## FEATURES

- Qualified for automotive applications
- Low power operation
- 5 V operation
- 1.2 mA per channel maximum at 0 Mbps to 2 Mbps
- 3.5 mA per channel maximum at 10 Mbps
- 32 mA per channel maximum at 90 Mbps
- 3 V operation
-0.8 mA per channel maximum at 0 Mbps to 2 Mbps
- 2.2 mA per channel maximum at 10 Mbps
- 20 mA per channel maximum at 90 Mbps
- Bidirectional communication
- 3 V/5 V level translation
- High temperature operation: $125^{\circ} \mathrm{C}$
- High data rate: dc to 90 Mbps (NRZ)
- Precise timing characteristics
- 2 ns maximum pulse width distortion
- 2 ns maximum channel-to-channel matching
- High common-mode transient immunity: >25 kV/ $\mu \mathrm{s}$
- Output enable function
- 16-lead SOIC wide body package
- RoHS-compliant models available
- Safety and regulatory approvals
- UL recognition: 2500 V rms for 1 minute per UL 1577
- CSA Component Acceptance Notice 5A
- VDE Certificate of Conformity
- DIN V VDE V 0884-10 (VDE V 0884-10):2006-12
- $\mathrm{V}_{\text {IORM }}=560 \mathrm{~V}$ peak
- TÜV approval: IEC/EN/UL/CSA 61010-1

## APPLICATIONS

- General-purpose multichannel isolation
- SPI interface/data converter isolation
- RS-232/RS-422/RS-485 transceivers
- Industrial field bus isolation
- Automotive systems

## GENERAL DESCRIPTION

The ADuM1300/ADuM1301 ${ }^{1}$ are triple-channel digital isolators based on the Analog Devices, Inc., iCoupler® technology. Combining high speed CMOS and monolithic transformer technology, these isolation components provide outstanding performance characteristics superior to alternatives, such as optocouplers.
By avoiding the use of LEDs and photodiodes, iCoupler devices remove the design difficulties commonly associated with optocouplers. The typical optocoupler concerns regarding uncertain current transfer ratios, nonlinear transfer functions, and temperature and lifetime effects are eliminated with the simple iCoupler digital interfaces and stable performance characteristics. The need for external drivers and other discrete components is eliminated with these iCoupler products. Furthermore, iCoupler devices consume one-tenth to one-sixth of the power of optocouplers at comparable signal data rates.

The ADuM1300/ADuM1301 isolators provide three independent isolation channels in a variety of channel configurations and data rates (see the Ordering Guide). Both models operate with the supply voltage on either side ranging from 2.7 V to 5.5 V , providing compatibility with lower voltage systems as well as enabling a voltage translation functionality across the isolation barrier. In addition, the ADuM1300/ADuM1301 provide low pulse width distortion (<2 ns for CRW grade) and tight channel-to-channel matching (<2 ns for CRW grade). Unlike other optocoupler alternatives, the ADuM1300/ADuM1301 isolators have a patented refresh feature that ensures dc correctness in the absence of input logic transitions and when power is not applied to one of the supplies.

## SPECIFICATIONS

## ELECTRICAL CHARACTERISTICS— $5 \mathrm{~V}, 105^{\circ} \mathrm{C}$ OPERATION

All voltages are relative to their respective ground. $4.5 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DD} 1} \leq 5.5 \mathrm{~V}, 4.5 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DD} 2} \leq 5.5 \mathrm{~V}$; all minimum/maximum specifications apply over the entire recommended operation range, unless otherwise noted; all typical specifications are at $T_{A}=25^{\circ} \mathrm{C}, \mathrm{V}_{\mathrm{DD} 1}=\mathrm{V}_{\mathrm{DD2}}=5 \mathrm{~V}$. These specifications do not apply to ADuM1300W and ADuM1301W automotive grade versions.

Table 1.

| Parameter | Symbol | Min | Typ | Max | Unit | Test Conditions/Comments |

| Common-Mode Transient Immunity at Logic Low Output ${ }^{7}$ | $\mid C M L$ | 25 | 35 |  | kV/ $/ \mathrm{s}$ | $\begin{aligned} & \mathrm{V}_{\mathrm{Ix}}=0 \mathrm{~V}, \mathrm{~V}_{\mathrm{CM}}=1000 \mathrm{~V}, \\ & \text { transient magnitude }=800 \mathrm{~V} \end{aligned}$ |
| Refresh Rate | $\mathrm{fr}_{\mathrm{r}}$ |  | 1.2 |  | Mbps |  |
| Input Dynamic Supply Current per Channe1 ${ }^{8}$ | $1 \mathrm{IDIL}_{(\mathrm{D})}$ |  | 0.19 |  | mA/Mbps |  |
| Output Dynamic Supply Current per Channel ${ }^{8}$ | $1 \mathrm{l}_{\text {DO ( }}(\mathrm{D})$ |  | 0.05 |  | mA/Mbps |  |

1 The supply current values are for all three channels combined when running at identical data rates. Output supply current values are specified with no output load present. The supply current associated with an individual channel operating at a given data rate may be calculated as described in the Power Consumption section. See Figure 6 through Figure 8 for information on per-channel supply current as a function of data rate for unloaded and loaded conditions. See Figure 9 through Figure 12 for total $V_{D D 1}$ and $\mathrm{V}_{\mathrm{DD2}}$ supply currents as a function of data rate for ADuM1300/ADuM1301 channel configurations.
2 The minimum pulse width is the shortest pulse width at which the specified pulse width distortion is guaranteed.
3 The maximum data rate is the fastest data rate at which the specified pulse width distortion is guaranteed.
${ }^{4} t_{\text {PHL }}$ propagation delay is measured from the $50 \%$ level of the falling edge of the $V_{\text {Ix }}$ signal to the $50 \%$ level of the falling edge of the $V_{0 x}$ signal. $t_{\text {pLH }}$ propagation delay is measured from the $50 \%$ level of the rising edge of the $\mathrm{V}_{1 \mathrm{x}}$ signal to the $50 \%$ level of the rising edge of the $\mathrm{V}_{0 \mathrm{x}}$ signal.
${ }^{5} t_{\text {PSK }}$ is the magnitude of the worst-case difference in $t_{\text {PHL }}$ or $t_{\text {PLH }}$ that is measured between units at the same operating temperature, supply voltages, and output load within the recommended operating conditions.
${ }^{6}$ Codirectional channel-to-channel matching is the absolute value of the difference in propagation delays between any two channels with inputs on the same side of the isolation barrier. Opposing-directional channel-to-channel matching is the absolute value of the difference in propagation delays between any two channels with inputs on opposing sides of the isolation barrier.

## SPECIFICATIONS

${ }^{7} \mathrm{CM}_{H}$ is the maximum common-mode voltage slew rate that can be sustained while maintaining $\mathrm{V}_{\mathrm{O}}>0.8 \mathrm{~V}_{\mathrm{DD} 2}$. $\mathrm{CM}_{\mathrm{L}}$ is the maximum common-mode voltage slew rate that can be sustained while maintaining $\mathrm{V}_{0}<0.8 \mathrm{~V}$. The common-mode voltage slew rates apply to both rising and falling common-mode voltage edges. The transient magnitude is the range over which the common mode is slewed.
${ }^{8}$ Dynamic supply current is the incremental amount of supply current required for a 1 Mbps increase in signal data rate. See Figure 6 through Figure 8 for information on per-channel supply current for unloaded and loaded conditions. See the Power Consumption section for guidance on calculating the per-channel supply current for a given data rate.

## ELECTRICAL CHARACTERISTICS—3 V, $105^{\circ} \mathrm{C}$ OPERATION

All voltages are relative to their respective ground. $2.7 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DD} 1} \leq 3.6 \mathrm{~V}, 2.7 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DD} 2} \leq 3.6 \mathrm{~V}$; all minimum/maximum specifications apply over the entire recommended operation range, unless otherwise noted; all typical specifications are at $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}, \mathrm{V}_{\mathrm{DD} 1}=\mathrm{V}_{\mathrm{DD} 2}=3.0 \mathrm{~V}$. These specifications do not apply to ADuM1300W and ADuM1301W automotive grade versions.

| Refresh Rate | $\mathrm{fr}_{\mathrm{r}}$ |  | 1.1 |  | Mbps |  |
| Input Dynamic Supply Current per Channel ${ }^{8}$ | ${ }_{\text {DII ( })^{\prime}}$ |  | 0.10 |  | mA/Mbps |  |
| Output Dynamic Supply Current per Channel ${ }^{8}$ | $\mathrm{l}_{\mathrm{DDO}}(\mathrm{D})$ |  | 0.03 |  | mA/Mbps |  |

1 The supply current values are for all three channels combined when running at identical data rates. Output supply current values are specified with no output load present. The supply current associated with an individual channel operating at a given data rate may be calculated as described in the Power Consumption section. See Figure 6 through Figure 8 for information on per-channel supply current as a function of data rate for unloaded and loaded conditions. See Figure 9 through Figure 12 for total $\mathrm{V}_{\mathrm{DD} 1}$ and $\mathrm{V}_{\mathrm{DD} 2}$ supply currents as a function of data rate for ADuM1300/ADuM1301 channel configurations.
2 The minimum pulse width is the shortest pulse width at which the specified pulse width distortion is guaranteed.
3 The maximum data rate is the fastest data rate at which the specified pulse width distortion is guaranteed.
${ }^{4}$ t $_{\text {PHL }}$ propagation delay is measured from the $50 \%$ level of the falling edge of the VIx signal to the $50 \%$ level of the falling edge of the VOx signal. tpLH propagation delay is measured from the $50 \%$ level of the rising edge of the VIx signal to the $50 \%$ level of the rising edge of the VOx signal.

## SPECIFICATIONS

${ }^{5} t_{\text {PSK }}$ is the magnitude of the worst-case difference in $t_{\text {PHL }}$ or $t_{\text {PLH }}$ that is measured between units at the same operating temperature, supply voltages, and output load within the recommended operating conditions.
${ }^{6}$ Codirectional channel-to-channel matching is the absolute value of the difference in propagation delays between any two channels with inputs on the same side of the isolation barrier. Opposing-directional channel-to-channel matching is the absolute value of the difference in propagation delays between any two channels with inputs on opposing sides of the isolation barrier.
${ }^{7} \mathrm{CM}_{\mathrm{H}}$ is the maximum common-mode voltage slew rate that can be sustained while maintaining $\mathrm{V}_{\mathrm{O}}>0.8 \mathrm{~V}_{\mathrm{DD2}}$. $\mathrm{CM}_{\mathrm{L}}$ is the maximum common-mode voltage slew rate that can be sustained while maintaining $\mathrm{V}_{0}<0.8 \mathrm{~V}$. The common-mode voltage slew rates apply to both rising and falling common-mode voltage edges. The transient magnitude is the range over which the common mode is slewed.
${ }^{8}$ Dynamic supply current is the incremental amount of supply current required for a 1 Mbps increase in signal data rate. See Figure 6 through Figure 8 for information on per-channel supply current for unloaded and loaded conditions. See the Power Consumption section for guidance on calculating the per-channel supply current for a given data rate.

## ELECTRICAL CHARACTERISTICS—MIXED 5 V/3 V OR 3 V/5 V, $105^{\circ} \mathrm{C}$ OPERATION

All voltages are relative to their respective ground. $5 \mathrm{~V} / 3 \mathrm{~V}$ operation: $4.5 \mathrm{~V} \leq \mathrm{V}_{D D 1} \leq 5.5 \mathrm{~V}, 2.7 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DD} 2} \leq 3.6 \mathrm{~V} ; 3 \mathrm{~V} / 5 \mathrm{~V}$ operation: $2.7 \mathrm{~V} \leq$ $\mathrm{V}_{D D 1} \leq 3.6 \mathrm{~V}, 4.5 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DD} 2} \leq 5.5 \mathrm{~V}$; all minimum/maximum specifications apply over the entire recommended operation range, unless otherwise noted; all typical specifications are at $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C} ; \mathrm{V}_{\mathrm{DD} 1}=3.0 \mathrm{~V}, \mathrm{~V}_{\mathrm{DD} 2}=5 \mathrm{~V}$ or $\mathrm{V}_{\mathrm{DD} 1}=5 \mathrm{~V}, \mathrm{~V}_{\mathrm{DD} 2}=3.0 \mathrm{~V}$. These specifications do not apply to ADuM1300W and ADuM1301W automotive grade versions.

1 The supply current values are for all three channels combined when running at identical data rates. Output supply current values are specified with no output load present. The supply current associated with an individual channel operating at a given data rate may be calculated as described in the Power Consumption section. See Figure 6 through Figure 8 for information on per-channel supply current as a function of data rate for unloaded and loaded conditions. See Figure 9 through Figure 12 for total $\mathrm{V}_{\mathrm{DD} 1}$ and $\mathrm{V}_{D D 2}$ supply currents as a function of data rate for ADuM1300/ADuM1301 channel configurations.

## SPECIFICATIONS

2 The minimum pulse width is the shortest pulse width at which the specified pulse width distortion is guaranteed.
3 The maximum data rate is the fastest data rate at which the specified pulse width distortion is guaranteed.
${ }^{4} t_{\text {PHL }}$ propagation delay is measured from the $50 \%$ level of the falling edge of the $V_{\text {IX }}$ signal to the $50 \%$ level of the falling edge of the $V_{0 x}$ signal. $t_{\text {pLH }}$ propagation delay is measured from the $50 \%$ level of the rising edge of the $\mathrm{V}_{1 \mathrm{x}}$ signal to the $50 \%$ level of the rising edge of the $\mathrm{V}_{0 \mathrm{x}}$ signal.
${ }^{5} t_{\text {PSK }}$ is the magnitude of the worst-case difference in $t_{\text {PHL }}$ or $t_{\text {PLH }}$ that is measured between units at the same operating temperature, supply voltages, and output load within the recommended operating conditions.
${ }^{6}$ Codirectional channel-to-channel matching is the absolute value of the difference in propagation delays between any two channels with inputs on the same side of the isolation barrier. Opposing-directional channel-to-channel matching is the absolute value of the difference in propagation delays between any two channels with inputs on opposing sides of the isolation barrier.
${ }^{7} \mathrm{CM}_{\mathrm{H}}$ is the maximum common-mode voltage slew rate that can be sustained while maintaining $\mathrm{V}_{\mathrm{O}}>0.8 \mathrm{~V}_{\mathrm{DD} 2}$. $\mathrm{CM}_{\mathrm{L}}$ is the maximum common-mode voltage slew rate that can be sustained while maintaining $\mathrm{V}_{0}<0.8 \mathrm{~V}$. The common-mode voltage slew rates apply to both rising and falling common-mode voltage edges. The transient magnitude is the range over which the common mode is slewed.
8 Dynamic supply current is the incremental amount of supply current required for a 1 Mbps increase in signal data rate. See Figure 6 through Figure 8 for information on per-channel supply current for unloaded and loaded conditions. See the Power Consumption section for guidance on calculating the per-channel supply current for a given data rate.

## ELECTRICAL CHARACTERISTICS— $5 \mathrm{~V}, 125^{\circ} \mathrm{C}$ OPERATION

All voltages are relative to their respective ground. $4.5 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DD} 1} \leq 5.5 \mathrm{~V}, 4.5 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DD} 2} \leq 5.5 \mathrm{~V}$; all minimum/maximum specifications apply over the entire recommended operation range, unless otherwise noted; all typical specifications are at $T_{A}=25^{\circ} \mathrm{C}, \mathrm{V}_{\mathrm{DD} 1}=\mathrm{V}_{\mathrm{DD} 2}=5 \mathrm{~V}$. These specifications apply to ADuM1300W and ADuM1301W automotive grade versions.

| Refresh Rate | $\mathrm{f}_{\mathrm{r}}$ |  | 1.2 |  | Mbps |  |
| Input Dynamic Supply Current per Channel ${ }^{8}$ | 1 DDI (D) |  | 0.19 |  | mA/Mbps |  |
| Output Dynamic Supply Current per Channel ${ }^{8}$ | $1 \mathrm{IDDO}_{(\mathrm{D})}$ |  | 0.05 |  | mA/Mbps |  |

1 The supply current values are for all three channels combined when running at identical data rates. Output supply current values are specified with no output load present. The supply current associated with an individual channel operating at a given data rate may be calculated as described in the Power Consumption section. See Figure 6 through Figure 8 for information on per-channel supply current as a function of data rate for unloaded and loaded conditions. See Figure 9 through Figure 12 for total $V_{D D 1}$ and $V_{D D 2}$ supply currents as a function of data rate for ADuM1300W/ADuM1301W channel configurations.
2 The minimum pulse width is the shortest pulse width at which the specified pulse width distortion is guaranteed.
3 The maximum data rate is the fastest data rate at which the specified pulse width distortion is guaranteed.
${ }^{4} t_{\text {PHL }}$ propagation delay is measured from the $50 \%$ level of the falling edge of the $V_{\text {IX }}$ signal to the $50 \%$ level of the falling edge of the $V_{0 x}$ signal. tpLH propagation delay is measured from the $50 \%$ level of the rising edge of the $\mathrm{V}_{\mathrm{Ix}}$ signal to the $50 \%$ level of the rising edge of the $\mathrm{V}_{0 \mathrm{x}}$ signal.
$5 t_{\text {PSK }}$ is the magnitude of the worst-case difference in $t_{\text {PHL }}$ or $t_{\text {PLH }}$ that is measured between units at the same operating temperature, supply voltages, and output load within the recommended operating conditions.
${ }^{6}$ Codirectional channel-to-channel matching is the absolute value of the difference in propagation delays between any two channels with inputs on the same side of the isolation barrier. Opposing-directional channel-to-channel matching is the absolute value of the difference in propagation delays between any two channels with inputs on opposing sides of the isolation barrier.
${ }^{7} \mathrm{CM}_{\mathrm{H}}$ is the maximum common-mode voltage slew rate that can be sustained while maintaining $\mathrm{V}_{\mathrm{O}}>0.8 \mathrm{~V}_{\mathrm{DD} 2}$. CML is the maximum common-mode voltage slew rate that can be sustained while maintaining $\mathrm{V}_{0}<0.8 \mathrm{~V}$. The common-mode voltage slew rates apply to both rising and falling common-mode voltage edges. The transient magnitude is the range over which the common mode is slewed.

## SPECIFICATIONS

${ }^{8}$ Dynamic supply current is the incremental amount of supply current required for a 1 Mbps increase in signal data rate. See Figure 6 through Figure 8 for information on per-channel supply current for unloaded and loaded conditions. See the Power Consumption section for guidance on calculating the per-channel supply current for a given data rate.

## ELECTRICAL CHARACTERISTICS—3 V, $125^{\circ} \mathrm{C}$ OPERATION

All voltages are relative to their respective ground. $3.0 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DD} 1} \leq 3.6 \mathrm{~V}, 3.0 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DD} 2} \leq 3.6 \mathrm{~V}$; all minimum/maximum specifications apply over the entire recommended operation range, unless otherwise noted; all typical specifications are at $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}, \mathrm{V}_{\mathrm{DD} 1}=\mathrm{V}_{\mathrm{DD} 2}=3.0 \mathrm{~V}$. These specifications apply to ADuM1300W and ADuM1301W automotive grade versions.

| Refresh Rate | $\mathrm{f}_{\mathrm{r}}$ |  | 1.2 |  | Mbps |  |
| Input Dynamic Supply Current per Channel ${ }^{8}$ | 1 DDI (D) |  | 0.19 |  | mA/Mbps |  |
| Output Dynamic Supply Current per Channel ${ }^{8}$ | $\mathrm{I}_{\text {DO ( }}(\mathrm{D})$ |  | 0.03 |  | mA/Mbps |  |

1 The supply current values are for all three channels combined when running at identical data rates. Output supply current values are specified with no output load present. The supply current associated with an individual channel operating at a given data rate may be calculated as described in the Power Consumption section. See Figure 6 through Figure 8 for information on per-channel supply current as a function of data rate for unloaded and loaded conditions. See Figure 9 through Figure 12 for total $V_{\text {DD1 }}$ and $\mathrm{V}_{\text {DD2 }}$ supply currents as a function of data rate for ADuM1300W/ADuM1301W channel configurations.
${ }^{2}$ The minimum pulse width is the shortest pulse width at which the specified pulse width distortion is guaranteed.
${ }^{3}$ The maximum data rate is the fastest data rate at which the specified pulse width distortion is guaranteed.
${ }^{4} t_{\text {PHL }}$ propagation delay is measured from the $50 \%$ level of the falling edge of the $V_{\text {IX }}$ signal to the $50 \%$ level of the falling edge of the $V_{O x}$ signal. $t_{\text {pLH }}$ propagation delay is measured from the $50 \%$ level of the rising edge of the $\mathrm{V}_{\mathrm{I}}$ signal to the $50 \%$ level of the rising edge of the $\mathrm{V}_{0 \mathrm{x}}$ signal.
${ }^{5} t_{\text {PSK }}$ is the magnitude of the worst-case difference in $t_{\text {PHL }}$ or $t_{\text {PLH }}$ that is measured between units at the same operating temperature, supply voltages, and output load within the recommended operating conditions.
${ }^{6}$ Codirectional channel-to-channel matching is the absolute value of the difference in propagation delays between any two channels with inputs on the same side of the isolation barrier. Opposing-directional channel-to-channel matching is the absolute value of the difference in propagation delays between any two channels with inputs on opposing sides of the isolation barrier.
${ }^{7} \mathrm{CM}_{H}$ is the maximum common-mode voltage slew rate that can be sustained while maintaining $\mathrm{V}_{\mathrm{O}}>0.8 \mathrm{~V}_{\mathrm{DD2}}$. $\mathrm{CM}_{\mathrm{L}}$ is the maximum common-mode voltage slew rate that can be sustained while maintaining $\mathrm{V}_{0}<0.8 \mathrm{~V}$. The common-mode voltage slew rates apply to both rising and falling common-mode voltage edges. The transient magnitude is the range over which the common mode is slewed.
${ }^{8}$ Dynamic supply current is the incremental amount of supply current required for a 1 Mbps increase in signal data rate. See Figure 6 through Figure 8 for information on per-channel supply current for unloaded and loaded conditions. See the Power Consumption section for guidance on calculating the per-channel supply current for a given data rate.

## SPECIFICATIONS

## ELECTRICAL CHARACTERISTICS—MIXED 3 V/5 V, $125^{\circ} \mathrm{C}$ OPERATION

All voltages are relative to their respective ground. $3.0 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DD} 1} \leq 3.6 \mathrm{~V}, 4.5 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DD} 2} \leq 5.5 \mathrm{~V}$; all minimum/maximum specifications apply over the entire recommended operation range, unless otherwise noted; all typical specifications are at $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C} ; \mathrm{V}_{\mathrm{DD} 1}=3.0 \mathrm{~V}, \mathrm{~V}_{\mathrm{DD} 2}=5 \mathrm{~V}$. These apply to ADuM1300W and ADuM1301W automotive grade versions.

1 Device is considered a 2-terminal device; Pin 1 , Pin 2 , Pin 3 , Pin 4 , Pin 5 , Pin 6 , Pin 7 , and Pin 8 are shorted together and Pin 9 , Pin 10 , Pin 11 , Pin 12 , Pin 13 , Pin 14 , Pin 15 , and Pin 16 are shorted together
2 Input capacitance is from any input data pin to ground.

## REGULATORY INFORMATION

The ADuM1300/ADuM1301 are approved by the organizations listed in Table 9. Refer to Table 14 and the Insulation Lifetime section for details regarding recommended maximum working voltages for specific cross-isolation waveforms and insulation levels.

Table 9.

| UL | CSA | CQC | VDE | TÜV |
| :---: | :---: | :---: | :---: | :---: |
| Recognized Under 1577 <br> Component Recognition Program ${ }^{1}$ | Approved under CSA Component Acceptance Notice 5A | Approved under CQC11-471543-2012 | Certified according to DIN V VDE V 0884-10(VDE V 0884-10):2006-12 ${ }^{2}$ | Approved according to IEC 61010-1:2001 (2 ${ }^{\text {nd }}$ Edition), EN 61010-1:2001 (2 $2^{\text {nd }}$ Edition), UL 61010-1:2004 CSA C22.2.61010.1:2005 |
| Single Protection, 2500 V rms Isolation Voltage | Basic insulation per CSA 60950-1-03 and IEC 60950-1, 800 V rms (1131 V peak) maximum working voltage <br> Reinforced insulation per CSA 60950-1-03 and IEC 60950-1, 400 V rms ( 566 V peak) maximum working voltage | Basic insulation per GB4943.1-2011 <br> Basic insulation, 415 V rms ( 588 V peak) maximum working voltage, tropical climate, altitude $\leq 5000 \mathrm{~m}$ | Reinforced insulation, 560 V peak | Reinforced insulation, 400 V rms maximum working voltage |
| File E214100 | File 205078 | File: CQC14001114900 | File 2471900-4880-0001 | Certificate U8V 050656232002 |

1 In accordance with UL 1577, each ADuM1300/ADuM1301 is proof tested by applying an insulation test voltage $\geq 3000 \mathrm{Vrms}$ for 1 sec (current leakage detection limit $=5$ $\mu \mathrm{A}$ ).
${ }^{2}$ In accordance with DIN V VDE V 0884-10, each ADuM1300/ADuM1301 is proof tested by applying an insulation test voltage $\geq 1050 \mathrm{~V}$ peak for 1 sec (partial discharge detection limit = 5 pC ). The * marking branded on the component designates DIN V VDE V 0884-10 approval.

## ABSOLUTE MAXIMUM RATINGS

Ambient temperature $=25^{\circ} \mathrm{C}$, unless otherwise noted.
Table 13.

| Parameter | Rating |
| :---: | :---: |
| Storage Temperature ( $\mathrm{T}_{\text {ST }}$ ) | $-65^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$ |
| Ambient Operating Temperature $\left(T_{A}\right)^{1}$ | $-40^{\circ} \mathrm{C}$ to $+105^{\circ} \mathrm{C}$ |
| Ambient Operating Temperature $\left(\mathrm{T}_{\mathrm{A}}\right)^{2}$ | $-40^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$ |
| Supply Voltages ( $\left.\mathrm{V}_{\mathrm{DD} 1}, \mathrm{~V}_{\mathrm{DD} 2}\right)^{3}$ | -0.5 V to +7.0 V |
| Input Voltage ( $\left.\mathrm{V}_{\mathrm{I}}, \mathrm{V}_{\mathrm{IB}}, \mathrm{V}_{\mathrm{IC}}, \mathrm{V}_{\mathrm{E} 1}, \mathrm{~V}_{\mathrm{E} 2}\right)^{3,4}$ | -0.5 V to $\mathrm{V}_{\text {DII }}+0.5 \mathrm{~V}$ |
| Output Voltage ( $\left.\mathrm{V}_{\text {OA }}, \mathrm{V}_{\text {OB }}, \mathrm{V}_{\text {OC }}\right)^{3,4}$ | -0.5 V to $\mathrm{V}_{\text {DDO }}+0.5 \mathrm{~V}$ |
| Average Output Current per Pin ${ }^{5}$ |  |
| Side 1 (101) | -23 mA to +23 mA |
| Side 2 ( $\mathrm{l}_{02}$ ) | $-30 \mathrm{~mA} \mathrm{to}+30 \mathrm{~mA}$ |
| Common-Mode Transients ${ }^{6}$ | $-100 \mathrm{kV} / \mathrm{\mu s}$ to $+100 \mathrm{kV} / \mu \mathrm{s}$ |
| 1 Does not apply to ADuM1300W and ADuM1301W automotive grade versions. |  |
| ${ }^{2}$ Applies to ADuM1300W and ADuM1301W automotive grade versions. |  |
| ${ }^{3}$ All voltages are relative to their respective ground. |  |
| ${ }^{4} V_{D D I}$ and $V_{D D O}$ refer to the supply voltages on the input and output sides of a given channel, respectively. See the Printed Circuit Board (PCB) Layout section. |  |

5 See Figure 3 for maximum rated current values for various temperatures.
6 This refers to common-mode transients across the insulation barrier. Commonmode transients exceeding the Absolute Maximum Ratings may cause latch-up or permanent damage.

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

## ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devi-
 ces and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

## MAXIMUM CONTINUOUS WORKING VOLTAGE AND TRUTH TABLE

Table 14. Maximum Continuous Working Voltage ${ }^{1}$

| Parameter | Max | Unit | Constraint |
| :--- | :--- | :--- | :--- |
| AC Voltage, Bipolar Waveform | 565 | V peak | 50-year minimum lifetime |
| AC Voltage, Unipolar Waveform |  |  |  |
| Basic Insulation <br> Reinforced Insulation | 1131 | V peak | Maximum approved working voltage per IEC 60950-1 |
| DC Voltage |  | V peak | Maximum approved working voltage per IEC 60950-1 and VDE V 0884-10 |
| Basic Insulation | 1131 | V peak | Maximum approved working voltage per IEC 60950-1 |
| Reinforced Insulation | 560 | V peak | Maximum approved working voltage per IEC 60950-1 and VDE V 0884-10 |

${ }^{1}$ Refers to continuous voltage magnitude imposed across the isolation barrier. See the Insulation Lifetime section for more details.

## APPLICATIONS INFORMATION

## PRINTED CIRCUIT BOARD (PCB) LAYOUT

The ADuM1300/ADuM1301 digital isolator requires no external interface circuitry for the logic interfaces. Power supply bypassing is strongly recommended at the input and output supply pins (see Figure 14). Bypass capacitors are most conveniently connected between Pin 1 and $\operatorname{Pin} 2$ for $V_{D D 1}$ and between Pin 15 and Pin 16 for $\mathrm{V}_{\mathrm{DD} 2}$. The capacitor value should be between $0.01 \mu \mathrm{~F}$ and 0.1 $\mu \mathrm{F}$. The total lead length between both ends of the capacitor and the input power supply pin should not exceed 20 mm . Bypassing between Pin 1 and Pin 8 and between Pin 9 and Pin 16 should also be considered unless the ground pair on each package side is connected close to the package.

Figure 14. Recommended Printed Circuit Board Layout
In applications involving high common-mode transients, take care to ensure that board coupling across the isolation barrier is minimized. Furthermore, the board layout should be designed such that any coupling that does occur equally affects all pins on a given component side. Failure to ensure this could cause voltage differentials between pins exceeding the absolute maximum ratings of the device, thereby leading to latch-up or permanent damage.
See the AN-1109 Application Note for board layout guidelines.

## PROPAGATION DELAY-RELATED PARAMETERS

Propagation delay is a parameter that describes the time it takes a logic signal to propagate through a component. The propagation delay to a logic low output may differ from the propagation delay to a logic high output.

Figure 15. Propagation Delay Parameters
Pulse width distortion is the maximum difference between these two propagation delay values and is an indication of how accurately the timing of the input signal is preserved.

Channel-to-channel matching refers to the maximum amount that the propagation delay differs between channels within a single ADuM1300/ADuM1301 component.

Propagation delay skew refers to the maximum amount that the propagation delay differs between multiple ADuM1300/ADuM1301 components operating under the same conditions.

## DC CORRECTNESS AND MAGNETIC FIELD IMMUNITY

Positive and negative logic transitions at the isolator input cause narrow (approximately 1 ns ) pulses to be sent to the decoder via the transformer. The decoder is bistable and is therefore either set or reset by the pulses, indicating input logic transitions. In the absence of logic transitions at the input for more than approximately $1 \mu \mathrm{~s}$, a periodic set of refresh pulses indicative of the correct input state are sent to ensure dc correctness at the output. If the decoder receives no internal pulses for more than about $5 \mu \mathrm{~s}$, the input side is assumed to be unpowered or nonfunctional, in which case the isolator output is forced to a default state (see Table 15) by the watchdog timer circuit.

The ADuM1300/ADuM1301 is extremely immune to external magnetic fields. The limitation on the magnetic field immunity of the ADuM1300/ADuM1301 is set by the condition in which induced voltage in the receiving coil of the transformer is sufficiently large enough to either falsely set or reset the decoder. The following analysis defines the conditions under which this may occur. The 3 V operating condition of the ADuM1300/ADuM1301 is examined because it represents the most susceptible mode of operation.
The pulses at the transformer output have an amplitude greater than 1.0 V . The decoder has a sensing threshold at about 0.5 V , thus establishing a 0.5 V margin in which induced voltages can be tolerated. The voltage induced across the receiving coil is given by $V=(-d \beta / d t) \sum \Pi r_{n}^{2} ; n=1,2, \ldots, N$
where:
$\beta$ is magnetic flux density (gauss).
$N$ is the number of turns in the receiving coil.
$r_{n}$ is the radius of the $\mathrm{n}^{\text {th }}$ turn in the receiving coil (cm).
Given the geometry of the receiving coil in the ADuM1300/ADuM1301 and an imposed requirement that the induced voltage be $50 \%$ at most of the 0.5 V margin at the decoder, a maximum allowable magnetic field is calculated as shown in Figure 16.

## APPLICATIONS INFORMATION

Figure 16. Maximum Allowable External Magnetic Flux Density
For example, at a magnetic field frequency of 1 MHz , the maximum allowable magnetic field of 0.2 kgauss induces a voltage of 0.25 V at the receiving coil. This is about $50 \%$ of the sensing threshold and does not cause a faulty output transition. Similarly, if such an event occurs during a transmitted pulse (and has the worst-case polarity), it reduces the received pulse from $>1.0 \mathrm{~V}$ to 0.75 V -still well above the 0.5 V sensing threshold of the decoder.

The preceding magnetic flux density values correspond to specific current magnitudes at given distances from the ADuM1300/ADuM1301 transformers. Figure 17 shows these allowable current magnitudes as a function of frequency for selected distances. The ADuM1300/ADuM1301 is extremely immune and can be affected only by extremely large currents operated at a high frequency very close to the component. For the 1 MHz example noted, one would have to place a 0.5 kA current 5 mm away from the ADuM1300/ADuM1301 to affect the operation of the component.

Figure 17. Maximum Allowable Current for Various Current-to-ADuM1300/ ADuM1301 Spacings

Note that at combinations of strong magnetic field and high frequency, any loops formed by printed circuit board traces could induce error voltages sufficiently large enough to trigger the thresh-
olds of succeeding circuitry. Take care in the layout of such traces to avoid this possibility.

## POWER CONSUMPTION

The supply current at a given channel of the ADuM1300/ADuM1301 isolator is a function of the supply voltage, the data rate of the channel, and the output load of the channel.

For each input channel, the supply current is given by
$I_{D D I}=I_{D D I(Q)} \quad f \leq 0.5 f_{r}$
$I_{D D I}=I_{D D(D)} \times\left(2 f-f_{r}\right)+I_{D D I(Q)} \quad f>0.5 f_{r}$
For each output channel, the supply current is given by

$$
\begin{aligned}
& I_{D D O}=I_{D D O(Q)} f \leq 0.5 f_{r} \\
& I_{D D O}=\left(I_{D D O(D)}+\left(0.5 \times 10^{-3}\right) \times C_{L} \times V_{D D O}\right) \times\left(2 f-f_{r}\right)+I_{D D O(Q)} \\
& f>0.5 f_{r}
\end{aligned}
$$

where:
$I_{D D I(D)}, I_{D D O \text { (D) }}$ are the input and output dynamic supply currents per channel (mA/Mbps).
$C_{L}$ is the output load capacitance (pF).
$V_{D D O}$ is the output supply voltage (V).
$f$ is the input logic signal frequency (MHz); it is half of the input data rate expressed in units of Mbps.
$f_{r}$ is the input stage refresh rate (Mbps).
$I_{D D I(Q)}, I_{D D O(Q)}$ are the specified input and output quiescent supply currents (mA).

To calculate the total $\mathrm{V}_{\mathrm{DD} 1}$ and $\mathrm{V}_{\mathrm{DD} 2}$ supply current, the supply currents for each input and output channel corresponding to $\mathrm{V}_{\mathrm{DD1}}$ and $V_{D D 2}$ are calculated and totaled. Figure 6 and Figure 7 provide perchannel supply currents as a function of data rate for an unloaded output condition. Figure 8 provides per-channel supply current as a function of data rate for a 15 pF output condition. Figure 9 through Figure 12 provide total $\mathrm{V}_{\mathrm{DD} 1}$ and $\mathrm{V}_{\mathrm{DD} 2}$ supply current as a function of data rate for ADuM1300/ADuM1301 channel configurations.

## INSULATION LIFETIME

All insulation structures eventually break down when subjected to voltage stress over a sufficiently long period. The rate of insulation degradation is dependent on the characteristics of the voltage waveform applied across the insulation. In addition to the testing performed by the regulatory agencies, Analog Devices carries out an extensive set of evaluations to determine the lifetime of the insulation structure within the ADuM1300/ADuM1301.

Analog Devices performs accelerated life testing using voltage levels higher than the rated continuous working voltage. Acceleration factors for several operating conditions are determined. These factors allow calculation of the time to failure at the actual working voltage. The values shown in Table 14 summarize the peak voltage for 50 years of service life for a bipolar ac operating condition and the maximum CSA/VDE approved working voltages. In many

## APPLICATIONS INFORMATION

cases, the approved working voltage is higher than the 50 -year service life voltage. Operation at these high working voltages can lead to shortened insulation life in some cases.
The insulation lifetime of the ADuM1300/ADuM1301 depends on the voltage waveform type imposed across the isolation barrier. The iCoupler insulation structure degrades at different rates depending on whether the waveform is bipolar ac, unipolar ac, or dc. Figure 18, Figure 19, and Figure 20 illustrate these different isolation voltage waveforms, respectively.
Bipolar ac voltage is the most stringent environment. The goal of a 50 -year operating lifetime under the ac bipolar condition determines the Analog Devices recommended maximum working voltage.

In the case of unipolar ac or dc voltage, the stress on the insulation is significantly lower, which allows operation at higher working voltages while still achieving a 50 -year service life. The working voltages listed in Table 14 can be applied while maintaining the 50 -year minimum lifetime provided the voltage conforms to either the unipolar ac or dc voltage cases. Any cross insulation voltage waveform that does not conform to Figure 19 or Figure 20 should be treated as a bipolar ac waveform, and its peak voltage should be limited to the 50 -year lifetime voltage value listed in Table 14.

Note that the voltage presented in Figure 19 is shown as sinusoidal for illustration purposes only. It is meant to represent any voltage waveform varying between 0 V and some limiting value. The limiting value can be positive or negative, but the voltage cannot cross 0 V .

${ }^{1}$ Z = RoHS Compliant Part.
2 W = Qualified for Automotive Applications.
3 The addition of an -RL suffix designates a $13^{\prime \prime}(1,000$ units) tape-and-reel option.

| ${ }^{1} \mathrm{Z}=$ RoHS Compliant Part. |  |

## OUTLINE DIMENSIONS

## AUTOMOTIVE PRODUCTS

The ADuM1300W/ADuM1301W models are available with controlled manufacturing to support the quality and reliability requirements of automotive applications. Note that these automotive models may have specifications that differ from the commercial models; therefore, designers should review the Specifications section of this data sheet carefully. Only the automotive grade products shown are available for use in automotive applications. Contact your local Analog Devices account representative for specific product ordering information and to obtain the specific Automotive Reliability reports for these models.

[^0]:    ${ }^{1} V_{I X}$ and $V_{O x}$ refer to the input and output signals of a given channel ( $A, B$, or $C$ ). $V_{E x}$ refers to the output enable signal on the same side as the $V_{O x}$ outputs. $V_{D D I}$ and $V_{D D O}$ refer to the supply voltages on the input and output sides of the given channel, respectively.
    2 In noisy environments, connecting $\mathrm{V}_{\mathrm{Ex}}$ to an external logic high or low is recommended.
