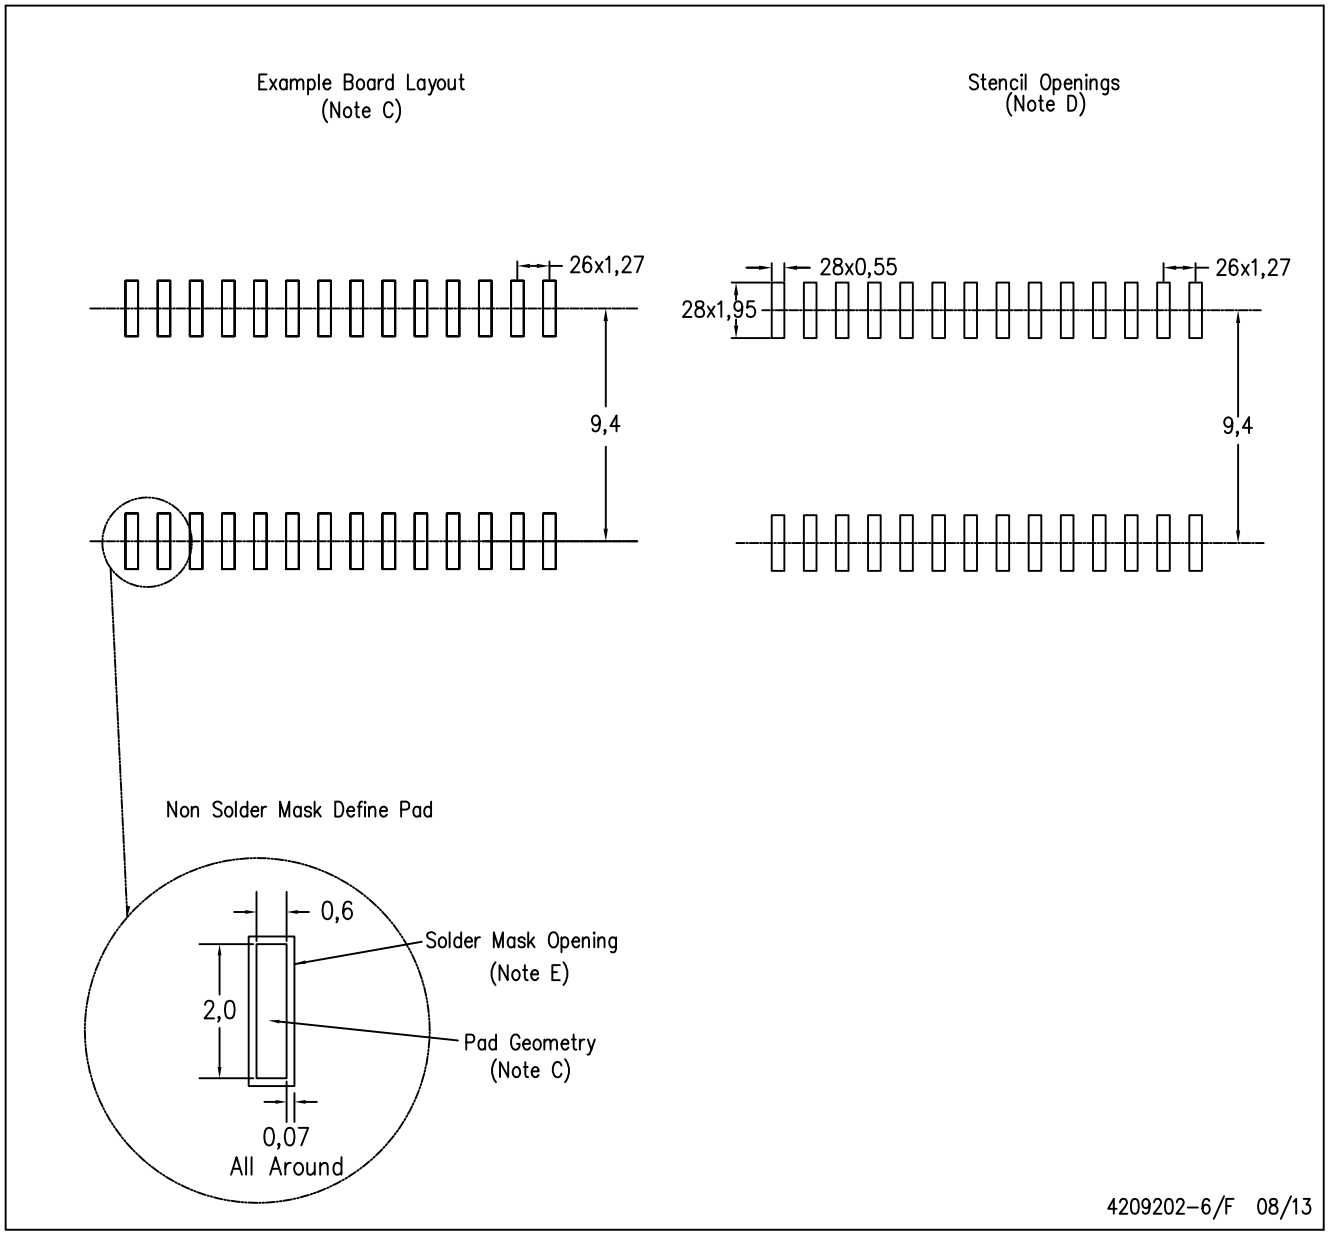
DW (R–PDSO–G28) PLASTIC SMALL OUTLINE



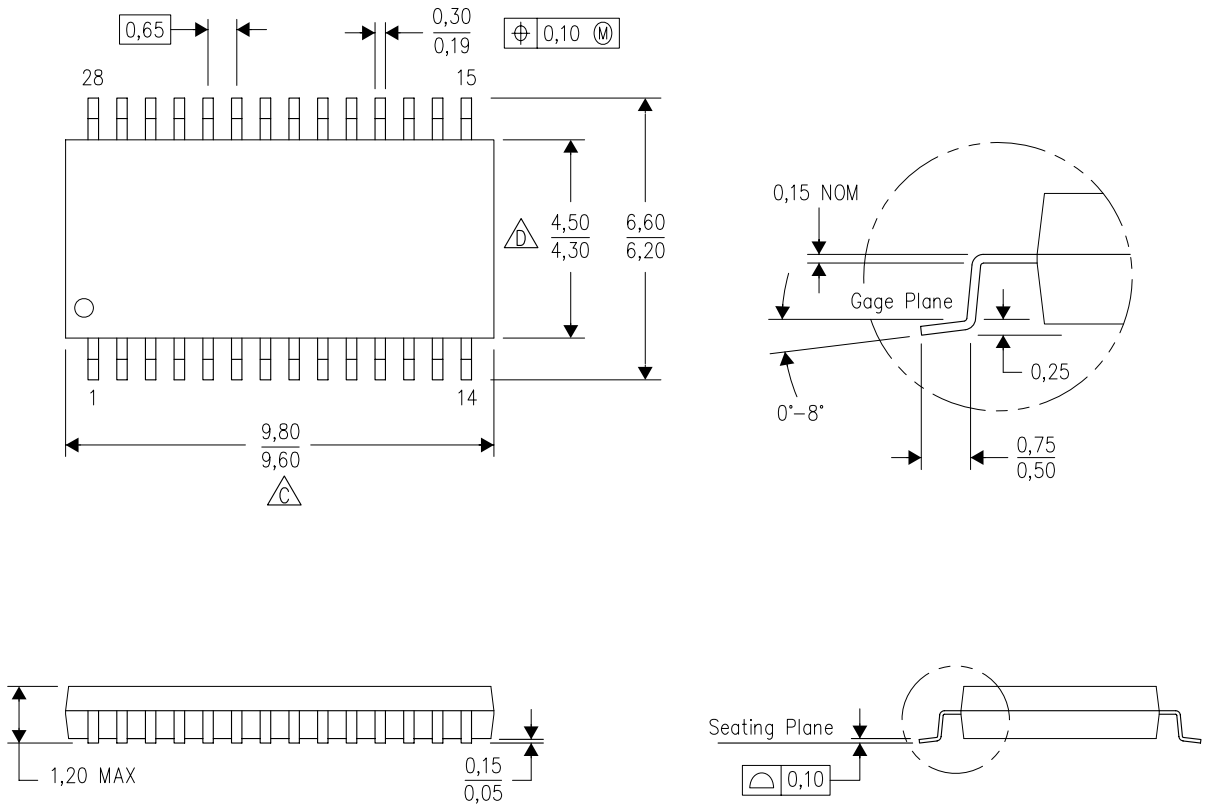
NOTES:
A. All linear dimensions are in inches (millimeters). Dimensioning and tolerancing per ASME Y14.5M–1994.
B. This drawing is subject to change without notice.
C. Body dimensions do not include mold flash or protrusion not to exceed 0.006 (0,15).
D. Falls within JEDEC MS–013 variation AE.

DW (R–PDSO–G28) PLASTIC SMALL OUTLINE



NOTES:
A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Refer to IPC7351 for alternate board design.
D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC–7525
E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

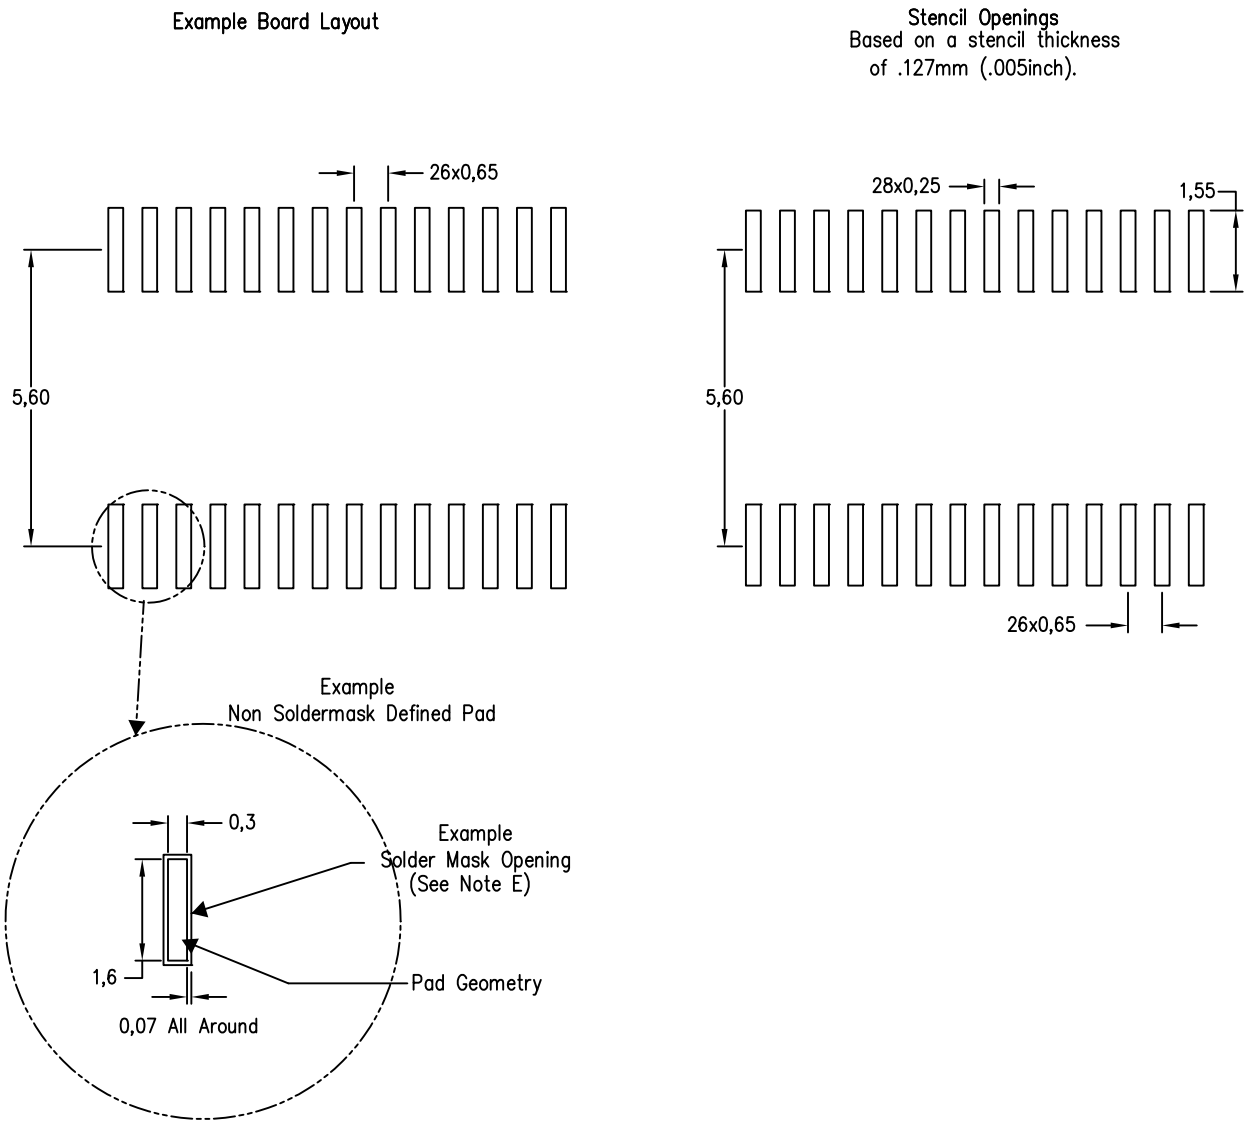
PW (R–PDSO–G28) PLASTIC SMALL OUTLINE



4040064–7/G 02/11

NOTES:
A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M–1994.
B. This drawing is subject to change without notice.
C. Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0,15 each side.
D. Body width does not include interlead flash. Interlead flash shall not exceed 0,25 each side.
E. Falls within JEDEC MO–153

PW (R–PDSO–G28) PLASTIC SMALL OUTLINE



NOTES:
A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Publication IPC–7351 is recommended for alternate design.
D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC–7525 for other stencil recommendations.
E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.
