General Description

The SY58012U is a 2.5V/3.3V precision, high-speed, fully differential 1:2 LVPECL fanout buffer. Optimized to provide two identical output copies with less than 15 ps of skew, the SY58012U can process clock signals as fast as 5 GHz or 5 Gbps data.

The differential input includes Microchip's unique, 3-pin input termination architecture that interfaces to LVPECL, LVDS or CML differential signals, (AC-coupled or DC-coupled) as small as 100 mV without any level-shifting or termination resistor networks in the signal path. For AC-coupled input interface applications, an on-board output reference voltage (V_{REF-AC}) is provided to bias the VT pin. The outputs are 100k LVPECL compatible, with extremely fast rise/fall times guaranteed to be less than 110 ps.

The SY58012U operates from a 2.5V $\pm 5\%$ supply or 3.3V $\pm 10\%$ supply and is guaranteed over the full industrial temperature range (-40°C to $+85^{\circ}\text{C}$). For applications that require faster rise/fall times, or greater bandwidth, consider the SY58013U 1:2 fanout buffer with 400 mV output swing, or the SY58011U 1:2 CML (400 mV) fanout buffer. The SY58012U is part of Microchip's high-speed, Precision Edge[®] product line.

4.0 PIN DESCRIPTIONS

The descriptions of the pins are listed in [Table 4-1](#).

TABLE 4-1: PIN FUNCTION TABLE

Pin Number	Pin Name	Pin Function
1, 4	IN, /IN	Differential Input: This input pair is the signal to be buffered. Each pin of this pair internally terminates with 50Ω to the VT pin. Note that this input will default to an indeterminate state if left open. See the Input Interface Applications section.
2	VT	Input Termination Center-Tap: Each input terminates to this pin. The VT pin provides a center-tap for each input (IN, /IN) to a termination network for maximum interface flexibility. See the Input Interface Applications section.
3	VREF-AC	Reference Output Voltage: This output biases to $V_{CC} - 1.2V$. It is used when AC-coupling the inputs (IN, /IN). Connect VREF-AC directly to the VT pin. Bypass with 0.01 μF low ESR capacitor to VCC. Maximum current source or sink is 0.5 mA. See the Input Interface Applications section.
5, 8, 13, 16	VCC	Positive Power Supply: Bypass with 0.1 μF//0.01 μF low ESR capacitors. 0.01 μF capacitor should be as close to VCC pin as possible.
12, 11, 9, 10	Q0, /Q0 Q1, /Q1	LVPECL Differential Output Pairs: Differential buffered output copy of the input signal. The output swing is typically 800 mV. Unused output pairs may be left floating with no impact on jitter. See the LVPECL Output Applications section.
6, 7, 14, 15	GND, Exposed Pad	Ground. Exposed pad must be connected to a ground plane that is the same potential as the ground pin.

6.0 LVPECL OUTPUT APPLICATIONS

LVPECL output have very low output impedance (open emitter), and small signal swing which results in low EMI. LVPECL is ideal for driving 50Ω and 100Ω controlled impedance transmission lines. There are several techniques in terminating the LVPECL output, as shown in [Figure 6-1](#) through [Figure 6-3](#).

FIGURE 6-1: Parallel Termination: Thevenin Equivalent.

- Note 1:** For +2.5V systems: R1 = 250Ω, R2 = 62.5Ω.
2: For +3.3V systems: R1 = 130Ω, R2 = 82Ω.

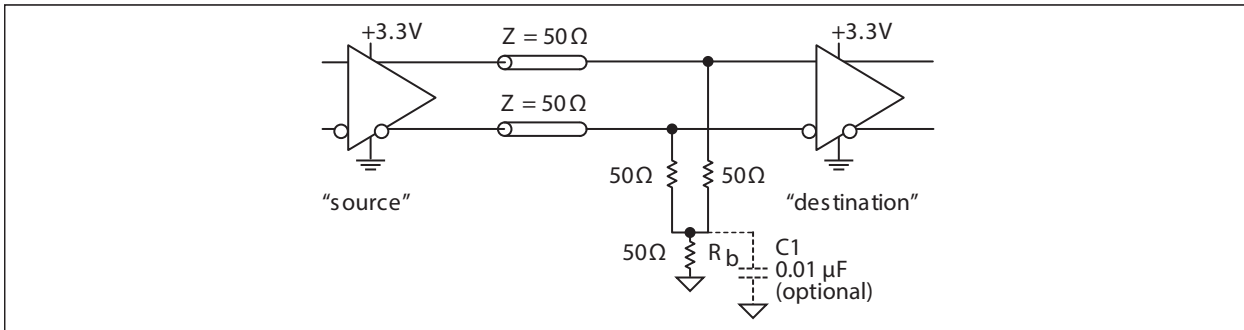

FIGURE 6-2: Three-Resistor "Y-Termination".

- Note 1:** Power-saving alternative to Thevenin termination.
2: Place termination resistors as close to destination inputs as possible.
3: R_b resistor sets the DC bias voltage, equal to V_T.
 For +2.5V systems R_b = 19Ω.
 For +3.3V systems R_b = 46Ω to 50Ω.
4: C1 is an optional bypass capacitor intended to compensate for any t_r/t_f mismatches.

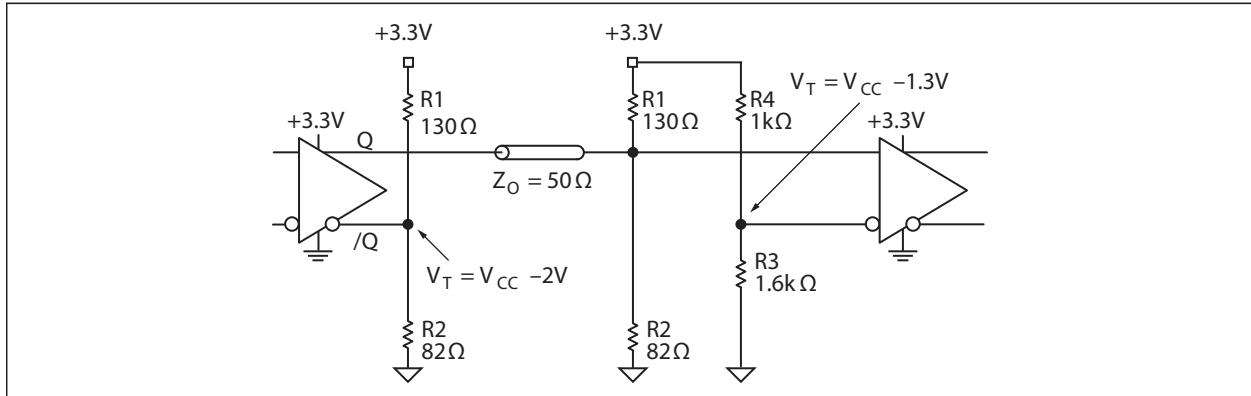

FIGURE 6-3: Terminating Unused I/O.

- Note 1:** Unused output (/Q) must be terminated to balance the output.
- 2:** For +2.5V systems: R1 = 250Ω, R2 = 62.5Ω, R3 = 1.25 kΩ, R4 = 1.2 kΩ.
For +3.3V systems: R1 = 130Ω, R2 = 82Ω, R3 = 1 kΩ, R4 = 1.6 kΩ.
- 3:** C1 is an optional bypass capacitor intended to compensate for any t_r/t_f mismatches.
- 4:** Unused output pairs (Q and /Q) may be left floating.

NOTES:

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.
