METRAL® IPCI Bus

FCI Electronics

METRAL® connector system was chosen as the interconnection system for the IPCI (Industrial peripheral computer Interface)

The following are typical 3SU and 6SU board configurations

Daughter Board Receptacle Right-Angle

- Solder-to-Board
5 x 48 positions
85866-xxxLF
- Press-Fit
5 x 48 positions
89055-xxxLF

Backpanel Header Straight

- Press-Fit
5 x 48 positions
89009-xxxLF

ELECTRICAL CHARACTERISTICS

GENERAL

- Although some of these parameters can be obtained from tabulated measured data, they are typically obtained from finite element or boundary element modeling type programs which model portions of the connector as separate transmission line sections. The resulting R, L, and C matrices are converted to SPICE parameters for each transmission line section. These parameters basically define lumped element approximations to each transmission line section. The METRAL® connector can be represented by three such transmission line sections; one for the leaded section, one for the internal block section, and one for the header section.
- The METRAL™ connector has been modeled by FCI Electronics, Ind. using Quantic Laboratories' two dimensional boundary element modeling program called Greenfield®.
- FCI Electronics has a number of SPICE models available.
- METRAL® 4 row 7 : 1 and 2 : 1 signal/ground ratio
- METRAL® 5 row 2 : 1 and 4 : 1 signal/ground ratio
- METRAL® 5 row row C grounded

Of course if needed, a specific SPICE model can be generated (ask for details)

Summary METRAL™ electrical data Standard

- All data :** With 2 : 1 signal to ground ratio
Measurement system 50 Ohm impedance
- Capacitance**
(1 mHz)
(mated connector) 1 - 1,25 pF max.
(location dependent)
- Inductance**
500 ps risetime 12 - 18 nH
1000 ps risetime 15 - 24 nH
(location dependent)
- Propagation delay** 143 - 214 ps
(24 ps. row to skew)
- Crosstalk** (single line driven)
500 ps risetime 6,0 % max. near end
1000 ps risetime 3,5 % max. near end
- Impedance**
1000 ps risetime 56 - 71 Ohm
(location dependent)
- Contact resistance**
signal 25 - 45 m Ohm
power 8 m Ohm
- Insulation resistance** > 5000 M Ohm

ELECTRICAL CHARACTERISTICS

GENERAL

Current Carrying Capacity.

The current carrying capacity of a connector is that current which elevates the contact temperature to a specified value. It is a function of many variables including interconnection wiring (open wires and/or printed wiring), gauge and/or cross sections of wiring, board thicknesses, current in adjacent contacts, ambient temperature, and air flow.

Since actual application details may differ from these experimental conditions, the following results are provided only as an approximate guide for the current carrying capacity of the METRAL® Modular System. Current carrying capacity was measured for 10°C and 30°C rise above ambient.

The results are shown in Fig. 1.

The curves show cluster number (number of current carrying contacts surrounding the measured contact, including the measured contact) versus contact current.

The curves will asymptotically approach constant current at large clusters, but are approximately linear on the log-log scale over a cluster range of 1 to 25 in all cases.

Fig. 1 Current carrying capacity per contact for 10 °C and 30 °C temperature rise

SPICE Parameters.

Some users might prefer to use SPICE parameter representations of the connector to do their own network simulation response studies. These are R,L, and C parameters placed in SPICE parameter formats to be used by a SPICE program.

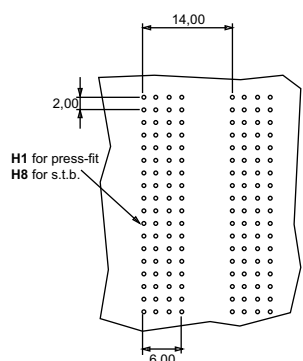

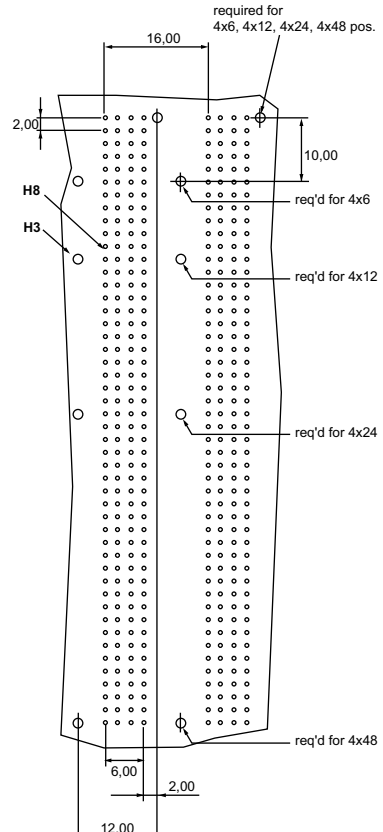

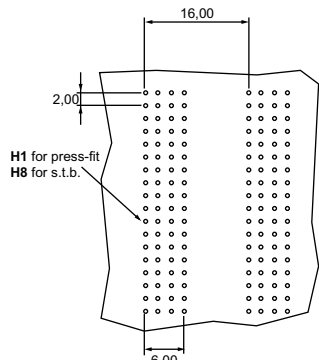

Hole Specifications
