## Description

The AL9910/A high voltage PWM LED driver-controller provides an efficient solution for offline high brightness LED lamps from rectified line voltages ranging from $85 \mathrm{~V}_{\mathrm{AC}}$ up to $277 \mathrm{~V}_{\mathrm{AC}}$. The AL9910 drives external MOSFETs at switching frequencies up to 300 kHz , with the switching frequency determined by a single resistor. The AL9910 topology creates a constant current through the LEDs providing constant light output. The output current is programmed by one external resistor and is ultimately determined by the external MOSFET chosen and therefore allows many low current LEDs to be driven as well as a few high current LEDs.

The LED brightness can be varied by both Linear and PWM dimming using the AL9910's LD and PWM_D pins respectively. The PWM_D input operates with duty ratio of $0-100 \%$ and frequency of up to several kHz.

The AL9910 can withstand input voltages up to 500 V which makes it very resilient to transients at standard mains voltages. As well as standard SO-8 package the AL9910 is available in the thermally enhanced SO-8EP package.

## Features

- >90\% Efficiency
- Universal Rectified 85 to $277 \mathrm{~V}_{\mathrm{AC}}$ Input Range
- Input Voltage Up to 500 V
- Internal Voltage Regulator Removes Start-Up Resistor
- 7.5V MOSFET Drive - AL9910
- 10V MOSFET Drive - AL9910A
- Tighter Current Sense Tolerance: 5\% AL9910-5, AL9910A-5
- Drives LED Lamps with Both High and Low Current LEDs
- LED Brightness Control with Linear and PWM Dimming
- Internal Thermal Protection (OTP)
- Available in SO-8 and SO-8EP Packages
- Totally Lead-Free \& Fully RoHS Compliant (Notes 1 \& 2)
- Halogen and Antimony Free. "Green" Device (Note 3)

## Pin Assignments

## Applications

- LED Offline Lamps
- High Voltage DC-DC LED Driver
- Signage and Decorative LED Lighting
- Back Lighting of Flat Panel Displays
- General Purpose Constant Current Source

Notes: $\quad$ 1. No purposely added lead. Fully EU Directive 2002/95/EC (RoHS) \& 2011/65/EU (RoHS 2) compliant.
2. See http://www.diodes.com/quality/lead_free.html for more information about Diodes Incorporated's definitions of Halogen- and Antimony-free, "Green" and Lead-free.
3. Halogen- and Antimony-free "Green" products are defined as those which contain $<900 \mathrm{ppm}$ bromine, $<900 \mathrm{ppm}$ chlorine ( $<1500 \mathrm{ppm}$ total $\mathrm{Br}+\mathrm{Cl}$ ) and <1000ppm antimony compounds.

## Typical Applications Circuit

Pin Descriptions

| Pin <br> Name | Pin Number |  | Function |
| :---: | :---: | :---: | :---: |
|  | SO-8 | SO-8EP |  |
| $\mathrm{V}_{\text {IN }}$ | 1 | 1 | Input Voltage |
| CS | 2 | 2 | Senses LED string and external MOSFET switch current |
| GND | 3 | 3 | Device Ground |
| Gate | 4 | 4 | Drives the gate of the external MOSFET switch. |
| PWM_D | 5 | 5 | Low Frequency PWM Dimming pin, also Enable input. Internal 200k p pull-down to GND. |
| $V_{D D}$ | 6 | 6 | Internally regulated supply voltage. <br> - 7.5 V nominal for AL9910 and AL9910-5 <br> - 10 V nominal for AL9910A. <br> Can supply up to 1 mA for external circuitry. A sufficient storage capacitor is used to provide storage when the rectified $A C$ input is near the zero crossing. |
| LD | 7 | 7 | Linear Dimming Input. Changes the current limit threshold at current sense comparator and changes the average LED current. |
| Rosc | 8 | 8 | Oscillator Control. A resistor connected between this pin and ground sets the PWM frequency. The devices can be switched into constant off time (PFM) mode by connecting the external oscillator resistor between Rosc pin and the gate of the external MOSFET. |
| EP PAD | N/A | EP | Exposed Pad (bottom). Connect to GND directly underneath the package. |

## Functional Block Diagram

Absolute Maximum Ratings (Note 4) (@T $\mathrm{A}_{\mathrm{A}}=+25^{\circ} \mathrm{C}$, unless otherwise specified.)

| Symbol | Parameter | Ratings | Unit |
| :---: | :---: | :---: | :---: |

| ESD HBM | Human Body Model ESD Protection (Note 5) | 1500 | V |
| ESD MM | Machine Model ESD Protection (Note 5) | 300 | V |

Notes: 4. Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those listed in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
All voltages are with respect to Ground. Currents are positive into, negative out of the specified terminal.
5. Semiconductor devices are ESD sensitive and may be damaged by exposure to ESD events. Suitable ESD precautions should be taken when handling and transporting these devices

Recommended Operating Conditions $\left(\mathrm{T}_{\mathrm{A}}=+25^{\circ} \mathrm{C}\right.$, unless otherwise specified.)

| Symbol | Parameter |  | Min | Max | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Vindc | Input DC Supply Voltage Range | $\begin{aligned} & \hline \begin{array}{l} \text { AL9910 } \\ \text { AL9910-5 } \end{array} \end{aligned}$ | 15.0 | 500 | V |

## Typical Characteristics (cont.) measured using AL9910EV4

## Application Information

The AL9910 is very versatile and is capable of operating in isolated or non-isolated topologies. It can also be made to operate in continuous as well as discontinuous conduction mode.

Figure 1 Functional Block Diagram
The AL9910 contains a high voltage LDO (see Figure 1) the output of the LDO provides a power rail to the internal circuitry including the gate driver. A UVLO on the output of the LDO prevents incorrect operation at low input voltage to the $\mathrm{V}_{\mathrm{IN}}$ pin.
In a non-isolated Buck LED driver when the gate pin goes high the external power MOSFET Q1 is turned on causing current to flow through the LEDs, inductor (L1) and current sense resistor (RSENSE). When the voltage across RSENSE exceeds the current sense pin threshold the external MOSFET Q1 is turned off. The stored energy in the inductor causes the current to continue to flow through the LEDs via diode D1.

The AL9910's LDO provides all power to the rest of the IC including Gate drive this removes the need for large high power start-up resistors. This means that operate correctly it requires around 0.5 mA from the high voltage power rail. The LDO can also be used to supply up to 1 mA to external circuits.

The AL9910 operates and regulates by limiting the peak current of the external MOSFET; the peak current sense threshold is nominally set at 250 mV .

The same basic operation is true for isolated topologies, however in these the energy stored in the transformer delivers energy to LEDs during the off-cycle of the external MOSFET.

## Design Parameters

## Setting the LED Current

In the non-isolated buck converter topology, figure 1, the average LED current is not the peak current divided by 2 - however, there is a certain error due to the difference between the peak and the average current in the inductor. The following equation accounts for this error:

$$
\mathrm{R}_{\text {SENSE }}=\frac{250 \mathrm{mV}}{\left.\left(\mathrm{I}_{\text {LED }}+\left(0.5^{*} \mathrm{I}_{\text {RIPPLE }}\right)\right)\right)}
$$

## Applications Information (cont.)

## Setting Operating Frequency

The AL9910 is capable of operating over a 25 and 300 kHz switching frequency range. The switching frequency is programmed by connecting an external resistor between Rosc pin and ground. The corresponding oscillator period is:

$$
\text { tosc }=\frac{\mathrm{R}_{\mathrm{osc}}+22}{25} \mu \mathrm{~s} \quad \text { with } \operatorname{Rosc} \text { in } \mathrm{k} \Omega
$$

The switching frequency is the reciprocal of the oscillator period. Typical values for Rosc vary from $75 \mathrm{k} \Omega$ to $1 \mathrm{M} \Omega$

When driving smaller numbers of LEDs, care should be taken to ensure that $t_{\text {ON }}>t_{B L A N K}$. The simplest way to do this is to reduce/limit the switching frequency by increasing the $R_{\text {OSC }}$ value. Reducing the switching frequency will also improve the efficiency.

When operating in buck mode the designer must keep in mind that the input voltage must be maintained higher than 2 times the forward voltage drop across the LEDs. This limitation is related to the output current instability that may develop when the AL9910 operates at a duty cycle greater than 0.5 . This instability reveals itself as an oscillation of the output current at a sub-harmonic (SBO) of the switching frequency.

The best solution is to adopt the so-called constant off-time operation as shown in Figure 2. The resistor (Rosc) is, connected to ground by default, to set operating frequency. To force the AL9910 to enter constant OFF time mode ROSC is connected to the gate of the external MOSFET. This will decrease the duty cycle from $50 \%$ by increasing the total period, $t_{\mathrm{OFF}}+\mathrm{t}_{\mathrm{ON}}$.

Figure 2. Constant Off-Time Configuration
The oscillator period equation above now defines the AL9910 off time, toff.
When using this mode the nominal switching frequency is chosen and from the nominal input and output voltages the off-time can be calculated:

$$
t_{\mathrm{OFF}}=\left(1-\frac{\mathrm{V}_{\mathrm{OUT}(\mathrm{nom})}}{\mathrm{V}_{\mathrm{IN}(\mathrm{nom})}}\right) * \frac{1}{\mathrm{f}_{\mathrm{OSC}}}
$$

From this the timing resistor, $\mathrm{R}_{\mathrm{OSC}}$, can be calculated: $\mathrm{R}_{\mathrm{OSC}}=\left(\mathrm{t}_{\mathrm{OFF}}(\mu \mathrm{s}) * 25\right)-22(\mathrm{k} \Omega)$

## Inductor Selection

The non-isolated buck circuit, Figure 1, is usually selected and it has two operation modes: continuous and discontinuous conduction modes. A buck power stage can be designed to operate in continuous mode for load current above a certain level usually $15 \%$ to $30 \%$ of full load. Usually, the input voltage range, the output voltage and load current are defined by the power stage specification. This leaves the inductor value as the only design parameter to maintain continuous conduction mode. The minimum value of inductor to maintain continuous conduction mode can be determined by the following example.

The required inductor value is determined from the desired peak-to-peak LED ripple current in the inductor; typically around $30 \%$ of the nominal LED current.

$$
L=\frac{\left(V_{I N}-V_{\text {LEDs }}\right) \times D}{\left(0.3 \times I_{\text {LED }}\right) \times f_{O S C}} \quad \text { Where } D \text { is duty cycle }
$$

The next step is determining the total voltage drop across the LED string. For example, when the string consists of 10 High-Brightness LEDs and each diode has a forward voltage drop of 3.0 V at its nominal current; the total LED voltage $\mathrm{V}_{\text {LEDS }}$ is 30 V .

## Applications Information (cont.)

## Dimming

The LED brightness can be dimmed either linearly (using the LD pin) or via pulse width modulation (using the PWM-D pin); or a combination of both - depending on the application. Pulling the PWM_D pin to ground will turn off the AL9910. When disabled, the AL9910's quiescent current is typically 0.5 mA ( 0.65 for AL9910A). Reducing the LD voltage will reduce the LED current but it will not entirely turn off the external power transistor and hence the LED current - this is due to the finite blanking period. Only the PWM_D pin will turn off the power transistor.

Linear dimming is accomplished by applying a 45 mV to 250 mV analog signal to the LD pin. This overrides the default 250 mV threshold level of the CS pin and reduces the output current. If an input voltage greater than 250 mV is applied to the LD then the output current will not change.

The LD pin also provides a simple cost effective solution to soft start; by connecting a capacitor to the LD pin down to ground at initial power up the LD pin will be held low causing the sense threshold to be low. As the capacitor charges up the current sense threshold will increase thereby causing the average LED current to increase.

PWM dimming is achieved by applying an external PWM signal to the PWM_D pin. The LED current is proportional to the PWM duty cycle and the light output can be adjusted between zero and $100 \%$. The PWM signal enables and disables the AL9910-modulating the LED current. The ultimate accuracy of the PWM dimming method is limited only by the minimum gate pulse width, which is a fraction of a percentage of the low frequency duty cycle. PWM dimming of the LED light can be achieved by turning on and off the converter with low frequency 50 Hz to 1000 Hz TTL logic level signal.

With both modes of dimming it is not possible to achieve average brightness levels higher than the one set by the current sense threshold level of the AL9910. If a greater LED current is required then a smaller sense resistor should be used

## Output Open Circuit Protection

The non-isolated buck LED driver topology provides inherent protection against an open circuit condition in the LED string due to the LEDs being connected in series with the inductor. Should the LED string become open circuit then no switching occurs and the circuit can be permanently left in this state with damage to the rest of the circuit.

## AC/DC Off-Line LED Driver

The AL9910 is a cost-effective off-line buck LED driver-controller specifically designed for driving LED strings. It is suitable for being used with either rectified AC line or any DC voltage between 15 V to 500 V . See Figure 3 for typical circuit.

Figure 3. Typical Application Circuit (without PFC)

## Buck Design Equations:

$$
\begin{aligned}
& D=\frac{V_{\text {LEDs }}}{V_{I N}} \\
& t_{\mathrm{ON}}=\frac{D}{f_{\mathrm{OSC}}} \\
& L \geq \frac{\left(V_{\mathrm{IN}}-V_{\text {LEDs }}\right) \times t_{\mathrm{ON}}}{0.3 \times I_{\text {LED }}} \\
& R_{\text {SENSE }}=\frac{0.25}{\mathrm{I}_{\text {LED }}+\left(0.5 \times\left(\mathrm{l}_{\text {LED }} \times 0.3\right)\right)} \text { where } \mathrm{I}_{\text {LED }} \times 0.3=\mathrm{I}_{\text {RIPPLE }}
\end{aligned}
$$

## Applications Information (cont.)

## Design Example

For an $A C$ line voltage of 120 V the nominal rectified input voltage $\mathrm{V}_{\mathrm{IN}}=120 \mathrm{~V} * 1.41=169 \mathrm{~V}$. From this and the LED chain voltage the duty cycle can be determined:

$$
D=V_{\text {LEDs }} / V_{I N}=30 / 169=0.177
$$

From the switching frequency, for example fosc $=50 \mathrm{kHz}$, the required on-time of the external MOSFET can be calculated:

$$
\mathrm{t}_{\mathrm{ON}}=\mathrm{D} / \mathrm{f} \mathrm{OSC}=3.5 \mu \mathrm{~s}
$$

The value of the inductor for an LED current of 350 mA is determined as follows:

$$
\mathrm{L}=\left(\mathrm{V}_{\mathrm{IN}}-\mathrm{V}_{\mathrm{LEDs}}\right) * \mathrm{t}_{\mathrm{ON}} /\left(0.3^{*} \mathrm{I}_{\mathrm{LED}}\right)=4.6 \mathrm{mH}
$$

## Input Bulk Capacitor

For Offline lamps an input bulk capacitor is required to ensure that the rectified AC voltage is held above twice the LED string voltage throughout the AC line cycle. The value can be calculated from:

$$
\mathrm{C}_{\mathrm{IN}} \geq \frac{\mathrm{P}_{\mathrm{IN}} \times\left(1-\mathrm{D}_{\mathrm{CH}}\right)}{\sqrt{2} \times \mathrm{V}_{\mathrm{LINE}_{-} \mathrm{MIN}} \times 2 \mathrm{f}_{\mathrm{L}} \times \Delta \mathrm{V}_{\mathrm{DC}_{-} \mathrm{MAX}}}
$$

Where

$$
\begin{aligned}
& \mathrm{D}_{\mathrm{ch}} \text { : Capacity charge work period, generally about } 0.2 \text { to } 0.25 \\
& \mathrm{f}_{\mathrm{L}} \text { : Input frequency for full range ( } 85 \text { to } 265 \mathrm{~V}_{\mathrm{RMS}} \text { ) } \\
& \Delta \mathrm{V}_{\mathrm{DC}} \text { _MAX Should be set } 10 \text { to } 15 \% \text { of } \sqrt{2} \mathrm{~V}_{\text {LINE _MIN }}
\end{aligned}
$$

If the capacitor has a $15 \%$ voltage ripple then a simplified formula for the minimum value of the bulk input capacitor approximates to:

$$
\mathrm{C}_{\mathrm{MIN}}=\frac{\mathrm{I}_{\mathrm{LED}} \times \mathrm{V}_{\mathrm{LEDs}} \times 0.06}{\mathrm{~V}_{\mathrm{IN}}{ }^{2}}
$$

## Power Factor Correction

If power factor improvement is required then for the input power less than 25 W , a simple passive power factor correction circuit can be added to the AL9910 typical application circuit. Figure 4 shows that passive PFC circuitry ( 3 current steering diodes and 2 identical capacitors) does not significantly affect the rest of the circuit. Simple passive PFC improves the line current harmonic distortion and achieves a power factor greater than 0.85.

Figure 4. Typical Application Circuit with Passive PFC

Each of these identical capacitors should be rated for half of the input voltage and have twice as much capacitance as the calculated $\mathrm{C}_{\text {min }}$ of the buck converter circuit without passive PFC (see above section on bulk capacitor calculation).

For further design information please see AN75 from the Diodes website.

## Applications Information (cont.)

## DC-DC Buck LED Driver

The design procedure for an ac input buck LED driver outlined in the previous chapters equally applies DC input LED drivers.
When driving long LED chains care should be taken not to induce SBO - maximum LED chain voltage should be less half of VIN. So either maximum duty cycle should be kept below $50 \%$ or use of constant off-time removes this issue.

## DC-DC Boost LED Driver

Due to the topology of the AL9910 LED driver-controller it is capable of being used in boost configurations - at reduced accuracy. The accuracy can be improved by measuring the LED current with an op amp and use the op amp's output to drive the LD pin.

A Boost LED driver is used when the forward voltage drop of the LED string is higher than the input supply voltage. For example, the Boost topology can be appropriate when input voltage is supplied by a 48 V power supply and the LED string consists of twenty HB LEDs, as the case may be for a street light.

Figure 5. Boost LED Driver
In a Boost converter, when the external MOSFET is ON the energy is stored in the inductor which is then delivered to the output when the external MOSFET switches OFF. If the energy stored in the inductor is not fully depleted by the next switching cycle (continuous conduction mode) the DC conversion between input and output voltage is given by:

$$
\mathrm{V}_{\text {OUT }}=\frac{\mathrm{V}_{\mathrm{IN}}}{1-\mathrm{D}} \rightarrow \mathrm{D}=\frac{\mathrm{V}_{\mathrm{OUT}}-\mathrm{V}_{\text {IN }}}{\mathrm{V}_{\mathrm{OUT}}}
$$

From the switching frequency, fosc, the on-time of the MOSFET can be calculated:

$$
\mathrm{t}_{\mathrm{ON}}=\frac{\mathrm{D}}{\mathrm{f}_{\mathrm{OSC}}}
$$

From this the required inductor value can be determined by:

$$
\mathrm{L}=\frac{\mathrm{V}_{\mathrm{IN}} * \mathrm{t}_{\mathrm{ON}}}{0.3 * \mathrm{I}_{\mathrm{LED}}}
$$

The Boost topology LED driver requires an output capacitor to deliver current to the LED string during the time that the external MOSFET is on.
In boost LED driver topologies if the LEDs should become open circuit damage may occur to the power switch and so some form of detection should be present to provide Over-voltage detection/protection.

## Marking Information

(1) SO-8

YY : Year : 08, 09,10~
WW : Week : 01~52; 52
represents 52 and 53 week X X : Internal Code
(2) SO8-EP

## Package Outline Dimensions (All dimensions in mm.)

Please see AP02002 at http://www.diodes.com/datasheets/ap02002.pdf for latest version.
(1) $\mathrm{SO}-8$

| SO-8 |  |  |
| :---: | :---: | :---: |
| Dim | Min | Max |
| A | - | 1.75 |
| A1 | 0.10 | 0.20 |
| A2 | 1.30 | 1.50 |
| A3 | 0.15 | 0.25 |
| b | 0.3 | 0.5 |
| D | 4.85 | 4.95 |
| E | 5.90 | 6.10 |
| E1 | 3.85 | 3.95 |
| e | 1.27 Typ |  |
| h | - | 0.35 |
| L | 0.62 | 0.82 |
| $\boldsymbol{\theta}$ | $0^{\circ}$ |  |
| All Dimensions in | $8^{\circ}$ |  |

(2) $\mathrm{SO}-8 \mathrm{EP}$

| SO-8EP (SOP-8L-EP) |  |  |  |
| :---: | :---: | :---: | :---: |
| Dim | Min | Max | Typ |
| A | 1.40 | 1.50 | 1.45 |
| A1 | 0.00 | 0.13 | - |
| b | 0.30 | 0.50 | 0.40 |
| C | 0.15 | 0.25 | 0.20 |
| D | 4.85 | 4.95 | 4.90 |
| E | 3.80 | 3.90 | 3.85 |
| E0 | 3.85 | 3.95 | 3.90 |

Diodes Incorporated and its subsidiaries reserve the right to make modifications, enhancements, improvements, corrections or other changes without further notice to this document and any product described herein. Diodes Incorporated does not assume any liability arising out of the application or use of this document or any product described herein; neither does Diodes Incorporated convey any license under its patent or trademark rights, nor the rights of others. Any Customer or user of this document or products described herein in such applications shall assume all risks of such use and will agree to hold Diodes Incorporated and all the companies whose products are represented on Diodes Incorporated website, harmless against all damages.

Diodes Incorporated does not warrant or accept any liability whatsoever in respect of any products purchased through unauthorized sales channel. Should Customers purchase or use Diodes Incorporated products for any unintended or unauthorized application, Customers shall indemnify and hold Diodes Incorporated and its representatives harmless against all claims, damages, expenses, and attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized application.

Products described herein may be covered by one or more United States, international or foreign patents pending. Product names and markings noted herein may also be covered by one or more United States, international or foreign trademarks.

This document is written in English but may be translated into multiple languages for reference. Only the English version of this document is the final and determinative format released by Diodes Incorporated.

## LIFE SUPPORT

Diodes Incorporated products are specifically not authorized for use as critical components in life support devices or systems without the express written approval of the Chief Executive Officer of Diodes Incorporated. As used herein:
A. Life support devices or systems are devices or systems which:

1. are intended to implant into the body, or
2. support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in significant injury to the user.
B. A critical component is any component in a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or to affect its safety or effectiveness.

Customers represent that they have all necessary expertise in the safety and regulatory ramifications of their life support devices or systems, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of Diodes Incorporated products in such safety-critical, life support devices or systems, notwithstanding any devices- or systems-related information or support that may be provided by Diodes Incorporated. Further, Customers must fully indemnify Diodes Incorporated and its representatives against any damages arising out of the use of Diodes Incorporated products in such safety-critical, life support devices or systems.
