

STM1831

Voltage detector with sense input and external delay capacitor

Features

- Voltage monitored on separate sense input V_{SEN}
- Factory-trimmed voltage thresholds in 100 mV increments from 1.6 V to 5.7 V
- $\pm 2\%$ voltage threshold accuracy
- Operating voltage 1.6 V to 6.0 V
- Open drain output
- Low supply current of 0.8 μA (typ.)
- Time delay programmable by external capacitor
- Power supply transient immunity
- Available in SOT23-5 package
- Operating temperature -40 to 85 °C

Applications

- Microprocessor reset circuitry
- Charge voltage monitors
- Memory battery backup switch circuits
- Power failure detection circuits

1 Description

The STM1831 is a voltage detector with very low current consumption. It monitors a voltage on a separate input pin (V_{SEN}), which is fully functional even if the monitored voltage goes down to 0 V. In addition, the delay of the output can be adjusted by an external capacitor.

Figure 1. Logic diagram

Table 1. Pin descriptions

Pin	Type	Name	Function
1	Output open drain	\overline{RST}	Active-low reset output
2	Power	V_{SS}	Ground
3	Power	V_{CC}	Supply voltage
4	Input	V_{SEN}	Sense voltage
5	I/O	C_D	Delay capacitor

Figure 2. SOT23-5 pin connections (top view)

1.1 Pin descriptions

See [Figure 1](#) and [Table 1](#) for a brief overview of the signals available on this device.

Power supply (V_{CC})

This pin is used to provide power to the device. A 0.1 μF decoupling ceramic capacitor is recommended to be connected between the V_{CC} and V_{SS} pins, as close to the STM1831 device as possible.

Sense voltage input (V_{SEN})

Input voltage on this pin is monitored. When it drops below the threshold (V_{DET}), reset output (\overline{RST}) is asserted. If V_{CC} is close to 0 V, internal logic disconnects the voltage divider from V_{SEN} input in order to minimize I_{SEN} current (see [Figure 3](#) and [Figure 20](#)).

Reset output (\overline{RST})

Reset output is asserted when the voltage on the V_{SEN} input pin drops below the threshold (V_{DET}).

The STM1831 has an open drain, active-low output which sinks current when the output is asserted. Connect a pull-up resistor from \overline{RST} to any supply voltage up to 6 V (see [Figure 4](#)). Select a resistor value large enough to register a logic low, and small enough to register a logic high, while all of the input current and leakage paths connected to the reset output line are being supplied. A 10 k Ω pull-up is sufficient in most applications.

The advantages of open drain output include the ability to connect more open drain outputs in parallel (wired OR connections) as well as connecting the output to a power supply voltage other than V_{CC} .

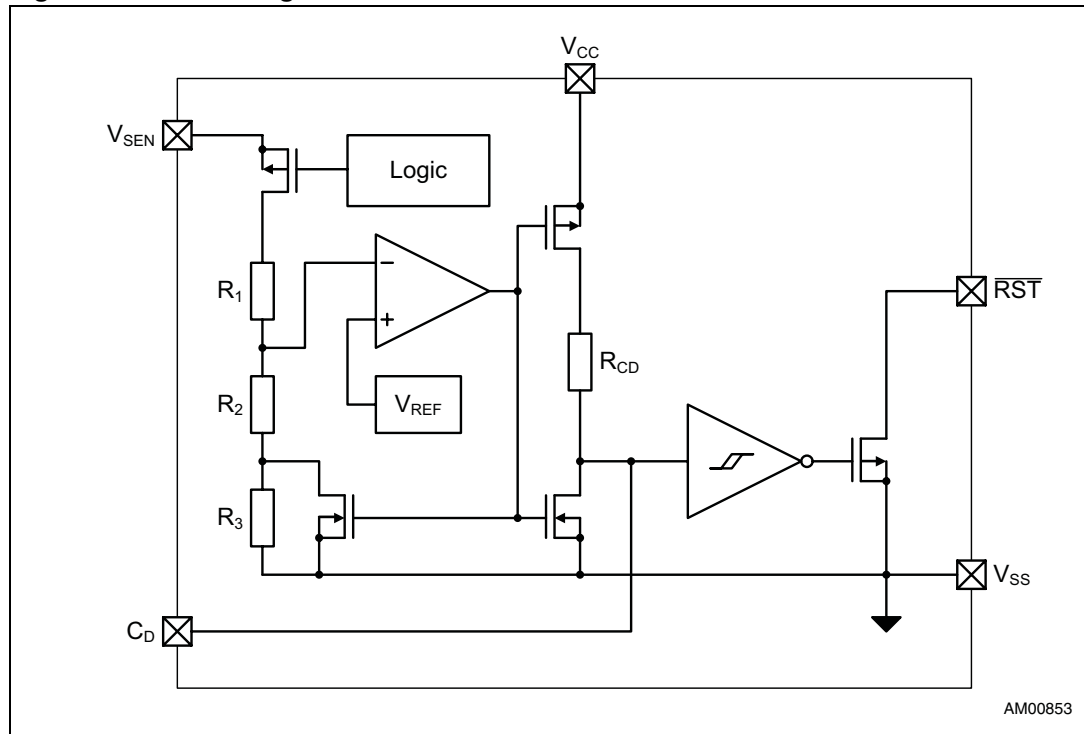

Delay capacitor (C_D)

Capacitor C_D determines the delay (t_{CD}) between reset deassertion and the moment when V_{SEN} voltage exceeds the V_{DET} threshold (see [Figure 5](#) with calculations for more details).

Any external leakage due to poor quality timing capacitors or excessive humidity may cause a significant leakage current which extends the t_{CD} timing. To minimize this effect, the PCB tracks between the C_D pin and its respective timing capacitor should be as short as possible, properly covered with solder mask and isolated from other tracks (especially V_{SS}) by as great a distance as possible. Low-leakage timing capacitors (ceramic or film capacitor) should be used.

Leave C_D pin open if unused (i.e. $t_{CD} = 0$ ms).

Figure 3. Block diagram

AM00853

Figure 4. Application hookup

AM00699

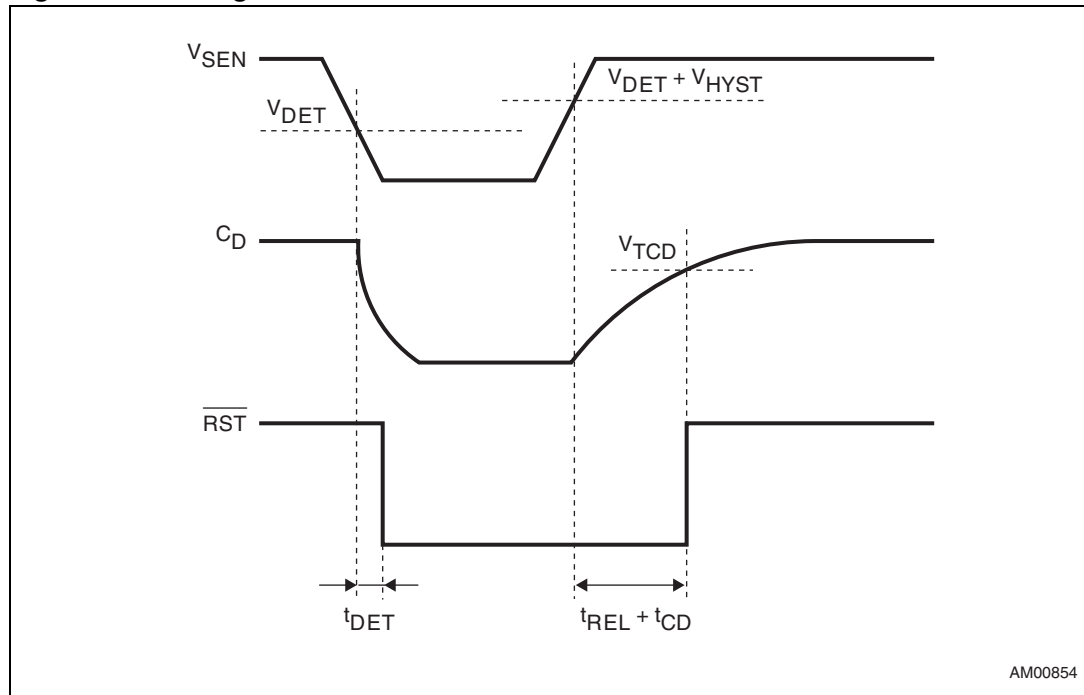

1. External pull-up resistor is needed for open drain \overline{RST} output. A 10 kΩ is sufficient in most applications.

2 Operation

The STM1831 voltage detector monitors system voltages from 1.6 V to 5.7 V in 100 mV increments, has a voltage hysteresis (V_{HYS}) and an output delay programmable by external capacitor C_D .

The STM1831 asserts a reset output (\overline{RST}) whenever V_{CC} goes below the detect voltage (V_{DET}). The reset output stays asserted until V_{CC} goes above the detect voltage with hysteresis ($V_{DET} + V_{HYS}$). If the external capacitor is connected to the C_D pin, the reset output deassertion is adequately delayed (see [Figure 5](#) with calculations below for more details). Leave the C_D pin open if unused (i.e. $t_{CD} = 0$ ms).

Figure 5. Timing waveforms

t_{DET} detect delay time

t_{REL} release delay time (measured when external capacitor C_D is disconnected)

t_{CD} delay by external capacitor C_D .

The t_{CD} delay can be calculated based on [Equation 1](#):

Equation 1

$$t_{CD} = -R_{CD} \times C_D \times \ln\left(1 - \frac{V_{TCD}}{V_{CC}}\right)$$

and considering $R_{CD} = 2 \text{ M}\Omega$ (typ.) and $V_{TCD} = 1.5 \text{ V}$ (typ.) at $V_{CC} = 3.0 \text{ V}$:

Equation 2

$$t_{CD} \cong 1.39 \times 10^6 \times C_D(\text{s, F})$$

4 Maximum ratings

Stressing the device above the ratings listed in [Table 2](#) may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the operating sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Table 2. Absolute maximum ratings

Symbol	Parameter	Value	Unit
T_{STG}	Storage temperature (V_{CC} off)	-55 to 150	°C
$T_{SLD}^{(1)}$	Lead solder temperature for 10 seconds	260	°C
T_J	Maximum junction temperature	125	°C
V_{CC}	Supply voltage	-0.3 to 7.0	V
V_{CD}	Delay capacitor pin voltage	-0.3 to $V_{CC} + 0.3$	V
V_{RST}	Reset output voltage – N-channel open drain	-0.3 to 7.0	V
V_{ESD}	ESD voltage – Human body model (MIL-STD-883, Method 3015) – Machine model	2000 200	V

1. Reflow at peak temperature of 260 °C. The time above 255 °C must not exceed 30 seconds.

5 DC and AC parameters

This section summarizes the operating measurement conditions, and the DC and AC characteristics of the device. The parameters in [Table 4](#) that follow, are derived from tests performed under the measurement conditions summarized in [Table 3](#) and [Figure 5](#) with measurement conditions for t_{DET} and t_{REL} . Designers should check that the operating conditions in their circuit match the operating conditions when relying on the quoted parameters.

Table 3. Operating and AC measurement conditions

Parameter	Value	Unit
Supply voltage (V_{CC})	1.6 to 6.0	V
Ambient operating temperature (T_A)	-40 to 85	°C
Input rise and fall times	≤ 5	ns
Input pulse voltages	0.2 to 0.8 V_{CC}	V
Input and output timing ref. voltages	0.3 to 0.7 V_{CC}	V

V_{TCD}	Delay capacitance pin threshold voltage	$V_{SEN} = 6.0\text{ V}$, $V_{CC} = 1.6\text{ V}$	0.70	0.85	1.00	V	
		$V_{SEN} = 6.0\text{ V}$, $V_{CC} = 3.0\text{ V}$	1.25	1.50	1.70		
		$V_{SEN} = 6.0\text{ V}$, $V_{CC} = 6.0\text{ V}$	2.45	2.65	2.85		
t_{DET}	Detect delay time	$V_{CC} = 6.0\text{ V}$, $V_{SEN} = 6.0\text{ V} \rightarrow 0\text{ V}$, C_D : open	—	40	75	μs	
t_{REL}	Release delay time	$V_{CC} = 6.0\text{ V}$, $V_{SEN} = 0\text{ V} \rightarrow 6\text{ V}$, C_D : open	—	55	170	μs	

1. Valid for ambient operating temperature: $T_A = 25\text{ °C}$; $V_{CC} = 1.6\text{ V}$ to 6.0 V (except where noted).

2. Factory-trimmed voltage thresholds in 100 mV increments from 1.6 V to 5.7 V.

6 Package mechanical data

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK[®] packages, depending on their level of environmental compliance. ECOPACK[®] specifications, grade definitions and product status are available at: www.st.com. ECOPACK[®] is an ST trademark.

The maximum ratings related to soldering conditions are also marked on the inner box label.
