## feATURES

- Low Noise Voltage: $1.9 n \mathrm{~V} / \sqrt{\mathrm{Hz}}$
- Low Supply Current: 1.2mA/Amp Max
- Low Offset Voltage: $350 \mu \mathrm{~V}$ Max
- Gain-Bandwidth Product:

LT6233: 60MHz; $A_{v} \geq 1$
LT6233-10: $375 \mathrm{MHz} ; \mathrm{A}_{\mathrm{v}} \geq 10$

- Wide Supply Range: 3 V to 12.6 V
- Output Swings Rail-to-Rail
- Common Mode Rejection Ratio: 115dB Typ
- Output Current: 30 mA
- Operating Temperature Range: $-40^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$
- LT6233 Shutdown to $10 \mu \mathrm{~A}$ Maximum
- LT6233/LT6233-10 in a Low Profile (1mm)

ThinSOTTM Package

- Dual LT6234 in 8-Pin SO and Tiny DFN Packages
- LT6235 in a 16-Pin SSOP Package

## APPLICATIONS

- Ultrasound Amplifiers
- Low Noise, Low Power Signal Processing
- Active Filters
- Driving A/D Converters
- Rail-to-Rail Buffer Amplifiers

## DESCRIPTIOn

The LT『 $6233 /$ /L6234/LT6235 are single/dual/quad low noise, rail-to-rail output unity-gain stable op amps that feature $1.9 \mathrm{nV} / \sqrt{\mathrm{Hz}}$ noise voltage and draw only 1.2 mA of supply current per amplifier. These amplifiers combine very low noise and supply current with a 60MHz gainbandwidth product, a $17 \mathrm{~V} / \mu \mathrm{s}$ slew rate and are optimized for low supply voltage signal conditioning systems. The LT6233-10 is a single amplifier optimized for higher gain applications resulting in higher gain bandwidth and slew rate. The LT6233 and LT6233-10 include an enable pin that can be used to reduce the supply current to less than $10 \mu \mathrm{~A}$.
The amplifierfamily has an outputthat swings within 50 mV of either supply rail to maximize the signal dynamic range in low supply applications and is specified on $3.3 \mathrm{~V}, 5 \mathrm{~V}$ and $\pm 5 \mathrm{~V}$ supplies. The $e_{n} \bullet \sqrt{\text { SUPPLY }}$ product of 2.1 peramplifier is among the most noise efficient of any op amp.
The LT6233/LT6233-10 are available in the 6-lead SOT-23 package and the LT6234 dual is available in the 8 -pin SO package with standard pinouts. For compact layouts, the dual is also available in a tiny dual fine pitch leadless package (DFN). The LT6235 is available in the 16 -pin SSOP package.

Note 1: Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.
Note 2: Inputs are protected by back-to-back diodes. If the differential input voltage exceeds 0.7 V , the input current must be limited to less than 40 mA .
Note 3: A heat sink may be required to keep the junction temperature below the absolute maximum rating when the output is shorted indefinitely.
Note 4: The LT6233C/LT6233I the LT6234C/LT6234I, and LT6235C/LT6235I are guaranteed functional over the temperature range of $-40^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$.

Note 5: The LT6233C/LT6234C/LT6235C are guaranteed to meet specified performance from $0^{\circ} \mathrm{C}$ to $70^{\circ} \mathrm{C}$. The LT6233C/LT6234C/LT6235C are designed, characterized and expected to meet specified performance from $-40^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$, but are not tested or QA sampled at these temperatures. The LT6233I/LT6234I/LT6235I are guaranteed to meet specified performance from $-40^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$.
Note 6: Matching parameters are the difference between the two amplifiers $A$ and $D$ and between $B$ and $C$ of the LT6235; between the two amplifiers of the LT6234. CMRR and PSRR match are defined as follows: CMRR and PSRR are measured in $\mu \mathrm{V} / \mathrm{V}$ on the matched amplifiers. The difference is calculated between the matching sides in $\mu \mathrm{V} / \mathrm{V}$. The result is converted to dB.

## ELECTRICAL CHARACTERISTICS

Note 7: Minimum supply voltage is guaranteed by power supply rejection ratio test.
Note 8: Output voltage swings are measured between the output and power supply rails.

Note 9: Full-power bandwidth is calculated from the slew rate:
FPBW $=S R / 2 \pi V_{P}$
Note 10: This parameter is not $100 \%$ tested.

## APPLICATIONS INFORMATION

## Amplifier Characteristics

Figure 1 is a simplified schematic of the LT6233/LT6234/ LT6235, which has a pair of low noise input transistors Q1 and Q2. A simple current mirror Q3/Q4 converts the differential signal to a single-ended output, and these transistors are degenerated to reduce their contribution to the overall noise.

Capacitor C 1 reduces the unity-cross frequency and improves the frequency stability without degrading the gain bandwidth of the amplifier. Capacitor $\mathrm{C}_{\mathrm{M}}$ sets the overall amplifier gain bandwidth. The differential drive generator supplies current to transistors Q5 and Q6 that swing the output from rail-to-rail.

## Input Protection

There are back-to-back diodes, D1 and D2 across the + and - inputs of these amplifiers to limit the differential input voltage to $\pm 0.7 \mathrm{~V}$. The inputs of the LT6233/LT6234/LT6235 do not have internal resistors in series with the input transistors. This technique is often used to protect the input devices from overvoltage that causes excessive current to flow. The addition of these resistors would significantly degrade the low noise voltage of these amplifiers. For instance, a $100 \Omega$ resistor in series with each input would generate $1.8 \mathrm{nV} / \sqrt{\mathrm{Hz}}$ of noise, and the total amplifier noise voltage would rise from $1.9 \mathrm{nV} / \sqrt{\mathrm{Hz}}$ to $2.6 \mathrm{nV} / \sqrt{\mathrm{Hz}}$. Once the input differential voltage exceeds $\pm 0.7 \mathrm{~V}$, steady-state current conducted through the protection diodes should
be limited to $\pm 40 \mathrm{~mA}$. This implies $25 \Omega$ of protection resistance is necessary per volt of overdrive beyond $\pm 0.7 \mathrm{~V}$. These input diodes are rugged enough to handle transient currents due to amplifier slew rate overdrive and clipping without protection resistors.

The photo of Figure 2 shows the output response to an input overdrive with the amplifier connected as a voltage follower. With the input signal low, current source $I_{1}$ saturates and the differential drive generator drives Q6 into saturation so the output voltage swings all the way to $\mathrm{V}^{-}$. The input can swing positive until transistor Q2 saturates into current mirror Q3/Q4. When saturation occurs, the output tries to phase invert, but diode D2 conducts current from the signal source to the output through the feedback connection. The output is clamped a diode drop below the input. In this photo, the input signal generator is limiting at about 20 mA .

Figure 2. $\mathrm{V}_{\mathrm{S}}= \pm 2.5 \mathrm{~V}, \mathrm{~A}_{\mathrm{V}}=1$ with Large Overdrive

Figure 1. Simplified Schematic

## APPLICATIONS INFORMATION

With the amplifier connected in a gain of $A_{V} \geq 2$, the output can invert with very heavy overdrive. To avoid this inversion, limit the input overdrive to 0.5 V beyond the power supply rails.

## ESD

The LT6233/LT6234/LT6235 have reverse-biased ESD protection diodes on all inputs and outputs as shown in Figure 1. If these pins are forced beyond either supply, unlimited current will flow through these diodes. If the current is transient and limited to one hundred milliamps or less, no damage to the device will occur.

## Noise

The noise voltage of the LT6233/LT6234/LT6235 is equivalent to that of a $225 \Omega$ resistor, and for the lowest possible noise it is desirable to keep the source and feedback resistance at or below this value, i.e., $R_{S}+R_{G} \| R_{F B}$ $\leq 225 \Omega$. With $R_{S}+R_{G} \| R_{F B}=225 \Omega$ the total noise of the amplifier is:

$$
\mathrm{e}_{\mathrm{N}}=\sqrt{(1.9 \mathrm{nV})^{2}+(1.9 \mathrm{nV})^{2}}=2.69 \mathrm{nV} / \sqrt{\mathrm{Hz}}
$$

Below this resistance value, the amplifier dominates the noise, but in the region between $225 \Omega$ and about 30 k , the noise is dominated by the resistor thermal noise. As the total resistance is further increased beyond 30k, the amplifier noise current multiplied by the total resistance eventually dominates the noise.

The product of $e_{N} \cdot \sqrt{I_{\text {SUPPLY }}}$ is an interesting way to gauge low noise amplifiers. Most low noise amplifiers with low $\mathrm{e}_{\mathrm{N}}$ have high I ISUPPLY current. In applications that require low noise voltage with the lowest possible supply current, this product can prove to be enlightening. The LT6233/LT6234/LT6235 have an $\mathrm{e}_{\mathrm{N}} \cdot \sqrt{\text { ISUPPLY }^{2}}$ product of only 2.1 per amplifier, yet it is common to see amplifiers with similar noise specifications to have $\mathrm{e}_{\mathrm{N}} \cdot \sqrt{\text { ISUPPLY }}$ as high as 13.5.
For a complete discussion of amplifier noise, see the LT1028 data sheet.

## Enable Pin

The LT6233 and LT6233-10 include an ENABLE pin that shuts down the amplifier to $10 \mu \mathrm{~A}$ maximum supply current. The $\overline{\text { ENABLE }}$ pin must be driven low to operate the amplifier with normal supply current. The ENABLE pin must be driven high to within 0.35 V of $\mathrm{V}^{+}$to shut down the supply current. This can be accomplished with simple gate logic; however care must be taken if the logic and the LT6233 operate from different supplies. If this is the case, then open-drain logic can be used with a pull-up resistor to ensure that the amplifier remains off. See Typical Performance Characteristics.
The output leakage current when disabled is very low; however, current can flow into the input protection diodes D1 and D2 if the output voltage exceeds the input voltage by a diode drop.

## S6 Package

6-Lead Plastic TSOT-23
(Reference LTC DWG \# 05-08-1636)

1. DIMENSIONS ARE IN MILLIMETERS
2. DRAWING NOT TO SCALE
3. DIMENSIONS ARE INCLUSIVE OF PLATING
4. DIMENSIONS ARE EXCLUSIVE OF MOLD FLASH AND METAL BURR
5. MOLD FLASH SHALL NOT EXCEED 0.254 mm
6. JEDEC PACKAGE REFERENCE IS MO-193

DD Package
8-Lead Plastic DFN ( $3 \mathrm{~mm} \times 3 \mathrm{~mm}$ )
(Reference LTC DWG \# 05-08-1698 Rev C)

RECOMMENDED SOLDER PAD PITCH AND DIMENSIONS APPLY SOLDER MASK TO AREAS THAT ARE NOT SOLDERED

NOTE:

1. DRAWING TO BE MADE A JEDEC PACKAGE OUTLINE MO-229 VARIATION OF (WEED-1) 2. DRAWING NOT TO SCALE
2. ALL DIMENSIONS ARE IN MILLIMETERS
3. DIMENSIONS OF EXPOSED PAD ON BOTTOM OF PACKAGE DO NOT INCLUDE MOLD FLASH. MOLD FLASH, IF PRESENT, SHALL NOT EXCEED 0.15 mm ON ANY SIDE
4. EXPOSED PAD SHALL BE SOLDER PLATED
5. SHADED AREA IS ONLY A REFERENCE FOR PIN 1 LOCATION ON TOP AND BOTTOM OF PACKAGE

## PACKAGE DESCRIPTION

S8 Package
8-Lead Plastic Small Outline (Narrow . 150 Inch)
(Reference LTC DWG \# 05-08-1610)

recommended solder pad layout

3. THESE DIMENSIONS DO NOT INCLUDE MOLD FLASH OR PROTRUSIONS MOLD FLASH OR PROTRUSIONS SHALL NOT EXCEED .006" (0.15mm)

## GN Package

16-Lead Plastic SSOP (Narrow . 150 Inch)
(Reference LTC DWG \# 05-08-1641)

DIMENSION DOES NOT INCLUDE MOLD FLASH. MOLD FLASH SHALL NOT EXCEED 0.006" ( 0.152 mm ) PER SIDE
**DIMENSION DOES NOT INCLUDE INTERLEAD FLASH. INTERLEAD FLASH SHALL NOT EXCEED $0.010^{\prime \prime}(0.254 \mathrm{~mm})$ PER SIDE

## TYPICAL APPLICATIONS

The LT6233 is applied as a transimpedance amplifier with an I-to-V conversion gain of $10 \mathrm{k} \Omega$ set by R1. The LT6233 is ideally suited to this application because of its low input offset voltage and current, and its low noise. This is because the 10k resistor has an inherent thermal noise of $13 \mathrm{nV} / \sqrt{\mathrm{Hz}}$ or $1.3 \mathrm{pA} / \sqrt{\mathrm{Hz}}$ at room temperature, while the LT6233 contributes only 2 nV and $0.8 \mathrm{pA} / \sqrt{\mathrm{Hz}}$. So, with respect to both voltage and current noises, the LT6233 is actually quieter than the gain resistor.
The circuit uses an avalanche photodiode with the cathode biased to approximately 200V. When light is incident on

Low Power Avalanche Photodiode Transimpedance Amplifier $I_{S}=1.2 \mathrm{~mA}$

OUTPUT OFFSET $=500 \mu \mathrm{~V}$ TYPICAL BANDWIDTH $=7.8 \mathrm{MHz}$ OUTPUT NOISE $=1 \mathrm{mV}$ P-P ( 20 MHz MEASUREMENT BW)
the photodiode, it induces a current IPD which flows into the amplifier circuit. The amplifier output falls negative to maintain balance at its inputs. The transfer function is therefore $\mathrm{V}_{\text {OUT }}=-_{\text {PD }} \cdot 10 \mathrm{k}$. C1 ensures stability and good settling characteristics. Output offset was measured at better than $500 \mu \mathrm{~V}$, so low in part because R2 serves to cancel the DC effects of bias current. Output noise was measured at below 1 mV p-p on a 20 MHz measurement bandwidth, with C2 shunting R2's thermal noise. As shown in the scope photo, the rise time is 45 ns , indicating a signal bandwidth of 7.8 MHz .
