

FEATURES

- **On-Chip ESD Protection:**
 - ±15kV Human Body Model
 - ±15kV IEC-1000-4-2 Air Gap Test**
 - ±8kV IEC-1000-4-2 Contact Test
- 125kBd Operation with 3kΩ/2500pF Load
- 250kBd Operation with 3kΩ/1000pF Load
- Outputs Can Be Driven ±30V Without Damage
- No Supply Current in Shutdown
- Operates from ±5V to ±15V Supplies
- Fully Protected Against Overload
- Three-State Outputs; Outputs Open When Off
- Bipolar Circuit—No Latchup
- ±30V Input Range
- Triple Driver/Receiver
- 30kΩ Input Impedance
- Meets All RS232 Specifications
- 16-Pin Version—Pin Compatible with MC145406
- Available in SO Package

APPLICATIONS

- RS232 Interface
- Terminals
- Modems

DESCRIPTION

The **LTC®1039A** is a triple RS232 driver/receiver that includes shutdown. Each receiver will accept up to ±30V input and can drive either TTL or CMOS logic. The RS232 drivers accept TTL logic inputs and output RS232 voltage levels. The outputs are fully protected against overload and can be shorted to ground or up to ±30V without damage to the drivers. Additionally, when the system is shut down or power is off, the outputs are in a high impedance state allowing data line sharing. On-chip ESD protection eliminates the need for external protection devices.

A bias pin allows one receiver to be kept on while the rest of the part is shut down.

The LT1039A is also available in the 16-pin version, without shutdown or bias pin functions.

For applications requiring operation from a single 5V supply, see the LT1180A/LT1181A and LT1130A data sheets.

Note 1: Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.

Note 2: $V_{\text{ON/OFF}} = 5\text{V}$ for LT1039AM grade devices.

Note 3: $V_{\text{ON/OFF}} = 0.4\text{V}$ for $-55^\circ\text{C} \leq T_A \leq 100^\circ\text{C}$ and $V_{\text{ON/OFF}} = 0.2\text{V}$ for $100^\circ\text{C} \leq T_A \leq 125^\circ\text{C}$. Does not apply to LT1039A-16 part.

Note 4: For $T_A \geq 100^\circ\text{C}$ leakage current is $350\mu\text{A}$ max.

Note 5: Bias pin open on 18-pin version.

TYPICAL PERFORMANCE CHARACTERISTICS

PIN FUNCTIONS (Pin numbers listed are for 18-pin device)

V^+ , V^- (Pins 1, 9): Driver Supply Pins. Supply current drops to zero in shutdown mode. Driver outputs are in a high impedance state when V^+ and $V^- = 0V$.

BIAS (Pin 2): Keeps receiver 1 on while the LT1039A is in the shutdown mode. Leave BIAS pin open when not in use. See Applications Information for proper use.

REC IN (Pins 3, 5, 7): Receiver Input Pins. Accepts RS232 voltage levels ($\pm 30V$) and has 0.4V of hysteresis to provide noise immunity. Input impedance is nominally 30k Ω . Receiver input pins are internally protected from ESD transients. In order to insure proper functioning of the ESD protection devices, the V_{CC} and V^- supply pins must be bypassed with low ESR capacitors located close to the pins. A 0.1 μ F ceramic capacitor works well.

TR OUT (Pins 4, 6, 8): Driver Outputs with RS232 Voltage Levels. Outputs are in a high impedance state when in the shutdown mode or when power is off (V^+ and $V^- = 0V$) to allow data line sharing. Outputs are fully short-circuit protected from $V^- + 30V$ to $V^+ - 30V$ with power on, off or in the shutdown mode. Typical output breakdowns are greater than $\pm 45V$ and higher applied voltages will not damage the device if moderately current limited. Driver-

output pins are internally protected from ESD transients. In order to insure proper functioning of the ESD protection devices, the V^+ and V^- supply pins must be bypassed with low ESR capacitors located close to the pins. 0.1 μ F ceramic capacitors work well.

GND (Pin 10): Ground Pin.

TR IN (Pins 11, 13, 15): RS232 Driver Input Pins. Inputs are TTL/CMOS compatible. Inputs should not be allowed to float. Tie unused inputs to V_{CC} .

REC OUT (Pins 12, 14, 16): Receiver Outputs with TTL/CMOS Voltage Levels. Outputs are in a high impedance state when in the shutdown mode to allow data line sharing. Outputs are fully short-circuit protected to ground or V_{CC} with power on, off or in the shutdown mode.

ON/OFF (Pin 17): Controls the operation mode of the LT1039A and is TTL/CMOS compatible. A logic low puts the device in the shutdown mode which reduces input supply current to zero and places both driver and receiver outputs in a high impedance state.

V_{CC} (Pin 18): 5V Power for Receivers.

APPLICATIONS INFORMATION

The driver output stage of the LT1039A offers significantly improved protection over older bipolar and CMOS designs. In addition to current limiting, the driver output can be externally forced to $\pm 30V$ with no damage or excessive current flow.

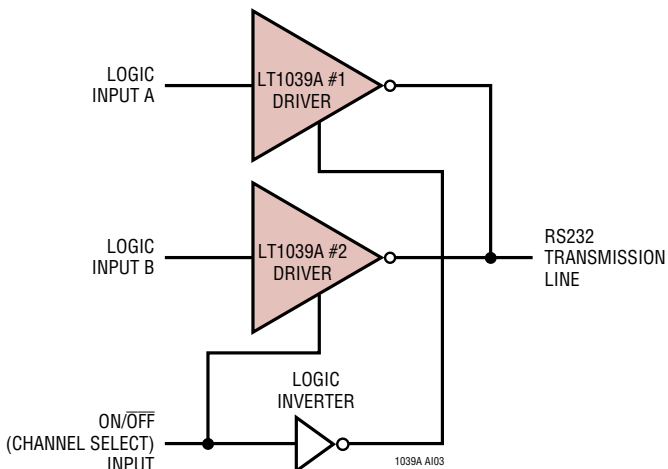

The driver outputs utilize high impedance overvoltage protection, eliminating the flow of fault currents into supplies, as will happen with conventional diode clamp-configurations.

Older RS232 Drivers and Other CMOS Drivers

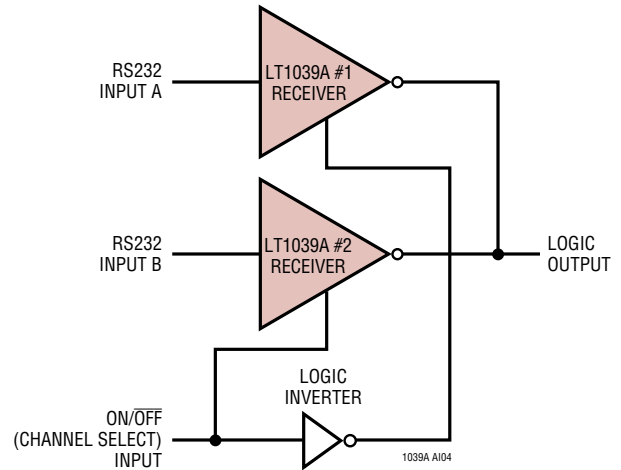

Placing the LT1039A in the shutdown mode (Pin 17 low) puts both the driver and receiver outputs in a high impedance state. This allows data line sharing and transceiver-applications.

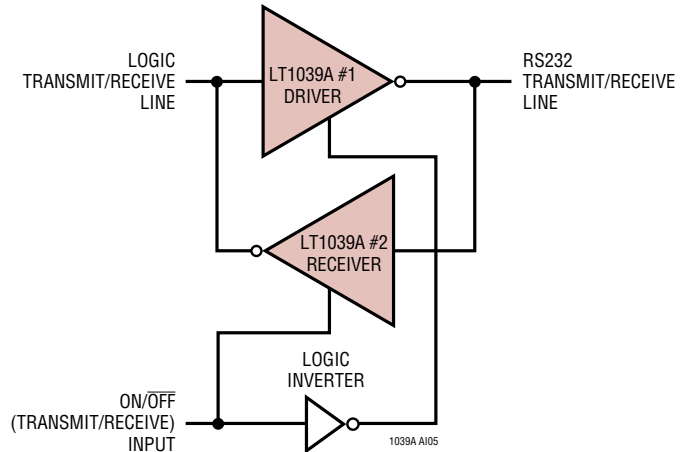

Sharing a Transmitter Line

Sharing a Receiver Line

Transceiver

The shutdown mode also drops all supply currents (V_{CC} , V^+ , V^-) to zero for power conscious systems.

APPLICATIONS INFORMATION

When driving CMOS logic from a receiver that will be used in the shutdown mode and there is no other active receiver on the line, a 51k resistor can be placed from the logic input to V_{CC} to force a definite logic level when the receiver output is in a high impedance state.

Driving CMOS Logic from a Receiver

To protect against receiver input overloads in excess of $\pm 30V$, a voltage clamp can be placed on the data line and still maintain RS232 compatibility.

Input Overvoltage Protection

The receiver input impedance of the LT1039A is nominally 30k Ω . For applications requiring a 5k Ω input impedance, a 5.6k resistor can be connected from the receiver input to ground.

5k Ω Impedance Matching

Driver inputs should not be allowed to float. Any unused inputs should be tied to V_{CC} .

The BIAS pin is used to “keep alive” one receiver while in the shutdown mode (all other circuitry being inactive). This allows a system to be in shutdown and still have one active receiver for transferring data.

Keeping Alive One Receiver While in Shutdown

It can also be used to make an RS232 compatible shutdown control line. Driving the BIAS pin low through a resistance of 24k to 30k keeps the receiver active. Do not drive the BIAS pin directly from a logic output without the series resistor. An unused BIAS pin should be left open.

RS232 Compatible Shutdown Control Line
