

DP Series DC Load Reversing Solid State Contactors

Crydom's advanced DC Switching Technology is now conveniently packaged in a High Power "H-Bridge" configuration with optional Soft Start/Ramp Up, Soft Stop/Ramp Down & Brake features for use in DC Load Reversing applications including motors, brakes, clutches, electro magnets, solenoids, plating baths and electrolytic cells. The DP Series Solid State DC Reversers are an all-solid-state design with 2.5 Kv Optical Isolation and incorporate low dissipation power FETs for fast and efficient Load control.

FEATURES

- Convenient FET switches in H-bridge configuration
- Built-in protective Forward/Reverse interlock function
- UL & IEC ratings for general use & Motor loads
- LED Status indicators for Operating Modes

MOUNTING INSTRUCTIONS (A)

Please read all installation instructions before using your DP Series Solid State Contactor (SSC).

- Choose one of the two mounting options and follow the instructions.

Mounting on Heat Sink

- Select adequate heat sink (see thermal derating curves). (B)
- Be sure to use thermal pad or grease between the SSC and the selected heat sink.
- DP Series Contactor mounting slots have a diameter of 0.2 in (5.0 mm). Four screws are needed (not included) to mount the SSC onto heat sink (See Fig. 1). Choose screw length considering the mounting surface and that DP Series baseplate thickness is 0.125 in (3.2 mm).

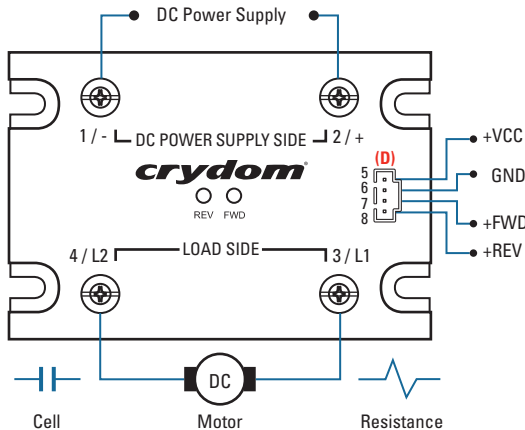

fig. 1 DP Series SSC mounted on HS053 heat sink(A)

- Before applying full torque tighten down all 4 screws until they contact the baseplate. Then, tighten them to 20 in-lbs (2.2 Nm) starting with one immediately followed by the one in the diagonally opposite corner. After the first 2 screws are completely tightened, proceed tightening the remaining 2 screws.
- For optimal thermal performance heat sink fins should be oriented vertically to natural airflow.

Mounting on Panel

- Locate the panel section on which the DP Series SSC will be mounted. Panel mount surface must provide adequate heat sinking capability. (B)
- Be sure to use thermal pad or grease between the SSC and the panel.
- DP Series Contactor mounting slots have a diameter of 0.2 in (5.0 mm). Four screws are needed (not included) to mount the SSC onto panel. Choose screw length considering the mounting surface and that DP Series baseplate thickness is 0.125 in (3.2 mm).
- Before applying full torque tighten down all 4 screws until they contact the baseplate. Then, tighten them to 20 in-lbs (2.2 Nm) starting with one immediately followed by the one in the diagonally opposite corner. After the first 2 screws are completely tightened, proceed tightening the remaining 2 screws.

- (A) See compatible accessories in TABLE 4.
- (B) For maximum ratings use heat sink ratings in TABLE 1.
- (C) Terminal (3/L1) is (+) during Forward operation. Terminal (4/L2) is (+) during Reverse operation.
- (D) Suggested Input Mating Connector/Plug : Crimp Housing, Positive Latch (Molex 050579404).
- (E) For a complete description of available Operating Modes, see definitions on reverse side of this sheet.

OPERATING MODES

Start: When either FWD or REV Control signal is applied, and after Control Signal Validation Delay, DC power supply on terminals 1/- and 2/+ is directly connected to Load at terminals 3/L1 and 4/L2 with a polarity according to the control signal. The start option can be combined with Stop and/or Dynamic Brake options.

Stop: Load is disconnected from DC power supply. All FET switches (S1, S2, S3 & S4) inside the DP Series SSC are turned off. This simple Stop option is available only in combination with the simple Start option (suffix Blank).

Soft Start/Ramp Up: It is a modified Start where the DC power supply is connected to the load using a 200 Hz pulse width modulation with a duty cycle going from 10% to 100%. Soft Start/Ramp Up time is defined by SA, SB and SC suffixes. After Soft Start/Ramp Up time is elapsed, the Load will remain continuously energized for as long as FWD or REV Control signal is applied. This option can be combined with Soft Stop/Ramp Down and Dynamic Braking modes, but not with simple Stop.

Soft Stop/Ramp Down: It is a modified Stop where the DC power supply is disconnected from the Load using a 200 Hz pulse width modulation with a duty cycle going from 100% to 0%. After Soft Stop/Ramp Down time is elapsed,

the Load will remain continuously de-energized waiting for a new FWD or REV Control signal. Soft Stop/Ramp Down time is tied to Soft Start/Ramp Up time selected by SA, SB and SC suffixes and can be combined with Soft Start/Ramp Up only.

Dynamic Brake: It could be used as a modified Stop where the FET switches inside the DP Series SSC are arranged in such a way that they provide a path for the Load Current to keep flowing after the DC power supply has been disconnected. This mode allows for energy stored in some type of loads to be discharged, i.e. back EMF on DC motors. Timing for Dynamic Brake is selected by suffixes B2, B5, B8 and B where the latest will keep the braking or discharging path enabled for as long as FWD and REV Control signals are removed.

Interlock: It will shut down all FET switches inside the DP Series SSC within 0.2 sec after both control signals FWD and REV are applied at the same time. An Interlock condition will trigger a modified Stop such as Soft Stop/Ramp Down or Dynamic Brake whenever an option has been selected.

Control Signals

- Int:** Interlock
- t:** Control Signal Validation Delay = 0.2 sec, except for Start / Stop (0.025 sec)
- t_i:** 0.15 sec Break-before-make delay
- t_B:** Dynamic Brake time
 - B2: 0.2 sec
 - B5: 0.5 sec
 - B8: 0.8 sec
 - B: Continuous
- t_{SP}:** Soft Stop/Ramp Down time = t_{ST}
- t_{ST}:** Soft Start/Ramp Up time
 - SA: 0.2 sec
 - SB: 0.5 sec
 - SC: 1 sec
- V_{DCS}:** VDC power supply
- V_{FWD}:** Forward Control Signal
- V_{REV}:** Reverse Control Signal

(F) Load voltage signals shown are typical of a DC motor, behavior may change for other load types.
