## Type MLSH 125 °C Hermetic Slimpack<sup>™</sup>, Aluminum Electrolytic Capacitor

The world's only hermetically sealed aluminum electrolytic capacitor with glass-to-metal seal, type MLSH has extraordinary long life and rugged construction for the most demanding power electronics applications.

Type MLSH has superior capacitance retention compared to axial wet tantalum capacitors at -55 °C. Packaged in a robust stainless steel case capable of withstanding 80g's, it replaces 3 or more axial wet tantalum capacitors in parallel. Unlike wet tantalums that require voltage derating at temperatures above 85 °C, type MLSH capacitors are rated for full operating voltage at 125 °C and tested to 5000 hrs at rated voltage and temperature.

#### **Highlights**

- Hermetically sealed with no dry out
- Alternative to axial wet tantalum
- High capacitance retention @ -55 °C
- 5000 Hr DC life test
- Up to 80g vibration

### **Specifications**

# Type MLSH 125 °C Hermetic Slimpack<sup>™</sup>, Aluminum Electrolytic Capacitor

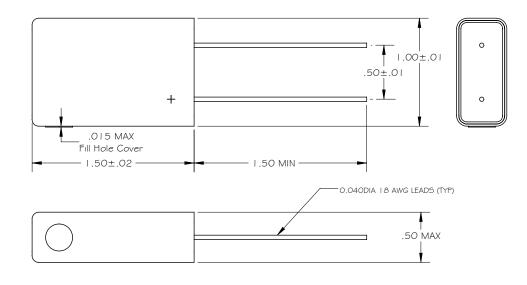

| Vibration Test                | LevelThe specimens, while deenergized or operating under the load conditions<br>specified, shall be subjected to the vibration amplitude, frequency range,<br>and duration specified for each case size.AmplitudeThe specimens shall be subjected to a simple harmonic motion having an<br>amplitude of either 0.06-inch double amplitude (maximum total excursion)<br>or peak level specified above, whichever is less. The tolerance on vibration<br>amplitude shall be ±10 percent.Frequency RangeThe vibration frequency shall be varied logarithmically between the<br>approximate limits of 10 to 2,000 Hz.Sweep Time and DurationThe entire frequency range of 10 to 2,000 Hz and return to 10 Hz shall be<br>traversed in 20 minutes. This cycle shall be performed 12 times in each<br>of three mutually perpendicular directions (total of 36 times), so that<br>the motion shall be applied for a total period of approximately 12 hours.Interruptions are permitted provided the requirements for rate of change<br>and test duration are met. |                           |             |      |  |  |  |  |  |
|-------------------------------|--|---------------------------|-------------|------|--|--|--|--|--|
| High Reliability Test/Burn-in | Established Reliability capacitors shall be subjected to a minimum of 100 percent of the DC rated voltage at 85 °C for 48 hours minimum but not to exceed 96 hours. During this test, capacitors shall be adequately protected against temporary voltage surges of 10 percent or more of the test voltage. After burn-in, the capacitors shall be returned to room ambient conditions and the DC leakage, capacitance, and ESR shall be measured with respect to specified limits.   |                           |             |      |  |  |  |  |  |

| Ripple Current Capability     | The ripple current capability is set by the maximum permissible internal core temperature, 125 °C.   |                           |             |      |  |  |  |  |  |
| Air Cooled                    | The ripple currents in the ratings tables are for 85 °C case temperatures.<br>For air temperatures without a heatsink use the multipliers for Ambient<br>Temperature, No Heatsink.   |                           |             |      |  |  |  |  |  |
| Heatsink Cooled               | Temperature rise from the hottest internal spot, the core, to ambient air is   |                           |             |      |  |  |  |  |  |
|                               | $\Delta T = I^2(ESR)(\theta cc + \theta ca)$ , recommended max $\Delta T$ of 30 °C   |                           |             |      |  |  |  |  |  |
|                               | where θcc is the thermal resistance from core to case and θca f<br>ambient. To calculate maximum ripple capability with the MLSH<br>a heatsink use the maximum core temperature and the values for   |                           |             |      |  |  |  |  |  |
| Example                       | As an illustration, suppose you operate an noninsulated MLSH172M050JK0C in 95 °C air and attach it to a commercial heatsink with a free-air thermal resistance of 2.7 °C/W. Use a good thermal grease between the MLSH and the heatsink, and the total thermal resistance is 2.7 +6. 6 or 9.3° C/W. The power which would heat the core to 125 °C is (125 - 95)/9. 3 or 3.2 W. For an ESR of 108 m $\Omega$ , 3.2 W equates to a ripple current of 5.45 A.   |                           |             |      |  |  |  |  |  |

Notice and Disclaimer: All product drawings, descriptions, specifications, statements, information and data (collectively, the "Information") in this datasheet or other publication are subject to change. The customer is responsible for checking, confirming and verifying the extent to which the Information contained in this datasheet or other publication is applicable to an order at the time the order is placed. All Information given herein is believed to be accurate and reliable, but it is presented without any guarantee, warranty, representation or responsibility of any kind, expressed or implied. Statements of suitability for certain applications are based on the knowledge that the Cornell Dubilier company providing such statements ("Cornell Dubilier") has of operating conditions that such Cornell Dubilier company regards as typical for such applications, but are not intended to constitute any guarantee, warranty or representation regarding any such matter – and Cornell Dubilier specifically and expressly disclaims any guarantee, warranty or representation concerning the suitability for a specific customer application, use, storage, transportation, or operating environment. The Information is intended for use only by customers who have the requisite experience and capability to determine the correct products for their application. Any technical advice inferred from this Information or otherwise provided by Cornell Dubilier with reference to the use of any Cornell Dubilier products is given gratis (unless otherwise specified by Cornell Dubilier), and Cornell Dubilier assumes no obligation or liability for the advice given or results obtained. Although Cornell Dubilier strives to apply the most stringent quality and safety standards regarding the design and manufacturing of its products, in light of the current state of the art, isolated component failures may still occur. Accordingly, customer applications which require a high degree of reliability or safety should employ suitable designs or other safeguards (such as installation of protective circuitry or redundancies or other appropriate protective measures) in order to ensure that the failure of an electrical component does not result in a risk of personal injury or property damage. Although all product-related warnings, cautions and notes must be observed, the customer should not assume that all safety measures are indicated in such warnings, cautions and notes, or that other safety measures may not be required.
