#### Description

The MADRCC0006 is a single channel driver used to translate TTL control inputs into gate control voltages for GaAs FET microwave switches and attenuators. High speed analog CMOS technology is utilized to achieve low power dissipation at moderate to high speeds, encompassing most microwave switching applications. The output high level is optionally 0 to +2 V (relative to GND) to optimize the intermodulation products of the control devices at low frequencies.

4. All voltages are relative to GND.

5. V<sub>OPT</sub> is grounded for most applications. To improve the intermodulation performance and the 1 dB compression point of GaAs control devices at low frequencies, V<sub>OPT</sub> can be increased to between 1 and 2 V. The nonlinear characteristics of the GaAs control devices will approximate performance at 500 MHz. It should be noted that the control current is on the GaAs MMICs will increase when positive controls are applied.

6. MACOM recommends that V<sub>CC</sub> be powered on before V<sub>EE</sub> and powered off after V<sub>EE</sub>.
