

# NCV7356

## Single Wire CAN Transceiver

The NCV7356 is a physical layer device for a single wire data link capable of operating with various Carrier Sense Multiple Access with Collision Resolution (CSMA/CR) protocols such as the Bosch Controller Area Network (CAN) version 2.0. This serial data link network is intended for use in applications where high data rate is not required and a lower data rate can achieve cost reductions in both the physical media components and in the microprocessor and/or dedicated logic devices which use the network.

The network shall be able to operate in either the normal data rate mode or a high-speed data download mode for assembly line and service data transfer operations. The high-speed mode is only intended to be operational when the bus is attached to an off-board service node. This node shall provide temporary bus electrical loads which facilitate higher speed operation. Such temporary loads should be removed when not performing download operations.

The bit rate for normal communications is typically 33 kbit/s, for high-speed transmissions like described above a typical bit rate of 83 kbit/s is recommended. The NCV7356 features undervoltage lockout, timeout for faulty blocked input signals, output blanking time in case of bus ringing and a very low sleep mode current.

The device is compliant with GMW3089V2.4 General Motors Corporation specification.

### Features

- Fully Compatible with J2411 Single Wire CAN Specification
- 60  $\mu$ A (max) Sleep Mode Current
- Operating Voltage Range 5.0 to 27 V
- Up to 100 kbps High-Speed Transmission Mode
- Up to 40 kbps Bus Speed
- Selective BUS Wake-Up
- Logic Inputs Compatible with 3.3 V and 5 V Supply Systems
- Control Pin for External Voltage Regulators (14 Pin Package Only)
- Standby to Sleep Mode Timeout
- Low RFI Due to Output Wave Shaping
- Fully Integrated Receiver Filter
- Bus Terminals Short-Circuit and Transient Proof
- Loss of Ground Protection
- Protection Against Load Dump, Jump Start
- Thermal Overload and Short Circuit Protection
- ESD Protection of 4.0 kV on CANH Pin (2.0 kV on Any Other Pin)
- Undervoltage Lock Out
- Bus Dominant Timeout Feature
- Internally Fused Leads in SO-14 Package
- NCV Prefix for Automotive and Other Applications Requiring Unique Site and Control Change Requirements; AEC-Q100 Qualified and PPAP Capable
- These Devices are Pb-Free and are RoHS Compliant

## PACKAGE PIN DESCRIPTION

SOIC-8	SOIC-14	Symbol	Description
1	2	TxD	Transmit data from microprocessor to CAN.
2	3	MODE0	Operating mode select input 0.
3	4	MODE1	Operating mode select input 1.
4	5	RxD	Receive data from CAN to microprocessor.
5	10	V <sub>BAT</sub>	Battery input voltage.
6	11	LOAD	Resistor load (loss of ground detection low side switch).
7	12	CANH	Single wire CAN bus pin.
8	1, 7, 8, 14	GND	Ground
-	6, 13	NC	No Connection (Note 1)
-	9	INH	Control pin for external voltage regulator (high voltage high side switch) (14 pin package only)

1. PWB terminal 13 can be connected to ground which will allow the board to be assembled with either the 8 pin package or the 14 pin package.

**Electrical Specification**

All voltages are referenced to ground (GND). Positive currents flow into the IC. The maximum ratings given in the table below are limiting values that do not lead to a

permanent damage of the device but exceeding any of these limits may do so. Long term exposure to limiting values may affect the reliability of the device.

**MAXIMUM RATINGS**

Rating	Symbol	Condition	Min	Max	Unit
Supply Voltage, Normal Operation	V <sub>BAT</sub>	–	–0.3	18	V
Short-Term Supply Voltage, Transient	V <sub>BAT.LD</sub>	Load Dump; t < 500 ms	–	40	V (peak)
		Jump Start; t < 1.0 min	–	27	V
Transient Supply Voltage	V <sub>BAT.TR1</sub>	ISO 7637/1 Pulse 1 (Note 2)	–50	–	V
Transient Supply Voltage	V <sub>BAT.TR2</sub>	ISO 7637/1 Pulses 2 (Note 2)	–	100	V
Transient Supply Voltage	V <sub>BAT.TR3</sub>	ISO 7637/1 Pulses 3A, 3B	–200	200	V
CANH Voltage	V <sub>CANH</sub>	V <sub>BAT</sub> < 27 V	–20	40	V
		V <sub>BAT</sub> = 0 V	–40		
Transient Bus Voltage	V <sub>CANHTR1</sub>	ISO 7637/1 Pulse 1 (Note 3)	–50	–	V
Transient Bus Voltage	V <sub>CANHTR2</sub>	ISO 7637/1 Pulses 2 (Note 3)	–	100	V
Transient Bus Voltage	V <sub>CANHTR3</sub>	ISO 7637/1 Pulses 3A, 3B (Note 3)	–200	200	V
DC Voltage on Pin LOAD	V <sub>LOAD</sub>	Via RT > 2.0 kΩ	–40	40	V
DC Voltage on Pins TxD, MODE1, MODE0, RxD	V <sub>DC</sub>	–	–0.3	7.0	V
ESD Capability of CANH	V <sub>ESDBUS</sub>	Human Body Model (with respect to V <sub>BAT</sub> and GND) Eq. to Discharge 100 pF with 1.5 kΩ	–4000	4000	V
ESD Capability of Any Other Pin	V <sub>ESD</sub>	Human Body Model Eq. to Discharge 100 pF with 1.5 kΩ	–2000	2000	V
Maximum Latchup Free Current at Any Pin	I <sub>LATCH</sub>	–	–500	500	mA
Storage Temperature	T <sub>STG</sub>	–	–55	150	°C
Junction Temperature	T <sub>J</sub>	–	–40	150	°C
Lead Temperature Soldering Reflow: (SMD styles only)	SOIC–14	T <sub>slid</sub>	60 s – 150 s above 183°C	–	240 peak
	SOIC–8				

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

- ISO 7637 test pulses are applied to V<sub>BAT</sub> via a reverse polarity diode and >1.0 μF blocking capacitor.
- ISO 7637 test pulses are applied to CANH via a coupling capacitance of 1.0 nF.
- ESD measured per Q100–002 (EIA/JESD22–A114–A).

## ELECTRICAL CHARACTERISTICS ( $V_{BAT} = 5.0$ to $27$ V, $T_A = -40$ to $+125^\circ\text{C}$ , unless otherwise specified.)

Characteristic	Symbol	Condition	Min	Typ	Max	Unit	
<b>GENERAL</b>							
Undervoltage Lock Out	$V_{BATUV}$	–	3.5	–	4.8	V	
Supply Current, Recessive, All Active Modes	$I_{BATN}$	$V_{BAT} = 18$ V, TxD Open	Not High Speed Mode	–	5.0	6.0	mA
			High Speed Mode	–	–	8.0	
Normal Mode Supply Current, Dominant	$I_{BATN}$ (Note 10)	$V_{BAT} = 27$ V, MODE0 = MODE1 = H, TxD = L, $R_{load} = 200 \Omega$	–	30	35	mA	
High-Speed Mode Supply Current, Dominant	$I_{BATN}$ (Note 10)	$V_{BAT} = 16$ V, MODE0 = H, MODE1 = L, TxD = L, $R_{load} = 75 \Omega$	–	70	75	mA	
Wake-Up Mode Supply Current, Dominant	$I_{BATW}$ (Note 10)	$V_{BAT} = 27$ V, MODE0 = L, MODE1 = H, TxD = L, $R_{load} = 200 \Omega$	–	60	75	mA	
Sleep Mode Supply Current (Note 9)	$I_{BATS}$	$V_{BAT} = 13$ V, $T_A = 85^\circ\text{C}$ , TxD, RxD, MODE0, MODE1 Open	–	30	60	$\mu\text{A}$	
Thermal Shutdown (Note 10)	$T_{SD}$	–	155	–	180	$^\circ\text{C}$	
Thermal Recovery (Note 10)	$T_{REC}$	–	126	–	150	$^\circ\text{C}$	

## CANH

Bus Output Voltage	$V_{oh}$	$R_L > 200 \Omega$ , Normal Mode $6.0 \text{ V} < V_{BAT} < 27 \text{ V}$	4.4	–	5.1	V
Bus Output Voltage Low Battery	$V_{oh}$	$R_L > 200 \Omega$ , Normal High-Speed Mode $5.0 \text{ V} < V_{BAT} < 6.0 \text{ V}$	3.4	–	5.1	V
Bus Output Voltage High-Speed Mode	$V_{oh}$	$R_L > 75 \Omega$ , High-Speed Mode $8.0 \text{ V} < V_{BAT} < 16 \text{ V}$	4.2	–	5.1	V
HV Fixed Wake-Up Output High Voltage	$V_{ohWuFix}$	Wake-Up Mode, $R_L > 200 \Omega$ , $11.4 \text{ V} < V_{BAT} < 27 \text{ V}$	9.9	–	12.5	V
HV Offset Wake-Up Output High Voltage	$V_{ohWuOffset}$	Wake-Up Mode, $R_L > 200 \Omega$ , $5.0 \text{ V} < V_{BAT} < 11.4 \text{ V}$	$V_{BAT} - 1.5$	–	$V_{BAT}$	V
Recessive State Output Voltage	$V_{ol}$	Recessive State or Sleep Mode, $R_{load} = 6.5 \text{ k}\Omega$	–0.20	–	0.20	V
Bus Short Circuit Current	$-I_{CAN\_SHORT}$	$V_{CANH} = 0$ V, $V_{BAT} = 27$ V, TxD = 0 V	50	–	350	mA
Bus Leakage Current During Loss of Ground	$I_{LKN\_CAN}$ (Note 11)	Loss of Ground, $V_{CANH} = 0$ V	–50	–	10	$\mu\text{A}$
Bus Leakage Current, Bus Positive	$I_{LKP\_CAN}$	TxD High	–10	–	10	$\mu\text{A}$
Bus Input Threshold	$V_{ih}$	Normal, High-Speed Mode, HVWU $6.0 \leq V_{BAT} \leq 27 \text{ V}$	2.0	2.1	2.2	V
Bus Input Threshold Low Battery	$V_{ihlb}$	Normal, $V_{BAT} = 5.0$ V to $6.0$ V	1.6	1.7	2.2	V
Fixed Wake-Up from Sleep Input High Voltage Threshold	$V_{ihWuFix}$ (Note 10)	Sleep Mode, $V_{BAT} > 10.9$ V	6.6	–	7.9	V
Offset Wake-Up from Sleep Input High Voltage Threshold	$V_{ihWuOffset}$ (Note 10)	Sleep Mode	$V_{BAT} - 4.3$	–	$V_{BAT} - 3.25$	V

## LOAD

Voltage on Switched Ground Pin	$V_{LOAD\_1mA}$	$I_{LOAD} = 1.0$ mA	–	–	0.1	V
Voltage on Switched Ground Pin	$V_{LOAD}$	$I_{LOAD} = 5.0$ mA	–	–	0.5	V
Voltage on Switched Ground Pin	$V_{LOAD\_LOB}$	$I_{LOAD} = 7.0$ mA, $V_{BAT} = 0$ V	–	–	1.0	V
Load Resistance During Loss of Battery	$R_{LOAD\_LOB}$	$V_{BAT} = 0$	$R_{LOAD} - 10\%$	–	$R_{LOAD} + 35\%$	$\Omega$

9. Characterization data supports  $I_{BATS} < 65 \mu\text{A}$  with conditions  $V_{BAT} = 18$  V,  $T_A = 125^\circ\text{C}$

10. Thresholds not tested in production, guaranteed by design.

11. Leakage current in case of loss of ground is the summary of both currents  $I_{LKN\_CAN}$  and  $I_{LKN\_LOAD}$ .

**ELECTRICAL CHARACTERISTICS (continued)** ( $V_{BAT} = 5.0$  to  $27$  V,  $T_A = -40$  to  $+125^\circ\text{C}$ , unless otherwise specified.)

Characteristic	Symbol	Condition	Min	Typ	Max	Unit
<b>TXD, MODE0, MODE1</b>						
High Level Input Voltage	$V_{ih}$	$6.0 < V_{BAT} < 27$ V	2.0	-	-	V
Low Level Input Voltage	$V_{il}$	$6.0 < V_{BAT} < 27$ V	-	-	0.8	V
TxD Pullup Current	$-I_{L\_TXD}$	TXD = L, MODE0 and 1 = H $5.0 < V_{BAT} < 27$ V	10	-	50	$\mu\text{A}$
MODE0 and 1 Pulldown Resistor	$R_{MODE\_pd}$		10	-	50	$\text{k}\Omega$

## RXD

Low Level Output Voltage	$V_{ol\_rxd}$	$I_{RXD} = 2.0$ mA	-	-	0.4	V
High Level Output Leakage	$I_{ih\_rxd}$	$V_{RXD} = 5.0$ V	-10	-	10	$\mu\text{A}$
RxD Output Current	$I_{rxd}$	$V_{RXD} = 5.0$ V	-	-	70	mA

## INH (14 Pin Package Only)

High Level Output Voltage	$V_{oh\_INH}$	$I_{INH} = -180$ $\mu\text{A}$	$V_{BAT} - 0.8$	$V_{BAT} - 0.5$	$V_{BAT}$	V
Leakage Current	$I_{INH\_lk}$	MODE0 = MODE1 = L, INH = 0 V	-5.0	-	5.0	$\mu\text{A}$

**TIMING MEASUREMENT LOAD CONDITIONS**

Normal and High Voltage Wake-Up Mode		High-Speed Mode
min load / min tau	3.3 kΩ / 540 pF	Additional 140 Ω tool resistance to ground in parallel
min load / max tau	3.3 kΩ / 1.2 nF	
max load / min tau	200 Ω / 5.0 nF	Additional 120 Ω tool resistance to ground in parallel
max load / max tau	200 Ω / 20 nF	

**ELECTRICAL CHARACTERISTICS** (5.0 V ≤ V<sub>BAT</sub> ≤ 27 V, -40°C ≤ T<sub>A</sub> ≤ 125°C, unless otherwise specified.)

**AC CHARACTERISTICS** (See Figures 3, 4, and 5)

Characteristic	Symbol	Condition	Min	Typ	Max	Unit
Transmit Delay in Normal and Wake-Up Mode, Bus Rising Edge (Notes 12, 13)	t <sub>Tr</sub>	Min and Max Loads per Timing Measurement Load Conditions	2.0	–	6.3	μs
Transmit Delay in Wake-Up Mode to V <sub>ihWU</sub> , Bus Rising Edge (Notes 12, 14)	t <sub>TWUr</sub>	Min and Max Loads per Timing Measurement Load Conditions	2.0	–	18	μs
Transmit Delay in Normal Mode, Bus Falling Edge (Notes 15, 16)	t <sub>Tf</sub>	Min and Max Loads per Timing Measurement Load Conditions	1.8	–	10	μs
Transmit Delay in Wake-Up Mode, Bus Falling Edge (Notes 15, 16)	t <sub>TWU1f</sub>	Min and Max Loads per Timing Measurement Load Conditions	3.0	–	13.7	μs
Transmit Delay in High-Speed Mode, Bus Rising Edge (Notes 12, 17)	t <sub>THSr</sub>	Min and Max Loads per Timing Measurement Load Conditions	0.1	–	1.5	μs
Transmit Delay in High-Speed Mode, Bus Falling Edge (Notes 16, 18)	t <sub>THSf</sub>	Min and Max Loads per Timing Measurement Load Conditions	0.04	–	3.0	μs
Receive Delay, All Active Modes (Note 19)	t <sub>DR</sub>	CANH High to Low Transition	0.3	–	1.0	μs
Receive Delay, All Active Modes (Note 19)	t <sub>RD</sub>	CANH Low to High Transition	0.3	–	1.0	μs
Input Minimum Pulse Length, All Active Modes (Note 17)	t <sub>mpDR</sub> t <sub>mpRD</sub>	CANH High to Low Transition	0.1	–	1.0	μs
		CANH Low to High Transition	0.1	–	1.0	
Wake-Up Filter Time Delay	t <sub>WUF</sub>	See Figure 4	10	–	70	μs
Receive Blanking Time, After TxD L-H Transition	t <sub>rb</sub>	See Figure 5	0.5	–	6.0	μs
TxD Timeout Reaction Time	t <sub>tout</sub>	Normal and High-Speed Mode	–	17	–	ms
TxD Timeout Reaction Time	t <sub>toutwu</sub>	Wake-Up Mode	–	17	–	ms
Delay from Normal to High-Speed and High Voltage Wake-Up Mode	t <sub>dnhs</sub>	–	–	–	30	ms
Delay from High-Speed and High Voltage Wake-Up to Normal Mode	t <sub>dhsn</sub>	–	–	–	30	ms
Delay from Normal to Standby Mode	t <sub>dsby</sub>	V <sub>BAT</sub> = 6.0 V to 27 V	–	–	500	μs
Delay from Sleep to Normal Mode	t <sub>dsnwu</sub>	V <sub>BAT</sub> = 6.0 V to 27 V	–	–	50	ms
Delay from Sleep to High Voltage Mode	t <sub>dshv</sub>	V <sub>BAT</sub> = 6.0 V to 27 V	–	–	50	ms
Delay from Standby to Sleep Mode (Note 20)	t <sub>dsleep</sub>	V <sub>BAT</sub> = 6.0 V to 27 V	100	250	500	ms

12. Minimum signal delay time is measured from the TxD voltage threshold to CANH = 1.0 V. τ load should be min per the Timing Measurement Load Conditions table.
13. Maximum signal delay time is measured from the TxD voltage threshold to CANH = 3.5 V at V<sub>BAT</sub> = 27 V, CANH = 2.8 V at V<sub>BAT</sub> = 5.0 V. τ load should be max per the Timing Measurement Load Conditions table.
14. Maximum signal delay time is measured from the TxD voltage threshold to CANH = 9.2 V. V<sub>ihwumax</sub> = V<sub>ihwufix</sub> max + V<sub>goff</sub> = 7.9 V + 1.3 V = 9.2 V. τ load should be max per the Timing Measurement Load Conditions table.
15. Minimum signal delay time is measured from the TxD voltage threshold to CANH = 3.5 V at V<sub>BAT</sub> = 27 V, CANH = 2.8 V at V<sub>BAT</sub> = 5.0 V. τ load should be min per the Timing Measurement Load Conditions table.
16. Maximum signal delay time is measured from the TxD voltage threshold to CANH = 1 V. τ load should be max per the Timing Measurement Load Conditions table.
17. Maximum signal delay time is measured from the TxD voltage threshold to CANH = 3.5 V. τ load should be max per the Timing Measurement Load Conditions table.
18. Minimum signal delay time is measured from the TxD voltage threshold to CANH = 3.5 V. τ load should be min per the Timing Measurement Load Conditions table.
19. Receive delay time is measured from the rising / falling edge crossing of the nominal V<sub>ih</sub> value on CANH to the falling (V<sub>cmos\_il\_max</sub>) / rising (V<sub>cmos\_ih\_min</sub>) edge of RxD. This parameter is tested by applying a square wave signal to CANH. The minimum slew rate for the bus rising and falling edges is 50 V/μs. The low level on bus is always 0 V. For normal mode and high-speed mode testing the high level on bus is 4 V. For HVWU mode testing the high level on bus is V<sub>BAT</sub> - 2 V. Relaxation of this non-critical parameter from 0.15 μs to 0.10 μs may be addressed in future revisions of GMW3089.
20. Tested on 14 Pin package only.

**BUS LOADING REQUIREMENTS**

Characteristic	Symbol	Min	Typ	Max	Unit
Number of System Nodes	-	2	-	32	-
Network Distance Between Any Two ECU Nodes	Bus Length	-	-	60	m
Node Series Inductor Resistance (If required)	$R_{ind}$	-	-	3.5	$\Omega$
Ground Offset Voltage	$V_{goff}$	-	-	1.3	V
Ground Offset Voltage, Low Battery	$V_{gofflowbat}$	-	$0.1 \times V_{BAT}$	0.7	V
Device Capacitance (Unit Load)	$C_{ul}$	135	150	300	pF
Network Total Capacitance	$C_{tl}$	396	-	19000	pF
Device Resistance (Unit Load)	$R_{ul}$	6435	6490	6565	$\Omega$
Device Resistance (Min Load)	$R_{min}$	2000	-	-	$\Omega$
Network Total Resistance	$R_{tl}$	200	-	4596	$\Omega$
Network Time Constant (Note 21)	$\tau$	1.0	-	4.0	$\mu s$
Network Time Constant in High-Speed Mode	$\tau$	-	-	1.5	$\mu s$
High-Speed Mode Network Resistance to GND	$R_{load}$	75	-	135	$\Omega$

21. The network time constant incorporates the bus wiring capacitance. The minimum value is selected to limit radiated emission. The maximum value is selected to ensure proper communication modes. Not all combinations of R and C are possible.

**TIMING DIAGRAMS**

**Figure 3. Input/Output Timing**

TIMING DIAGRAMS

Figure 4. Wake-Up Filter Time Delay

Figure 5. Receive Blanking Time

**FUNCTIONAL DESCRIPTION**

**TxD Input Pin**

*TxD Polarity*

- TxD = logic 1 (or floating) on this pin produces an undriven or recessive bus state (low bus voltage)
- TxD = logic 0 on this pin produces either a bus normal or a bus high voltage dominant state depending on the transceiver mode state (high bus voltage)

If the TxD pin is driven to a logic low state while the sleep mode (Mode 0 = 0 and Mode 1 = 0) is activated, the transceiver can not drive the CANH pin to the dominant state.

The transceiver provides an internal pullup current on the TxD pin which will cause the transmitter to default to the bus recessive state when TxD is not driven.

TxD input signals are standard CMOS logic levels.

**Timeout Feature**

In case of a faulty blocked dominant TxD input signal, the CANH output is switched off automatically after the specified TxD timeout reaction time to prevent a dominant bus.

The transmission is continued by next TxD L to H transition without delay.

**MODE0 and MODE1 Pins**

The transceiver provides a weak internal pulldown current on each of these pins which causes the transceiver to default to sleep mode when they are not driven. The mode input signals are standard CMOS logic level for 3.3 V and 5 V supply voltages. See Electrical Characteristics table for timing limitations for mode changes.

MODE0	MODE1	Mode
L	L	Sleep Mode
H	L	High-Speed Mode
L	H	High Voltage Wake-Up
H	H	Normal Mode

**Sleep Mode**

Transceiver is in low power state, waiting for wake-up via high voltage signal or by mode pins change to any state other than 0,0. In this state, the CANH pin is not in the dominant state regardless of the state of the TxD pin.

**High-Speed Mode**

This mode allows high-speed download with bit rates up to 100 Kbit/s. The output wave shaping circuit is disabled in this mode. Bus transmitter drive circuits for those nodes which are required to communicate in high-speed mode are able to drive reduced bus resistance in this mode.

**High Voltage Wake-Up Mode**

This bus includes a selective node awake capability, which allows normal communication to take place among some nodes while leaving the other nodes in an undisturbed sleep state. This is accomplished by controlling the signal voltages such that all nodes must wake-up when they receive a higher voltage message signal waveform. The communication system communicates to the nodes information as to which nodes are to stay operational (awake) and which nodes are to put themselves into a non communicating low power “sleep” state. Communication at the lower, normal voltage levels shall not disturb the sleeping nodes.

**Normal Mode**

Transmission bit rate in normal communication is 33 Kbits/s. In normal transmission mode the NCV7356 supports controlled waveform rise and overshoot times. Waveform trailing edge control is required to assure that high frequency components are minimized at the beginning of the downward voltage slope. The remaining fall time occurs after the bus is inactive with drivers off and is determined by the RC time constant of the total bus load.

**RxD Output Pin**

Logic data as sensed on the single wire CAN bus.

*RxD Polarity*

- RxD = logic 1 on this pin indicates a bus recessive state (low bus voltage)
- RxD = logic 0 on this pin indicates a bus normal or high voltage bus dominant state

**RxD in Sleep Mode**

RxD does not pass signals to the microprocessor while in sleep mode until a valid wake-up bus voltage level is received or the MODE0 and MODE 1 pins are not 0, 0 respectively. When the valid wake-up bus voltage signal awakens the transceiver, the RxD pin signals an interrupt (logic 0). If there is no mode change within 250 ms (typ), the transceiver re-enters the sleep mode.

When not in sleep mode all valid bus signals will be sent out on the RxD pin.

RxD will be placed in the undriven or off state when in sleep mode.

*RxD Typical Load*

- Resistance: 2.7 kΩ
- Capacitance: < 25 pF

**Bus LOAD Pin**

*Resistor ground connection with internal open-on-loss-of-ground protection*

When the ECU experiences a loss of ground condition, this pin is switched to a high impedance state.

The ground connection through this pin is not interrupted in any transceiver operating mode including the sleep mode. The ground connection only is interrupted when there is a valid loss of ground condition.

This pin provides the bus load resistor with a path to ground which contributes less than 0.1 V to the bus offset voltage when sinking the maximum current through one unit load resistor. This path exists in all operating modes, including the sleep mode.

The transceiver’s maximum bus leakage current contribution to  $V_{ol}$  from the LOAD pin when in a loss of ground state is 50  $\mu$ A over all operating temperatures and  $3.5 < V_{BAT} < 27$  V.

**$V_{BAT}$  Input Pin**

*Vehicle Battery Voltage*

The transceiver is fully operational as described in the Electrical Characteristics Table over the range  $6.0$  V  $< V_{BAT} < 18$  V as measured between the GND pin and the  $V_{BAT}$  pin.

For  $5.0$  V  $< V_{Bat} < 6.0$  V, the bus operates in normal mode with reduced dominant output voltage and reduced receiver input voltage. High voltage wake-up is not possible (dominant output voltage is the same as in normal or high-speed mode).

The transceiver operates in normal mode when  $18$  V  $< V_{Bat} < 27$  V at 85°C for one minute.

**CAN BUS**

*Input/Output Pin*

*Wave Shaping in Normal and High Voltage Wake-Up Mode*

Wave shaping is incorporated into the transmitter to minimize EMI radiated emissions. An important contributor to emissions is the rise and fall times during output transitions at the “corners” of the voltage waveform. The resultant waveform is one half of a sin wave of frequency 50–65 kHz at the rising waveform edge and one quarter of this sin wave at falling or trailing edge.

*Wave Shaping in High-Speed Mode*

Wave shaping control of the rising and falling waveform edges are disabled during high-speed mode. EMI emissions requirements are waived during this mode. The waveform rise time in this mode is less than 1.0  $\mu$ s.

*Short Circuits*

If the CAN BUS pin is shorted to ground for any duration of time, the current is limited as specified in the Electrical Characteristics Table until an overtemperature shutdown circuit disables the output high side drive source transistor preventing damage to the IC.

*Loss of Ground*

In case of a valid loss of ground condition, the LOAD pin is switched into high impedance state. The CANH transmission is continued until the undervoltage lock out voltage threshold is detected.

*Loss of Battery*

In case of loss of battery ( $V_{BAT} = 0$  or open) the transceiver does not disturb bus communication. The maximum reverse current into the power supply system ( $V_{BAT}$ ) doesn’t exceed 500  $\mu$ A.

**INH Pin (14 pin package only)**

The INH pin is a high-voltage highside switch used to control the ECU’s regulated microcontroller power supply. After power-on, the transceiver automatically enters an intermediate standby mode, the INH output will go high (up to  $V_{BAT}$ ) turning on the external voltage regulator. The external regulator provides power to the ECU. If there is no mode change within 250 ms (typ), the transceiver re-enters the sleep mode and the INH output goes to logic 0 (floating).

When the transceiver has detected a valid wake-up condition (bus HVWU traffic which exceeds the wake-up filter time delay) the INH output will become high (up to  $V_{BAT}$ ) again and the same procedure starts as described after power-on. In case of a mode change into any active mode, the sleep timer is stopped and INH stays high (up to  $V_{BAT}$ ). If the transceiver enters the sleep mode, INH goes to logic 0 (floating) after 250 ms (typ) when no wake-up signal is present.

\*Bold face items in the Cauer network above, represent the package without the external thermal system. The Bold face items in the Foster network are computed by the square root of time constant  $R(t) = 130 * \text{sqrt}(\text{time}(\text{sec}))$ . The constant is derived based on the active area of the device with silicon and epoxy at the interface of the heat generation.

The Cauer networks generally have physical significance and may be divided between nodes to separate thermal behavior due to one portion of the network from another. The Foster networks, though when sorted by time constant (as above) bear a rough correlation with the Cauer networks, are really only convenient mathematical models. Both Foster and Cauer networks can be easily implemented

using circuit simulating tools, whereas Foster networks may be more easily implemented using mathematical tools (for instance, in a spreadsheet program), according to the following formula:

$$R(t) = \sum_{i=1}^n R_i (1 - e^{-t/\tau_i})$$

SOIC-14  
CASE 751A-03  
ISSUE H

NOTES:

1. DIMENSIONING AND TOLERANCING PER ANSI Y14.5M, 1982.
2. CONTROLLING DIMENSION: MILLIMETER.
3. DIMENSIONS A AND B DO NOT INCLUDE MOLD PROTRUSION.
4. MAXIMUM MOLD PROTRUSION 0.15 (0.006) PER SIDE.
5. DIMENSION D DOES NOT INCLUDE DAMBAR PROTRUSION. ALLOWABLE DAMBAR PROTRUSION SHALL BE 0.127 (0.005) TOTAL IN EXCESS OF THE D DIMENSION AT MAXIMUM MATERIAL CONDITION.
