## Precision Monolithic Quad SPST CMOS Analog Switches

## DESCRIPTION

The DG411 series of monolithic quad analog switches was designed to provide high speed, low error switching of precision analog signals. Combining low power ( $0.35 \mu \mathrm{~W}$ ) with high speed ( $\mathrm{t}_{\mathrm{ON}}$ : 110 ns ), the DG411 family is ideally suited for portable and battery powered industrial and military applications.
To achieve high-voltage ratings and superior switching performance, the DG411 series was built on Vishay Siliconix's high voltage silicon gate process. An epitaxial layer prevents latchup.
Each switch conducts equally well in both directions when on, and blocks input voltages up to the supply levels when off.
The DG411, DG412 respond to opposite control logic as shown in the Truth Table. The DG413 has two normally open and two normally closed switches.

## APPLICATIONS

## Single Supply Operation:

The DG411, DG412, DG413 can be operated with unipolar supplies from 5 V to 44 V . These devices are characterized and tested for unipolar supply operation at 12 V to facilitate the majority of applications. In single supply operation, $\mathrm{V}+$ is tied to $\mathrm{V}_{\mathrm{L}}$ and V - is tied to 0 V . See Input Switching Threshold vs. Supply Voltage curve for $\mathrm{V}_{\mathrm{L}}$ versus input threshold requirments.

Figure 7. Source/Drain Capacitances

## Summing Amplifier

When driving a high impedance, high capacitance load such as shown in figure 8, where the inputs to the summing amplifier have some noise filtering, it is necessary to have shunt switches for rapid discharge of the filter capacitor, thus preventing offsets from occurring at the output.
