

# Stop 'n' Search

- Battery & mains powered versions
- Audible bleep & led indicator
- Remote indication option
- Adjustable selection frequency
- Touch button or remote input
- Cuts out discrimination and deters staff pilfering
- Heavy duty button
- Stop n Search II can be wall or desk mounted

Does searching staff cause you problems? Search regimes are disruptive and cause tension amongst staff leading to allegations of discrimination and victimisation.

Stop n Search is invaluable providing re-assurance to staff that if subjected to a search regime it is at least carried out randomly and that no one is being singled out for special treatment.

## **It is impossible to control the randomness or create a guessable pattern.**

There are two versions **Stop n Search II** a simple battery operated unit and **Stop n Search III** a more sophisticated mains powered unit that can be used to control an exit door and signal to remote equipment.

The principle of operation is the same for both units and can be used on leaving or entering premises where staff pilfering or the carrying of weapons or drugs may be a problem. The selection frequency is set up on installation but can be changed to suit changing circumstances. The selection frequency can be set as 2, 5, 10, 20, 30, 50, 70 or 90 percent. If for example a selection frequency of 30% is used then 30 in 100 people would be selected randomly.

The software generates a selection if the button is permanently pressed in order to deter users from trying to disable the system.

Stop n Search III mains powered version has all the features of Stop n Search II its additional features include:

- a. Relay output to enable an exit door to be kept locked on selection.
- b. Relay output for signalling selection to a remote point eg. a manager
- c. A door contact or PIR input to activate the selection process.
- d. A card reader or keypad unit to activate the selection process.
- e. A "No Search" facility is available if security staff are not around to conduct a search, this gives the impression that the random search regime is in use.
- f. Reset keyswitch to permit passage after selection.

Various modes of operation are possible including a fast moving mode where dwell times for door retainers would cause congestion.

Stop n Search II

Stop n Search III
