MX25R1635F

## MX25R1635F

## ULTRA LOW POWER, 16M-BIT [x 1/x 2/x 4] CMOS MXSMIO ${ }^{\circledR}$ (SERIAL MULTI I/O) FLASH MEMORY

## Key Features

- Ultra Low Power Mode and High Performance Mode
- Wide Range VCC 1.65V-3.6V for Read, Erase and Program Operations
- Unique ID and Secure OTP Support
- Multi I/O Support - Single I/O, Dual I/O and Quad I/O
- Program Suspend/Resume \& Erase Suspend/Resume

Macronix
International Co., Ltd.

Macronix
International Co., Ltd.
M×25R1635F
Ultra Low Power 16M-BIT [x 1/x 2/x 4] CMOS MXSMIO ${ }^{\circledR}$ (SERIAL MULTI I/O) FLASH MEMORY

## 1. FEATURES

## GENERAL

- Supports Serial Peripheral Interface -- Mode 0 and Mode 3
- $16,777,216 \times 1$ bit structure or $8,388,608 \times 2$ bits (two I/O mode) structure or $4,194,304 \times 4$ bits (four I/O mode) structure
- Equal Sectors with 4 K byte each, Equal Blocks with 32 K byte each, or Equal Blocks with 64 K byte each
- Any Block can be erased individually
- Single Power Supply Operation
- Operation Voltage: 1.65V-3.6V for Read, Erase and Program Operations
- Latch-up protected to 100 mA from -1 V to $\mathrm{Vcc}+1 \mathrm{~V}$

## PERFORMANCE

- High Performance
- Fast read
-1 I/O: 80 MHz with 8 dummy cycles
-2 I/O: 80 MHz with 4 dummy cycles, equivalent to 160 MHz
-4 I/O: 80 MHz with $2+4$ dummy cycles, equivalent to 320 MHz
- Fast program and erase time
- 8/16/32/64 byte Wrap-Around Burst Read Mode
- Ultra Low Power Consumption
- Minimum 100,000 erase/program cycles
- 20 years data retention

## SOFTWARE FEATURES

- Input Data Format
- 1-byte Command code
- Advanced Security Features
- Block lock protection

The BPO-BP3 status bit defines the size of the area to be software protection against program and erase instructions

- Additional 8 K bits secured OTP
- Features unique identifier.
- Factory locked identifiable and customer lockable
- Auto Erase and Auto Program Algorithm
- Automatically erases and verifies data at selected sector or block
- Automatically programs and verifies data at selected page by an internal algorithm that automatically times the program pulse widths (Any page to be programed should have page in the erased state first)
- Status Register Feature
- Command Reset
- Program/Erase Suspend and Program/Erase Resume
- Electronic Identification
- JEDEC 1-byte manufacturer ID and 2-byte device ID
- RES command for 1-byte Device ID
- REMS command for 1-byte manufacturer ID and 1-byte device ID
- Support Serial Flash Discoverable Parameters (SFDP) mode
- Support Unique ID (Please contact local Macronix sales for detail information)

Macronix
International Co., Ltd.

## HARDWARE FEATURES

- SCLK Input
- Serial clock input
- SI/SIOO
- Serial Data Input or Serial Data Input/Output for $2 \times \mathrm{I} / \mathrm{O}$ read mode and $4 \times \mathrm{I} / \mathrm{O}$ read mode
- SO/SIO1
- Serial Data Output or Serial Data Input/Output for $2 \times \mathrm{I} / \mathrm{O}$ read mode and $4 \times \mathrm{I} / \mathrm{O}$ read mode
- WP\#/SIO2
- Hardware write protection or serial data Input/Output for $4 \times \mathrm{I} / \mathrm{O}$ read mode
- RESET\#/SIO3 * or HOLD\#/SIO3 *
- Hardware Reset pin or Serial input \& Output for $4 \times \mathrm{I} / \mathrm{O}$ read mode
or
- HOLD feature, to pause the device without deselecting the device or Serial input \& Output for $4 \times \mathrm{I} / \mathrm{O}$ read mode
* Depends on part number options
- PACKAGE
- 8-pin SOP (150mil/200mil)
- 8-land USON (2x3mm)
- 8-land WSON (6x5mm)
- 12-ball WLCSP (3-2-3 Ball Array)
- All devices are RoHS Compliant and Halogen-free

Macronix
International Co., Ltd.

## 2. GENERAL DESCRIPTION

MX25R1635F is 16 Mb bits Serial NOR Flash memory, which is configured as $2,097,152 \times 8$ internally. When it is in four I/O mode, the structure becomes $4,194,304$ bits $\times 4$ or $8,388,608$ bits $\times 2$. MX25R1635F features a serial peripheral interface and software protocol allowing operation on a simple 3-wire bus while it is in single I/O mode. The three bus signals are a clock input (SCLK), a serial data input (SI), and a serial data output (SO). Serial access to the device is enabled by CS\# input.

When it is in two I/O read mode, the SI pin and SO pin become SIO0 pin and SIO1 pin for address/dummy bits input and data output. When it is in four I/O read mode, the SI pin, SO pin, WP\# pin and RESET\#/HOLD\# pin become SIO0 pin, SIO1 pin, SIO2 pin and SIO3 pin for address/dummy bits input and data output.

The MX25R1635F MXSMIO ${ }^{\circledR}$ (Serial Multi I/O) provides sequential read operation on the whole chip.

After program/erase command is issued, auto program/erase algorithms which program/erase and verify the specified page or sector/block locations will be executed. Program command is executed on byte basis, or page (256 bytes) basis, or word basis. Erase command is executed on 4 K -byte sector, or 32 KB block ( 32 K -byte), or 64 K -byte block, or whole chip basis.

To provide user with ease of interface, a status register is included to indicate the status of the chip. The status read command can be issued to detect completion status of a program or erase operation via WIP bit.

Advanced security features enhance the protection and security functions, please refer to the security features section for more details.

The MX25R1635F utilizes Macronix's proprietary memory cell, which reliably stores memory contents even after 100,000 program and erase cycles.

Table 1. Additional Feature

| Protection and Security | MX25R1635F |
| :--- | :---: |
| Flexible Block Protection (BP0-BP3) | V |
| 8K-bit security OTP | V |

| Fast Read <br> Performance | Ultra Low Power Mode <br> (Configuration Register-2 bit1= 0) |  |  |  |  | High Performance Mode <br> (Configuration Register-2 bit1= 1) |  |  |  |  |

## 3. PIN CONFIGURATIONS

## 8-PIN SOP (150mil/200mil)

## 8-LAND USON (2x3mm), WSON (6x5mm) <br> 

3-2-3 Ball Array 12-WLCSP TOP View

* Depends on part number options.

## 4. PIN DESCRIPTION

| SYMBOL | DESCRIPTION |
| :---: | :--- |
| CS\# | Chip Select |
| SI/SIOO | Serial Data Input (for 1 x I/O)/ Serial <br> Data Input \& Output (for 4xI/O read <br> mode) |
| SO/SIO1 | Serial Data Output (for 1 x I/O)/ <br> Serial Data Input \& Output (for 4xI/O <br> read mode) |
| SCLK | Clock Input |
| WP\#/SIO2 | Write Protection Active Low or Serial <br> Data Input \& Output (for 4xI/O read <br> mode) |
| RESET\#/SIO3 * | Hardware Reset Pin Active low or <br> Serial Data Input \& Output (for 4xl/O <br> read mode) |
| HOLD\#/SIO3 * * | To pause the device without <br> deselecting the device or Serial Data <br> Input \& Output (for 4xI/O read mode) |
| VCC | Power Supply |
| GND | Ground |

* Depends on part number options.

## Note:

1. The pin of RESET\#/SIO3, HOLD\#/SIO3 or WP\#/SIO2 will remain internal pull up function while this pin is not physically connected in system configuration. However, the internal pull up function will be disabled if the system has physical connection to RESET\#/ SIO3, HOLD\#/SIO3 or WP\#/SIO2 pin.

Macronix International Co., Ltd.

## 6. DATA PROTECTION

During power transition, there may be some false system level signals which result in inadvertent erasure or programming. The device is designed to protect itself from these accidental write cycles.

The state machine will be reset as standby mode automatically during power up. In addition, the control register architecture of the device constrains that the memory contents can only be changed after specific command sequences have completed successfully.

In the following, there are several features to protect the system from the accidental write cycles during VCC powerup and power-down or from system noise.

- Power-on reset: to avoid sudden power switch by system power supply transition, the power-on reset may protect the Flash.
- Valid command length checking: The command length will be checked whether it is at byte base and completed on byte boundary.
- Write Enable (WREN) command: WREN command is required to set the Write Enable Latch bit (WEL) before issuing other commands to change data.
- Deep Power Down Mode: By entering deep power down mode, the flash device is under protected from writing all commands except toggling the CS\#. For more details, please refer to "10-24. Deep Power-down (DP)".
- Advanced Security Features: there are some protection and security features which protect content from inadvertent write and hostile access.

## I. Block lock protection

- The Software Protected Mode (SPM) use (BP3, BP2, BP1, BP0) bits to allow part of memory to be protected as read only. The protected area definition is shown as "Table 2. Protected Area Sizes", the protected areas are more flexible which may protect various area by setting value of $\mathrm{BPO}-\mathrm{BP} 3$ bits.
- The Hardware Protected Mode (HPM) use WP\#/SIO2 to protect the (BP3, BP2, BP1, BP0) bits and Status Register Write Protect (SRWD) bit. If the system goes into four I/O mode, the feature of HPM will be disabled.

Macronix
International Co., Ltd.

Table 2. Protected Area Sizes
Protected Area Sizes (TB bit $=0$ )

| Status bit |  |  |  | $\begin{gathered} \hline \text { Protect Level } \\ \hline 16 \mathrm{Mb} \end{gathered}$ |

| 1 | 1 | 1 | 0 | 14 (32blocks, protect all) |
| 1 | 1 | 1 | 1 | 15 (32blocks, protect all) |

Note: The device is ready to accept a Chip Erase instruction if, and only if, all Block Protect (BP3, BP2, BP1, BPO) are 0 .

Macronix
International Co., Ltd.
II. Additional 8K-bit secured OTP for unique identifier: to provide 8K-bit One-Time Program area for setting device unique serial number - Which may be set by factory or system maker.

The 8 K -bit secured OTP area is composed of two rows of 4 K -bit. Customer could lock the first 4K-bit OTP area and factory could lock the other.

- Security register bit 0 indicates whether the second 4 K -bit is locked by factory or not.
- Customer may lock-down the customer lockable secured OTP by writing WRSCUR(write security register) command to set customer lock-down bit1 as "1". Please refer to "Table 8. Security Register Definition" for security register bit definition and "Table 3. 8K-bit Secured OTP Definition" for address range definition.
- To program 8 K -bit secured OTP by entering secured OTP mode (with ENSO command), and going through normal program procedure, and then exiting secured OTP mode by writing EXSO command.

Note: Once lock-down whatever by factory or customer, the corresponding secured area cannot be changed any more. While in 8 K -bit Secured OTP mode, array access is not allowed.

Table 3. 8K-bit Secured OTP Definition

| Address range | Size | Customer Lock | Standard Factory Lock |
| :---: | :---: | :---: | :---: |
| xxx000-xxx1FF | 4096 -bit | Determined by customer | N/A |
| xxx200-xxx3FF | 4096 -bit | N/A | Determined by factory |

## 8. DEVICE OPERATION

1. Before a command is issued, status register should be checked to ensure device is ready for the intended operation.
2. When incorrect command is inputted to this device, it enters standby mode and remains in standby mode until next CS\# falling edge. In standby mode, SO pin of the device is High-Z.
3. When correct command is inputted to this device, it enters active mode and remains in active mode until next CS\# rising edge.
4. Input data is latched on the rising edge of Serial Clock (SCLK) and data shifts out on the falling edge of SCLK. The difference of Serial mode 0 and mode 3 is shown as "Figure 1. Serial Modes Supported".
5. For the following instructions: RDID, RDSR, RDCR, RDSCUR, READ, FAST_READ, DREAD, 2READ, 4READ, QREAD, RDSFDP, RES, REMS, the shifted-in instruction sequence is followed by a data-out sequence. After any bit of data being shifted out, the CS\# can be high. For the following instructions: WREN, WRDI, WRSR, SE, BE, BE32K, CE, PP, 4PP, DP, ENSO, EXSO, WRSCUR, SUSPEND, RESUME, NOP, RSTEN, RST, the CS\# must go high exactly at the byte boundary; otherwise, the instruction will be rejected and not executed.
6. While a Write Status Register, Program or Erase operation is in progress, access to the memory array is neglected and will not affect the current operation of Write Status Register, Program, Erase.

Figure 1. Serial Modes Supported

Note:
CPOL indicates clock polarity of Serial master, CPOL=1 for SCLK high while idle, CPOL=0 for SCLK low while not transmitting. CPHA indicates clock phase. The combination of CPOL bit and CPHA bit decides which Serial mode is supported.

Figure 2. Serial Input Timing

Figure 3. Output Timing

## 9. HOLD FEATURE

HOLD\# pin signal goes low to hold any serial communications with the device. The HOLD feature will not stop the operation of write status register, programming, or erasing in progress.

The operation of HOLD requires Chip Select (CS\#) keeping low and starts on falling edge of HOLD\# pin signal while Serial Clock (SCLK) signal is being low (if Serial Clock signal is not being low, HOLD operation will not start until Serial Clock signal being low). The HOLD condition ends on the rising edge of HOLD\# pin signal while Serial Clock(SCLK) signal is being low (if Serial Clock signal is not being low, HOLD operation will not end until Serial Clock being low).

Figure 4. Hold Condition Operation

During the HOLD operation, the Serial Data Output (SO) is high impedance when Hold\# pin goes low and will keep high impedance until Hold\# pin goes high. The Serial Data Input (SI) is don't care if both Serial Clock (SCLK) and Hold\# pin goes low and will keep the state until SCLK goes low and Hold\# pin goes high. If Chip Select (CS\#) drives high during HOLD operation, it will reset the internal logic of the device. To re-start communication with chip, the HOLD\# must be at high and CS\# must be at low.

Note: The HOLD feature is disabled during Quad I/O mode.

## 10. COMMAND DESCRIPTION

Table 5. Command Set
Read/Write Array Commands

| I/O | 1 | 1 | 2 | 2 | 4 | 4 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Command (byte) | READ (normal read) | FAST READ (fast read data) | 2READ $(2 \times 1 / O$ read command $)$ | $\begin{aligned} & \text { DREAD } \\ & \text { (1I / } 2 \mathrm{O} \text { read } \\ & \text { command) } \end{aligned}$ | 4READ <br> (4 x l/O read) | QREAD (1//4O read) |
| 1st byte | 03 (hex) | 0B (hex) | BB (hex) | 3B (hex) | EB (hex) | 6B (hex) |
| 2nd byte | ADD1 | ADD1 | ADD1 | ADD1 | ADD1 | ADD1 |
| 3rd byte | ADD2 | ADD2 | ADD2 | ADD2 | ADD2 | ADD2 |

Note 1: $A D D=00 \mathrm{H}$ will output the manufacturer ID first and $A D D=01 \mathrm{H}$ will output device ID first.
Note 2: It is not recommended to adopt any other code not in the command definition table, which will potentially enter the hidden mode.
Note 3: The RSTEN command must be executed before executing the RST command. If any other command is issued in-between RSTEN and RST, the RST command will be ignored.

Macronix
International Co., Ltd.

## 10-1. Write Enable (WREN)

The Write Enable (WREN) instruction is for setting Write Enable Latch (WEL) bit. For those instructions like PP, 4PP, SE, BE32K, BE, CE, and WRSR, which are intended to change the device content WEL bit should be set every time after the WREN instruction setting the WEL bit.

The sequence of issuing WREN instruction is: CS\# goes low $\rightarrow$ sending WREN instruction code $\rightarrow$ CS\# goes high.
The SIO[3:1] are "don't care" .

Figure 5. Write Enable (WREN) Sequence

Macronix
International Co., Ltd.

## 10-2. Write Disable (WRDI)

The Write Disable (WRDI) instruction is to reset Write Enable Latch (WEL) bit.
The sequence of issuing WRDI instruction is: CS\# goes low $\rightarrow$ sending WRDI instruction code $\rightarrow$ CS\# goes high.

The SIO[3:1] are "don't care".
The WEL bit is reset by following situations:

- Power-up
- Reset\# pin driven low
- Completion of Write Disable (WRDI) instruction
- Completion of Write Status Register (WRSR) instruction
- Completion of Page Program (PP) instruction
- Completion of Quad Page Program (4PP) instruction
- Completion of Sector Erase (SE) instruction
- Completion of Block Erase 32KB (BE32K) instruction
- Completion of Block Erase (BE) instruction
- Completion of Chip Erase (CE) instruction
- Program/Erase Suspend
- Completion of Softreset command
- Completion of Write Security Register (WRSCUR) command

Figure 6. Write Disable (WRDI) Sequence
scLk

Macronix
International Co., Ltd.
MX25R1635F

## 10-3. Read Identification (RDID)

The RDID instruction is for reading the manufacturer ID of 1-byte and followed by Device ID of 2-byte. The Macronix Manufacturer ID and Device ID are listed as "Table 6. ID Definitions".

The sequence of issuing RDID instruction is: CS\# goes low $\rightarrow$ sending RDID instruction code $\rightarrow 24$-bits ID data out on $\mathrm{SO} \rightarrow$ to end RDID operation can drive CS\# to high at any time during data out.

While Program/Erase operation is in progress, it will not decode the RDID instruction, therefore there's no effect on the cycle of program/erase operation which is currently in progress. When CS\# goes high, the device is at standby stage.

Figure 7. Read Identification (RDID) Sequence

Macronix
International Co., Ltd.

## 10-4. Read Electronic Signature (RES)

RES instruction is for reading out the old style of 8-bit Electronic Signature, whose values are shown as "Table 6. ID Definitions". This is not the same as RDID instruction. It is not recommended to use for new design. For new design, please use RDID instruction.

The SIO[3:1] are "don't care".
The RES instruction is ended by CS\# goes high after the ID been read out at least once. The ID outputs repeatedly if continuously send the additional clock cycles on SCLK while CS\# is at low.

Figure 8. Read Electronic Signature (RES) Sequence

Macronix
International Co., Ltd.

## 10-5. Read Electronic Manufacturer ID \& Device ID (REMS)

The REMS instruction returns both the JEDEC assigned manufacturer ID and the device ID. The Device ID values are listed in "Table 6. ID Definitions".

The REMS instruction is initiated by driving the CS\# pin low and sending the instruction code "90h" followed by two dummy bytes and one address byte (A7~A0). After which the manufacturer ID for Macronix (C2h) and the device ID are shifted out on the falling edge of SCLK with the most significant bit (MSB) first. If the address byte is 00h, the manufacturer ID will be output first, followed by the device ID. If the address byte is 01 h , then the device ID will be output first, followed by the manufacturer ID. While CS\# is low, the manufacturer and device IDs can be read continuously, alternating from one to the other. The instruction is completed by driving CS\# high.

Figure 9. Read Electronic Manufacturer \& Device ID (REMS) Sequence

Notes:
(1) $\mathrm{ADD}=00 \mathrm{H}$ will output the manufacturer's ID first and $\mathrm{ADD}=01 \mathrm{H}$ will output device ID first.

Macronix
International Co., Ltd.

## 10-6. ID Read

User can execute this ID Read instruction to identify the Device ID and Manufacturer ID. The sequence of issuing RDID instruction is: CS\# goes low $\rightarrow$ sending RDID instruction code $\rightarrow 24$-bits ID data out on SO $\rightarrow$ to end RDID operation can drive CS\# to high at any time during data out.

After the command cycle, the device will immediately output data on the falling edge of SCLK. The manufacturer ID, memory type, and device ID data byte will be output continuously, until the CS\# goes high.

While Program/Erase operation is in progress, it will not decode the RDID instruction, therefore there's no effect on the cycle of program/erase operation which is currently in progress. When CS\# goes high, the device is at standby stage.

Table 6. ID Definitions

| Command Type | Command | MX25R1635F |  |  |
| :---: | :---: | :---: | :---: | :---: |
| RDID | 9 Fh | Manufacturer ID | Memory type | Memory density |
|  |  | C2 | 28 | 15 |
| RES | ABh |  | Electronic ID |  |
|  |  | Manufacturer ID | Device ID |  |
|  |  | C2 | 15 |  |

Macronix
International Co., Ltd.
MX25R1635F

## 10-7. Read Status Register (RDSR)

The RDSR instruction is for reading Status Register Bits. The Read Status Register can be read at any time (even in program/erase/write status register condition). It is recommended to check the Write in Progress (WIP) bit before sending a new instruction when a program, erase, or write status register operation is in progress.

The sequence of issuing RDSR instruction is: CS\# goes low $\rightarrow$ sending RDSR instruction code $\rightarrow$ Status Register data out on SO.

The SIO[3:1] are "don't care".

Figure 10. Read Status Register (RDSR) Sequence
somen

Macronix
International Co., Ltd.

## 10-8. Read Configuration Register (RDCR)

The RDCR instruction is for reading Configuration Register Bits. The Read Configuration Register can be read at any time (even in program/erase/write configuration register condition). It is recommended to check the Write in Progress (WIP) bit before sending a new instruction when a program, erase, or write configuration register operation is in progress.

The sequence of issuing RDCR instruction is: CS\# goes low $\rightarrow$ sending RDCR instruction code $\rightarrow$ Configuration Register data out on SO.

The SIO[3:1] are don't care.

Figure 11. Read Configuration Register (RDCR) Sequence

Macronix
International Co., Ltd.

For user to check if Program/Erase operation is finished or not, RDSR instruction flow are shown as follows:

Figure 12. Program/Erase flow with read array data

## Status Register

The definition of the status register bits is as below:
WIP bit. The Write in Progress (WIP) bit, a volatile bit, indicates whether the device is busy in program/erase/write status register progress. When WIP bit sets to 1 , which means the device is busy in program/erase/write status register progress. When WIP bit sets to 0 , which means the device is not in progress of program/erase/write status register cycle.

WEL bit. The Write Enable Latch (WEL) bit is a volatile bit that is set to " 1 " by the WREN instruction. WEL needs to be set to " 1 " before the device can accept program and erase instructions, otherwise the program and erase instructions are ignored. WEL automatically clears to " 0 " when a program or erase operation completes. To ensure that both WIP and WEL are " 0 " and the device is ready for the next program or erase operation, it is recommended that WIP be confirmed to be " 0 " before checking that WEL is also " 0 ". If a program or erase instruction is applied to a protected memory area, the instruction will be ignored and WEL will clear to " 0 ".

BP3, BP2, BP1, BP0 bits. The Block Protect (BP3, BP2, BP1, BP0) bits, non-volatile bits, indicate the protected area (as defined in "Table 2. Protected Area Sizes") of the device to against the program/erase instruction without hardware protection mode being set. To write the Block Protect (BP3, BP2, BP1, BP0) bits requires the Write Status Register (WRSR) instruction to be executed. Those bits define the protected area of the memory to against Page Program (PP), Sector Erase (SE), Block Erase (BE/BE32K) and Chip Erase (CE) instructions (only if Block Protect bits (BP3:BP0) set to 0 , the CE instruction can be executed). The BP3, BP2, BP1, BP0 bits are "0" as default, which is un-protected.

QE bit. The Quad Enable (QE) bit, non-volatile bit, while it is "0" (factory default), it performs non-Quad and WP\#, RESET\#/HOLD\# are enable. While QE is "1", it performs Quad I/O mode and WP\#, RESET\#/HOLD\# are disabled. In the other word, if the system goes into four I/O mode ( $\mathrm{QE}=1$ ), the feature of HPM and RESET/HOLD will be disabled.

SRWD bit. The Status Register Write Disable (SRWD) bit, non-volatile bit, is operated together with Write Protection (WP\#/SIO2) pin for providing hardware protection mode. The hardware protection mode requires SRWD sets to 1 and WP\#/SIO2 pin signal is low stage. In the hardware protection mode, the Write Status Register (WRSR) instruction is no longer accepted for execution and the SRWD bit and Block Protect bits (BP3, BP2, BP1, BP0) are read only. The SRWD bit defaults to be " 0 ".

## Status Register

| bit7 | bit6 | bit5 | bit4 | bit3 | bit2 | bit1 | bit0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| SRWD (status <br> register write <br> protect) | QE <br> (Quad <br> Enable) | BP3 <br> (level of <br> protected <br> block) | BP2 <br> (level of <br> protected <br> block) | BP1 <br> (level of <br> protected <br> block) | BP0 <br> (level of <br> protected <br> block) | WEL <br> (write enable <br> latch) | WIP <br> (write in <br> progress bit) |
| 1=status <br> register write <br> disabled <br> $0=$ status <br> register write <br> enabled | 1=Quad <br> Enable <br> $0=$ not Quad <br> Enable | (note 1) | (note 1) | (note 1) | (note 1) | 1=write <br> enable <br> $0=$ not write <br> enable | 1=write <br> operation <br> onot in write <br> operation |
| Non-volatile <br> bit | Non-volatile <br> bit | Non-volatile <br> bit | Non-volatile <br> bit | Non-volatile <br> bit | Non-volatile <br> bit | volatile bit | volatile bit |

Note 1: Please refer to the "Table 2. Protected Area Sizes".

Macronix
International Co., Ltd.

## Configuration Register

The Configuration Register is able to change the default status of Flash memory. Flash memory will be configured after the CR bit is set.

## TB bit

The Top/Bottom (TB) bit is a non-volatile OTP bit. The Top/Bottom (TB) bit is used to configure the Block Protect area by BP bit (BP3, BP2, BP1, BP0), starting from TOP or Bottom of the memory array. The TB bit is defaulted as " 0 ", which means Top area protect. When it is set as " 1 ", the protect area will change to Bottom area of the memory device. To write the TB bit requires the Write Status Register (WRSR) instruction to be executed.

## L/H switch bit

The Low Power / High Performance bit is a volatile bit. User can change the value of L/H switch bit to keep Ultra Low Power mode or High Performance mode. Please check Ordering Information for the L/H Switch default support.

Configuration Register - 1

| bit7 | bit6 | bit5 | bit4 | bit3 | bit2 | bit1 | bit0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Reserved | DC <br> (Dummy <br> Cycle) | Reserved | Reserved | TB <br> (top/bottom <br> selected) | Reserved | Reserved | Reserved |

## Dummy Cycle Table

|  | DC | Numbers of Dummy <br> Cycles |
| :---: | :---: | :---: |
| 2READ | 0 (default) | 4 |
|  | 1 | 8 |
| 4 READ | 0 (default) | 6 |
|  | 1 | 10 |

Macronix
International Co., Ltd.

## 10-9. Write Status Register (WRSR)

The WRSR instruction is for changing the values of Status Register Bits and Configuration Register Bits. Before sending WRSR instruction, the Write Enable (WREN) instruction must be decoded and executed to set the Write Enable Latch (WEL) bit in advance. The WRSR instruction can change the value of Block Protect (BP3, BP2, BP1, BP0) bits to define the protected area of memory (as shown in "Table 2. Protected Area Sizes"). The WRSR also can set or reset the Quad enable (QE) bit and set or reset the Status Register Write Disable (SRWD) bit in accordance with Write Protection (WP\#/SIO2) pin signal, but has no effect on bit1(WEL) and bit0 (WIP) of the status register. The WRSR instruction cannot be executed once the Hardware Protected Mode (HPM) is entered.

The sequence of issuing WRSR instruction is: CS\# goes low $\rightarrow$ sending WRSR instruction code $\rightarrow$ Status Register data on $\mathrm{SI} \rightarrow \mathrm{CS} \mathrm{\#}$ goes high.

The CS\# must go high exactly at the 8 bits, 16 bits or 24 bits data boundary; otherwise, the instruction will be rejected and not executed. The self-timed Write Status Register cycle time (tW) is initiated as soon as Chip Select (CS\#) goes high. The Write in Progress (WIP) bit still can be checked during the Write Status Register cycle is in progress. The WIP sets 1 during the tW timing, and sets 0 when Write Status Register Cycle is completed, and the Write Enable Latch (WEL) bit is reset. Please note that there is another parameter, "Write Status Register cycle time for Mode Changing Switching (tWMS)", which is only for the self-timed of Mode Switching (changing L/H switch bit). For more detail please check "Table 17. AC Characteristics".

Figure 14. Write Status Register (WRSR) Sequence

## Software Protected Mode (SPM):

- When SRWD bit=0, no matter WP\#/SIO2 is low or high, the WREN instruction may set the WEL bit and can change the values of SRWD, BP3, BP2, BP1, BP0. The protected area, which is defined by BP3, BP2, BP1, BPO, is at software protected mode (SPM).
- When SRWD bit=1 and WP\#/SIO2 is high, the WREN instruction may set the WEL bit can change the values of SRWD, BP3, BP2, BP1, BP0. The protected area, which is defined by BP3, BP2, BP1, BP0, is at software protected mode (SPM)

## Note:

If SRWD bit=1 but WP\#/SIO2 is low, it is impossible to write the Status Register even if the WEL bit has previously been set. It is rejected to write the Status Register and not be executed.

## Hardware Protected Mode (HPM):

- When SRWD bit=1, and then WP\#/SIO2 is low (or WP\#/SIO2 is low before SRWD bit=1), it enters the hardware protected mode (HPM). The data of the protected area is protected by software protected mode by BP3, BP2, BP1, BP0 and hardware protected mode by the WP\#/SIO2 to against data modification.

## Note:

To exit the hardware protected mode requires WP\#/SIO2 driving high once the hardware protected mode is entered. If the WP\#/SIO2 pin is permanently connected to high, the hardware protected mode can never be entered; only can use software protected mode via BP3, BP2, BP1, BP0.

Table 7. Protection Modes

| Mode | Status register condition | WP\# and SRWD bit status | Memory |
| :---: | :---: | :---: | :---: |
| Software protection <br> mode (SPM) | Status register can be written <br> in (WEL bit is set to "1") and <br> the SRWD, BP0-BP3 <br> bits can be changed | WP\#=1 and SRWD bit=0, or <br> WP\#=0 and SRWD bit=0, or <br> WP\#=1 and SRWD=1 | The protected area <br> cannot |
| Hardware protection program or erase. <br> mode (HPM) | The SRWD, BP0-BP3 of <br> status register bits cannot be <br> changed | WP\#=0, SRWD bit=1 | The protected area <br> cannot <br> be program or erase. |

## Note:

1. As defined by the values in the Block Protect (BP3, BP2, BP1, BP0) bits of the Status Register, as shown in "Table 2. Protected Area Sizes".

## 10-10. Read Data Bytes (READ)

The read instruction is for reading data out. The address is latched on rising edge of SCLK, and data shifts out on the falling edge of SCLK at a maximum frequency $f R$. The first address byte can be at any location. The address is automatically increased to the next higher address after each byte data is shifted out, so the whole memory can be read out at a single READ instruction. The address counter rolls over to 0 when the highest address has been reached.

The sequence of issuing READ instruction is: CS\# goes low $\rightarrow$ sending READ instruction code $\rightarrow$ 3-byte address on $\mathrm{SI} \rightarrow$ data out on SO $\rightarrow$ to end READ operation can use CS\# to high at any time during data out.

Figure 17. Read Data Bytes (READ) Sequence

Macronix International Co., Ltd.

## 10-11.Read Data Bytes at Higher Speed (FAST_READ)

The FAST_READ instruction is for quickly reading data out. The address is latched on rising edge of SCLK, and data of each bit shifts out on the falling edge of SCLK at a maximum frequency fC. The first address byte can be at any location. The address is automatically increased to the next higher address after each byte data is shifted out, so the whole memory can be read out at a single FAST_READ instruction. The address counter rolls over to 0 when the highest address has been reached.

The sequence of issuing FAST_READ instruction is: CS\# goes low $\rightarrow$ sending FAST_READ instruction code $\rightarrow$ 3-byte address on SI $\rightarrow$ 1-dummy byte (default) address on $\mathrm{SI} \rightarrow$ data out on SO $\rightarrow$ to end FAST_READ operation can use CS\# to high at any time during data out.

While Program/Erase/Write Status Register cycle is in progress, FAST_READ instruction is rejected without any impact on the Program/Erase/Write Status Register current cycle.

Figure 18. Read at Higher Speed (FAST_READ) Sequence

Macronix International Co., Ltd.

## 10-12. Dual Read Mode (DREAD)

The DREAD instruction enable double throughput of Serial NOR Flash in read mode. The address is latched on rising edge of SCLK, and data of every two bits (interleave on 2 I/O pins) shift out on the falling edge of SCLK at a maximum frequency fT . The first address byte can be at any location. The address is automatically increased to the next higher address after each byte data is shifted out, so the whole memory can be read out at a single DREAD instruction. The address counter rolls over to 0 when the highest address has been reached. Once writing DREAD instruction, the following data out will perform as 2-bit instead of previous 1-bit.

The sequence of issuing DREAD instruction is: CS\# goes low $\rightarrow$ sending DREAD instruction $\rightarrow$ 3-byte address on $\mathrm{SI} \rightarrow$ 8-bit dummy cycle $\rightarrow$ data out interleave on SIO \& $\mathrm{SIO} \rightarrow$ to end DREAD operation can use CS\# to high at any time during data out.

While Program/Erase/Write Status Register cycle is in progress, DREAD instruction is rejected without any impact on the Program/Erase/Write Status Register current cycle.

Figure 19. Dual Read Mode Sequence (Command 3B)

Macronix International Co., Ltd.

## 10-13. $2 \times$ I/O Read Mode (2READ)

The 2READ instruction enables Double Transfer Rate of Serial NOR Flash in read mode. The address is latched on rising edge of SCLK, and data of every two bits (interleave on 2 I/O pins) shift out on the falling edge of SCLK at a maximum frequency fT . The first address byte can be at any location. The address is automatically increased to the next higher address after each byte data is shifted out, so the whole memory can be read out at a single 2READ instruction. The address counter rolls over to 0 when the highest address has been reached. Once writing 2READ instruction, the following address/dummy/data out will perform as 2-bit instead of previous 1-bit.

The sequence of issuing 2READ instruction is: CS\# goes low $\rightarrow$ sending 2READ instruction $\rightarrow$ 24-bit address interleave on SIO1 \& SIO0 $\rightarrow$ 4-bit dummy cycle on SIO1 \& SIO0 $\rightarrow$ data out interleave on $\mathrm{SIO} 1 \& \mathrm{SIO} \rightarrow$ to end 2READ operation can use CS\# to high at any time during data out.

While Program/Erase/Write Status Register cycle is in progress, 2READ instruction is rejected without any impact on the Program/Erase/Write Status Register current cycle.

Figure 20.2 x I/O Read Mode Sequence (Command BB)

Note: SI/SIO0 or SO/SIO1 should be kept "Oh" or "Fh" in the first two dummy cycles. In other words, P2=P0 or $P 3=P 1$ is necessary.

Macronix International Co., Ltd.

## 10-14. Quad Read Mode (QREAD)

The QREAD instruction enable quad throughput of Serial NOR Flash in read mode. A Quad Enable (QE) bit of status Register must be set to "1" before sending the QREAD instruction. The address is latched on rising edge of SCLK, and data of every four bits (interleave on 4 I/O pins) shift out on the falling edge of SCLK at a maximum frequency fQ. The first address byte can be at any location. The address is automatically increased to the next higher address after each byte data is shifted out, so the whole memory can be read out at a single QREAD instruction. The address counter rolls over to 0 when the highest address has been reached. Once writing QREAD instruction, the following data out will perform as 4-bit instead of previous 1-bit.

The sequence of issuing QREAD instruction is: CS\# goes low $\rightarrow$ sending QREAD instruction $\rightarrow$ 3-byte address on $\mathrm{SI} \rightarrow$ 8-bit dummy cycle $\rightarrow$ data out interleave on $\mathrm{SIO} 3, \mathrm{SIO} 2, \mathrm{SIO} 1 \& \mathrm{SIOO} \rightarrow$ to end QREAD operation can use CS\# to high at any time during data out.

While Program/Erase/Write Status Register cycle is in progress, QREAD instruction is rejected without any impact on the Program/Erase/Write Status Register current cycle.

Figure 21. Quad Read Mode Sequence (Command 6B)

Macronix
International Co., Ltd.

## 10-15. $4 \times$ I/O Read Mode (4READ)

The 4READ instruction enable quad throughput of Serial NOR Flash in read mode. A Quad Enable (QE) bit of status Register must be set to "1" before sending the 4READ instruction. The address is latched on rising edge of SCLK, and data of every four bits (interleave on $4 \mathrm{l} / \mathrm{O}$ pins) shift out on the falling edge of SCLK at a maximum frequency fQ . The first address byte can be at any location. The address is automatically increased to the next higher address after each byte data is shifted out, so the whole memory can be read out at a single 4READ instruction. The address counter rolls over to 0 when the highest address has been reached. Once writing 4READ instruction, the following address/dummy/data out will perform as 4-bit instead of previous 1-bit.

The sequence of issuing 4READ instruction is: CS\# goes low $\rightarrow$ sending 4READ instruction $\rightarrow 24$-bit address interleave on $\mathrm{SIO} 3, \mathrm{SIO} 2, \mathrm{SIO} 1 \& \mathrm{SIO} \rightarrow 2+4$ dummy cycles $\rightarrow$ data out interleave on $\mathrm{SIO}, \mathrm{SIO}, \mathrm{SIO} 1 \& \mathrm{SIO} \rightarrow$ to end 4READ operation can use CS\# to high at any time during data out.

Another sequence of issuing 4READ instruction especially useful in random access is : CS\# goes low $\rightarrow$ sending 4READ instruction $\rightarrow$ 3-bytes address interleave on $\mathrm{SIO} 3, \mathrm{SIO} 2, \mathrm{SIO} 1 \& \mathrm{SIO} \rightarrow$ performance enhance toggling bit $\mathrm{P}[7: 0] \rightarrow 4$ dummy cycles $\rightarrow$ data out still CS\# goes high $\rightarrow$ CS\# goes low (reduce 4READ instruction) $\rightarrow 24$-bit random access address.

In the performance-enhancing mode, $\mathrm{P}[7: 4$ ] must be toggling with $\mathrm{P}[3: 0$ ] ; likewise $\mathrm{P}[7: 0]=\mathrm{A} 5 \mathrm{~h}, 5 \mathrm{Ah}$, F 0 h or 0Fh can make this mode continue and reduce the next 4READ instruction. Once $\mathrm{P}[7: 4]$ is no longer toggling with $\mathrm{P}[3: 0]$; likewise $P[7: 0]=F F h, 00 h, A A h$ or $55 h$ and afterwards $C S \#$ is raised and then lowered, the system then will escape from performance enhance mode and return to normal operation.

While Program/Erase/Write Status Register cycle is in progress, 4READ instruction is rejected without any impact on the Program/Erase/Write Status Register current cycle.

For the speed of 4READ, please check "Table 1. Additional Feature". Please note that under following conditon in Ultra low power mode, the 4READ oepration can acheive 16 MHz :
The 4READ oepation can not cross 4 Mb bank boundary as the table below. In other words, to read another bank in 16 MHz , request to input a new 4READ command.

| BANK (4M bit) | Address Range |
| :---: | :---: |
| 3 | $180000 \mathrm{~h}-1 F F F F F h$ |
| 2 | $100000 \mathrm{~h}-17 F F F F h$ |
| 1 | $080000 \mathrm{~h}-0 F F F F F h$ |
| 0 | $000000 \mathrm{~h}-07 F F F F h$ |

Figure 22. 4 x I/O Read Mode Sequence

Note:

1. Hi-impedance is inhibited for the two clock cycles.
2. $\mathrm{P} 7 \neq \mathrm{P} 3, \mathrm{P} 6 \neq \mathrm{P} 2, \mathrm{P} 5 \neq \mathrm{P} 1$ \& $\mathrm{P} 4 \neq \mathrm{P} 0$ (Toggling) is inhibited.

Macronix
International Co., Ltd.

## 10-16. Burst Read

This device supports Burst Read.
To set the Burst length, following command operation is required
Issuing command: "COh" in the first Byte (8-clocks), following 4 clocks defining wrap around enable with "Oh" and disable with"1h".

Next 4 clocks is to define wrap around depth. Definition as following table:

| Data | Wrap Around | Wrap Depth |
| :---: | :---: | :---: |
| 00 h | Yes | 8-byte |
| 01 h | Yes | 16-byte |
| 02 h | Yes | 32-byte |
| 03 h | Yes | 64 -byte |
| 1 xh | No | X |

The wrap around unit is defined within the 256Byte page, with random initial address. It's defined as "wrap-around mode disable" for the default state of the device. To exit wrap around, it is required to issue another "C0h" command in which data='1xh". Otherwise, wrap around status will be retained until power down or reset command. To change wrap around depth, it is requried to issue another "COh" command in which data="0xh". "EBh" supports wrap around feature after wrap around enable. The device is default without Burst read.

Figure 23. Burst Read

Macronix
International Co., Ltd.

## 10-17. Performance Enhance Mode

The device could waive the command cycle bits if the two cycle bits after address cycle toggles.
"EBh" command supports enhance mode. The performance enhance mode is not supported in dual I/O mode.

After entering enhance mode, following CS\# go high, the device will stay in the read mode and treat CS\# go low of the first clock as address instead of command cycle.

To exit enhance mode, a new fast read command whose first two dummy cycles is not toggle then exit. Or issue "FFh" command to exit enhance mode.

Notice: Performance Enhance can only be operated in high performance mode.

Figure $24.4 \times \mathrm{l} / \mathrm{O}$ Read enhance performance Mode Sequence

## Note:

1. Performance enhance mode, if $P 7 \neq P 3$ \& $P 6 \neq P 2$ \& $P 5 \neq P 1$ \& $P 4 \neq P 0$ (Toggling), ex: $A 5,5 A, 0 F$, if not using performance enhance recommend to keep 1 or 0 in performance enhance indicator.
2. Reset the performance enhance mode, if $P 7=P 3$ or $P 6=P 2$ or $P 5=P 1$ or $P 4=P 0, e x: A A, 00, F F$

Macronix International Co., Ltd.

## 10-18. Sector Erase (SE)

The Sector Erase (SE) instruction is for erasing the data of the chosen sector to be "1". The instruction is used for any 4K-byte sector. A Write Enable (WREN) instruction must execute to set the Write Enable Latch (WEL) bit before sending the Sector Erase (SE). Any address of the sector (Please refer to "Table 4. Memory Organization") is a valid address for Sector Erase (SE) instruction. The CS\# must go high exactly at the byte boundary (the latest eighth of address byte been latched-in); otherwise, the instruction will be rejected and not executed.

Address bits [Am-A12] (Am is the most significant address) select the sector address.

The sequence of issuing SE instruction is: CS\# goes low $\rightarrow$ sending SE instruction code $\rightarrow 3$-byte address on $\mathrm{SI} \rightarrow$ CS\# goes high.

The SIO[3:1] are "don't care".
The self-timed Sector Erase Cycle time (tSE) is initiated as soon as Chip Select (CS\#) goes high. The Write in Progress (WIP) bit still can be checked during the Sector Erase cycle is in progress. The WIP sets 1 during the tSE timing, and sets 0 when Sector Erase Cycle is completed, and the Write Enable Latch (WEL) bit is reset. If the sector is protected by BP3, BP2, BP1, BP0 bits, the Sector Erase (SE) instruction will not be executed on the sector.

Figure 25. Sector Erase (SE) Sequence

Macronix International Co., Ltd.

## 10-19. Block Erase (BE32K)

The Block Erase (BE32K) instruction is for erasing the data of the chosen block to be "1". The instruction is used for 32K-byte block erase operation. A Write Enable (WREN) instruction must be executed to set the Write Enable Latch (WEL) bit before sending the Block Erase (BE32K). Any address of the block (see "Table 4. Memory Organization") is a valid address for Block Erase (BE32K) instruction. The CS\# must go high exactly at the byte boundary (the least significant bit of address byte has been latched-in); otherwise, the instruction will be rejected and not executed.

The sequence of issuing BE32K instruction is: CS\# goes low $\rightarrow$ sending BE32K instruction code $\rightarrow$ 3-byte address on $\mathrm{SI} \rightarrow \mathrm{CS} \#$ goes high.

The SIO[3:1] are don't care.
The self-timed Block Erase Cycle time (tBE32K) is initiated as soon as Chip Select (CS\#) goes high. The Write in Progress (WIP) bit still can be checked while the Block Erase cycle is in progress. The WIP sets during the tBE32K timing, and clears when Block Erase Cycle is completed, and the Write Enable Latch (WEL) bit is cleared. If the block is protected by BP3~0, the array data will be protected (no change) and the WEL bit still be reset.

Figure 26. Block Erase 32KB (BE32K) Sequence (Command 52)

Macronix International Co., Ltd.

## 10-20. Block Erase (BE)

The Block Erase (BE) instruction is for erasing the data of the chosen block to be "1". The instruction is used for 64K-byte block erase operation. A Write Enable (WREN) instruction must execute to set the Write Enable Latch (WEL) bit before sending the Block Erase (BE). Any address of the block (Please refer to "Table 4. Memory Organization") is a valid address for Block Erase (BE) instruction. The CS\# must go high exactly at the byte boundary (the latest eighth of address byte been latched-in); otherwise, the instruction will be rejected and not executed.

The sequence of issuing BE instruction is: CS\# goes low $\rightarrow$ sending BE instruction code $\rightarrow$ 3-byte address on $\mathrm{SI} \rightarrow$ CS\# goes high.

The SIO[3:1] are "don't care".

The self-timed Block Erase Cycle time (tBE) is initiated as soon as Chip Select (CS\#) goes high. The Write in Progress (WIP) bit still can be checked during the Block Erase cycle is in progress. The WIP sets 1 during the tBE timing, and sets 0 when Block Erase Cycle is completed, and the Write Enable Latch (WEL) bit is reset. If the block is protected by BP3, BP2, BP1, BP0 bits, the Block Erase (BE) instruction will not be executed on the block.

Figure 27. Block Erase (BE) Sequence

Macronix
International Co., Ltd.

## 10-21. Chip Erase (CE)

The Chip Erase (CE) instruction is for erasing the data of the whole chip to be "1". A Write Enable (WREN) instruction must execute to set the Write Enable Latch (WEL) bit before sending the Chip Erase (CE). The CS\# must go high exactly at the byte boundary, otherwise the instruction will be rejected and not executed.

The sequence of issuing CE instruction is: CS\# goes low $\rightarrow$ sending CE instruction code $\rightarrow$ CS\# goes high.
The SIO[3:1] are "don't care".

The self-timed Chip Erase Cycle time (tCE) is initiated as soon as Chip Select (CS\#) goes high. The Write in Progress (WIP) bit still can be checked during the Chip Erase cycle is in progress. The WIP sets 1 during the tCE timing, and sets 0 when Chip Erase Cycle is completed, and the Write Enable Latch (WEL) bit is reset. If the chip is protected by BP3, BP2, BP1, BP0 bits, the Chip Erase (CE) instruction will not be executed. It will be only executed when BP3, BP2, BP1, BP0 all set to "0".

Figure 28. Chip Erase (CE) Sequence

Macronix
International Co., Ltd.

## 10-22. Page Program (PP)

The Page Program (PP) instruction is for programming the memory to be " 0 ". A Write Enable (WREN) instruction must be executed to set the Write Enable Latch (WEL) bit before sending the Page Program (PP). The device programs only the last 256 data bytes sent to the device. The last address byte (the 8 least significant address bits, A7-A0) should be set to 0 for 256 bytes page program. If A7-A0 are not all zero, transmitted data that exceed page length are programmed from the starting address (24-bit address that last 8 bit are all 0 ) of currently selected page. If the data bytes sent to the device exceeds 256 , the last 256 data byte is programmed at the request page and previous data will be disregarded. If the data bytes sent to the device has not exceeded 256 , the data will be programmed at the request address of the page. There will be no effort on the other data bytes of the same page.

The sequence of issuing PP instruction is: CS\# goes low $\rightarrow$ sending PP instruction code $\rightarrow$ 3-byte address on $\mathrm{SI} \rightarrow$ at least 1-byte on data on $\mathrm{SI} \rightarrow \mathrm{CS} \mathrm{\#}$ goes high.

The CS\# must be kept low during the whole Page Program cycle; The CS\# must go high exactly at the byte boundary (the latest eighth bit of data being latched in), otherwise the instruction will be rejected and will not be executed.

The self-timed Page Program Cycle time (tPP) is initiated as soon as Chip Select (CS\#) goes high. The Write in Progress (WIP) bit still can be checked during the Page Program cycle is in progress. The WIP sets 1 during the tPP timing, and sets 0 when Page Program Cycle is completed, and the Write Enable Latch (WEL) bit is reset. If the page is protected by BP3, BP2, BP1, BP0 bits, the Page Program (PP) instruction will not be executed.

The SIO[3:1] are "don't care".

Figure 29. Page Program (PP) Sequence

Macronix
International Co., Ltd.
MX25R1635F

## 10-23. $4 \times \mathrm{I} / \mathrm{O}$ Page Program (4PP)

The Quad Page Program (4PP) instruction is for programming the memory to be "0". A Write Enable (WREN) instruction must execute to set the Write Enable Latch (WEL) bit and Quad Enable (QE) bit must be set to "1" before sending the Quad Page Program (4PP). The Quad Page Programming takes four pins: SIO0, SIO1, SIO2, and SIO3 as address and data input, which can improve programmer performance and the effectiveness of application. The 4PP operation frequency supports as fast as f4PP. The other function descriptions are as same as standard page program.

The sequence of issuing 4PP instruction is: CS\# goes low $\rightarrow$ sending 4PP instruction code $\rightarrow 3$-byte address on $\mathrm{SIO}[3: 0] \rightarrow$ at least 1-byte on data on $\mathrm{SIO}[3: 0] \rightarrow \mathrm{CS} \#$ goes high.

Figure 30.4 x I/O Page Program (4PP) Sequence

Macronix International Co., Ltd.

## 10-24. Deep Power-down (DP)

The Deep Power-down (DP) instruction places the device into a minimum power consumption state, Deep Power down mode, in which the quiescent current is reduced from ISB1 to ISB2.

The sequence of issuing DP instruction: CS\# goes low $\rightarrow$ send DP instruction code $\rightarrow$ CS\# goes high. The CS\# must go high at the byte boundary; otherwise the instruction will not be executed. $\mathrm{SIO}[3: 1$ ] are "don't care".

After CS\# goes high there is a delay of tDP before the device transitions from Stand-by mode to Deep Power-down mode and the current reduces from ISB1 to ISB2. Once in Deep Power-down mode, all instructions will be ignored.

CS\# must not be pulsed low until the device has been in Deep Power-down mode for a minimum of tDPDD. The device exits Deep Power-down mode and returns to Stand-by mode if CS\# pulses low for tCRDP or if the device is power-cycled or hardware reset. After CS\# goes high, there is a delay of tRDP before the device transitions from Deep Power-down mode back to Stand-by mode.

Figure 31. Deep Power-down (DP) Sequence and Release from Deep Power-down Sequence

Macronix
International Co., Ltd.

## 10-25. Enter Secured OTP (ENSO)

The ENSO instruction is for entering the additional 8K-bit secured OTP mode. The additional 8K-bit secured OTP is independent from main array, which may use to store unique serial number for system identifier. After entering the Secured OTP mode, and then follow standard read or program procedure to read out the data or update data. The Secured OTP data cannot be updated again once it is lock-down.

The sequence of issuing ENSO instruction is: CS\# goes low $\rightarrow$ sending ENSO instruction to enter Secured OTP mode $\rightarrow$ CS\# goes high.

The SIO[3:1] are "don't care".

Please note that WRSR/WRSCUR commands are not acceptable during the access of secure OTP region, once security OTP is lock down, only read related commands are valid.

## 10-26. Exit Secured OTP (EXSO)

The EXSO instruction is for exiting the additional 8K-bit secured OTP mode.
The sequence of issuing EXSO instruction is: CS\# goes low $\rightarrow$ sending EXSO instruction to exit Secured OTP mode $\rightarrow$ CS\# goes high.

The SIO[3:1] are "don't care".

## 10-27. Read Security Register (RDSCUR)

The RDSCUR instruction is for reading the value of Security Register bits. The Read Security Register can be read at any time (even in program/erase/write status register/write security register condition) and continuously.

The sequence of issuing RDSCUR instruction is : CS\# goes low $\rightarrow$ sending RDSCUR instruction $\rightarrow$ Security Register data out on $\mathrm{SO} \rightarrow \mathrm{CS} \#$ goes high.

The SIO[3:1] are "don't care".

The definition of the Security Register bits is as below:
Secured OTP Indicator bit. The Secured OTP indicator bit shows the secured OTP area is locked by factory before ex- factory or not. When it is " 0 ", it indicates non-factory lock; "1" indicates factory-lock.

Lock-down Secured OTP (LDSO) bit. By writing WRSCUR instruction, the LDSO bit may be set to "1" for customer lock-down purpose. However, once the bit is set to "1" (lock-down), the LDSO bit and the $1^{\text {st }} 4 \mathrm{~K}$-bit Secured OTP area cannot be update any more. While it is in 8K-bit secured OTP mode, main array access is not allowed.

Program Suspend Status bit. Program Suspend Bit (PSB) indicates the status of Program Suspend operation. Users may use PSB to identify the state of flash memory. After the flash memory is suspended by Program Suspend command, PSB is set to " 1 ". PSB is cleared to " 0 " after program operation resumes.

Erase Suspend Status bit. Erase Suspend Bit (ESB) indicates the status of Erase Suspend operation. Users may use ESB to identify the state of flash memory. After the flash memory is suspended by Erase Suspend command, ESB is set to " 1 ". ESB is cleared to " 0 " after erase operation resumes.

Macronix
International Co., Ltd.
MX25R1635F

Program Fail Flag bit. The Program Fail bit shows the status of the last Program operation. The bit will be set to "1" if the program operation failed or the program region was protected. It will be automatically cleared to " 0 " if the next program operation succeeds. Please note that it will not interrupt or stop any operation in the flash memory.

Erase Fail Flag bit. The Erase Fail bit shows the status of last Erase operation. The bit will be set to "1" if the erase operation failed or the erase region was protected. It will be automatically cleared to "0" if the next erase operation succeeds. Please note that it will not interrupt or stop any operation in the flash memory.

Table 8. Security Register Definition

| bit7 | bit6 | bit5 | bit4 | bit3 | bit2 | bit1 | bit0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Reserved | E_FAIL | P_FAIL | Reserved | ESB (Erase Suspend bit) | PSB (Program Suspend bit) | LDSO <br> (lock-down $1^{\text {st }}$ 4K-bit Secured OTP) | $\begin{gathered} \hline \text { Secured OTP } \\ \text { Indicator bit } \\ \left(2^{\text {nd }} 4 \mathrm{~K}\right. \text {-bit } \\ \text { Secured OTP }) \\ \hline \end{gathered}$ |
| - | 0=normal Erase succeed 1=indicate Erase failed (default=0) | 0=normal <br> Program <br> succeed <br> 1=indicate <br> Program failed (default=0) | - | $0=$ Erase is not suspended 1= Erase suspended (default=0) | $0=$ Program is not suspended 1= Program suspended (default=0) | $0=$ not lockdown $1=$ lock-down (cannot program/erase OTP) | $\begin{gathered} 0=\begin{array}{c} \text { nonfactory } \\ \text { lock } \end{array} \\ 1=\text { factory } \\ \text { lock } \end{gathered}$ |
| X | Volatile bit | Volatile bit | Volatile bit | Volatile bit | Volatile bit | non-volatile bit | non-volatile bit |
|  | Read Only | Read Only |  | Read Only | Read Only | OTP | Read Only |

## 10-28. Write Security Register (WRSCUR)

The WRSCUR instruction is for changing the values of Security Register Bits. The WREN (Write Enable) instruction is required before issuing WRSCUR instruction. The WRSCUR instruction may change the values of bit1 (LDSO bit) for customer to lock-down the $1^{\text {st }} 4 \mathrm{~K}$-bit Secured OTP area. Once the LDSO bit is set to " 1 ", the $1{ }^{\text {st }} 4 \mathrm{~K}$-bit Secured OTP area cannot be updated any more.

The sequence of issuing WRSCUR instruction is :CS\# goes low $\rightarrow$ sending WRSCUR instruction $\rightarrow$ CS\# goes high.
The SIO[3:1] are "don't care".
The CS\# must go high exactly at the boundary; otherwise, the instruction will be rejected and not executed.

Macronix
International Co., Ltd.

## 10-29. Program Suspend and Erase Suspend

The Suspend instruction interrupts a Page Program, Sector Erase, or Block Erase operation to allow access to the memory array. After the program or erase operation has entered the suspended state, the memory array can be read except for the page being programmed or the sector or block being erased ("Table 9. Readable Area of Memory While a Program or Erase Operation is Suspended").

Table 9. Readable Area of Memory While a Program or Erase Operation is Suspended

| Suspended Operation | Readable Region of Memory Array |
| :---: | :---: |
| Page Program | All but the Page being programmed |
| Sector Erase (4KB) | All but the 4KB Sector being erased |
| Block Erase $(32 \mathrm{~KB})$ | All but the 32 KB Block being erased |
| Block Erase $(64 \mathrm{~KB})$ | All but the 64 KB Block being erased |

When the Serial NOR Flash receives the Suspend instruction, there is a latency of tPSL or tESL ("Figure 33. Suspend to Read/Program Latency") before the Write Enable Latch (WEL) bit clears to "0" and the PSB or ESB sets to "1", after which the device is ready to accept one of the commands listed in "Table 10. Acceptable Commands During Program/Erase Suspend after tPSL/tESL" (e.g. FAST READ). Refer to "Table 17. AC Characteristics" for tPSL and tESL timings.
"Table 11. Acceptable Commands During Suspend (tPSL/tESL not required)" lists the commands for which the tPSL and tESL latencies do not apply. For example, RDSR, RDSCUR, RSTEN, and RST can be issued at any time after the Suspend instruction.

Security Register bit 2 (PSB) and bit 3 (ESB) can be read to check the suspend status. The PSB (Program Suspend Bit) sets to " 1 " when a program operation is suspended. The ESB (Erase Suspend Bit) sets to " 1 " when an erase operation is suspended. The PSB or ESB clears to " 0 " when the program or erase operation is resumed.

Table 10. Acceptable Commands During Program/Erase Suspend after tPSL/tESL

| Command Name | Command Code | Suspend Type |  |
| :---: | :---: | :---: | :---: |
|  |  | Program Suspend | Erase Suspend |
| READ | 03 h | $\bullet$ | $\bullet$ |
| FAST READ | $0 B h$ | $\bullet$ | $\bullet$ |
| DREAD | $3 B h$ | $\bullet$ | $\bullet$ |

| NOP | 00h | - | - |

Figure 32. Resume to Suspend Latency

## 10-29-1. Erase Suspend to Program

The "Erase Suspend to Program" feature allows Page Programming while an erase operation is suspended. Page Programming is permitted in any unprotected memory except within the sector of a suspended Sector Erase operation or within the block of a suspended Block Erase operation. The Write Enable (WREN) instruction must be issued before any Page Program instruction.

A Page Program operation initiated within a suspended erase cannot itself be suspended and must be allowed to finish before the suspended erase can be resumed. The Status Register can be polled to determine the status of the Page Program operation. The WEL and WIP bits of the Status Register will remain "1" while the Page Program operation is in progress and will both clear to " 0 " when the Page Program operation completes.

Figure 33. Suspend to Read/Program Latency

## Notes:

1. Please note that Program only available after the Erase-Suspend operation
2. To check suspend ready information, please read security register bit2(PSB) and bit3(ESB)

## 10-30. Program Resume and Erase Resume

The Resume instruction resumes a suspended Page Program, Sector Erase, or Block Erase operation. Before issuing the Resume instruction to restart a suspended erase operation, make sure that there is no Page Program operation in progress.

Immediately after the Serial NOR Flash receives the Resume instruction, the WEL and WIP bits are set to " 1 " and the PSB or ESB is cleared to " 0 ". The program or erase operation will continue until finished ("Figure 34. Resume to Read Latency") or until another Suspend instruction is received. A resume-to-suspend latency of tPRS or tERS must be observed before issuing another Suspend instruction ("Figure 32. Resume to Suspend Latency").

Please note that the Resume instruction will be ignored if the Serial NOR Flash is in "Performance Enhance Mode". Make sure the Serial NOR Flash is not in "Performance Enhance Mode" before issuing the Resume instruction.

Figure 34. Resume to Read Latency

Macronix
International Co., Ltd.

## 10-31. No Operation (NOP)

The "No Operation" command is only able to terminate the Reset Enable (RSTEN) command and will not affect any other command.

The SIO[3:1] are don't care.

## 10-32. Software Reset (Reset-Enable (RSTEN) and Reset (RST))

The Software Reset operation combines two instructions: Reset-Enable (RSTEN) command and Reset (RST) command. It returns the device to a standby mode. All the volatile bits and settings will be cleared then, which makes the device return to the default status as power on.

To execute Reset command (RST), the Reset-Enable (RSTEN) command must be executed first to perform the Reset operation. If there is any other command to interrupt after the Reset-Enable command, the Reset-Enable will be invalid.

The SIO[3:1] are "don't care".
If the Reset command is executed during program or erase operation, the operation will be disabled, the data under processing could be damaged or lost.

The reset time is different depending on the last operation. Longer latency time is required to recover from a program operation than from other operations.

Macronix
International Co., Ltd.
MX25R1635F

Figure 35. Software Reset Recovery

Note: Refer to "Table 13. Reset Timing-(Other Operation)" for tREADY2 data.

Figure 36. Reset Sequence

Macronix
International Co., Ltd.

## 10-33. High Voltage Operation

The flash device supports High Voltage Operation. This opeartion allows user can have better performance in following Program/Erase operation.

To enable High Voltage Opeartion, WP\#/SIO2 need to apply Vhv during whole operation. If the voltage can not sustain in Vhv range, the Program/Erase opeation might be failed. CS\# can only go low after tVSL1+tVhv +tVhv2 timing during High Voltage Operation. WP\# can only start to go low after whole Erase/Program Operation has been done.

To check the operation status, user may check the status of WIP bit.

Figure 37. High Voltage Operation Diagram

Note 1: Please note that the CS\# can only go low after $t V S L 1+t V h v+t V h v 2$ timing during High Voltage Operation.
Note 2: Please note that the WP\# can only start to go low after whole Erase/Program Operation has been done. To check the operation status, user may check the status of WIP bit.
Note 3: $t V h v(m i n)=.250 n s, t V S L 1(m i n)=.800 u s ; ~ t V h v 2(m i n)=.0 n s$
Note 4: Vhv range is $7 V($ min. $) \leq V h v \leq 8$ (max.)
Note 5: The High Voltage Operation can only work during Vcc(min.) $\leq$ Vcc $\leq 2.0 \mathrm{~V}$

Macronix International Co., Ltd.

## 10-34. Read SFDP Mode (RDSFDP)

The Serial Flash Discoverable Parameter (SFDP) standard provides a consistent method of describing the functional and feature capabilities of serial flash devices in a standard set of internal parameter tables. These parameter tables can be interrogated by host system software to enable adjustments needed to accommodate divergent features from multiple vendors. The concept is similar to the one found in the Introduction of JEDEC Standard, JESD68 on CFI.

The sequence of issuing RDSFDP instruction is same as FAST_READ: CS\# goes low $\rightarrow$ send RDSFDP instruction $(5 \mathrm{Ah}) \rightarrow$ send 3 address bytes on SI pin $\rightarrow$ send 1 dummy byte on SI pin $\rightarrow$ read SFDP code on SO $\rightarrow$ to end RDSFDP operation can use CS\# to high at any time during data out.

SFDP is a JEDEC Standard, JESD216B.
For SFDP register values detail, please contact local Macronix sales channel for Application Note.

Figure 38. Read Serial Flash Discoverable Parameter (RDSFDP) Sequence

International Co., Ltd.

## 11. RESET

Driving the RESET\# pin low for a period of tRLRH or longer will reset the device. After reset cycle, the device is at the following states:

- Standby mode
- All the volatile bits such as WEL/WIP/SRAM lock bit will return to the default status as power on.

If the device is under programming or erasing, driving the RESET\# pin low will also terminate the operation and data could be lost. During the resetting cycle, the SO data becomes high impedance and the current will be reduced to minimum.

Figure 39. RESET Timing

Table 12. Reset Timing-(Power On)

| Symbol | Parameter | Min. | Typ. | Max. |
| :---: | :--- | :---: | :---: | :---: |
| Unit |  |  |  |  |
| tRHSL | Reset\# high before CS\# low | 10 |  |  |
| tRH | Reset\# setup time | 15 |  |  |
| tRLRH | Reset\# hold time | 15 |  | ns |
| tREADY1 | Reset Recovery time | 10 |  | ns |

Table 13. Reset Timing-(Other Operation)

| Symbol | Parameter | Min. | Typ. | Max. |
| :---: | :--- | :---: | :---: | :---: |
| Unit |  |  |  |  |
| tRHSL | Reset\# high before CS\# low | 10 |  |  |
| tRS | Reset\# setup time | 15 |  | us |
| tRH | Reset\# hold time | 15 |  | ns |
| tRLRH | Reset\# low pulse width | 10 |  | ns |
| tREADY2 | Reset Recovery time (During instruction decoding) | 30 |  | us |
|  | Reset Recovery time (for read operation) | Reset Recovery time (for program operation) | 30 |  |
|  | Reset Recovery time(for SE4KB operation) | 80 |  | us |
|  | Reset Recovery time (for BE32K/64K operation) | 12 |  | us |
|  | Reset Recovery time (for Chip Erase operation) | 12 |  | us |
|  | Reset Recovery time (for WRSR operation) | 12 |  | ms |

## 12. POWER-ON STATE

The device is at the following states after power-up:

- Standby mode (please note it is not deep power-down mode)
- Write Enable Latch (WEL) bit is reset

The device must not be selected during power-up and power-down stage until the VCC reaches the following levels:

- VCC minimum at power-up stage and then after a delay of tVSL
- GND at power-down

Please note that a pull-up resistor on CS\# may ensure a safe and proper power-up/down level.
An internal power-on reset (POR) circuit may protect the device from data corruption and inadvertent data change during power up state. When VCC is lower than VWI (POR threshold voltage value), the internal logic is reset and the flash device has no response to any command.

For further protection on the device, if the VCC does not reach the VCC minimum level, the correct operation is not guaranteed. The write, erase, and program command should be sent after the below time delay:

- tVSL after VCC reached VCC minimum level

The device can accept read command after VCC reached VCC minimum and a time delay of tVSL.
Please refer to the "Figure 47. Power-up Timing".

## Note:

- To stabilize the VCC level, the VCC rail decoupled by a suitable capacitor close to package pins is recommended. (generally around 0.1uF)
- At power-down stage, the VCC drops below VWI level, all operations are disable and device has no response to any command. The data corruption might occur during this stage if a write, program, erase cycle is in progress.

International Co., Ltd.

## 13. ELECTRICAL SPECIFICATIONS

Table 14. Absolute Maximum Ratings

| Rating | Value |  |
| :--- | :---: | :---: |
| Ambient Operating Temperature | Industrial grade | $-40^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$ |
| Storage Temperature | $-65^{\circ} \mathrm{C}$ to $150^{\circ} \mathrm{C}$ |  |
| Applied Input Voltage | -0.5 V to $\mathrm{VCC}+0.5 \mathrm{~V}$ |  |
| Applied Output Voltage | -0.5 V to $\mathrm{VCC}+0.5 \mathrm{~V}$ |  |
| VCC to Ground Potential | MX25R $(1.65 \mathrm{~V}-3.6 \mathrm{~V})$ | -0.5 V to 4.0 V |

## NOTICE:

1. Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is stress rating only and functional operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended period may affect reliability.
2. Specifications contained within the following tables are subject to change.
3. During voltage transitions, all pins may overshoot to $\mathrm{VCC}+1.0 \mathrm{~V}$ or -1.0 V for period up to 20 ns .

## Notes:

1. $\mathrm{tCH}+\mathrm{tCL}$ must be greater than or equal to 1 / Frequency.
2. Typical values given for $\mathrm{TA}=25^{\circ} \mathrm{C}$. Not $100 \%$ tested.
3. Only applicable as a constraint for a WRSR instruction when SRWD is set at 1.
4. Program operation may be interrupted as often as system request. The minimum timing of tPRS must be observed before issuing the next program suspend command. However, in order for an Program operation to make progress, tPRS $\geq 100$ us must be included in resume-to-suspend loop(s). Not $100 \%$ tested.
5. Erase operation may be interrupted as often as system request. The minimum timing of tERS must be observed before issuing the next erase suspend command. However, in order for an Erase operation to make progress, tERS $\geq 280$ us must be included in resume-to-suspend loop(s). The details are described in Macronix application notes. Not $100 \%$ tested.
6. If the address range is within 4 Mb , the 4 READ/QREAD clock rate could achieve to 16 MHz for 4 READ/QREAD operation. If user wants to keep 4READ/QREAD at 16 MHz for address range that is more than 4 Mb , it is necessary to re-issue 4READ/QREAD command again after each 4Mb boundary.
7. Test condition is shown as "Figure 42. Input Test Waveforms and Measurement Level", "Figure 43. Output Loading".
8. WRSR speed max. is 33 MHz when issuing WRSR for performance mode switch no matter High Performance Mode to Ultra Low Power Mode or Ultra Low Power Mode to High Performance Mode.
9. Latency time is required to complete Erase/Program Suspend operation until WIP bit is " 0 ".
10. The value guaranteed by characterization, not $100 \%$ tested in production.

Macronix
International Co., Ltd.

## 14. OPERATING CONDITIONS

## At Device Power-Up and Power-Down

AC timing illustrated in "Figure 45. AC Timing at Device Power-Up" and "Figure 46. Power-Down Sequence" are for the supply voltages and the control signals at device power-up and power-down. If the timing in the figures is ignored, the device will not operate correctly.

During power-up and power-down, CS\# needs to follow the voltage applied on VCC to keep the device not to be selected. The CS\# can be driven low when VCC reach Vcc(min.) and wait a period of tVSL.

Figure 45. AC Timing at Device Power-Up

| Symbol | Parameter | Notes | Min. | Max. | Unit |
| :---: | :--- | :---: | :---: | :---: | :---: |
| tVR | VCC Rise Time | 1 |  | 500000 | us/V |

## Notes:

1. Sampled, not $100 \%$ tested.
2. For AC spec tCHSL, tSLCH, tDVCH, tCHDX, tSHSL, tCHSH, tSHCH, tCHCL, tCLCH in the figure, please refer to "Table 17. AC Characteristics".

Figure 46. Power-Down Sequence
During power-down, CS\# needs to follow the voltage drop on VCC to avoid mis-operation.
VCC

Figure 47. Power-up Timing

Macronix
International Co., Ltd.

## Figure 48. Power Up/Down and Voltage Drop

When powering down the device, VCC must drop below $\mathrm{V}_{\text {PWD }}$ for at least tPWD to ensure the device will initialize correctly during power up. Please refer to "Figure 48. Power Up/Down and Voltage Drop" and "Table 18. PowerUp/Down Voltage and Timing" below for more details.

Table 18. Power-Up/Down Voltage and Timing

| Symbol | Parameter | Min. | Max. | Unit |
| :---: | :--- | :---: | :---: | :---: |
| tVSL | VCC(min.) to device operation | 800 |  | us |
| VWI | Write Inhibit Voltage | 1.1 | 1.5 | V |
| $\mathrm{~V}_{\text {PWD }}$ | VCC voltage needed to below $\mathrm{V}_{\text {PWD }}$ for <br> ensuring initialization will occur | Deep Power Mode |  | 0.4 |
|  | others |  | 0.9 | V |
| tPWD | The minimum duration for ensuring initialization will occur | 300 |  | us |

Note: These parameters are characterized only.

## 14-1. Initial Delivery State

The device is delivered with the memory array erased: all bits are set to 1 (each byte contains FFh). The Status Register contains 00h (all Status Register bits are 0).

## 15. ERASE AND PROGRAMMING PERFORMANCE

Ultra Low Power Mode (Configuration Register-2 bit1=0):

| PARAMETER | Min. | Typ. $^{(1)}$ | Max. $^{(2)}$ | Unit |
| :--- | :---: | :---: | :---: | :---: |
| Write Status Register Cycle Time |  | 10 | 30 | ms |
| Sector Erase Cycle Time (4KB) |  | 58 | 240 | ms |
| Sector Erase Cycle Time (4KB) (Applied Vhv at WP\# pin) |  | 36 | 240 | ms |
| Block Erase Cycle Time (32KB) |  | 1 | 3 | s |
| Block Erase Cycle Time (32KB) (Applied Vhv at WP\# pin) |  | 0.22 | 1.05 | s |
| Block Erase Cycle Time (64KB) |  | 0.8 | 3.5 | s |
| Block Erase Cycle Time (64KB) (Applied Vhv at WP\# pin) |  | 0.43 | 2.1 | s |
| Chip Erase Cycle Time |  | 30 | 60 | s |
| Chip Erase Cycle Time (Applied Vhv at WP\# pin) |  | 12 | 37.5 | s |
| Byte Program Time |  | $40^{(4)}$ | 100 | us |
| Byte Program Time (Applied Vhv at WP\# pin) |  | 32 | 100 | us |
| Page Program Time |  | $3.2^{(4)}$ | 10 | ms |
| Page Program Time (Applied Vhv at WP\# pin) |  | 0.6 | 3.6 | ms |
| Erase/Program Cycle | 100,000 |  |  | cycles |

High Performance Mode (Configuration Register-2 bit1= 1):

| PARAMETER | Min. | Typ. $^{(1)}$ | Max. $^{(2)}$ | Unit |
| :--- | :---: | :---: | :---: | :---: |
| Write Status Register Cycle Time |  | 9.5 | 20 | ms |
| Sector Erase Cycle Time (4KB) |  | 40 | 240 | ms |
| Sector Erase Cycle Time (4KB) (Applied Vhv at WP\# pin) |  | 36 | 210 | ms |
| Block Erase Cycle Time (32KB) |  | 0.24 | 1.5 | s |
| Block Erase Cycle Time (32KB) (Applied Vhv at WP\# pin) |  | 0.22 | 1.05 | s |
| Block Erase Cycle Time (64KB) |  | 0.48 | 3 | s |
| Block Erase Cycle Time (64KB) (Applied Vhv at WP\# pin) |  | 0.43 | 2.1 | s |
| Chip Erase Cycle Time |  | 13 | 38 | s |
| Chip Erase Cycle Time (Applied Vhv at WP\# pin) |  | 12 | 34 | s |
| Byte Program Time |  | $32^{(4)}$ | 100 | us |
| Byte Program Time (Applied Vhv at WP\# pin) |  | 32 | 100 | us |
| Page Program Time |  | $0.85^{(4)}$ | 4 | ms |
| Page Program Time (Applied Vhv at WP\# pin) | 0.6 | 3.6 | ms |  |
| Erase/Program Cycle | 100,000 |  |  | cycles |

Notes:

1. Typical erase assumes the following conditions: $25^{\circ} \mathrm{C}$, typical operation voltage and all zero pattern.
2. Under worst conditions of $85^{\circ} \mathrm{C}$ and minimum operation voltage.
3. System-level overhead is the time required to execute the first-bus-cycle sequence for the programming command.
4. Typical program assumes the following conditions: $25^{\circ} \mathrm{C}$, typical VCC, and checkerboard pattern.

## 16. LATCH-UP CHARACTERISTICS

|  | Min. | Max. |
| :--- | :---: | :---: |
| Input Voltage with respect to GND on all power pins, SI, CS\# | -1.0 V | 2 VCCmax |
| Input Voltage with respect to GND on SO | -1.0 V | VCC +1.0 V |
| Current | -100 mA | +100 mA |

Includes all pins except VCC. Test conditions: typical operation voltage, one pin at a time.

Note:
This package has an exposed metal pad underneath the package. It is recommended to leave the metal pad floating or to connect it to the same ground as the GND pin of the package. Do not connect the metal pad to any other voltage or signal line on the PCB. Avoid placing vias or traces underneath the metal pad. Connection of this metal pad to any other voltage or signal line can result in shorts and/or electrical malfunction of the device.

## 20. REVISION HISTORY

Macronix

| Revision No.$1.4$ | Description | Page | Date |
| :---: | :---: | :---: | :---: |
|  | 1. Optimized tREADY2/ISB2/tW values | P62,66-68,70,75 | JUL/28/2016 |
|  | 2. Updated tVR values | P72,74 |  |
|  | 3. Added bit6 information | P31 |  |
|  | 4. Added a statement for product ordering information | P77 |  |
|  | 5. Updated package outline for 8-land USON ( $2 \times 3 \mathrm{~mm} \mathrm{)}$ | P81 |  |
| 1.5 | 1. Added Part No. : MX25R1635FZNIH2/MX25R1635FM2IH2 | P77,78 | DEC/20/2016 |
|  | 2. Updated the note for the internal pull up status of RESET\#/SIO3, HOLD\#/SIO3 and WP\#/SIO2 | P8 |  |
|  | 3. Content correction. | P30 |  |
| 1.6 | 1. Added Part No. : MX25R1635FBDIH0 | P77 | DEC/12/2018 |
|  | 2. Added "Macronix Proprietary" footnote | All |  |
|  | 3. Added "Figure 44. SCLK TIMING DEFINITION" | P65 |  |
|  | 4. Updated "19-4. 8-land WSON (6x5mm)" in Min./Max. D1, E1 and L values. | P82 |  |
|  | 5. Format modification. | P79-82 |  |

Macronix
International Co., Ltd.

Except for customized products which have been expressly identified in the applicable agreement, Macronix's products are designed, developed, and/or manufactured for ordinary business, industrial, personal, and/or household applications only, and not for use in any applications which may, directly or indirectly, cause death, personal injury, or severe property damages. In the event Macronix products are used in contradicted to their target usage above, the buyer shall take any and all actions to ensure said Macronix's product qualified for its actual use in accordance with the applicable laws and regulations; and Macronix as well as it's suppliers and/or distributors shall be released from any and all liability arisen therefrom.
