LPC185x/3x/2x/1x
32-bit ARM Cortex-M3 MCU; up to 1 MB flash and 136 kB SRAM; Ethernet, two High-speed USB, LCD, EMC
Rev. 5.3 - 10 January 2020
Product data sheet

## 1. General description

The LPC185x/3x/2x/1x are ARM Cortex-M3 based microcontrollers for embedded applications. The ARM Cortex-M3 is a next generation core that offers system enhancements such as low power consumption, enhanced debug features, and a high level of support block integration.

The LPC185x/3x/2x/1x operate at CPU frequencies of up to 180 MHz . The ARM Cortex-M3 CPU incorporates a 3 -stage pipeline and uses a Harvard architecture with separate local instruction and data buses as well as a third bus for peripherals. The ARM Cortex-M3 CPU also includes an internal prefetch unit that supports speculative branching.

The LPC $185 \mathrm{x} / 3 \mathrm{x} / 2 \mathrm{x} / 1 \mathrm{x}$ include up to 1 MB of flash and 136 kB of on-chip SRAM, 16 kB of EEPROM memory, a quad SPI Flash Interface (SPIFI), a State-configurable Timer/PWM (SCTimer/PWM) subsystem, two High-speed USB controllers, Ethernet, LCD, an external memory controller, and multiple digital and analog peripherals.

For additional documentation related to the LPC18xx parts, see Section 17 "References".

## 2. Features and benefits

- Processor core
- ARM Cortex-M3 processor (version r2p1), running at CPU frequencies of up to 180 MHz .
- ARM Cortex-M3 built-in Memory Protection Unit (MPU) supporting eight regions.
- ARM Cortex-M3 built-in Nested Vectored Interrupt Controller (NVIC).
- Non-maskable Interrupt (NMI) input.
- JTAG and Serial Wire Debug, serial trace, eight breakpoints, and four watch points.
- Enhanced Trace Module (ETM) and Enhanced Trace Buffer (ETB) support.
- System tick timer.
- On-chip memory
- Up to 1 MB on-chip dual bank flash memory with flash accelerator.
- 16 kB on-chip EEPROM data memory.
- 136 kB SRAM for code and data use.
- Multiple SRAM blocks with separate bus access.
- 64 kB ROM containing boot code and on-chip software drivers.
- 64 bit+ 256 bit of One-Time Programmable (OTP) memory for general-purpose use.
- Clock generation unit

- Crystal oscillator with an operating range of 1 MHz to 25 MHz .
- 12 MHz internal RC oscillator trimmed to $3 \%$ accuracy over temperature and voltage ( $1.5 \%$ accuracy for $\mathrm{T}_{\mathrm{amb}}=0^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$ ).
- Ultra-low power RTC crystal oscillator.
- Three PLLs allow CPU operation up to the maximum CPU rate without the need for a high-frequency crystal. The second PLL can be used with the High-speed USB, the third PLL can be used as audio PLL.
- Clock output.
- Configurable digital peripherals:
- State Configurable Timer/PWM (SCTimer/PWM) subsystem on AHB.
- Global Input Multiplexer Array (GIMA) allows to cross-connect multiple inputs and outputs to event driven peripherals like timers, SCTimer/PWM, and ADC0/1.
- Serial interfaces:
- Quad SPI Flash Interface (SPIFI) with 1-, 2-, or 4-bit data at rates of up to 52 MB per second.
- 10/100T Ethernet MAC with RMII and MII interfaces and DMA support for high throughput at low CPU load. Support for IEEE 1588 time stamping/advanced time stamping (IEEE 1588-2008 v2).
- One High-speed USB 2.0 Host/Device/OTG interface with DMA support and on-chip high-speed PHY (USBO).
- One High-speed USB 2.0 Host/Device interface with DMA support, on-chip full-speed PHY and ULPI interface to an external high-speed PHY (USB1).
- USB interface electrical test software included in ROM USB stack.
- Four 550 UARTs with DMA support: one UART with full modem interface; one UART with IrDA interface; three USARTs support UART synchronous mode and a smart card interface conforming to ISO7816 specification.
- Up to two C_CAN 2.0B controllers with one channel each.
- Two SSP controllers with FIFO and multi-protocol support. Both SSPs with DMA support.
- One Fast-mode Plus $\mathrm{I}^{2} \mathrm{C}$-bus interface with monitor mode and with open-drain I/O pins conforming to the full $\mathrm{I}^{2} \mathrm{C}$-bus specification. Supports data rates of up to 1 Mbit/s.
- One standard $\mathrm{I}^{2} \mathrm{C}$-bus interface with monitor mode and standard I/O pins.
- Two $I^{2}$ S interfaces with DMA support, each with one input and one output.
- Digital peripherals:
- External Memory Controller (EMC) supporting external SRAM, ROM, NOR flash, and SDRAM devices.
- LCD controller with DMA support and a programmable display resolution of up to $1024 \mathrm{H} \times 768 \mathrm{~V}$. Supports monochrome and color STN panels and TFT color panels; supports 1/2/4/8 bpp Color Look-Up Table (CLUT) and 16/24-bit direct pixel mapping.
- SD/MMC card interface.
- Eight-channel General-Purpose DMA controller can access all memories on the AHB and all DMA-capable AHB slaves.
- Up to 164 General-Purpose Input/Output (GPIO) pins with configurable pull-up/pull-down resistors.
- GPIO registers are located on the AHB for fast access. GPIO ports have DMA support.
- Up to eight GPIO pins can be selected from all GPIO pins as edge and level sensitive interrupt sources.
- Two GPIO group interrupt modules enable an interrupt based on a programmable pattern of input states of a group of GPIO pins.
- Four general-purpose timer/counters with capture and match capabilities.
- One motor control PWM for three-phase motor control.
- One Quadrature Encoder Interface (QEI).
- Repetitive Interrupt timer (RI timer).
- Windowed watchdog timer.
- Ultra-low power Real-Time Clock (RTC) on separate power domain with 256 bytes of battery powered backup registers.
- Event recorder with three inputs to record event identification and event time; can be battery powered.
- Alarm timer; can be battery powered.
- Analog peripherals:
- One 10-bit DAC with DMA support and a data conversion rate of $400 \mathrm{kSamples} / \mathrm{s}$.
- Two 10-bit ADCs with DMA support and a data conversion rate of $400 \mathrm{kSamples} / \mathrm{s}$. Up to eight analog channels total. Each analog input is connected to both ADCs.
- Unique ID for each device.
- Power:

Single $3.3 \mathrm{~V}(2.4 \mathrm{~V}$ to 3.6 V ) power supply with on-chip internal voltage regulator for the core supply and the RTC power domain.

- RTC power domain can be powered separately by a 3 V battery supply.
- Four reduced power modes: Sleep, Deep-sleep, Power-down, and Deep power-down.
- Processor wake-up from Sleep mode via wake-up interrupts from various peripherals.
- Wake-up from Deep-sleep, Power-down, and Deep power-down modes via external interrupts and interrupts generated by battery powered blocks in the RTC power domain.
- Brownout detect with four separate thresholds for interrupt and forced reset.
- Power-On Reset (POR).
- Available in LQFP208, LBGA256, LQFP144, and TFBGA100 packages.

Fig 5. Pin configuration LQFP144 package

### 6.2 Pin description

On the LPC185x/3x/2x/1x, digital pins are grouped into 16 ports, named P0 to P9 and PA to PF, with up to 20 pins used per port. Each digital pin can support up to eight different digital functions, including General-Purpose I/O (GPIO), selectable through the SCU registers.

The pin name is not indicative of the GPIO port assigned to it.
The parts contain two 10-bit ADCs (ADC0 and ADC1). The input channels of ADC0 and ADC1 on dedicated pins and multiplexed pins are combined in such a way that all channel 0 inputs (named ADC0_0 and ADC1_0) are tied together and connected to both, channel

0 on ADC0 and channel 0 on ADC1, channel 1 inputs (named ADC0_1 and ADC1_1) are tied together and connected to channel 1 on ADC0 and ADC1, and so forth. There are eight ADC channels total for the two ADCs.

Table 3. Pin description ...continued

| Pin name |  | O <br>  <br> 0 <br> 0 <br> 1 <br> 1 |  | $\infty$ <br> $\stackrel{\circ}{N}$ <br> N <br> O <br> 1 |  |  | $\stackrel{\text { ® }}{\stackrel{\text { ® }}{2}}$ | Description |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Debug pins |  |  |  |  |  |  |  |  |
| DBGEN | L4 | A6 | 28 | 41 | [2] | I | I | JTAG interface control signal. Also used for boundary scan. To use the part in functional mode, connect this pin in one of the following ways: <br> - Leave DBGEN open. The DBGEN pin is pulled up internally by a $50 \mathrm{k} \Omega$ resistor. <br> - Tie DBGEN to VDDIO. <br> - Pull DBGEN up to VDDIO with an external pull-up resistor. |
| TCK/SWDCLK | J5 | H2 | 27 | 38 | [2] | I; F | I | Test Clock for JTAG interface (default) or Serial Wire (SW) clock. |
| TRST | M4 | B4 | 29 | 42 | [2] | I; PU | I | Test Reset for JTAG interface. |
| TMS/SWDIO | K6 | C4 | 30 | 44 | [2] | I; PU | I | Test Mode Select for JTAG interface (default) or SW debug data input/output. |
| TDO/SWO | K5 | H3 | 31 | 46 | [2] | 0 | 0 | Test Data Out for JTAG interface (default) or SW trace output. |
| TDI | J4 | G3 | 26 | 35 | [2] | I; PU | I | Test Data In for JTAG interface. |
| USB0 pins |  |  |  |  |  |  |  |  |
| USB0_DP | F2 | E1 | 18 | 26 | [6] | - | I/O | USB0 bidirectional D+ line. Do not add an external series resistor. |
| USB0_DM | G2 | E2 | 20 | 28 | [6] | - | I/O | USB0 bidirectional D- line. Do not add an external series resistor. |
| USB0_VBUS | F1 | E3 | 21 | 29 | $\begin{aligned} & {[6]} \\ & {[\underline{[7]}} \\ & \hline \end{aligned}$ | - | I | VBUS pin (power on USB cable). This pin includes an internal pull-down resistor of $70 \mathrm{k} \Omega$ (typical) $\pm 30 \mathrm{k} \Omega$. |
| USB0_ID | H2 | F1 | 22 | 30 | [8] | - | I | Indicates to the transceiver whether connected as an A-device (USB0_ID LOW) or B-device (USB0_ID HIGH). For use with OTG, this pin has an internal pull-up resistor. |
| USB0_RREF | H1 | F3 | 24 | 32 | [8] | - |  | $12.0 \mathrm{k} \Omega$ (accuracy $1 \%$ ) on-board resistor to ground for current reference. |
| USB1 pins |  |  |  |  |  |  |  |  |
| USB1_DP | F12 | E9 | 89 | 129 | [9] | - | I/O | USB1 bidirectional $\mathrm{D}+$ line. Add an external series resistor of $33 \Omega+/-2 \%$. |
| USB1_DM | G12 | E10 | 90 | 130 | [9] | - | I/O | USB1 bidirectional D- line. Add an external series resistor of $33 \Omega+/-2 \%$. |
| $1^{2} \mathrm{C}$-bus pins |  |  |  |  |  |  |  |  |
| I2C0_SCL | L15 | D6 | 92 | 132 | [10] | I; F | I/O | $\mathrm{I}^{2} \mathrm{C}$ clock input/output. Open-drain output (for $\mathrm{I}^{2} \mathrm{C}$-bus compliance). |
| I2C0_SDA | L16 | E6 | 93 | 133 | [10] | I; F | I/O | $\mathrm{I}^{2} \mathrm{C}$ data input/output. Open-drain output (for $\mathrm{I}^{2} \mathrm{C}$-bus compliance). |
| Reset and wake-up pins |  |  |  |  |  |  |  |  |
| RESET | D9 | B6 | 128 | 185 | [11] | I; IA | I | External reset input: A LOW on this pin resets the device, causing I/O ports and peripherals to take on their default states, and processor execution to begin at address 0 . This pin does not have an internal pull-up. |

Table 3. Pin description ...continued

| Pin name | $\begin{aligned} & \text { O } \\ & \underset{N}{\mathbf{N}} \\ & \mathbf{0} \\ & \underset{\sim}{2} \end{aligned}$ |  | $\begin{aligned} & \underset{\sim}{J} \\ & \dot{\lambda} \\ & \underset{\sim}{u} \end{aligned}$ |  |  |  | $\stackrel{0}{2}$ | Description |

| VSSA | B2 | C2 | 135 | 196 |  | - | - | Analog ground. |

[1] $N=$ neutral, input buffer disabled; no extra VDDIO current consumption if the input is driven midway between supplies; set the EZI bit in the SFS register to enable the input buffer; $\mathrm{I}=$ input, $\mathrm{OL}=$ output driving LOW; $\mathrm{OH}=$ output driving $\mathrm{HIGH} ; \mathrm{Al} / \mathrm{O}=$ analog input/output; IA $=$ inactive; $\mathrm{PU}=$ pull-up enabled (weak pull-up resistor pulls up pin to VDDIO; $\mathrm{F}=$ floating. Reset state reflects the pin state at reset without boot code operation.
[2] 5 V tolerant pad with 15 ns glitch filter ( 5 V tolerant if VDDIO present; if VDDIO not present, do not exceed 3.6 V ); provides digital I/O functions with TTL levels and hysteresis; normal drive strength.
[3] 5 V tolerant pad with 15 ns glitch filter ( 5 V tolerant if VDDIO present; if VDDIO not present, do not exceed 3.6 V ) providing digital I/O functions with TTL levels, and hysteresis; high drive strength.
[4] 5 V tolerant pad with 15 ns glitch filter ( 5 V tolerant if VDDIO present; if VDDIO not present, do not exceed 3.6 V ) providing high-speed digital I/O functions with TTL levels and hysteresis.
[5] 5 V tolerant pad providing digital I/O functions (with TTL levels and hysteresis) and analog input or output (5 V tolerant if VDDIO present; if VDDIO not present, do not exceed 3.6 V ). When configured as an ADC input or DAC output, the pin is not 5 V tolerant. For analog functionality, disable the digital section of the pad by setting the pin to an input function and by disabling the pull-up resistor through the corresponding SFSP register.
[6] 5 V tolerant transparent analog pad.
[7] For maximum load $C_{L}=6.5 \mu \mathrm{~F}$ and maximum resistance $R_{p d}=80 \mathrm{k} \Omega$, the VBUS signal takes about 2 s to fall from $\mathrm{VBUS}=5 \mathrm{~V}$ to VBUS $=0.2 \mathrm{~V}$ when it is no longer driven.
[8] Transparent analog pad. Not 5 V tolerant.
[9] Pad provides USB functions; It is designed in accordance with the USB specification, revision 2.0 (Full-speed and Low-speed mode only).
[10] Open-drain 5 V tolerant digital I/O pad, compatible with $\mathrm{I}^{2} \mathrm{C}$-bus Fast Mode Plus specification. This pad requires an external pull-up to provide output functionality. When power is switched off, this pin connected to the $I^{2} \mathrm{C}$-bus is floating and does not disturb the $\mathrm{I}^{2} \mathrm{C}$ lines.
[11] 5 V tolerant pad with 20 ns glitch filter; provides digital I/O functions with open-drain output with weak pull-up resistor and hysteresis.
[12] On the LQFP208 package, VPP is internally connected to VDDIO.
[13] On the LQFP208 package, VSSIO and VSS are connected to a common ground plane.

## 7. Functional description

### 7.1 Architectural overview

The ARM Cortex-M3 includes three AHB-Lite buses: the system bus, the l-code bus, and the D-code bus. The I-code and D-code core buses allow for concurrent code and data accesses from different slave ports.

The LPC $185 \mathrm{x} / 3 \mathrm{x} / 2 \mathrm{x} / 1 \mathrm{x}$ use a multi-layer AHB matrix to connect the ARM Cortex-M3 buses and other bus masters to peripherals. Flexible connections allow different bus masters to access peripherals that are on different slave ports of the matrix simultaneously.

### 7.2 ARM Cortex-M3 processor

The ARM Cortex-M3 is a general purpose, 32-bit microprocessor, which offers high performance and low-power consumption. The ARM Cortex-M3 offers many new features, including a Thumb-2 instruction set, low interrupt latency, hardware division, hardware single-cycle multiply, interruptable/continuable multiple load and store instructions, automatic state save and restore for interrupts, tightly integrated interrupt controller with wake-up interrupt controller, and multiple core buses capable of simultaneous accesses.

Pipeline techniques are employed so that all parts of the processing and memory systems can operate continuously. Typically, while one instruction is being executed, its successor is being decoded, and a third instruction is being fetched from memory.

The ARM Cortex-M3 processor is described in detail in the Cortex-M3 Technical Reference Manual.

### 7.3 System Tick timer (SysTick)

The ARM Cortex-M3 includes a system tick timer (SYSTICK) that is intended to generate a dedicated SYSTICK exception at a 10 ms interval.

### 7.4 AHB multilayer matrix

Fig 6. AHB multilayer matrix master and slave connections

### 7.5 Nested Vectored Interrupt Controller (NVIC)

The NVIC is part of the Cortex-M3. The tight coupling to the CPU allows for low interrupt latency and efficient processing of late arriving interrupts.

### 7.5.1 Features

- Controls system exceptions and peripheral interrupts.
- On the LPC185x/3x/2x/1x, the NVIC supports 53 vectored interrupts.
- Eight programmable interrupt priority levels, with hardware priority level masking.
- Relocatable vector table.
- Non-Maskable Interrupt (NMI).
- Software interrupt generation.

### 7.5.2 Interrupt sources

Each peripheral device has one interrupt line connected to the NVIC but can have several interrupt flags. Individual interrupt flags can also represent more than one interrupt source.

### 7.6 Event router

The event router combines various internal signals, interrupts, and the external interrupt pins (WAKEUP[3:0]) to create an interrupt in the NVIC, if enabled. In addition, the event router creates a wake-up signal to the ARM core and the CCU for waking up from Sleep, Deep-sleep, Power-down, and Deep power-down modes. Individual events can be configured as edge or level sensitive and can be enabled or disabled in the event router. The event router can be battery powered.

The following events if enabled in the event router can create a wake-up signal from sleep, deep-sleep, power-down, and deep power-down modes and/or create an interrupt:

- External pins WAKEUP0/1/2/3 and RESET
- Alarm timer, RTC ( 32 kHz oscillator running)

The following events if enabled in the event router can create a wake-up signal from sleep mode only and/or create an interrupt:

- WWDT, BOD interrupts.
- C_CANO/1 and QEl interrupts.
- Ethernet, USB0, USB1 signals.
- Selected outputs of combined timers (SCTimer/PWM and timer0/1/3).

Remark: Any interrupt can wake up the ARM Cortex-M3 from sleep mode if enabled in the NVIC.

### 7.7 Global Input Multiplexer Array (GIMA)

The GIMA routes signals to event-driven peripheral targets like the SCTimer/PWM, timers, event router, or the ADCs.
7.7.1 Features

- Single selection of a source.
- Signal inversion.
- Can capture a pulse if the input event source is faster than the target clock.
- Synchronization of input event and target clock.
- Single-cycle pulse generation for target.

### 7.8 On-chip static RAM

The LPC185x/3x/2x/1x support up to 136 kB SRAM with separate bus master access for higher throughput and individual power control for low-power operation.

### 7.9 On-chip flash memory

The LPC185x/3x/2x/1x contain up to 1 MB of dual-bank flash program memory. With dual-bank flash memory, the user code can write or erase one flash bank while reading the other flash bank without interruption. A two-port flash accelerator maximizes the flash performance.

In-System Programming (ISP) and In-Application Programming (IAP) routines for programming the flash memory are provided in the Boot ROM.

### 7.10 EEPROM

The LPC185x/3x/2x/1x contain up to 16 kB of on-chip byte-erasable and byte-programmable EEPROM memory.

The EEPROM memory is divided into 128 pages. The user can access pages 1 through 127. Page 128 is protected.

### 7.11 Boot ROM

The internal ROM memory is used to store the boot code of the LPC185x/3x/2x/1x. After a reset, the ARM processor will start its code execution from this memory.

The boot ROM memory includes the following features:

- The ROM memory size is 64 kB .
- Supports booting from external static memory such as NOR flash, SPI flash, quad SPI flash, USB0, and USB1.
- Includes API for OTP programming.
- Includes a flexible USB device stack that supports Human Interface Device (HID), Mass Storage Class (MSC), and Device Firmware Upgrade (DFU) drivers.

The default boot source is the flash memory. Several other boot modes are available if P2_7 is LOW on reset depending on the values of the OTP bits BOOT_SRC. If the OTP memory is not programmed or the BOOT_SRC bits are all zero, the states of the boot pins P2_9, P2_8, P1_2, and P1_1 determine the boot mode.

Table 4. Boot mode when OTP BOOT_SRC bits are programmed

| Boot mode | BOOT_SRC <br> bit 3 | BOOT_SRC <br> bit 2 | BOOT_SRC <br> bit 1 | BOOT_SRC <br> bit 0 | Description |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Pin state | 0 | 0 | 0 | 0 | The reset state of P1_1, P1_2, P2_8, and P2_9 <br> pins determines the boot source. See Table 5. |
| USART0 | 0 | 0 | 0 | 1 | Enter ISP mode using USART0 functions on pins <br> P2_0 and P2_1. |
| SPIFI | 0 | 0 | 1 | 0 | Boot from Quad SPI flash connected to the SPIFI <br> interface using pins P3_3 to P3_8. |
| EMC 8-bit | 0 | 0 | 1 | Boot from external static memory (such as NOR <br> flash) using CS0 and an 8-bit data bus. |  |
| EMC 16-bit | 0 | 1 | 0 | Boot from external static memory (such as NOR <br> flash) using CS0 and a 16-bit data bus. |  |
| EMC 32-bit | 0 | 1 | 0 | Boot from external static memory (such as NOR <br> flash) using CS0 and a 32-bit data bus. |  |

Table 4. Boot mode when OTP BOOT_SRC bits are programmed
$\left.\begin{array}{|l|l|l|l|l|l|}\hline \text { Boot mode } & \begin{array}{l}\text { BOOT_SRC } \\ \text { bit 3 }\end{array} & \begin{array}{l}\text { BOOT_SRC } \\ \text { bit 2 }\end{array} & \begin{array}{l}\text { BOOT_SRC } \\ \text { bit 1 }\end{array} & \begin{array}{l}\text { BOOT_SRC } \\ \text { bit 0 }\end{array} & \text { Description } \\ \hline \text { USB0 } & 0 & 1 & 1 & 0 & \text { Boot from USB0. } \\ \hline \text { USB1 } & 0 & 1 & 1 & 1 & \text { Boot from USB1. } \\ \hline \text { SPI (SSP) } & 1 & 0 & 0 & 0 & \begin{array}{l}\text { Boot from SPI flash connected to the SSP0 } \\ \text { interface on P3_3 (function SSP0_SCK), P3_6 } \\ \text { (function SSP0_SSEL), P3_7 (function }\end{array} \\ \text { SSP0_MISO), and P3_8 (function SSP0_MOSI)[1]. }\end{array}\right]$
[1] The boot loader programs the appropriate pin function at reset to boot using either SSP0 or SPIFI.
Remark: Pin functions for SPIFI and SSPO boot are different.

Table 5. Boot mode when OPT BOOT_SRC bits are zero

| Boot mode | Pins |  |  |  | Description |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | P2_9 | P2_8 | P1_2 | P1_1 |  |
| USARTO | LOW | LOW | LOW | LOW | Enter ISP mode using USARTO pins P2_0 and P2_1. |
| SPIFI | LOW | LOW | LOW | HIGH | Boot from Quad SPI flash connected to the SPIFI interface on P3_3 to P3_8[1]. |
| EMC 8-bit | LOW | LOW | HIGH | LOW | Boot from external static memory (such as NOR flash) using CSO and an 8-bit data bus. |
| EMC 16-bit | LOW | LOW | HIGH | HIGH | Boot from external static memory (such as NOR flash) using CSO and a 16-bit data bus. |
| EMC 32-bit | LOW | HIGH | LOW | LOW | Boot from external static memory (such as NOR flash) using CSO and a 32-bit data bus. |
| USB0 | LOW | HIGH | LOW | HIGH | Boot from USB0 |
| USB1 | LOW | HIGH | HIGH | LOW | Boot from USB1. |
| SPI (SSP) | LOW | HIGH | HIGH | HIGH | Boot from SPI flash connected to the SSP0 interface on P3_3 (function SSP0_SCK), P3_6 (function SSP0_SSEL), P3_7 (function SSP0_MISO), and P3_8 (function SSP0_MOSI)[1]. |
| USART3 | HIGH | LOW | LOW | LOW | Enter ISP mode using USART3 pins P2_3 and P2_4. |

[1] The boot loader programs the appropriate pin function at reset to boot using either SSP0 or SPIFI. Remark: Pin functions for SPIFI and SSPO boot are different.

### 7.12 Memory mapping

Fig 7. LPC $185 \times / 3 x / 2 x / 1 x$ Memory mapping (overview)

Fig 8. LPC185x/3x/2x/1x Memory mapping (peripherals)

### 7.13 One-Time Programmable (OTP) memory <br> The OTP provides 64 bit+ 256 bit of memory for general-purpose use.

### 7.14 General-Purpose I/O (GPIO)

The LPC185x/3x/2x/1x provides 8 GPIO ports with up to 31 GPIO pins each.
Device pins that are not connected to a specific peripheral function are controlled by the GPIO registers. Pins may be dynamically configured as inputs or outputs. Separate registers allow setting or clearing any number of outputs simultaneously. The value of the output register may be read back as well as the current state of the port pins.

All GPIO pins default to inputs with pull-up resistors enabled and input buffer disabled on reset. The input buffer must be turned on in the system control block SFS register before the GPIO input can be read.

### 7.14.1 Features

- Accelerated GPIO functions:
- GPIO registers are located on the AHB so that the fastest possible I/O timing can be achieved.
- Mask registers allow treating sets of port bits as a group, leaving other bits unchanged.
- All GPIO registers are byte and half-word addressable.
- Entire port value can be written in one instruction.
- Bit-level set and clear registers allow a single instruction set or clear of any number of bits in one port.
- Direction control of individual bits.
- Up to eight GPIO pins can be selected from all GPIO pins to create an edge- or level-sensitive GPIO interrupt request.
- Two GPIO group interrupts can be triggered by any pin or pins in each port.

### 7.15 AHB peripherals

### 7.15.1 State Configurable Timer/PWM (SCTimer/PWM) subsystem

The SCTimer/PWM allows a wide variety of timing, counting, output modulation, and input capture operations. The inputs and outputs of the SCTimer/PWM are shared with the capture and match inputs/outputs of the 32-bit general-purpose counter/timers.

The SCTimer/PWM can be configured as two 16-bit counters or a unified 32-bit counter. In the two-counter case, in addition to the counter value the following operational elements are independent for each half:

- State variable.
- Limit, halt, stop, and start conditions.
- Values of Match/Capture registers, plus reload or capture control values.

In the two-counter case, the following operational elements are global to the SCTimer/PWM, but the last three can use match conditions from either counter:

- Clock selection
- Inputs
- Events
- Outputs
- Interrupts

### 7.15.1.1 Features

- Two 16-bit counters or one 32-bit counter.
- Counters clocked by bus clock or selected input.
- Up counters or up-down counters.
- State variable allows sequencing across multiple counter cycles.
- The following conditions define an event: a counter match condition, an input (or output) condition, a combination of a match and/or and input/output condition in a specified state.
- Events control outputs, interrupts, and DMA requests.
- Match register 0 can be used as an automatic limit.
- In bi-directional mode, events can be enabled based on the count direction.
- Match events can be held until another qualifying event occurs.
- Selected events can limit, halt, start, or stop a counter.
- Supports:
- 8 inputs
- 16 outputs
- 16 match/capture registers
- 16 events
- 32 states
- Match register 0 to 5 support a fractional component for the dither engine

### 7.15.2 General-Purpose DMA

The DMA controller allows peripheral-to memory, memory-to-peripheral, peripheral-to-peripheral, and memory-to-memory transactions. Each DMA stream provides unidirectional serial DMA transfers for a single source and destination. For example, a bidirectional port requires one stream for transmit and one for receives. The source and destination areas can each be either a memory region or a peripheral for master 1 , but only memory for master 0 .

### 7.15.2.1 Features

- Eight DMA channels. Each channel can support a unidirectional transfer.
- 16 DMA request lines.
- Single DMA and burst DMA request signals. Each peripheral connected to the DMA Controller can assert either a burst DMA request or a single DMA request. The DMA burst size is set by programming the DMA Controller.
- Memory-to-memory, memory-to-peripheral, peripheral-to-memory, and peripheral-to-peripheral transfers are supported.
- Scatter or gather DMA is supported through the use of linked lists. This means that the source and destination areas do not have to occupy contiguous areas of memory.
- Hardware DMA channel priority.
- AHB slave DMA programming interface. The DMA Controller is programmed by writing to the DMA control registers over the AHB slave interface.
- Two AHB bus masters for transferring data. These interfaces transfer data when a DMA request goes active. Master 1 can access memories and peripherals, master 0 can access memories only.
- 32-bit AHB master bus width.
- Incrementing or non-incrementing addressing for source and destination.
- Programmable DMA burst size. The DMA burst size can be programmed to more efficiently transfer data.
- Internal four-word FIFO per channel.
- Supports 8,16 , and 32 -bit wide transactions.
- Big-endian and little-endian support. The DMA Controller defaults to little-endian mode on reset.
- An interrupt to the processor can be generated on a DMA completion or when a DMA error has occurred.
- Raw interrupt status. The DMA error and DMA count raw interrupt status can be read prior to masking.

### 7.15.3 SPI Flash Interface (SPIFI)

The SPI Flash Interface allows low-cost serial flash memories to be connected to the ARM Cortex-M3 processor with little performance penalty compared to parallel flash devices with higher pin count.

After a few commands configure the interface at startup, the entire flash content is accessible as normal memory using byte, halfword, and word accesses by the processor and/or DMA channels. Simple sequences of commands handle erasure and programming.

Many serial flash devices use a half-duplex command-driven SPI protocol for device setup and initialization and then move to a half-duplex, command-driven 4-bit protocol for normal operation. Different serial flash vendors and devices accept or require different commands and command formats. SPIFI provides sufficient flexibility to be compatible with common flash devices and includes extensions to help insure compatibility with future devices.

### 7.15.3.1 Features

- Interfaces to serial flash memory in the main memory map.
- Supports classic and 4-bit bidirectional serial protocols.
- Half-duplex protocol compatible with various vendors and devices.
- Quad SPI Flash Interface (SPIFI) with 1-, 2-, or 4-bit data at rates of up to 52 MB per second.
- Supports DMA access.

### 7.15.4 SD/MMC card interface

The SD/MMC card interface supports the following modes:

- Secure Digital memory (SD version 3.0).
- Secure Digital I/O (SDIO version 2.0).
- Consumer Electronics Advanced Transport Architecture (CE-ATA version 1.1).
- Multimedia Cards (MMC version 4.4).

### 7.15.5 External Memory Controller (EMC)

Remark: The EMC is available on all LPC185x/3x/2x/1x parts. The following memory bus widths are supported:

- LBGA256 packages: 32 bit
- TFBGA100 packages: 8 bit
- LQFP208 packages: 16 bit
- LQFP144 packages: 16 bit

The LPC185x/3x/2x/1x EMC is a Memory Controller peripheral offering support for asynchronous static memory devices such as RAM, ROM, and NOR flash. In addition, it can be used as an interface with off-chip memory-mapped devices and peripherals.

Table 6. EMC pinout for different packages

| Function | LBGA256 | TFBGA100 | LQFP208 | LQFP144 |
| :---: | :---: | :---: | :---: | :---: |

| $\overline{\text { RAS }}$ | EMC_RAS | EMC_RAS | EMC_RAS | EMC_RAS |

### 7.15.5.1 Features

- Dynamic memory interface support including single data rate SDRAM.
- Asynchronous static memory device support including RAM, ROM, and NOR flash, with or without asynchronous page mode.
- Low transaction latency.
- Read and write buffers to reduce latency and to improve performance.
- 8/16/32 data and 24 address lines-wide static memory support.
- 16-bit and 32-bit wide chip select SDRAM memory support.
- Static memory features include:
- Asynchronous page mode read.
- Programmable Wait States.
- Bus turnaround delay.
- Output enable and write enable delays.
- Extended wait.
- Four chip selects for synchronous memory and four chip selects for static memory devices.
- Power-saving modes dynamically control CKE and CLKOUT to SDRAMs.
- Software-controlled dynamic memory self-refresh mode.
- Controller supports 2048 (A0 to A10), 4096 (A0 to A11), and 8192 (A0 to A12) row address synchronous memory parts. Those are typically $512 \mathrm{MB}, 256 \mathrm{MB}$, and 128 MB parts.
- Separate reset domains allow auto-refresh through a chip reset if desired.

Note: Synchronous static memory devices (synchronous burst mode) are not supported.

### 7.15.6 High-speed USB Host/Device/OTG interface (USB0)

Remark: USB0 is available on the following parts: LPC185x, LPC183x, LPC182x. USB0 is not available on the LPC181x parts.

The USB OTG module allows the part to connect directly to a USB host such as a PC (in device mode) or to a USB device in host mode.

### 7.15.6.1 Features

- On-chip UTMI+ compliant high-speed transceiver (PHY).
- Complies with Universal Serial Bus specification 2.0.
- Complies with USB On-The-Go supplement.
- Complies with Enhanced Host Controller Interface Specification.
- Supports auto USB 2.0 mode discovery.
- Supports all high-speed USB-compliant peripherals.
- Supports all full-speed USB-compliant peripherals.
- Supports software Host Negotiation Protocol (HNP) and Session Request Protocol (SRP) for OTG peripherals.
- Supports interrupts.
- Supports Start Of Frame (SOF) frame length adjust.
- This module has its own, integrated DMA engine.
- USB interface electrical test software included in ROM USB stack.

### 7.15.7 High-speed USB Host/Device interface with ULPI (USB1)

Remark: USB1 is available on the following parts: LPC185x and LPC183x. USB1 is not available on the LPC182x and LPC181x parts.

The USB1 interface can operate as a full-speed USB host/device interface or can connect to an external ULPI PHY for High-speed operation.
7.15.7.1 Features

- Complies with Universal Serial Bus specification 2.0.
- Complies with Enhanced Host Controller Interface Specification.
- Supports auto USB 2.0 mode discovery.
- Supports all high-speed USB-compliant peripherals if connected to external ULPI PHY.
- Supports all full-speed USB-compliant peripherals.
- Supports interrupts.
- Supports Start Of Frame (SOF) frame length adjust.
- This module has its own, integrated DMA engine.
- USB interface electrical test software included in ROM USB stack.

### 7.15.8 LCD controller

Remark: The LCD controller is only available on parts LPC185x. LCD is not available on parts LPC183x, LPC182x, and LPC181x.

The LCD controller provides all of the necessary control signals to interface directly to various color and monochrome LCD panels. Both STN (single and dual panel) and TFT panels can be operated. The display resolution is selectable and can be up to $1024 \times 768$ pixels. Several color modes are provided, up to a 24 -bit true-color non-palettized mode. An on-chip 512 byte color palette allows reducing bus utilization (that is, memory size of the displayed data) while still supporting many colors.

The LCD interface includes its own DMA controller to allow it to operate independently of the CPU and other system functions. A built-in FIFO acts as a buffer for display data, providing flexibility for system timing. Hardware cursor support can further reduce the amount of CPU time required to operate the display.

### 7.15.8.1 Features

- AHB master interface to access frame buffer.
- Setup and control via a separate AHB slave interface.
- Dual 16-deep programmable 64-bit wide FIFOs for buffering incoming display data.
- Supports single and dual-panel monochrome Super Twisted Nematic (STN) displays with 4-bit or 8-bit interfaces.
- Supports single and dual-panel color STN displays.
- Supports Thin Film Transistor (TFT) color displays.
- Programmable display resolution including, but not limited to: $320 \times 200,320 \times 240$, $640 \times 200,640 \times 240,640 \times 480,800 \times 600$, and $1024 \times 768$.
- Hardware cursor support for single-panel displays.
- 15 gray-level monochrome, 3375 color STN, and 32 K color palettized TFT support.
- 1, 2, or 4 bits-per-pixel (bpp) palettized displays for monochrome STN.
- $1,2,4$, or 8 bpp palettized color displays for color STN and TFT.
- 16 bpp true-color non-palettized for color STN and TFT.
- 24 bpp true-color non-palettized for color TFT.
- Programmable timing for different display panels.
- 256 entry, 16 -bit palette RAM, arranged as a $128 \times 32$-bit RAM.
- Frame, line, and pixel clock signals.
- AC bias signal for STN, data enable signal for TFT panels.
- Supports little and big-endian, and Windows CE data formats.
- LCD panel clock can be generated from the peripheral clock, or from a clock input pin.

### 7.15.9 Ethernet

Remark: The ethernet controller is available on parts LPC185x and LPC183x. Ethernet is not available on parts LPC182x and LPC181x.

### 7.15.9.1 Features

- 10/100 Mbit/s.
- DMA support.
- Power management remote wake-up frame and magic packet detection.
- Supports both full-duplex and half-duplex operation
- Supports CSMA/CD Protocol for half-duplex operation.
- Supports IEEE 802.3x flow control for full-duplex operation.
- Optional forwarding of received pause control frames to the user application in full-duplex operation.
- Back-pressure support for half-duplex operation.
- Automatic transmission of zero-quanta pause frame on deassertion of flow control input in full-duplex operation.
- Support for IEEE 1588 time stamping and IEEE 1588 advanced time stamping (IEEE $1588-2008 \mathrm{v} 2)$.

### 7.16 Digital serial peripherals

### 7.16.1 UART

Remark: The LPC185x/3x/2x/1x contain one UART with standard transmit and receive data lines.

UART1 also provides a full modem control handshake interface and support for RS-485/9-bit mode allowing both software address detection and automatic address detection using 9 -bit mode.

UART1 includes a fractional baud rate generator. Standard baud rates such as 115200 Bd can be achieved with any crystal frequency above 2 MHz .

### 7.16.1.1 Features

- Maximum UART data bit rate of $8 \mathrm{MBit} / \mathrm{s}$.
- 16 B Receive and Transmit FIFOs.
- Register locations conform to 16C550 industry standard.
- Receiver FIFO trigger points at 1 B, 4 B, 8 B, and 14 B.
- Built-in fractional baud rate generator covering wide range of baud rates without a need for external crystals of particular values.
- Auto baud capabilities and FIFO control mechanism that enables software flow control implementation.
- Equipped with standard modem interface signals. This module also provides full support for hardware flow control (auto-CTS/RTS).
- Support for RS-485/9-bit/EIA-485 mode (UART1).
- DMA support.

### 7.16.2 USART

Remark: The LPC185x/3x/2x/1x contain three USARTs. In addition to standard transmit and receive data lines, the USARTs support a synchronous mode and a smart card mode.

The USARTs include a fractional baud rate generator. Standard baud rates such as 115200 Bd can be achieved with any crystal frequency above 2 MHz .

### 7.16.2.1 Features

- Maximum UART data bit rate of $8 \mathrm{MBit} / \mathrm{s}$.
- 16 B Receive and Transmit FIFOs.
- Register locations conform to 16 C 550 industry standard.
- Receiver FIFO trigger points at 1 B, 4 B, 8 B, and 14 B.
- Built-in fractional baud rate generator covering wide range of baud rates without a need for external crystals of particular values.
- Auto baud capabilities and FIFO control mechanism that enables software flow control implementation.
- Support for RS-485/9-bit/EIA-485 mode.
- USART3 includes an IrDA mode to support infrared communication.
- All USARTs have DMA support.
- Support for synchronous mode at a data bit rate of up to 8 Mbit/s.
- Smart card mode conforming to ISO7816 specification

### 7.16.3 SSP serial I/O controller

Remark: The LPC185x/3x/2x/1x contain two SSP controllers.
The SSP controller can operate on a SPI, 4-wire SSI, or Microwire bus. It can interact with multiple masters and slaves on the bus. Only a single master and a single slave can communicate on the bus during a given data transfer. The SSP supports full-duplex
transfers, with frames of 4 bit to 16 bit of data flowing from the master to the slave and from the slave to the master. In practice, often only one of these data flows carries meaningful data.

### 7.16.3.1 Features

- Maximum SSP speed in full-duplex mode of $25 \mathrm{Mbit} / \mathrm{s}$; for transmit only $50 \mathrm{Mbit} / \mathrm{s}$ (master) and $15 \mathrm{Mbit} / \mathrm{s}$ (slave).
- Compatible with Motorola SPI, 4-wire Texas Instruments SSI, and National Semiconductor Microwire buses.
- Synchronous serial communication.
- Master or slave operation.
- Eight-frame FIFOs for both transmit and receive.
- 4-bit to 16-bit frame.
- Connected to the GPDMA.

### 7.16.4 $\quad I^{2} \mathrm{C}$-bus interface

Remark: The LPC185x/3x/2x/1x contain two $I^{2} \mathrm{C}$-bus interfaces.
The $I^{2} \mathrm{C}$-bus is bidirectional for inter-IC control using only two wires: a Serial Clock line (SCL) and a Serial Data line (SDA). Each device is recognized by a unique address and can operate as either a receiver-only device (for example, an LCD driver) or a transmitter with the capability to both receive and send information (such as memory). Transmitters and/or receivers can operate in either master or slave mode, depending on whether the chip has to initiate a data transfer or is only addressed. The $I^{2} \mathrm{C}$-bus interface is a multi-master bus and can be controlled by more than one bus master connected to it.

### 7.16.4.1 Features

- $I^{2} \mathrm{CO}$ is a standard $\mathrm{I}^{2} \mathrm{C}$-bus compliant bus interface with open-drain pins. $I^{2} \mathrm{CO}$ also supports Fast mode plus with bit rates up to $1 \mathrm{Mbit} / \mathrm{s}$.
- $\mathrm{I}^{2} \mathrm{C} 1$ uses standard $\mathrm{I} / \mathrm{O}$ pins with bit rates of up to $400 \mathrm{kbit/s}$ (Fast $\mathrm{I}^{2} \mathrm{C}$-bus).
- Easy to configure as master, slave, or master/slave.
- Programmable clocks allow versatile rate control.
- Bidirectional data transfer between masters and slaves.
- Multi-master bus (no central master).
- Arbitration between simultaneously transmitting masters without corruption of serial data on the bus.
- Serial clock synchronization allows devices with different bit rates to communicate via one serial bus.
- Serial clock synchronization can be used as a handshake mechanism to suspend and resume serial transfer.
- The $\mathrm{I}^{2} \mathrm{C}$-bus can be used for test and diagnostic purposes.
- All $I^{2} \mathrm{C}$-bus controllers support multiple address recognition and a bus monitor mode.

### 7.16.5 $\mathrm{I}^{2} \mathrm{~S}$ interface

Remark: The LPC185x/3x/2x/1x contain two I ${ }^{2}$ S interfaces.

The $\mathrm{I}^{2} \mathrm{~S}$-bus provides a standard communication interface for digital audio applications.
The $I^{2} S$-bus specification defines a 3 -wire serial bus using one data line, one clock line, and one word select signal. The basic $\mathrm{I}^{2} \mathrm{~S}$-bus connection has one master, which is always the master, and one slave. The $\mathrm{I}^{2} \mathrm{~S}$-bus interface provides a separate transmit and receive channel, each of which can operate as either a master or a slave.

### 7.16.5.1 Features

- The interface has separate input/output channels each of which can operate in master or slave mode.
- Capable of handling 8 -bit, 16 -bit, and 32 -bit word sizes.
- Mono and stereo audio data supported.
- The sampling frequency can range from 16 kHz to $192 \mathrm{kHz}(16,22.05,32,44.1,48$, $96,192) \mathrm{kHz}$.
- Support for an audio master clock.
- Configurable word select period in master mode (separately for $I^{2} S$-bus input and output).
- Two 8-word FIFO data buffers are provided, one for transmit and one for receive.
- Generates interrupt requests when buffer levels cross a programmable boundary.
- Two DMA requests, controlled by programmable buffer levels. The DMA requests are connected to the GPDMA block.
- Controls include reset, stop and mute options separately for $I^{2} S$-bus input and $I^{2} S$-bus output.

### 7.16.6 C_CAN

Remark: The LPC185x/3x/2x/1x contain two C_CAN controllers.
Controller Area Network (CAN) is the definition of a high performance communication protocol for serial data communication. The C_CAN controller is designed to provide a full implementation of the CAN protocol according to the CAN Specification Version 2.0B. The C_CAN controller can build powerful local networks with low-cost multiplex wiring by supporting distributed real-time control with a high level of reliability.
7.16.6.1 Features

- Conforms to protocol version 2.0 parts A and B.
- Supports bit rate of up to $1 \mathrm{Mbit} / \mathrm{s}$.
- Supports 32 Message Objects.
- Each Message Object has its own identifier mask.
- Provides programmable FIFO mode (concatenation of Message Objects).
- Provides maskable interrupts.
- Supports Disabled Automatic Retransmission (DAR) mode for time-triggered CAN applications.
- Provides programmable loop-back mode for self-test operation.

### 7.17 Counter/timers and motor control

### 7.17.1 General purpose 32-bit timers/external event counter

Remark: The LPC185x/3x/2x/1x include four 32-bit timer/counters.
The timer/counter is designed to count cycles of the system derived clock or an externally supplied clock. It can optionally generate interrupts, generate timed DMA requests, or perform other actions at specified timer values, based on four match registers. Each timer/counter also includes two capture inputs to trap the timer value when an input signal transitions, optionally generating an interrupt.

### 7.17.1.1 Features

- A 32-bit timer/counter with a programmable 32-bit prescaler.
- Counter or timer operation.
- Two 32-bit capture channels per timer, that can take a snapshot of the timer value when an input signal transitions. A capture event can also generate an interrupt.
- Four 32-bit match registers that allow:
- Continuous operation with optional interrupt generation on match.
- Stop timer on match with optional interrupt generation.
- Reset timer on match with optional interrupt generation.
- Up to four external outputs corresponding to match registers, with the following capabilities:
- Set LOW on match.
- Set HIGH on match.
- Toggle on match.
- Do nothing on match.
- Up to two match registers can be used to generate timed DMA requests.

### 7.17.2 Motor control PWM

The motor control PWM is a specialized PWM supporting 3-phase motors and other combinations. Feedback inputs are provided to automatically sense rotor position and use that information to ramp speed up or down. An abort input causes the PWM to release all motor drive outputs immediately. At the same time, the motor control PWM is highly configurable for other generalized timing, counting, capture, and compare applications.

### 7.17.3 Quadrature Encoder Interface (QEI)

A quadrature encoder, also known as a 2-channel incremental encoder, converts angular displacement into two pulse signals. By monitoring both the number of pulses and the relative phase of the two signals, the user code can track the position, direction of rotation, and velocity. In addition, a third channel, or index signal, can be used to reset the position counter. The quadrature encoder interface decodes the digital pulses from a quadrature encoder wheel to integrate position over time and determine direction of rotation. In addition, the QEI can capture the velocity of the encoder wheel.

### 7.17.3.1 Features

- Tracks encoder position.
- Increments/decrements depending on direction.
- Programmable for $2 \times$ or $4 \times$ position counting.
- Velocity capture using built-in timer.
- Velocity compare function with "less than" interrupt.
- Uses 32-bit registers for position and velocity.
- Three position-compare registers with interrupts.
- Index counter for revolution counting.
- Index compare register with interrupts.
- Can combine index and position interrupts to produce an interrupt for whole and partial revolution displacement.
- Digital filter with programmable delays for encoder input signals.
- Can accept decoded signal inputs (clk and direction).

### 7.17.4 Repetitive Interrupt (RI) timer

The repetitive interrupt timer provides a free-running 32-bit counter which is compared to a selectable value, generating an interrupt when a match occurs. Any bits of the timer compare function can be masked such that they do not contribute to the match detection. The repetitive interrupt timer can be used to create an interrupt that repeats at predetermined intervals.

### 7.17.4.1 Features

- 32-bit counter. Counter can be free-running or be reset by a generated interrupt.
- 32-bit compare value.
- 32-bit compare mask. An interrupt is generated when the counter value equals the compare value, after masking. This mechanism allows for combinations not possible with a simple compare.

### 7.17.5 Windowed WatchDog Timer (WWDT)

The purpose of the watchdog is to reset the controller if software fails to periodically service it within a programmable time window.

### 7.17.5.1 Features

- Internally resets chip if not periodically reloaded during the programmable time-out period.
- Optional windowed operation requires reload to occur between a minimum and maximum time period, both programmable.
- Optional warning interrupt can be generated at a programmable time prior to watchdog time-out.
- Enabled by software but requires a hardware reset or a watchdog reset/interrupt to be disabled.
- Incorrect feed sequence causes reset or interrupt if enabled.
- Flag to indicate watchdog reset.
- Programmable 24-bit timer with internal prescaler.
- Selectable time period from $\left(T_{\text {cy }}(\right.$ WDCLK $\left.) \times 256 \times 4\right)$ to $\left(T_{\text {cy }(\text { WDCLK })} \times 2^{24} \times 4\right)$ in multiples of $\mathrm{T}_{\text {cy }(W D C L K)} \times 4$.
- The Watchdog Clock (WDCLK) uses the IRC as the clock source.

### 7.18 Analog peripherals

### 7.18.1 Analog-to-Digital Converter

Remark: The LPC185x/3x/2x/1x contain two 10-bit ADCs. All input channels are shared between ADC0 and ADC1.

### 7.18.1.1 Features

- 10-bit successive approximation analog to digital converter.
- Input multiplexing among 8 pins.
- Power-down mode.
- Measurement range 0 to VDDA.
- Sampling frequency up to $400 \mathrm{kSamples} / \mathrm{s}$.
- Burst conversion mode for single or multiple inputs.
- Optional conversion on transition on ADCTRIG0 or ADCTRIG1 pins, combined timer outputs 8 or 15 , or the PWM output MCOA2.
- Individual result registers for each A/D channel to reduce interrupt overhead.
- DMA support.

### 7.18.2 Digital-to-Analog Converter (DAC)

### 7.18.2.1 Features

- 10-bit resolution.
- Monotonic by design (resistor string architecture).
- Controllable conversion speed.
- Low power consumption.

### 7.19 Peripherals in the RTC power domain

### 7.19.1 RTC

The Real-Time Clock (RTC) is a set of counters for measuring time when system power is on, and optionally when it is off. It uses little power when the CPU does not access its registers, especially in the reduced power modes. A separate 32 kHz oscillator clocks the RTC. The oscillator produces a 1 Hz internal time reference and is powered by its own power supply pin, VBAT.
7.19.1.1 Features

- Measures the passage of time to maintain a calendar and clock. Provides seconds, minutes, hours, day of month, month, year, day of week, and day of year.
- Ultra-low power design to support battery powered systems. Uses power from the CPU power supply when it is present.
- Dedicated battery power supply pin.
- RTC power supply is isolated from the rest of the chip.
- Calibration counter allows adjustment to better than $\pm 1 \mathrm{sec} / \mathrm{day}$ with 1 sec resolution.
- Periodic interrupts can be generated from increments of any field of the time registers.
- Alarm interrupt can be generated for a specific date/time.

### 7.19.2 Event monitor/recorder

The event monitor/recorder allows recording and creating a time stamp of events related to the WAKEUP pins. Sensors report changes to the state of the WAKEUP pins, and the event monitor/recorder stores records of such events. The event recorder can be powered by the backup battery.

The event monitor/recorder can monitor the integrity of the device and record any tampering events.

### 7.19.2.1 Features

- Supports three digital event inputs in the VBAT power domain.
- An event is defined as a level change at the digital event inputs.
- For each event channel, two timestamps mark the first and the last occurrence of an event. Each channel also has a dedicated counter tracking the total number of events. Timestamp values are taken from the RTC.
- Runs in VBAT power domain, independent of system power supply. The event/recorder/monitor can therefore operate in Deep power-down mode.
- Low power consumption.
- Interrupt available if system is running.
- A qualified event can be used as a wake-up trigger.
- State of event interrupts accessible by software through GPIO.

### 7.19.3 Alarm timer

The alarm timer is a 16 -bit timer and counts down at 1 kHz from a preset value generating alarms in intervals of up to 1 min . The counter triggers a status bit when it reaches $0 \times 00$ and asserts an interrupt, if enabled.

The alarm timer is part of the RTC power domain and can be battery powered.

### 7.20 System control

### 7.20.1 Configuration registers (CREG)

The following settings are controlled in the configuration register block:

- BOD trip settings
- Oscillator output
- DMA-to-peripheral muxing
- Ethernet mode
- Memory mapping
- Timer/USART inputs
- Enabling the USB controllers

In addition, the CREG block contains the part identification and part configuration information.

### 7.20.2 System Control Unit (SCU)

The system control unit determines the function and electrical mode of the digital pins. By default function 0 is selected for all pins with pull-up enabled. For pins that support a digital and analog function, the ADC function select registers in the SCU enable the analog function.

A separate set of analog I/Os for the ADCs and the DAC as well as most USB pins are located on separate pads and are not controlled through the SCU.

In addition, the clock delay register for the SDRAM EMC_CLK pins and the registers that select the pin interrupts are located in the SCU.

### 7.20.3 Clock Generation Unit (CGU)

The Clock Generator Unit (CGU) generates several base clocks. The base clocks can be unrelated in frequency and phase and can have different clock sources within the CGU. One CGU base clock is routed to the CLKOUT pins. The base clock that generates the CPU clock is referred to as CCLK.

Multiple branch clocks are derived from each base clock. The branch clocks offer flexible control for power-management purposes. All branch clocks are outputs of one of two Clock Control Units (CCUs) and can be controlled independently. Branch clocks derived from the same base clock are synchronous in frequency and phase.

### 7.20.4 Internal RC oscillator (IRC)

The IRC is used as the clock source for the WWDT and/or as the clock that drives the PLLs and the CPU. The nominal IRC frequency is 12 MHz . The IRC is trimmed to $1.5 \%$ accuracy for $\mathrm{T}_{\text {amb }}=0^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$ and $3 \%$ accuracy for $\mathrm{T}_{\text {amb }}=-40^{\circ} \mathrm{C}$ to $0^{\circ} \mathrm{C}$ and $\mathrm{T}_{\text {amb }}=$ $85^{\circ} \mathrm{C}$ to $105^{\circ} \mathrm{C}$.

Upon power-up or any chip reset, the LPC185x/3x/2x/1x use the IRC as the clock source. The boot loader then configures the PLL1 to provide a 96 MHz clock for the core and the PLLOUSB or PLLOAUDIO as needed if an external boot source is selected.

### 7.20.5 PLLOUSB (for USB0)

PLLO is a dedicated PLL for the USB0 High-speed controller.
PLL0 accepts an input clock frequency from an external oscillator in the range of 14 kHz to 25 MHz . The input frequency is multiplied up to a high frequency with a Current Controlled Oscillator (CCO). The CCO operates in the range of 4.3 MHz to 550 MHz .

### 7.20.6 PLLOAUDIO (for audio)

The audio PLL PLLOAUDIO is a general-purpose PLL with a small step size. This PLL accepts an input clock frequency derived from an external oscillator or internal IRC. The input frequency is multiplied up to a high frequency with a Current Controlled Oscillator (CCO). A sigma-delta converter modulates the PLL divider ratios to obtain the desired
output frequency. The output frequency can be set as a multiple of the sampling frequency $\mathrm{f}_{\mathrm{s}}$ to $32 \times \mathrm{f}_{\mathrm{s}}, 64 \times \mathrm{f}_{\mathrm{s}}, 128 \times \mathrm{f}_{\mathrm{s}}, 256 \times \mathrm{f}_{\mathrm{s}}, 384 \times \mathrm{f}_{\mathrm{s}}, 512 \times \mathrm{f}_{\mathrm{s}}$ and the sampling frequency $\mathrm{f}_{\mathrm{s}}$ can range from 16 kHz to $192 \mathrm{kHz}(16,22.05,32,44.1,48,96,192) \mathrm{kHz}$. Many other frequencies are possible as well using the integrated fractional divider.

### 7.20.7 System PLL1

The PLL1 accepts an input clock frequency from an external oscillator in the range of 1 MHz to 25 MHz . The input frequency is multiplied up to a high frequency with a Current Controlled Oscillator (CCO). The multiplier can be an integer value from 1 to 32 . The CCO operates in the range of 156 MHz to 320 MHz . This range is possible through an additional divider in the loop to keep the CCO within its frequency range while the PLL is providing the desired output frequency. The output divider can be set to divide by $2,4,8$, or 16 to produce the output clock. Since the minimum output divider value is 2 , it is insured that the PLL output has a $50 \%$ duty cycle. The PLL is turned off and bypassed following a chip reset. After reset, software can enable the PLL. The program must configure and activate the PLL, wait for the PLL to lock, and then connect to the PLL as a clock source. The PLL settling time is $100 \mu$ s.

### 7.20.8 Reset Generation Unit (RGU)

The RGU allows generation of independent reset signals for individual blocks and peripherals.

### 7.20.9 Power control

The LPC $185 \mathrm{x} / 3 \mathrm{x} / 2 \mathrm{x} / 1 \mathrm{x}$ feature several independent power domains to control power to the core and the peripherals (see Figure 9). The RTC and its associated peripherals (the alarm timer, the CREG block, the OTP controller, the back-up registers, and the event router) are located in the RTC power-domain. The main regulator or a battery supply can power the RTC. A power selector switch ensures that the RTC block is always powered on.

Fig 9. LPC185x/3x/2x/1x Power domains
The LPC185x/3x/2x/1x support four reduced power modes: Sleep, Deep-sleep, Power-down, and Deep power-down.

The LPC185x/3x/2x/1x can wake up from Deep-sleep, Power-down, and Deep power-down modes via the WAKEUP[3:0] pins and interrupts generated by battery powered blocks in the RTC power domain.
7.20.10 Code security (Code Read Protection - CRP)

CRP enables different levels of security so that access to the on-chip flash and use of the JTAG and ISP can be restricted. CRP is invoked by programming a specific pattern into a dedicated flash location. IAP commands are not affected by CRP.

There are three levels of the Code Read Protection:

- In level CRP1, access to the chip via the JTAG is disabled. Partial flash updates are allowed (excluding flash sector 0 ) using a limited set of the ISP commands. This level is useful when CRP is required and flash field updates are needed. CRP1 does prevent the user code from erasing all sectors.
- In level CRP2, access to the chip via the JTAG is disabled. Only a full flash erase and update using a reduced set of the ISP commands is allowed.
- In level CRP3, any access to the chip via the JTAG pins or the ISP is disabled. This mode also disables the ISP override using P2_7 pin. If necessary, the application code must provide a flash update mechanism using the IAP calls or using the reinvoke ISP command to enable flash update via USARTO. See Table 5.

## CAUTION

If level three Code Read Protection (CRP3) is selected, no future factory testing can be performed on the device.

### 7.21 Emulation and debugging

Debug and trace functions are integrated into the ARM Cortex-M3. Serial wire debug and trace functions are supported in addition to a standard JTAG debug and parallel trace functions. The ARM Cortex-M3 is configured to support up to eight breakpoints and four watch points.

## 8. Limiting values

Table 7. Limiting values
In accordance with the Absolute Maximum Rating System (IEC 60134).[1]

| Symbol | Parameter | Conditions |  | Min | Max | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{V}_{\text {DD(REG)(3V3) }}$ | regulator supply voltage $(3.3 \mathrm{~V})$ | on pin VDDREG |  | -0.5 | 3.6 | V |
| $\mathrm{V}_{\mathrm{DD}(\mathrm{IO})}$ | input/output supply voltage | on pin VDDIO |  | -0.5 | 3.6 | V |
| $\mathrm{V}_{\text {DDA(3V3) }}$ | analog supply voltage (3.3 V) | on pin VDDA |  | -0.5 | 3.6 | V |
| $V_{\text {BAT }}$ | battery supply voltage | on pin VBAT |  | -0.5 | 3.6 | V |
| $\mathrm{V}_{\text {prog(pf) }}$ | polyfuse programming voltage | on pin VPP |  | -0.5 | 3.6 | V |
| $V_{1}$ | input voltage | when $\mathrm{V}_{\mathrm{DD}(\mathrm{IO})} \geq 2.4 \mathrm{~V}$ <br> 5 V tolerant digital I/O pins | [2] | -0.5 | 5.5 | V |
|  |  | ADC/DAC pins and digital I/O pins configured for an analog function |  | -0.5 | $\mathrm{V}_{\text {DDA(3V3) }}$ | V |
|  |  | $\begin{aligned} & \text { USB0 pins USBO_DP; } \\ & \text { USBO_DM; USB0_VBUS } \end{aligned}$ |  | -0.3 | 5.2 | V |
|  |  | USB0 pins USB0_ID; USB0_RREF |  | -0.3 | 3.6 | V |

| $\mathrm{l}_{\mathrm{DD}}$ | supply current | per supply pin | [3] | - | 100 | mA |
| ISS | ground current | per ground pin | [3] | - | 100 | mA |
| 1 latch | I/O latch-up current | $\begin{aligned} & -\left(0.5 \mathrm{~V}_{\mathrm{DD}(\mathrm{IO})}\right)<\mathrm{V}_{\mathrm{I}}<\left(1.5 \mathrm{~V}_{\mathrm{DD}(\mathrm{IO})}\right) \\ & \mathrm{T}_{\mathrm{j}}<125^{\circ} \mathrm{C} \end{aligned}$ |  | - | 100 | mA |
| $\mathrm{T}_{\text {stg }}$ | storage temperature |  | [4] | -65 | +150 | ${ }^{\circ} \mathrm{C}$ |
| $\mathrm{P}_{\text {tot(pack) }}$ | total power dissipation (per package) | based on package heat transfer, not device power consumption |  | - | 1.5 | W |
| $V_{\text {ESD }}$ | electrostatic discharge voltage | human body model; all pins | [5] | - | 2000 | V |

[1] The following applies to the limiting values:
a) This product includes circuitry designed for the protection of its internal devices from the damaging effects of excessive static charge. Nonetheless, it is suggested that conventional precautions be taken to avoid applying greater than the rated maximum.
b) Parameters are valid over operating temperature range unless otherwise specified. All voltages are with respect to $V_{S S}$ unless otherwise noted.
[2] Including voltage on outputs in 3-state mode.
[3] The peak current is limited to 25 times the corresponding maximum current.
[4] Dependent on package type.
[5] Human body model: equivalent to discharging a 100 pF capacitor through a $1.5 \mathrm{k} \Omega$ series resistor.

## 9. Thermal characteristics

The average chip junction temperature, $\mathrm{T}_{\mathrm{j}}\left({ }^{\circ} \mathrm{C}\right)$, can be calculated using the following equation:
$T_{j}=T_{a m b}+\left(P_{D} \times R_{t h(j-a)}\right)$

- $\mathrm{T}_{\mathrm{amb}}=$ ambient temperature $\left({ }^{\circ} \mathrm{C}\right)$,
- $R_{\text {th }(j-a)}=$ the package junction-to-ambient thermal resistance $\left({ }^{\circ} \mathrm{C} / \mathrm{W}\right)$
- $P_{D}=$ sum of internal and I/O power dissipation

The internal power dissipation is the product of $I_{D D(R E G)(3 V 3)}$ and $V_{D D(R E G)(3 V 3)}$. The $I / O$ power dissipation of the I/O pins is often small and many times can be negligible. However it can be significant in some applications.

[1] Typical ratings are not guaranteed. The values listed are at room temperature ( $25^{\circ} \mathrm{C}$ ), nominal supply voltages.
[2] The recommended operating condition for the battery supply is $\mathrm{V}_{\mathrm{DD}(\mathrm{REG})(3 \mathrm{~V} 3)}>\mathrm{V}_{\mathrm{BAT}}+0.2 \mathrm{~V}$. Special conditions for $\mathrm{V}_{\mathrm{DD}(\mathrm{REG})(3 \mathrm{~V} 3)}$ apply when writing to the flash and EEPROM. See Table 16 and Table 15.
[3] Pin VPP should either be not connected (when OTP does not need to be programmed) or tied to pins VDDIO and VDDREG to ensure the same ramp-up time for both supply voltages.
[4] $\quad \mathrm{V}_{\mathrm{DD}(\mathrm{REG})(3 \mathrm{~V} 3)}=3.3 \mathrm{~V} ; \mathrm{V}_{\mathrm{DD}(\mathrm{IO})}=3.3 \mathrm{~V}$; $\mathrm{T}_{\mathrm{amb}}=25^{\circ} \mathrm{C}$.
[5] PLL1 disabled; IRC running; CCLK $=12 \mathrm{MHz}$.
[6] $V_{B A T}=3.6 \mathrm{~V}$.
[7] $\mathrm{T}_{\mathrm{amb}}=-40^{\circ} \mathrm{C}$ to $+105^{\circ} \mathrm{C}$; $\mathrm{V}_{\mathrm{DD}(10)}=\mathrm{V}_{\mathrm{DDA}}=3.6 \mathrm{~V}$; over entire frequency range CCLK $=12 \mathrm{MHz}$ to 180 MHz ; in active mode, sleep mode; deep-sleep mode, power-down mode, and deep power-down mode.
[8] $\mathrm{V}_{\mathrm{ps}}$ corresponds to the output of the power switch (see Figure 9) which is determined by the greater of $\mathrm{V}_{\mathrm{BAT}}$ and $\mathrm{V}_{\mathrm{DD}(\mathrm{Reg})(3 \mathrm{~V} 3)}$.
[9] $V_{D D A(3 V 3)}=3.3 \mathrm{~V} ; \mathrm{T}_{\mathrm{amb}}=25^{\circ} \mathrm{C}$.
[10] Allowed as long as the current limit does not exceed the maximum current allowed by the device.
[11] To Vss.
[12] The values specified are simulated and absolute values.
[13] The weak pull-up resistor is connected to the $\mathrm{V}_{\mathrm{DD}(10)}$ rail and pulls up the $\mathrm{I} / \mathrm{O}$ pin to the $\mathrm{V}_{\mathrm{DD}(\mathrm{IO})}$ level.
[14] The input cell disables the weak pull-up resistor when the applied input voltage exceeds $V_{\mathrm{DD}(10)}$.
[15] The parameter value specified is a simulated value excluding bond capacitance.
[16] For USB operation $3.0 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DD}((10)} \leq 3.6 \mathrm{~V}$. Guaranteed by design.
[17] $V_{D D(10)}$ present.
[18] Includes external resistors of $33 \Omega \pm 1 \%$ on $\mathrm{D}+$ and $\mathrm{D}-$.

### 10.1 Power consumption

Conditions: $\mathrm{T}_{\mathrm{amb}}=25^{\circ} \mathrm{C}$; executing code while (1)\{\} from SRAM; system PLL enabled; IRC enabled; all peripherals disabled; all peripheral clocks disabled.
Fig 10. Typical supply current versus regulator supply voltage $\mathrm{V}_{\mathrm{DD}(\mathrm{REG})(3 \mathrm{~V} 3)}$ in active mode

Conditions: $V_{\mathrm{DD}(\mathrm{REG})(3 \mathrm{~V} 3)}=3.3 \mathrm{~V}$; executing code while (1)\{\} from SRAM; internal pull-up resistors disabled; system PLL enabled; IRC enabled; all peripherals disabled; all peripheral clocks disabled.
Fig 11. Typical supply current versus temperature in active mode

Conditions: active mode entered executing code while (1)\{\} from SRAM; $\mathrm{V}_{\mathrm{DD}(\mathrm{REG})(3 \mathrm{~V} 3)}=3.3 \mathrm{~V}$; system PLL enabled; IRC enabled; all peripherals disabled; all peripheral clocks disabled.
Fig 12. Typical supply current versus core frequency in active mode; code executed from SRAM

Conditions: $\mathrm{V}_{\mathrm{DD}(\mathrm{REG})(3 \mathrm{~V} 3)}=3.3 \mathrm{~V}$; internal pull-up resistors disabled; system PLL disabled; IRC enabled; all peripherals disabled; all peripheral clocks disabled. CCLK $=12 \mathrm{MHz}$.
Fig 13. Typical supply current versus temperature in sleep mode

Conditions: $\mathrm{V}_{\mathrm{DD}(\mathrm{REG})(3 \mathrm{~V} 3)}=\mathrm{V}_{\mathrm{DD}(\mathrm{IO})}=3.3 \mathrm{~V}$.
Fig 14. Typical supply current versus temperature in Deep-sleep mode

Conditions: $\mathrm{V}_{\mathrm{DD}(\mathrm{REG})(3 \mathrm{~V} 3)}=\mathrm{V}_{\mathrm{DD}(\mathrm{IO})}=3.3 \mathrm{~V} . \mathrm{V}_{\mathrm{BAT}}=$ $\mathrm{V}_{\mathrm{DD}(\mathrm{REG})(3 \mathrm{~V} 3)}+0.4 \mathrm{~V}$.

Fig 16. Typical supply current versus temperature in Deep power-down mode

Conditions: $\mathrm{V}_{\mathrm{DD}(\mathrm{REG})(3 \mathrm{~V} 3)}=\mathrm{V}_{\mathrm{DD}(\mathrm{IO})}=3.3 \mathrm{~V}$.
Fig 15. Typical supply current versus temperature in Power-down mode

Conditions: $\mathrm{V}_{\mathrm{BAT}}=3.6 \mathrm{~V} . \mathrm{V}_{\mathrm{DD}(\mathrm{REG})(3 \mathrm{~V} 3)}$ not present.

Fig 17. Typical battery supply current versus temperature

Conditions: $\mathrm{V}_{\mathrm{DD}(\mathrm{REG})(3 \mathrm{~V} 3)}=3.0 \mathrm{~V} ; \mathrm{V}_{\mathrm{BAT}}=2.6 \mathrm{~V}$ to 3.6 V ; $\mathrm{CCLK}=12 \mathrm{MHz}$.
Remark: The recommended operating condition for the battery supply is $\mathrm{V}_{\mathrm{DD}(\mathrm{REG})(3 \mathrm{~V} 3)}>\mathrm{V}_{\mathrm{BAT}}+0.2 \mathrm{~V}$.
Fig 18. Typical battery supply current in Active mode

### 10.2 Peripheral power consumption

The typical power consumption at $\mathrm{T}=25^{\circ} \mathrm{C}$ for each individual peripheral is measured as follows:

1. Enable all branch clocks and measure the current $I_{\mathrm{DD}(\mathrm{REG})(3 \mathrm{~V} 3)}$.
2. Disable the branch clock to the peripheral to be measured and keep all other branch clocks enabled.
3. Calculate the difference between measurement 1 and 2 . The result is the peripheral power consumption.

Table 12. Peripheral power consumption

| Peripheral | Branch clock | lDD(REG)(3V3) in mA |  |
| :--- | :--- | :--- | :--- |
|  |  | Branch clock <br> frequency = 48 MHz | Branch clock <br> frequency = 96 MHz |
| I2C1 | CLK_APB3_I2C1 | 0.01 | 0.01 |
| I2C0 | CLK_APB1_I2C0 | $<0.01$ | 0.02 |
| DAC | CLK_APB3_DAC | 0.01 | 0.02 |

### 10.3 Electrical pin characteristics

Conditions: $\mathrm{V}_{\mathrm{DD}(\mathrm{REG})(3 \mathrm{~V} 3)}=\mathrm{V}_{\mathrm{DD}(\mathrm{IO})}=3.3 \mathrm{~V}$.
Fig 19. Standard I/O pins; typical LOW level output current lol versus LOW level output voltage $\mathrm{V}_{\mathrm{OL}}$

Conditions: $\mathrm{V}_{\mathrm{DD}(\mathrm{REG})(3 \mathrm{~V} 3)}=\mathrm{V}_{\mathrm{DD}(\mathrm{IO})}=3.3 \mathrm{~V}$.
Fig 20. Standard I/O pins; typical HIGH level output voltage $\mathrm{V}_{\mathrm{OL}}$ versus HIGH level output current $\mathrm{IOH}_{\mathrm{OH}}$

Conditions: $\mathrm{V}_{\mathrm{DD}(\mathrm{REG})(3 \mathrm{~V} 3)}=\mathrm{V}_{\mathrm{DD}(\mathrm{IO})}=3.3 \mathrm{~V}$; normal-drive; $\mathrm{EHD}=0 \times 0$.

Conditions: $\mathrm{V}_{\mathrm{DD}(\mathrm{REG})(3 \mathrm{~V} 3)}=\mathrm{V}_{\mathrm{DD}(\mathrm{IO})}=3.3 \mathrm{~V}$; high-drive; $\mathrm{EHD}=0 \times 2$.

Conditions: $\mathrm{V}_{\mathrm{DD}(\mathrm{REG})(3 \mathrm{~V} 3)}=\mathrm{V}_{\mathrm{DD}(\mathrm{IO})}=3.3 \mathrm{~V}$; medium-drive; EHD $=0 \times 1$.

Conditions: $\mathrm{V}_{\mathrm{DD}(\mathrm{REG})(3 \mathrm{~V} 3)}=\mathrm{V}_{\mathrm{DD}(\mathrm{IO})}=3.3 \mathrm{~V}$; ultra high-drive; EHD = 0x3.

Fig 21. High-drive pins; typical LOW level output current loL versus LOW level output voltage $\mathrm{V}_{\mathrm{OL}}$

Conditions: $\mathrm{V}_{\mathrm{DD}(\mathrm{REG})(3 \mathrm{~V} 3)}=\mathrm{V}_{\mathrm{DD}(\mathrm{IO})}=3.3 \mathrm{~V}$; normal-drive; EHD $=0 \times 0$.

Conditions: $\mathrm{V}_{\mathrm{DD}(\mathrm{REG})(3 \mathrm{~V} 3)}=\mathrm{V}_{\mathrm{DD}(\mathrm{IO})}=3.3 \mathrm{~V}$; high-drive; EHD $=0 \times 2$.

Conditions: $\mathrm{V}_{\mathrm{DD}(\mathrm{REG})(3 \mathrm{~V} 3)}=\mathrm{V}_{\mathrm{DD}(\mathrm{IO})}=3.3 \mathrm{~V}$; medium-drive; EHD $=0 \times 1$.

Conditions: $\mathrm{V}_{\mathrm{DD}(\mathrm{REG})(3 \mathrm{~V} 3)}=\mathrm{V}_{\mathrm{DD}(\mathrm{IO})}=3.3 \mathrm{~V}$; ultra high-drive; EHD = 0x3.

Fig 22. High-drive pins; typical HIGH level output voltage $\mathrm{V}_{\mathrm{OH}}$ versus HGH level output current $\mathrm{I}_{\mathrm{OH}}$

Conditions: $\mathrm{V}_{\mathrm{DD}(\mathrm{IO})}=3.3 \mathrm{~V}$. Simulated data over process and temperature.
Fig 23. Pull-up current $I_{p u}$ versus input voltage $V_{I}$

Conditions: $\mathrm{V}_{\mathrm{DD}(\mathrm{IO})}=3.3 \mathrm{~V}$. Simulated data over process and temperature.
Fig 24. Pull-down current $I_{p d}$ versus input voltage $V_{I}$

### 10.4 BOD and band gap static characteristics

Table 13. BOD static characteristics [1]
$T_{\text {amb }}=25^{\circ} \mathrm{C}$; simulated values for nominal processing.

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{V}_{\text {th }}$ | threshold voltage | interrupt level 2 |  |  |  |  |
|  |  | assertion | - | 2.95 | - | V |
|  |  | de-assertion | - | 3.03 | - | V |
|  |  | interrupt level 3 |  |  |  |  |
|  |  | assertion | - | 3.05 | - | V |
|  |  | de-assertion | - | 3.13 | - | V |
|  |  | reset level 2 |  |  |  |  |
|  |  | assertion | - | 2.1 | - | V |
|  |  | de-assertion | - | 2.18 | - | V |
|  |  | reset level 3 |  |  |  |  |
|  |  | assertion | - | 2.2 | - | V |
|  |  | de-assertion | - | 2.28 | - | V |

[1] Interrupt and reset levels are selected by writing to the BODLV1/2 bits in the control register CREGE0, see the LPC18xx user manual.

Table 14. Band gap characteristics
$V_{D D A(3 V 3)}$ over specified ranges; $T_{\text {amb }}=-40^{\circ} \mathrm{C}$ to $+105^{\circ} \mathrm{C}$; unless otherwise specified

| Symbol | Parameter |  | Min | Typ | Max | Unit |
| :--- | :--- | :---: | :--- | :--- | :--- | :--- |
| $\mathrm{V}_{\text {ref(bg) }}$ | band gap reference voltage | $\underline{[1]}$ | 0.707 | 0.745 | 0.783 | mV |

[1] Based on characterization, not tested in production.

## 11. Dynamic characteristics

### 11.1 Flash/EEPROM memory

Table 15. Flash characteristics
$T_{\text {amb }}=-40^{\circ} \mathrm{C}$ to $+105^{\circ} \mathrm{C}$, unless otherwise specified. $V_{D D(R E G)(3 V 3)}=2.4 \mathrm{~V}$ to 3.6 V for read operations; $V_{D D(R E G)(3 V 3)}=2.7 \mathrm{~V}$ to 3.6 V for erase/program operations.

| Symbol | Parameter | Conditions |  | Min | Typ | Max | Unit |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| N $_{\text {endu }}$ | endurance | sector erase/program <br> page erase/program; page <br> in large sector | page erase/program; page <br> in small sector | 10000 | - | - | cycles |
| $\mathrm{t}_{\text {ret }}$ | retention time | powered | 1000 | - | - | cycles |  |
|  | unpowered |  | 10 | - | - | years |  |
| $\mathrm{t}_{\text {er }}$ | erase time | page, sector, or multiple <br> consecutive sectors |  | - | 100 | - | ms |
| $\mathrm{t}_{\text {prog }}$ | programming <br> time |  | $\underline{[2]}$ | - | 1 | - | ms |

[1] Number of erase/program cycles.
[2] Programming times are given for writing 512 bytes from RAM to the flash. Data must be written to the flash in blocks of 512 bytes.

Table 16. EEPROM characteristics
$T_{\text {amb }}=-40^{\circ} \mathrm{C}$ to $+105^{\circ} \mathrm{C} ; V_{D D(R E G)(3 \mathrm{~V} 3)}=2.7 \mathrm{~V}$ to 3.6 V .

| Symbol | Parameter | Conditions |  | Min | Typ | Max | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{f}_{\mathrm{clk}}$ | clock frequency |  |  | 800 | 1500 | 1600 | kHz |
| $\mathrm{N}_{\text {endu }}$ | endurance |  |  | 100000 | - | - | cycles |
| $\mathrm{t}_{\text {ret }}$ | retention time | $\mathrm{T}_{\text {amb }}=-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ |  | 20 | - | - | years |
|  |  | $85^{\circ} \mathrm{C}<\mathrm{T}_{\text {amb }} \leq 105^{\circ} \mathrm{C}$ |  | 10 | - | - | years |
| $\mathrm{ta}_{\text {a }}$ | access time | read |  | - | 120 | - | ns |
|  |  | erase/program; $\mathrm{f}_{\mathrm{clk}}=1500 \mathrm{kHz}$ |  | - | 1.99 | - | ms |
|  |  | erase/program; $\mathrm{f}_{\mathrm{clk}}=1600 \mathrm{kHz}$ |  | - | 1.87 | - | ms |
| $\mathrm{t}_{\text {wait }}$ | wait time | read; RPHASE1 | [1] | 35 | - | - | ns |
|  |  | read; RPHASE2 | [1] | 70 | - | - | ns |
|  |  | write; PHASE1 | [1] | 20 | - | - | ns |
|  |  | write; PHASE2 | [1] | 40 | - | - | ns |
|  |  | write; PHASE3 | [1] | 10 | - | - | ns |

[1] See the LPC18xx user manual how to program the wait states for the different read (RPHASEx) and erase/program phases (PHASEx)

### 11.2 Wake-up times

Table 17. Dynamic characteristic: Wake-up from Deep-sleep, Power-down, and Deep power-down modes
$T_{\text {amb }}=-40^{\circ} \mathrm{C}$ to $+105^{\circ} \mathrm{C}$

| Symbol | Parameter | Conditions |  | Min | Typ $^{[1]}$ | Max | Unit |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\mathrm{t}_{\text {wake }}$ | wake-up time | from Sleep mode | $\underline{[2]} 3 \times \mathrm{T}_{\text {cy(clk) }}$ | $5 \times \mathrm{T}_{\text {cy(clk) }}$ | - | ns |  |
|  | from Deep-sleep and <br> Power-down mode |  | 12 | 51 | - | $\mu \mathrm{s}$ |  |
|  | from Deep power-down mode | - | 200 | - | $\mu \mathrm{s}$ |  |  |
|  | after reset | - | 200 | - | $\mu \mathrm{s}$ |  |  |

[1] Typical ratings are not guaranteed. The values listed are at room temperature ( $25^{\circ} \mathrm{C}$ ), nominal supply voltages.
[2] $T_{\text {cy(clk) }}=1 /$ CCLK with CCLK $=$ CPU clock frequency.

### 11.3 External clock for oscillator in slave mode

Remark: The input voltage on the XTAL1/2 pins must be $\leq 1.2 \mathrm{~V}$ (see Table 11). For connecting the oscillator to the XTAL pins, also see Section 13.2 and Section 13.4.

Table 18. Dynamic characteristic: external clock
$T_{\text {amb }}=-40^{\circ} \mathrm{C}$ to $+105^{\circ} \mathrm{C}$; $V_{D D(I O)}$ over specified ranges.[1]

| Symbol | Parameter | Conditions |  | Min | Max | Unit |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\mathrm{f}_{\text {osc }}$ | oscillator frequency |  |  | 1 | 25 | MHz |
| $\mathrm{T}_{\text {cy(clk) }}$ | clock cycle time |  |  | 40 | 1000 | ns |
| $\mathrm{t}_{\mathrm{CHCX}}$ | clock HIGH time |  |  | $\mathrm{T}_{\text {cy(clk })} \times 0.4$ | $\mathrm{~T}_{\text {cy }(\mathrm{clk})} \times 0.6$ | ns |
| $\mathrm{t}_{\mathrm{CLCX}}$ | clock LOW time |  |  | $\mathrm{T}_{\text {cy(clk })} \times 0.4$ | $\mathrm{~T}_{\text {cy }(\mathrm{clk})} \times 0.6$ | ns |

[1] Parameters are valid over operating temperature range unless otherwise specified.

002aag698
Fig 25. External clock timing (with an amplitude of at least $\mathrm{V}_{\mathrm{i}(\mathrm{RMS})}=\mathbf{2 0 0} \mathbf{~ m V}$ )

### 11.4 Crystal oscillator

Table 19. Dynamic characteristic: oscillator
$T_{\text {amb }}=-40^{\circ} \mathrm{C}$ to $+105^{\circ} \mathrm{C}$; $V_{D D(I))}$ over specified ranges; $2.4 \mathrm{~V} \leq V_{D D(R E G)(3 V 3)} \leq 3.6 \mathrm{~V} \cdot \underline{[1]}$

| Symbol | Parameter | Conditions |  | Min | Typ[2] | Max | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Low-frequency mode (1-20 MHz) ${ }^{[5]}$ |  |  |  |  |  |  |  |
| $\mathrm{t}_{\text {jit }}$ (per) | period jitter time | 5 MHz crystal | [3][4] | - | 13.2 | - | ps |
|  |  | 10 MHz crystal |  | - | 6.6 | - | ps |
|  |  | 15 MHz crystal |  | - | 4.8 | - | ps |
| High-frequency mode ( $20-25 \mathrm{MHz}$ ) $\underline{\text { [6] }}$ |  |  |  |  |  |  |  |
| $\mathrm{t}_{\mathrm{jit} \text { (per) }}$ | period jitter time | 20 MHz crystal | [3][4] | - | 4.3 | - | ps |
|  |  | 25 MHz crystal |  | - | 3.7 | - | ps |

[1] Parameters are valid over operating temperature range unless otherwise specified.
[2] Typical ratings are not guaranteed. The values listed are at room temperature $\left(25^{\circ} \mathrm{C}\right)$, nominal supply voltages.
[3] Indicates RMS period jitter.
[4] PLL-induced jitter is not included.
[5] Select HF $=0$ in the XTAL_OSC_CTRL register.
[6] Select HF = 1 in the XTAL_OSC_CTRL register.

### 11.5 IRC oscillator

Table 20. Dynamic characteristic: IRC oscillator
$2.4 \mathrm{~V} \leq V_{D D(R E G)(3 V 3)} \leq 3.6 \mathrm{~V}$

| Symbol | Parameter | Conditions | Min | Typ ${ }^{[1]}$ | Max | Unit |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\mathrm{f}_{\mathrm{osc}(\mathrm{RC})}$ | internal RC <br> oscillator <br> frequency | $-40^{\circ} \mathrm{C} \leq \mathrm{T}_{\mathrm{amb}}<0^{\circ} \mathrm{C}$ | $12.0-3 \%$ | 12.0 | $12.0+3 \%$ | MHz |
|  | $0^{\circ} \mathrm{C} \leq \mathrm{T}_{\mathrm{amb}} \leq 85^{\circ} \mathrm{C}$ | $12.0-1.5 \%$ | 12.0 | $12.0+1.5 \%$ | MHz |  |
|  | $85^{\circ} \mathrm{C}<\mathrm{T}_{\mathrm{amb}} \leq 105^{\circ} \mathrm{C}$ | $12.0-3 \%$ | 12.0 | $12.0+3 \%$ | MHz |  |

[1] Typical ratings are not guaranteed. The values listed are at room temperature ( $25^{\circ} \mathrm{C}$ ), nominal supply voltages.

### 11.6 RTC oscillator

See Section 13.3 for connecting the RTC oscillator to an external clock source.
Table 21. Dynamic characteristic: RTC oscillator $T_{\text {amb }}=-40^{\circ} \mathrm{C}$ to $+105^{\circ} \mathrm{C} ; 2.4 \mathrm{~V} \leq V_{D D(R E G)(3 V 3)} \leq 3.6 \mathrm{~V}$ or $2.4 \mathrm{~V} \leq V_{B A T} \leq 3.6 \mathrm{~V} \underline{[1]}$

| Symbol | Parameter | Conditions |  | Min | Typ므 | Max | Unit |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\mathrm{f}_{\mathrm{i}}$ | input frequency | - |  | - | 32.768 | - | kHz |
| ICC(osc) $^{\text {oscillator supply }}$current |  |  |  | 280 | 800 | nA |  |

[1] Parameters are valid over operating temperature range unless otherwise specified.
[2] Typical ratings are not guaranteed. The values listed are at room temperature $\left(25^{\circ} \mathrm{C}\right)$, nominal supply voltages.

### 11.7 GPCLKIN

Table 22. Dynamic characteristic: GPCLKIN
$T_{\text {amb }}=25^{\circ} \mathrm{C}$; $2.4 \mathrm{~V} \leq V_{D D(R E G)(3 V 3)} \leq 3.6 \mathrm{~V}$

| Symbol | Parameter | Min | Typ | Max | Unit |
| :--- | :--- | :--- | :--- | :--- | :--- |
| GP_CLKIN | input frequency | - | - | 25 | MHz |

### 11.8 I/O pins

For I/O pins that are configured as input only, there is no limitation on the rise and fall times.

Table 23. Dynamic characteristic: I/O pins[1]
$T_{\text {amb }}=-40^{\circ} \mathrm{C}$ to $+105^{\circ} \mathrm{C} ; 2.7 \mathrm{~V} \leq V_{D D(I O)} \leq 3.6 \mathrm{~V}$.

| Symbol | Parameter | Conditions |  | Min | Typ | Max | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Standard I/O pins - normal drive strength |  |  |  |  |  |  |  |
| $\mathrm{t}_{\mathrm{r}}$ | rise time | pin configured as output; EHS = 1 | [2][3] | 1.0 | - | 2.5 | ns |
| $\mathrm{t}_{\mathrm{f}}$ | fall time | pin configured as output; EHS = 1 | [2][3] | 0.9 | - | 2.5 | ns |
| $\mathrm{t}_{\mathrm{r}}$ | rise time | pin configured as output; EHS $=0$ | [2][3] | 1.9 | - | 4.3 | ns |
| $\mathrm{t}_{\mathrm{f}}$ | fall time | pin configured as output; EHS = 0 | [2][3] | 1.9 | - | 4.0 | ns |
| I/O pins - high drive strength |  |  |  |  |  |  |  |
| $\mathrm{t}_{\mathrm{r}}$ | rise time | pin configured as output; standard drive mode (EHD = 0x0) | [2][5] | 4.3 | - | 7.9 | ns |
| $\mathrm{t}_{\mathrm{f}}$ | fall time | pin configured as output; standard drive mode (EHD = 0x0) | [2][5] | 4.7 | - | 8.7 | ns |
| $\mathrm{t}_{\mathrm{r}}$ | rise time | pin configured as output; medium drive mode (EHD = 0x1) | [2][5] | 3.2 | - | 5.7 | ns |
| $\mathrm{t}_{\mathrm{f}}$ | fall time | pin configured as output; medium drive mode (EHD = 0x1) | [2][5] | 3.2 | - | 5.5 | ns |
| $\mathrm{t}_{\mathrm{r}}$ | rise time | pin configured as output; high drive mode (EHD = 0x2) | [2][5] | 2.9 | - | 4.9 | ns |
| $\mathrm{t}_{\mathrm{f}}$ | fall time | pin configured as output; high drive mode (EHD = 0x2) | [2][5] | 2.5 | - | 3.9 | ns |
| $\mathrm{t}_{\mathrm{r}}$ | rise time | pin configured as output; ultra-high drive mode (EHD = 0x3) | [2][5] | 2.8 | - | 4.7 | ns |
| $\mathrm{t}_{\mathrm{f}}$ | fall time | pin configured as output; ultra-high drive mode (EHD = 0x3) | [2][5] | 2.4 | - | 3.4 | ns |
| I/O pins - high-speed |  |  |  |  |  |  |  |
| $\mathrm{tr}_{\mathrm{r}}$ | rise time | pin configured as output; EHS = 1 | [2][3] | 350 | - | 670 | ps |
| $\mathrm{t}_{\mathrm{f}}$ | fall time | pin configured as output; EHS = 1 | [2][3] | 450 | - | 730 | ps |
| $\mathrm{t}_{\mathrm{r}}$ | rise time | pin configured as output; EHS $=0$ | [2][3] | 1.0 | - | 1.9 | ns |
| $\mathrm{t}_{\mathrm{f}}$ | fall time | pin configured as output; EHS $=0$ | [2][3] | 1.0 | - | 2.0 | ns |

[1] Simulated data.
[2] Simulated using 10 cm of $50 \Omega$ PCB trace with 5 pF receiver input. Rise and fall times measured between $80 \%$ and $20 \%$ of the full output signal level.
[3] The slew rate is configured in the system control block in the SFSP registers using the EHS bit. See the LPC43xx user manual.
[4] $C_{L}=20 \mathrm{pF}$. Rise and fall times measured between $90 \%$ and $10 \%$ of the full input signal level.
[5] The drive modes are configured in the system control block in the SFSP registers using the EHD bit. See the LPC18xx user manual.

## $11.9 \mathrm{I}^{2} \mathrm{C}$-bus

Table 24. Dynamic characteristic: $I^{2} \mathrm{C}$-bus pins
$T_{\text {amb }}=-40^{\circ} \mathrm{C}$ to $+105^{\circ} \mathrm{C} ; 2.4 \mathrm{~V} \leq V_{D D(R E G)(3 V 3)} \leq 3.6 \mathrm{~V}$. ${ }^{[1]}$

|  |  |  | Fast-mode Plus | - | 120 | ns |
| tıow | LOW period of the SCL clock |  | Standard-mode | 4.7 | - | $\mu \mathrm{s}$ |
|  |  |  | Fast-mode | 1.3 | - | $\mu \mathrm{S}$ |
|  |  |  | Fast-mode Plus | 0.5 | - | $\mu \mathrm{S}$ |
| $\mathrm{t}_{\text {HIGH }}$ | HIGH period of the SCL clock |  | Standard-mode | 4.0 | - | $\mu \mathrm{s}$ |
|  |  |  | Fast-mode | 0.6 | - | $\mu \mathrm{s}$ |
|  |  |  | Fast-mode Plus | 0.26 | - | $\mu \mathrm{s}$ |
| $t_{\text {HD } ; \text { DAT }}$ | data hold time | [2][3][7] | Standard-mode | 0 | - | $\mu \mathrm{S}$ |
|  |  |  | Fast-mode | 0 | - | $\mu \mathrm{S}$ |
|  |  |  | Fast-mode Plus | 0 | - | $\mu \mathrm{S}$ |
| $\mathrm{t}_{\text {SU; }}$ DAT | data set-up time | [8][9] | Standard-mode | 250 | - | ns |
|  |  |  | Fast-mode | 100 | - | ns |
|  |  |  | Fast-mode Plus | 50 | - | ns |

[1] Parameters are valid over operating temperature range unless otherwise specified. See the $I^{2} \mathrm{C}$-bus specification UM10204 for details.
[2] tHD;DAT is the data hold time that is measured from the falling edge of SCL; applies to data in transmission and the acknowledge.
[3] A device must internally provide a hold time of at least 300 ns for the SDA signal (with respect to the $\mathrm{V}_{1 \mathrm{H}}(\mathrm{min})$ of the SCL signal) to bridge the undefined region of the falling edge of SCL.
[4] $\mathrm{C}_{\mathrm{b}}=$ total capacitance of one bus line in pF . If mixed with Hs-mode devices, faster fall times are allowed.
[5] The maximum $t_{f}$ for the SDA and SCL bus lines is specified at 300 ns . The maximum fall time for the SDA output stage $t_{f}$ is specified at 250 ns . This allows series protection resistors to be connected in between the SDA and the SCL pins and the SDA/SCL bus lines without exceeding the maximum specified $\mathrm{t}_{\mathrm{f}}$.
[6] In Fast-mode Plus, fall time is specified the same for both output stage and bus timing. If series resistors are used, designers should allow for this when considering bus timing.
[7] The maximum $t_{H D ; D A T}$ could be $3.45 \mu \mathrm{~s}$ and $0.9 \mu \mathrm{~s}$ for Standard-mode and Fast-mode but must be less than the maximum of $\mathrm{t}_{\mathrm{VD} ; \mathrm{DAT}}$ or $t_{V D ; A C K}$ by a transition time. This maximum must only be met if the device does not stretch the LOW period ( $t_{\text {Low }}$ ) of the SCL signal. If the clock stretches the SCL, the data must be valid by the set-up time before it releases the clock.
[8] tSU;DAT is the data set-up time that is measured with respect to the rising edge of SCL; applies to data in transmission and the acknowledge.
[9] A Fast-mode $I^{2} \mathrm{C}$-bus device can be used in a Standard-mode $\mathrm{I}^{2} \mathrm{C}$-bus system but the requirement $\mathrm{t}_{\mathrm{SU} ; \mathrm{DAT}}=250 \mathrm{~ns}$ must then be met. This will automatically be the case if the device does not stretch the LOW period of the SCL signal. If such a device does stretch the LOW period of the SCL signal, it must output the next data bit to the SDA line $t_{r(\max )}+t_{\text {SU;DAT }}=1000+250=1250 \mathrm{~ns}$ (according to the Standard-mode $\mathrm{I}^{2} \mathrm{C}$-bus specification) before the SCL line is released. Also the acknowledge timing must meet this set-up time.

### 11.13 External memory interface

Table 28. Dynamic characteristics: Static asynchronous external memory interface
$C_{L}=22 \mathrm{pF}$ for EMC_Dn $C_{L}=20 \mathrm{pF}$ for all others; $T_{\text {amb }}=-40^{\circ} \mathrm{C}$ to $+105^{\circ} \mathrm{C} ; 2.4 \mathrm{~V} \leq V_{D D(R E G)(3 \mathrm{~V} 3)} \leq 3.6 \mathrm{~V}$; $2.7 \mathrm{~V} \leq V_{D D(I O)} \leq 3.6 \mathrm{~V}$; values guaranteed by design; the values in the table have been calculated with WAITTURN $=0 \times 0$ in STATICWAITTURN register.Timing parameters are given for single memory access cycles. In a normal read operation, the EMC changes the address while CS is asserted which results in multiple memory accesses.

Table 28. Dynamic characteristics: Static asynchronous external memory interface ...continued
$C_{L}=22 \mathrm{pF}$ for EMC_Dn $C_{L}=20 \mathrm{pF}$ for all others; $T_{\text {amb }}=-40^{\circ} \mathrm{C}$ to $+105^{\circ} \mathrm{C} ; 2.4 \mathrm{~V} \leq V_{D D(R E G)(3 \mathrm{~V} 3)} \leq 3.6 \mathrm{~V}$;
2.7 V $\leq V_{D D(I O)} \leq 3.6 \mathrm{~V}$; values guaranteed by design; the values in the table have been calculated with WAITTURN $=0 \times 0$ in STATICWAITTURN register.Timing parameters are given for single memory access cycles. In a normal read operation, the EMC changes the address while CS is asserted which results in multiple memory accesses.

Table 30. Dynamic characteristics: Dynamic external memory interface; EMC_CLK[3:0] delay values
$T_{\text {amb }}=-40^{\circ} \mathrm{C}$ to $105^{\circ} \mathrm{C}$; $V_{D D(I))}=3.3 \mathrm{~V} \pm 10 \% ; 2.4 \mathrm{~V} \leq V_{D D(R E G)(3 V 3)} \leq 3.6 \mathrm{~V}$.

| Symbol | Parameter | Conditions |  | Min | Typ | Max | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $t_{d}$ | delay time | delay value CLKn DELAY $=0$ | [1] | 0.0 | 0.0 | 0.0 | ns |
|  |  | CLKn_DELAY = 1 | [1] | 0.4 | 0.5 | 0.8 | ns |
|  |  | CLKn_DELAY $=2$ | [1] | 0.7 | 1.0 | 1.7 | ns |
|  |  | CLKn_DELAY $=3$ | [1] | 1.1 | 1.6 | 2.5 | ns |
|  |  | CLKn_DELAY = 4 | [1] | 1.4 | 2.0 | 3.3 | ns |
|  |  | CLKn_DELAY = 5 | [1] | 1.7 | 2.6 | 4.1 | ns |
|  |  | CLKn_DELAY = 6 | [1] | 2.1 | 3.1 | 4.9 | ns |
|  |  | CLKn_DELAY = 7 | [1] | 2.5 | 3.6 | 5.8 | ns |

[1] Program the EMC_CLKn delay values in the EMCDELAYCLK register (see the LPC18xx User manual). The delay values must be the same for all SDRAM clocks EMC_CLKn: CLK0_DELAY = CLK1_DELAY = CLK2_DELAY = CLK3_DELAY.

For the programmable EMC_CLK[3:0] clock delays CLKn_DELAY, see Table 30.
Remark: For SDRAM operation, set CLK0_DELAY = CLK1_DELAY = CLK2_DELAY = CLK3_DELAY in the EMCDELAYCLK register.

Fig 34. SDRAM timing

### 11.14 USB interface

Table 31. Dynamic characteristics: USB0 and USB1 pins (full-speed)
$C_{L}=50 \mathrm{pF} ; R_{p u}=1.5 \mathrm{k} \Omega$ on $D+$ to $V_{D D(I O)}$, unless otherwise specified; $3.0 \mathrm{~V} \leq V_{D D(I O)} \leq 3.6 \mathrm{~V}$.

| Symbol | Parameter | Conditions |  | Min | Typ | Max | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{t}_{\mathrm{r}}$ | rise time | 10 \% to 90 \% |  | 4.0 | - | 20.0 | ns |
| $\mathrm{t}_{\mathrm{f}}$ | fall time | 10 \% to 90 \% |  | 4.0 | - | 20.0 | ns |
| tFRFM | differential rise and fall time matching | $\mathrm{tr}_{\mathrm{r}} / \mathrm{t}_{\mathrm{f}}$ |  | 90 | - | 111.11 | \% |
| $\mathrm{V}_{\text {CRS }}$ | output signal crossover voltage |  |  | 1.3 | - | 2.0 | V |
| $\mathrm{t}_{\text {FEOPT }}$ | source SE0 interval of EOP | see Figure 35 |  | 160 | - | 175 | ns |

## 12. ADC/DAC electrical characteristics

Table 37. ADC characteristics
$V_{D D A(3 V 3)}$ over specified ranges; $T_{a m b}=-40^{\circ} \mathrm{C}$ to $+105^{\circ} \mathrm{C}$; unless otherwise specified.

| Symbol | Parameter | Conditions |  | Min | Typ | Max | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $V_{\text {IA }}$ | analog input voltage |  |  | 0 | - | $\mathrm{V}_{\text {DDA }}$ (3V3) | V |
| $\mathrm{C}_{\text {ia }}$ | analog input capacitance |  |  | - | - | 2 | pF |
| $\mathrm{E}_{\mathrm{D}}$ | differential linearity error | $2.7 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DDA}(3 \mathrm{~V} 3)} \leq 3.6 \mathrm{~V}$ | [1][2] | - | $\pm 0.8$ | - | LSB |
|  |  | $2.4 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DDA}(3 \mathrm{~V} 3)}<2.7 \mathrm{~V}$ |  | - | $\pm 1.0$ | - | LSB |
| $\mathrm{E}_{\mathrm{L} \text { (adj) }}$ | integral non-linearity | $2.7 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DDA}(3 \mathrm{~V} 3)} \leq 3.6 \mathrm{~V}$ | [3] | - | $\pm 0.8$ | - | LSB |
|  |  | $2.4 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DDA}(3 \mathrm{~V} 3)}<2.7 \mathrm{~V}$ |  | - | $\pm 1.5$ | - | LSB |
| $\mathrm{E}_{\mathrm{O}}$ | offset error | $2.7 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DDA}(3 \mathrm{~V} 3)} \leq 3.6 \mathrm{~V}$ | [4] | - | $\pm 0.15$ | - | LSB |
|  |  | $2.4 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DDA}(3 \mathrm{~V} 3)}<2.7 \mathrm{~V}$ |  | - | $\pm 0.15$ | - | LSB |
| $\mathrm{E}_{\mathrm{G}}$ | gain error | $2.7 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DDA}(3 \mathrm{~V} 3)} \leq 3.6 \mathrm{~V}$ | [5] | - | $\pm 0.3$ | - | \% |
|  |  | $2.4 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DDA}(3 \mathrm{~V} 3)}<2.7 \mathrm{~V}$ |  | - | $\pm 0.35$ | - | \% |
| $\mathrm{E}_{\mathrm{T}}$ | absolute error | $2.7 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DDA}(3 \mathrm{~V} 3)} \leq 3.6 \mathrm{~V}$ | [6] | - | $\pm 3$ | - | LSB |
|  |  | $2.4 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DDA}(3 \mathrm{~V} 3)}<2.7 \mathrm{~V}$ |  | - | $\pm 4$ | - | LSB |
| $\mathrm{R}_{\mathrm{vsi}}$ | voltage source interface resistance | see Figure 40 |  | - | - | $\begin{aligned} & 1 /\left(7 \times f_{\mathrm{clk}(\mathrm{ADC})} \times\right. \\ & \left.\mathrm{C}_{\mathrm{ia}}\right) \end{aligned}$ | $\mathrm{k} \Omega$ |
| $\mathrm{R}_{\mathrm{i}}$ | input resistance |  | [7][8] | - | - | 1.2 | $\mathrm{M} \Omega$ |
| $\mathrm{f}_{\mathrm{clk} \text { (ADC) }}$ | ADC clock frequency |  |  | - | - | 4.5 | MHz |
| $\mathrm{f}_{\text {s }}$ | sampling frequency | 10-bit resolution; 11 clock cycles |  | - | - | 400 | kSamples/s |
|  |  | 2-bit resolution; 3 clock cycles |  |  |  | 1.5 | MSamples/s |

[1] The ADC is monotonic, there are no missing codes.
[2] The differential linearity error $\left(E_{D}\right)$ is the difference between the actual step width and the ideal step width. See Figure 39.
[3] The integral non-linearity ( $\mathrm{E}_{\mathrm{L}(\mathrm{adj})}$ ) is the peak difference between the center of the steps of the actual and the ideal transfer curve after appropriate adjustment of gain and offset errors. See Figure 39.
[4] The offset error $\left(\mathrm{E}_{\mathrm{O}}\right)$ is the absolute difference between the straight line which fits the actual curve and the straight line which fits the ideal curve. See Figure 39.
[5] The gain error $\left(\mathrm{E}_{\mathrm{G}}\right)$ is the relative difference in percent between the straight line fitting the actual transfer curve after removing offset error, and the straight line which fits the ideal transfer curve. See Figure 39.
[6] The absolute error $\left(\mathrm{E}_{T}\right)$ is the maximum difference between the center of the steps of the actual transfer curve of the non-calibrated ADC and the ideal transfer curve. See Figure 39.
[7] $\mathrm{T}_{\text {amb }}=25^{\circ} \mathrm{C}$.
[8] Input resistance $R_{i}$ depends on the sampling frequency fs: $R_{i}=2 k \Omega+1 /\left(f_{s} \times C_{i a}\right)$.

(1) Example of an actual transfer curve.
(2) The ideal transfer curve.
(3) Differential linearity error $\left(E_{D}\right)$.
(4) Integral non-linearity ( $E_{\text {L(adj) }}$ ).
(5) Center of a step of the actual transfer curve.

Fig 39. 10-bit ADC characteristics

$\mathrm{R}_{\mathrm{s}}<1 /\left(\left(7 \times \mathrm{f}_{\mathrm{clk}(\mathrm{ADC})} \times \mathrm{C}_{\mathrm{ia}}\right)-2 \mathrm{k} \Omega\right.$

### 13.2 Crystal oscillator

The crystal oscillator is controlled by the XTAL_OSC_CTRL register in the CGU (see LPC18xx user manual).

The crystal oscillator operates at frequencies of 1 MHz to 25 MHz . This frequency can be boosted to a higher frequency, up to the maximum CPU operating frequency, by the PLL. The oscillator can operate in one of two modes: slave mode and oscillation mode.

- In slave mode, couple the input clock signal with a capacitor of $100 \mathrm{pF}\left(\mathrm{C}_{\mathrm{C}}\right.$ in Figure 41), with an amplitude of at least 200 mV (RMS). The XTAL2 pin in this configuration can be left unconnected.
- External components and models used in oscillation mode are shown in Figure 42, and in Table 42 and Table 43. Since the feedback resistance is integrated on chip, only a crystal and the capacitances Cx1 and Cx2 need to be connected externally in case of fundamental mode oscillation (L, CL and Rs represent the fundamental frequency). Capacitance $C_{P}$ in Figure 42 represents the parallel package capacitance and must not be larger than 7 pF . Parameters Fc, CL, Rs and Cp are supplied by the crystal manufacturer.

Table 42. Recommended values for $\mathrm{C}_{\mathrm{X} 1 / \mathrm{X} 2}$ in oscillation mode (crystal and external components parameters) low frequency mode

| Fundamental oscillation <br> frequency | Maximum crystal series <br> resistance $\mathbf{R}_{\mathbf{S}}$ | External load capacitors <br> $\mathbf{C}_{\mathbf{X} 1}, \mathbf{C}_{\mathbf{X} \mathbf{2}}$ |
| :--- | :--- | :--- |
| 2 MHz | $<200 \Omega$ | $33 \mathrm{pF}, 33 \mathrm{pF}$ |

002aag031
Fig 42. Oscillator modes with external crystal model used for $\mathrm{C}_{\mathrm{X} 1} / \mathrm{C}_{\mathrm{X} 2}$ evaluation

### 13.3 RTC oscillator

In the RTC oscillator circuit, only the crystal (XTAL) and the capacitances C $_{\text {RTCX1 }}$ and $\mathrm{C}_{\text {RTCX2 }}$ need to be connected externally. Typical capacitance values for $\mathrm{C}_{\text {RTCX1 }}$ and $\mathrm{C}_{\text {RTCX2 }}$ are $\mathrm{C}_{\mathrm{RTCX1/2}}=20$ (typical) $\pm 4 \mathrm{pF}$.

An external clock can be connected to RTCX1 if RTCX2 is left open. The recommended amplitude of the clock signal is $\mathrm{V}_{\mathrm{i}(\mathrm{RMS})}=100 \mathrm{mV}$ to 200 mV with a coupling capacitance of 5 pF to 10 pF .

002aah066
Fig 43. RTC 32 kHz oscillator circuit

### 13.4 XTAL and RTCX Printed Circuit Board (PCB) layout guidelines

Connect the crystal on the PCB as close as possible to the oscillator input and output pins of the chip. Take care that the load capacitors $\mathrm{C}_{\mathrm{X} 1}, \mathrm{C}_{\mathrm{X} 2}$, and $\mathrm{C}_{\mathrm{X} 3}$ in case of third overtone crystal usage have a common ground plane. Also connect the external components to the ground plain. To keep the noise coupled in via the PCB as small as possible, make loops and parasitics as small as possible. Choose smaller values of $\mathrm{C}_{\mathrm{X} 1}$ and $\mathrm{C}_{\mathrm{X} 2}$ if parasitics increase in the PCB layout.

Ensure no high-speed or high-drive signals are near the RTCX1/2 signals.

### 13.5 Standard I/O pin configuration

Figure 44 shows the possible pin modes for standard I/O pins with analog input function:

- Digital output driver enabled/disabled
- Digital input: Pull-up enabled/disabled
- Digital input: Pull-down enabled/disabled
- Digital input: Repeater mode enabled/disabled
- Digital input: Input buffer enabled/disabled
- Analog input

The default configuration for standard I/O pins is input buffer disabled and pull-up enabled. The weak MOS devices provide a drive capability equivalent to pull-up and pull-down resistors.

### 13.6 Reset pin configuration

Fig 45. Reset pin configuration

### 13.7 Suggested USB interface solutions

The USB device can be connected to the USB as self-powered device (see Figure 46) or bus-powered device (see Figure 47).

On the LPC $185 \mathrm{x} / 3 \mathrm{x} / 2 \mathrm{x} / 1 \mathrm{x}$, USBn_VBUS pins are 5 V tolerant only when VDDIO is applied and at operating voltage level. Therefore, if the USBn_VBUS function is connected to the USB connector and the device is self-powered, the USBn_VBUS pins must be protected for situations when VDDIO $=0 \mathrm{~V}$.

If VDDIO is always at operating level while VBUS $=5 \mathrm{~V}$, the USBn_VBUS pin can be connected directly to the VBUS pin on the USB connector.

For systems where VDDIO can be 0 V and VBUS is directly applied to the USBn_VBUS pins, precautions must be taken to reduce the voltage to below 3.6 V , which is the maximum allowable voltage on the USBn_VBUS pins in this case.

One method is to use a voltage divider to connect the USBn_VBUS pins to VBUS on the USB connector. The voltage divider ratio should be such that the USB_VBUS pin will be greater than 0.7VDDIO to indicate a logic HIGH while below the 3.6 V allowable maximum voltage.

For the following operating conditions
$\mathrm{VBUS}_{\text {max }}=5.25 \mathrm{~V}$
VDDIO $=3.6 \mathrm{~V}$,
the voltage divider should provide a reduction of $3.6 \mathrm{~V} / 5.25 \mathrm{~V}$ or $\sim 0.686 \mathrm{~V}$.
For bus-powered devices, a regulator powered by USB can provide 3.3 V to VDDIO whenever bus power is present and ensure that power to the USBn_VBUS pins is always present when the 5 V VBUS signal is applied. See Figure 47.

Remark: Applying 5 V to the USBn_VBUS pins for a short time while the regulator ramps up might compromise the long-term reliability of the part but does not affect its function.

Fig 46. USB interface on a self-powered device where USBn_VBUS $=5 \mathrm{~V}$

Fig 47. USB interface on a bus-powered device
Remark: If the VBUS function of the USB1 interface is not connected, configure the pin function for GPIO using the function control bits in the SYSCON block.

Remark: In OTG mode, it is important to be able to detect the VBUS level and to charge and discharge VBUS. This requires adding active devices that disconnect the link when VDDIO is not present.

## 18. Revision history

Table 45. Revision history

| Document ID | Release date | Data sheet status | Change notice | Supersedes |
| :---: | :---: | :---: | :---: | :---: |
| LPC185X_3X_2X_1X v.5.3 | 20200109 | Product data sheet |  | LPC185X_3X_2X_1X v.5.2 |
| Modifications: | - Updated for rise and fall times for I/O pins configured as input only. |  |  |  |
| LPC185X_3X_2X_1X v.5.2 | 20160303 | Product data sheet |  | PC185X_3X_2X_1X v.5.1 |
| Modifications: | - Updated Table 29 "Dynamic characteristics: Dynamic external memory interface": Read cycle parameters $\mathrm{t}_{\mathrm{h}(\mathrm{D})}$ min value is 2.2 ns and max value is "-". |  |  |  |
| LPC185X_3X_2X_1X V | 20151117 | Product data sheet | 2015110041 | LPC185X_3X_2X_1X v. 5 |
| Modifications: | - Updated Table 2 "Ordering options"; TFBGA100 packages do not support ULPI interface. <br> - Updated SSP slave and SSP master values in Table 27 "Dynamic characteristics: SSP pins in SPI mode". Updated footnote 2 to: $\mathrm{T}_{\mathrm{cy}(\mathrm{clk})} \geq 12 \times \mathrm{T}_{\mathrm{cy}(\text { PCLK })}$. <br> - removed $\mathrm{t}_{\mathrm{v}(\mathrm{Q})}$, data output valid time in SPI mode, minimum value of $3^{\prime}$ (1/PCLK) from SSP slave mode. <br> - added units to $t_{d}$, delay time, for SSP slave and master mode. <br> - Added GPCLKIN section and table. See Section 11.7 "GPCLKIN" and Table 22 "Dynamic characteristic: GPCLKIN". |  |  |  |
| LPC185X_3X_2X_1X v.5 | 20150429 | Product data sheet | - | LPC185X_3X_2X_1X v.4.1 |

Table 45. Revision history ...continued

| Document ID | Release date | Data sheet statu | Change notice | rse |
| :---: | :---: | :---: | :---: | :---: |
| Modifications: | - Minimum operating voltage changed from 2.2 V to 2.4 V for $\mathrm{V}_{\mathrm{DD}(\mathrm{REG})(3 \mathrm{~V} 3)}, \mathrm{V}_{\mathrm{DD}(\mathrm{IO})}$, $V_{\mathrm{DDA}(3 \mathrm{~V} 3)}, \mathrm{V}_{\mathrm{BAT}}$ in Table 11. <br> - Updated Dynamic characteristics: SSP pins in SPI mode. See Table 27. <br> - Updated Dynamic characteristics: SD/MMC. See Table 34. <br> - SPIFI timing data restated for CL $=20 \mathrm{pF}$ in Table 36 "Dynamic characteristics: SPIFI". <br> - SPIFI timing diagram corrected and specified for mode 0 . See Table 36 and Figure 38. <br> - Table 23 "Dynamic characteristic: I/O pins[1]" added. <br> - Parameter CI corrected for high-drive pins (changed from 2 pF to 5.2 pF ). See Table 11. <br> - Internal pull-up resistor configuration added for RESET, WAKEUPn, and ALARM pins. See Table 3. <br> - Description of DEBUG pin updated. <br> - Input range for PLL1 corrected: 1 MHz to 25 MHz . See Section 7.20.7 "System PLL1". <br> - Signal polarity corrected for pins EMC_CKEOUT and EMC_DQMOUT. Both signals are active HIGH. <br> - Updated USART timing figure. See Figure 29 "USART timing". <br> - Updated USART Dynamic characteristics table. See Table 26. <br> - USB0_VBUS changed to input only. See Table 3 "Pin description" <br> - SPIFI output timing parameters in Table 36 corrected to apply to Mode 0: <br> - $\mathrm{t}_{\mathrm{v}(\mathrm{Q})}$ changed to 3.2 ns . <br> - $t_{h(Q)}$ changed to 0.6 ns , <br> - Parameter $\mathrm{t}_{\mathrm{CsLW}}$ EL with condition $\mathrm{PB}=1$ corrected: (WAITWEN +1$) \times \mathrm{T}_{\mathrm{cy}(\mathrm{clc})}$ added. See Table 28 "Dynamic characteristics: Static asynchronous external memory interface". <br> - Parameter $\mathrm{t}_{\text {CSLBLSL }}$ with condition $\mathrm{PB}=0$ corrected: (WAITWEN +1$) \times \mathrm{T}_{\mathrm{cy}(\mathrm{clk})}$ added. See Table 28 "Dynamic characteristics: Static asynchronous external memory interface". <br> - Removed restriction on C_CAN bus usage. See CAN. 1 errata in Ref. 2. <br> - Updated Figure 30, SSP master timing in SPI mode and Figure 31, SSP slave timing in SPI mode. <br> - Changed the flash erase time ( $\mathrm{t}_{\mathrm{er}}$ ) to 100 ms . See Table 15. <br> - Updated Dynamic characteristics: USB0 and USB1 pins (full-speed). See Table 31. <br> - Updated Dynamic characteristics: SD/MMC table. See Table 34. <br> - Updated Table 2: Motor control PWM instead of PWM. <br> - Added a remark to Table 31. <br> - Updated Table 13 "BOD static characteristics[1]". Removed BOD interrupt levels 0 and 1; removed Reset levels 0 and 1. They are not applicable. |  |  |  |
| LPC185X_3X_2X_1X v.4.1 | <tbd> | Product data sheet |  | LPC185X_3X_2X_1X v. |

Table 45. Revision history ...continued

| Document ID | Release date | Data sheet status | Change notice | persedes |
| :---: | :---: | :---: | :---: | :---: |
| Modifications: | - Parameter $\mathrm{t}_{\text {ret }}$ (retention time) for EEPROM updated in Table 15. <br> - Parameter V ${ }_{\text {DDA(3V3) }}$ added for pins USB0_VDDA3V3_DRIVER and USB0_VDDA3V3 in Table 11. <br> - Parameter name $I_{D D(A D C)}$ changed to $I_{D D A}$ in Table 11. <br> - Minimum wake-up time from sleep mode added in Table 16. <br> - Data for $\mathrm{I}_{\mathrm{DD}(\mathrm{IO})}$ added in Table 11. <br> - Data sheet status changed to Product data sheet. <br> - IRC specifications corrected in Table 19 "Dynamic characteristic: IRC oscillator" and Section 2: Accuracy changed to +/- 3 \% over the entire temperature range. <br> - Bandgap characteristics removed. <br> - Section 13.7 "Suggested USB interface solutions" added. <br> - $I_{D D(R E G)(3 V 3)}$ updated in Table 11 "Static characteristics" for the following conditions: <br> - Active mode: $\operatorname{CCLK}=12 \mathrm{MHz} ; \mathrm{I}_{\mathrm{DD}(\mathrm{REG})(3 \mathrm{~V} 3)}$ changed from 9.3 mA to 10 mA . <br> - Active mode: CCLK = 60 MHz ; $\mathrm{I}_{\mathrm{DD}(\mathrm{REG})(3 \mathrm{~V} 3)}$ changed from 26 mA to 28 mA . <br> - Active mode: $\operatorname{CCLK}=120 \mathrm{MHz} ; \mathrm{I}_{\mathrm{DD}(\mathrm{REG})(3 \mathrm{~V} 3)}$ changed from 46 mA to 51 mA . <br> - Active mode: $\operatorname{CCLK}=180 \mathrm{MHz} ; \mathrm{I}_{\mathrm{DD}(\mathrm{REG})(3 \mathrm{~V} 3)}$ changed from 66 mA to 74 mA . <br> - Sleep mode: CCLK = 12 MHz ; $\mathrm{I}_{\mathrm{DD}(\mathrm{REG})(3 \mathrm{~V} 3)}$ changed from 6.2 mA to 8.8 mA . <br> - Figure 10 to Figure 13 updated. <br> - General-purpose OTP size corrected. |  |  |  |
| LPC185X_3X_2X_1X v. 4 | 20121031 | eliminary data sheet |  | C1857_ |
| Modifications: | - Removed TFBGA180 package. <br> - Parts LPC183x, LPC182x, and LPC181x added. <br> - LQFP144 and TFBGA100 packages added. <br> - $\mathrm{T}=105^{\circ} \mathrm{C}$ data added in Figure 19 to Figure 22. <br> - Changed symbol names and parameter names in Table 21. <br> - Parameter $\mathrm{I}_{\mathrm{LH}}$ updated for condition $\mathrm{V}_{\mathrm{I}}=5 \mathrm{~V}$ and $\mathrm{T}_{\mathrm{amb}}=25^{\circ} \mathrm{C} / 105^{\circ} \mathrm{C}$ in Table 11. <br> - Power consumption data added in Section 10.1. |  |  |  |
| Modifications: | - SPIFI dynamic characteristics added in Section 11.16. <br> - IRC accuracy corrected to $\pm 2 \%$ for $\mathrm{T}_{\text {amb }}=-40^{\circ} \mathrm{C}$ to $0^{\circ} \mathrm{C}$ and $\mathrm{T}_{\mathrm{amb}}=85^{\circ} \mathrm{C}$ to $105^{\circ} \mathrm{C}$. <br> - Pull-up and Pull-down current data (Figure 23 and Figure 24) updated with data for $\mathrm{T}_{\mathrm{amb}}=105^{\circ} \mathrm{C}$. <br> - SCT dither engine added and SCT bi-directional event enable features added. See Section 7.15.1. <br> - SPIFI maximum data rate changed to 52 MB per second. <br> - Recommendation for $\mathrm{V}_{\mathrm{BAT}}$ use added: The recommended operating condition for the battery supply is $\mathrm{V}_{\mathrm{DD}(\mathrm{REG})(3 \mathrm{~V} 3)}>\mathrm{V}_{\mathrm{BAT}}+0.2 \mathrm{~V}$. See Table 11, Table note 2. <br> - Table 14 "Band gap characteristics" added. <br> - Minimum value for parameter VIL changed to 0 V in Table 11 "Static characteristics". <br> - Description of ADC pins on digital/analog input pins changed. Each input to the ADC is connected to ADC0 and ADC1. See Table 3. <br> - OTP memory size changed to 64 bit. <br> - Use of C_CAN peripheral restricted in Section 2. <br> - ADC channels limited to a total of 8 channels shared between ADC0 and ADC1. |  |  |  |
| LPC1857_53 v.3.2 | 20120920 | Preliminary data sheet |  | LPC1857_53 v.3.1 |
|  | Position of inde | sector in Figure 4 "P | guration LQFP | package" corrected. |

Table 45. Revision history ...continued

## 19. Legal information

### 19.1 Data sheet status

| Document status $\underline{[1][2]}$ | Product status $\underline{[3]}$ | Definition |
| :--- | :--- | :--- |
| Objective [short] data sheet | Development | This document contains data from the objective specification for product development. |
| Preliminary [short] data sheet | Qualification | This document contains data from the preliminary specification. |
| Product [short] data sheet | Production | This document contains the product specification. |

[1] Please consult the most recently issued document before initiating or completing a design.
[2] The term 'short data sheet' is explained in section "Definitions".
[3] The product status of device(s) described in this document may have changed since this document was published and may differ in case of multiple devices. The latest product status information is available on the Internet at URL http://www.nxp.com.

### 19.2 Definitions

Draft - The document is a draft version only. The content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included herein and shall have no liability for the consequences of use of such information.

Short data sheet - A short data sheet is an extract from a full data sheet with the same product type number(s) and title. A short data sheet is intended for quick reference only and should not be relied upon to contain detailed and full information. For detailed and full information see the relevant full data sheet, which is available on request via the local NXP Semiconductors sales office. In case of any inconsistency or conflict with the short data sheet, the full data sheet shall prevail.
Product specification - The information and data provided in a Product data sheet shall define the specification of the product as agreed between NXP Semiconductors and its customer, unless NXP Semiconductors and customer have explicitly agreed otherwise in writing. In no event however, shall an agreement be valid in which the NXP Semiconductors product is deemed to offer functions and qualities beyond those described in the Product data sheet.

### 19.3 Disclaimers

Limited warranty and liability - Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. NXP Semiconductors takes no responsibility for the content in this document if provided by an information source outside of NXP Semiconductors.
In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive, special or consequential damages (including - without limitation - lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory.

Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors' aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the Terms and conditions of commercial sale of NXP Semiconductors.

Right to make changes - NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

Suitability for use - NXP Semiconductors products are not designed authorized or warranted to be suitable for use in life support, life-critical or safety-critical systems or equipment, nor in applications where failure or malfunction of an NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental damage. NXP Semiconductors and its suppliers accept no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.
Applications - Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the NXP Semiconductors product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products.
NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using NXP Semiconductors products in order to avoid a default of the applications and the products or of the application or use by customer's third party customer(s). NXP does not accept any liability in this respect.
Limiting values - Stress above one or more limiting values (as defined in the Absolute Maximum Ratings System of IEC 60134) will cause permanent damage to the device. Limiting values are stress ratings only and (proper) operation of the device at these or any other conditions above those given in the Recommended operating conditions section (if present) or the Characteristics sections of this document is not warranted. Constant or repeated exposure to limiting values will permanently and irreversibly affect the quality and reliability of the device.

Terms and conditions of commercial sale - NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at http://www.nxp.com/profile/terms, unless otherwise agreed in a valid written individual agreement. In case an individual agreement is concluded only the terms and conditions of the respective agreement shall apply. NXP Semiconductors hereby expressly objects to applying the customer's general terms and conditions with regard to the purchase of NXP Semiconductors products by customer.

No offer to sell or license - Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.

Export control - This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from competent authorities.
Non-automotive qualified products - Unless this data sheet expressly states that this specific NXP Semiconductors product is automotive qualified, the product is not suitable for automotive use. It is neither qualified nor tested in accordance with automotive testing or application requirements. NXP Semiconductors accepts no liability for inclusion and/or use of non-automotive qualified products in automotive equipment or applications.
In the event that customer uses the product for design-in and use in automotive applications to automotive specifications and standards, customer (a) shall use the product without NXP Semiconductors' warranty of the product for such automotive applications, use and specifications, and (b)
whenever customer uses the product for automotive applications beyond NXP Semiconductors' specifications such use shall be solely at customer's own risk, and (c) customer fully indemnifies NXP Semiconductors for any liability, damages or failed product claims resulting from customer design and use of the product for automotive applications beyond NXP Semiconductors' standard warranty and NXP Semiconductors' product specifications.
