Remarks:

1) Specifications are for 90-minute warm-up and 100 NPLC integration time. For integration time <100 NPLC, add the appropriate "RMS Noise Adder" listed in the following table.
2) 10 % over range on all ranges except DCV 1000 V and DCI 10 A range.
3) Relative to calibration standards.
4) For each additional volt over ± 500 V, add 0.03 mV error.
5) For continuous current > 7A DC or 7A AC RMS, use 30 seconds ON followed by 30 seconds OFF.
6) Specifications are for 4-wire resistance measurement or 2-wire resistance measurement using REL operation. Without REL operation, add 0.2 Ω additional error in 2-wire resistance measurement.
7) Accuracy specifications for the voltage measured at the input terminal only. 1 mA test current is typical. Variation in the current source will create some variation in the voltage drop across a diode junction. Adjustable voltage range: 0 ~ 4V.

Diode Threshold	Adjustable from 0 to 4 V
Continuity Threshold	Adjustable from 1 Ω to 2 KΩ

Settling Time Considerations

Reading settling times are affected by source impedance, cable dielectric characteristics and input signal changes.
The default measurement delay is selected to the correct reading for most measurements.

Measurement Considerations

Teflon or other high-impedance, low-dielectric absorption wire insulation is recommended for these measurements.

True RMS AC Voltage

Measurement Method	AC-coupled True-RMS measurement with up to 400 V DC bias on any range.
Crest Factor	≤ 5 at full range
Input Impedance	1 MΩ ± 2 % in parallel with <150 pF capacitance on any range
Input Protection	750V rms on all ranges
AC Filter Bandwidth	Slow: 3 Hz ~ 300 KHz
	Medium: 20 Hz ~ 300 KHz
	Fast: 200 Hz ~ 300 KHz
CMRR (common mode rejection ratio)	70 dB, for the 1 kΩ unbalance in LO lead, < 60 Hz, ± 500 VDC peak maximum

True RMS AC Current

Measurement Method	Direct coupled to the fuse and shunt; AC-coupled True RMS measurement (Measure the AC component only).
Crest Factor	≤ 3 at full range
Max. Input	DC + AC current peak value < 300 % of range. The RMS current < 10 A rms including the DC component.
Shunt Resistor	100 Ω for 200 uA , 2 mA
	1 Ω for 20 mA, 200 mA
	0.01 Ω for 2 A, 10 A
Input Protection	Externally accessible 500 mA, 250 V fast blow fuse
	Internal 12 A, 250 V slow blow fuse

Settling Time Considerations

The default measurement delay is selected to give the correct reading for most measurements. Make sure the RC circuit of the input terminal has fully settled (about 1s) before taking higher accuracy measurements.
Applying > 300 Vrms (or > 5 Arms) will cause self-heating of signal-conditioning components and these error are included in the instrument specifications. Internal temperature changes due to self-heating may cause additional error on lower ac voltage ranges. The additional error will be lower than 0.02 % of reading and will generally dissipate within a few minutes as the signal-conditioning components return to normal operating temperature.

Frequency and Period

Measurement Method	Reciprocal-counting technique, AC-coupled input using the AC voltage function.
Input Impedance	1 MΩ ± 2% in parallel with < 150 pF capacitance on any range
Input Protection	750 V rms on all ranges
Measurement Considerations	All frequency counters are susceptible to error when measuring low-voltage, low-frequency signals. Shielding inputs from external noise is recommended.
Settling Time Considerations	Errors will occur when attempting to measure the frequency or period of an input following a dc offset voltage change. Make sure the RC input circuit at the input terminals has fully settled (about 1 s) before making accurate measurements.

Capacitance Measurement

Measurement Method	Apply constant current into the capacitance, and measure the rate of voltage change.
Connection Type	2-wire
Input Protection	1000 V on all ranges
Measurement considerations	Since small capacitance measurements are susceptible to the external noise, shielding inputs from external noise pickup is critical for minimizing measurement errors.

Temperature Measurement

Measurement Method	Support for TC and RTD types of sensor
Measurement considerations	The built-in cold junction temperature tracks the temperature inside the banana jack. The change of the temperature in the banana jack may cause additional error. When using the built-in cold junction compensation, connect the sensor terminal of the thermocouple to the banana jack and allow it to warm up for at least 3 minutes to minimize errors.
