

High Speed Low Power CAN, CAN FD Transceiver

NCV7344

Description

The NCV7344 CAN transceiver is the interface between a controller area network (CAN) protocol controller and the physical bus. The transceiver provides differential transmit capability to the bus and differential receive capability to the CAN controller.

The NCV7344 is an addition to the CAN high-speed transceiver family complementing NCV734x CAN stand-alone transceivers and previous generations such as AMIS42665, AMIS3066x, etc.

The NCV7344 guarantees additional timing parameters to ensure robust communication at data rates beyond 1 Mbps to cope with CAN flexible data rate requirements (CAN FD). These features make the NCV7344 an excellent choice for all types of HS-CAN networks, in nodes that require a low-power mode with wake-up capability via the CAN bus.

Features

- Compatible with ISO 11898-2:2016
- Specification for Loop Delay Symmetry up to 5 Mbps
- V_{IO} pin on NCV7344-3 Version Allowing Direct Interfacing with 3 V to 5 V Microcontrollers
- Very Low Current Standby Mode with Wake-up via the Bus
- Low Electromagnetic Emission (EME) and High Electromagnetic Immunity
- Very Low EME without Common-mode (CM) Choke
- No Disturbance of the Bus Lines with an Un-powered Node
- Transmit Data (TxD) Dominant Timeout Function
- Under All Supply Conditions the Chip Behaves Predictably
- Very High ESD Robustness of Bus Pins, >8 kV System ESD Pulses
- Thermal Protection
- Bus Pins Short Circuit Proof to Supply Voltage and Ground
- Bus Pins Protected Against Transients in an Automotive Environment
- These are Pb-free Devices

Quality

- Wettable Flank Package for Enhanced Optical Inspection
- NCV Prefix for Automotive and Other Applications Requiring Unique Site and Control Change Requirements; AEC-Q100 Qualified and PPAP Capable

Typical Applications

- Automotive
- Industrial Networks

Table 1. PIN FUNCTION DESCRIPTION

Pin	Name	Description
1	TxD	Transmit data input; low input → dominant driver; internal pull-up current
2	GND	Ground
3	V _{CC}	Supply voltage
4	RxD	Receive data output; dominant transmitter → low output
5	NC	Not connected. On NCV7344-0 only
5	V _{IO}	Digital Input / Output pins and other functions supply voltage. On NCV7344-3 only
6	CANL	Low-level CAN bus line (low in dominant mode)
7	CANH	High-level CAN bus line (high in dominant mode)
8	STB	Standby mode control input; internal pull-up current
	EP	Exposed Pad. Recommended to connect to GND or left floating in application (DFN8 package only).

FUNCTIONAL DESCRIPTION

Operating Modes

NCV7344 provides two modes of operation as illustrated in Table 2. These modes are selectable through pin STB.

Table 2. OPERATING MODES

Pin STB	Mode	Pin RxD	
Low	Normal	Low when bus dominant	High when bus recessive
High	Standby	Follows the bus when wake-up detected	High when no wake-up request detected

Normal Mode

In the normal mode, the transceiver is able to communicate via the bus lines. The signals are transmitted and received to the CAN controller via the pins TxD and RxD. The slopes on the bus lines outputs are optimized to give low EME.

Standby Mode

In standby mode both the transmitter and receiver are disabled and a very low-power differential receiver monitors the bus lines for CAN bus activity. The bus lines are biased to ground and supply current is reduced to a minimum, typically 10 µA. When a wake-up request is detected by the low-power differential receiver, the signal is first filtered and then verified as a valid wake signal after a time period of t_{wake_filt} , the RxD pin is driven low by the transceiver (following the bus) to inform the controller of the wake-up request.

Wake-up

When a valid wake-up pattern (phase in order dominant – recessive – dominant) is detected during the standby mode the RxD pin follows the bus. Minimum length of each phase is t_{wake_filt} – see Figure 5.

Pattern must be received within t_{wake_to} to be recognized as valid wake-up otherwise internal logic is reset.

Figure 5. NCV7344 Wake-up Behavior

Overtemperature Detection

A thermal protection circuit protects the IC from damage by switching off the transmitter if the junction temperature exceeds a value of approximately 180°C. Because the transmitter dissipates most of the power, the power dissipation and temperature of the IC is reduced. All other IC functions continue to operate. The transmitter off-state resets when the temperature decreases below the shutdown threshold and pin TxD goes high. The thermal protection circuit is particularly needed when a bus line short circuits.

TxD Dominant Timeout Function

A TxD dominant timeout timer circuit prevents the bus lines being driven to a permanent dominant state (blocking all network communication) if pin TxD is forced permanently low by a hardware and/or software application failure. The timer is triggered by a negative edge on pin TxD. If the duration of the low-level on pin TxD exceeds the internal timer value $t_{dom(TxD)}$, the transmitter is disabled, driving the bus into a recessive state. The timer is reset by a positive edge on pin TxD.

This TxD dominant timeout time $t_{dom(TxD)}$ defines the minimum possible bit rate to 17 kbps.

Fail Safe Features

A current-limiting circuit protects the transmitter output stage from damage caused by accidental short circuit to either positive or negative supply voltage, although power dissipation increases during this fault condition.

Standby undervoltage on VCC pin prevents the chip sending data on the bus when there is not enough VCC supply voltage by entering standby mode. Undervoltage detection on VIO pin (NCV7344-3 version only) also causes transition to standby mode. Switch-off undervoltage detection level on supply pin(s) forces transceiver to disengage from the bus until the supply is recovered. After supply is recovered TxD pin must be first released to high to allow sending dominant bits again. Recovery time from undervoltage detection is equal to $t_d(stb-nm)$ time.

The pins CANH and CANL are protected from automotive electrical transients (according to ISO 7637; see Figure 7). Pins TxD and STB are pulled high internally should the input become disconnected. Pins TxD, STB and RxD will be floating, preventing reverse supply should the VCC supply be removed.

VIO Supply Pin

The VIO pin (available only on NCV7344-3 version) should be connected to microcontroller supply pin. By using VIO supply pin shared with microcontroller the I/O levels between microcontroller and transceiver are properly adjusted. See Figure 4. Pin VIO also provides the internal supply voltage for low-power differential receiver of the transceiver. This allows detection of wake-up request even when there is no supply voltage on pin VCC.

ELECTRICAL CHARACTERISTICS

Definitions

All voltages are referenced to GND (pin 2). Positive currents flow into the IC. Sinking current means the current is flowing into the pin; sourcing current means the current is flowing out of the pin.

Transmitted recessive bit width @ 5 Mbit/s	$t_{Bit(RxD)}$	$t_{Bit(RxD)}$
Received recessive bit width @ 5 Mbit/s	Δt_{Rec}	Δt_{Rec}
Maximum ratings of V_{CAN_H}, V_{CAN_L} and V_{Diff}		
Maximum rating V_{Diff}	V_{Diff}	$V_{CANH-CANL}$
General maximum rating V_{CAN_H} and V_{CAN_L}	V_{CAN_H} V_{CAN_L}	V_{CANH} V_{CANL}
Optional: Extended maximum rating V_{CAN_H} and V_{CAN_L}	V_{CAN_H} V_{CAN_L}	NA
Maximum leakage currents on CAN_H and CAN_L, unpowered		
Leakage current on CAN_H, CAN_L	I_{CAN_H} I_{CAN_L}	I_{LI}
Bus biasing control timings		
CAN activity filter time, long	t_{Filter}	t_{wake_filt}
CAN activity filter time, short	t_{Filter}	t_{wake_filt}
Wake-up timeout, short	t_{Wake}	NA
Wake-up timeout, long	t_{Wake}	t_{wake_to}
Timeout for bus inactivity (Required for selective wake-up implementation only)	$t_{Silence}$	NA
Bus Bias reaction time (Required for selective wake-up implementation only)	t_{Bias}	NA

DFNW8 3x3, 0.65P CASE 507AB ISSUE E

DATE 02 JUL 2021

NOTES:

1. DIMENSIONING AND TOLERANCING PER ASME Y14.5M, 1994.
2. CONTROLLING DIMENSION: MILLIMETERS
3. DIMENSION b APPLIES TO PLATED TERMINALS AND IS MEASURED BETWEEN 0.15 AND 0.30MM FROM THE TERMINAL TIP.
4. COPLANARITY APPLIES TO THE EXPOSED PAD AS WELL AS THE TERMINALS.
5. THIS DEVICE CONTAINS WETTABLE FLANK DESIGN FEATURES TO AID IN FILLET FORMATION ON THE LEADS DURING MOUNTING.
