A DIN Power female low profile					Type H standard contacts have a silver plated surface. This precious metal has excellent conductive properties. In the course of a contact's lifetime, the silver surface generates a black oxide layer due to its affinity to sulphur. This layer is smooth and very thin and is partly interrupted when the contacts are mated and unmated, thus guaranteeing very low contact resistances. In the case of very low currents or voltages small changes to the transmitted signal may be encountered. In systems where such a change to the transmitted signal could lead to faulty functions and					
General information	· · · · · · · · · · · · · · · · · · ·			changes to the trans also in extremely an	smitted signal may be encountered Igressive environments,HARTING re	d. In systems where su ecommend the use of a	ich a change to the transmitti old plated contacts.	ed signal could lead to faulty functions and
