

High Noise Immunity 42 V Input Voltage 70 mA Voltage Tracker

NO.EA-513-200728

OVERVIEW

The R1540x is a voltage tracker featuring input voltage in the range of 3.5 V to 42 V. Highly accurate output voltage which attributes to CE/ADJ pin achieves successful sequence control of the integrated off-board sensor module. Strong enough not to require the circuit to avoid external electromagnetic interference (EMI) and this contributes space saving.

KEY BENEFITS

- Excellent noise immunity provides effective shielding against EMI.
- Lower stand-by current consumption leads to energy saving of the whole system to prolong battery life.
- Response to requirements for sequence control in the system with integrated sensors.

KEY SPECIFICATIONS

- Input Voltage Range (Maximum Rating):
3.5 V to 42.0 V (50.0 V)
- Supply Current: Typ. 60 μ A
- Standby Current: Typ. 0.1 μ A
- Tracking Voltage Range: 2.2 V to 14 V
- Tracking Voltage Accuracy: ± 15 mV
($-40^{\circ}\text{C} \leq T_a \leq 105^{\circ}\text{C}$, $V_{\text{CE/ADJ}} = 5$ V)
- Output Current 70 mA
- Ripple Rejection: Typ. 80 dB ($f = 100$ Hz)
- Protections: Thermal Shutdown, Output Current Limiting and Short-circuit Current Limiting

ABSOLUTE MAXIMUM RATINGS

Electronic and mechanical stress momentarily exceeded absolute maximum ratings may cause permanent damage and may degrade the life time and safety for both device and system using the device in the field. The functional operation at or over these absolute maximum ratings are not assured.

RECOMMENDED OPERATING CONDITIONS

Symbol	Parameter	Rating	Unit
V_{IN}	Input Voltage	3.5 to 42	V
$V_{CE/ADJ}$	CE/ADJ Input Pin Voltage	0 to 14	V
T_a	Operating Temperature Range	-40 to 105	°C

RECOMMENDED OPERATING CONDITIONS

All of electronic equipment should be designed that the mounted semiconductor devices operate within the recommended operating conditions. The semiconductor devices cannot operate normally over the recommended operating conditions, even if they are used over such ratings by momentary electronic noise or surge. And the semiconductor devices may receive serious damage when they continue to operate over the recommended operating conditions.

TECHNICAL NOTES

Phase Compensation

R1540x adopts capacitance and Equivalent Series Resistance (ESR) for phase compensation to ensure stable operation even with load varying current. For this end, the capacitor of 10 μ F or more is essential. A certain amount of ESR may cause unstable output voltage. Fully take temperature and frequency characteristics into consideration when evaluating the circuit. Place the capacitor of 0.1 μ F or more between VDD and GND with using short leads and short printed circuit traces.

PCB Layout

SOT-23-5 package: connect Nos. 2 and 5 of GND pin together.

HSOP-8E package: connect Nos. 5 and 6 of GND pin together.

ESR vs. output current characteristics

Using ceramic output capacitor is highly recommended although availability of another low-ESR capacitors. The mutual relations between the output current (I_{OUT}) causes noise under the specified value and the ESR are indicated below for reference.

Measurement Conditions

Frequency Band: 10 Hz to 2 MHz

Temperature: -40°C to 105°C

Shaded portion: Noise level is $40\ \mu\text{V}$ (average) or below

Capacitors: $C_{IN} = 0.1\ \mu\text{F}$ of Ceramic, $C_{OUT} = 10\ \mu\text{F}$ of Ceramic

R1540x001B

THEORY OF OPERATION

Thermal Shutdown

Thermal Shutdown occurs when the device's junction temperature reaches 165°C (Typ.) at which point the regulator will automatically shut down. Then the regulator resumes from the stand-by state when the junction temperature decreases below 135°C (Typ.). Unless the cause of overheating is eliminated, the device cycles on and off to generate pulse output.

APPLICATION INFORMATION

Typical Application for IC Chip Breakdown Prevention

A sudden surge of current flowing through the VOUT pin during a short to GND leads to negative voltage due to resonance generated between the impedance of the wire and the output capacitor, C₂. Consequently, large short-circuit current may destroy the IC or a load device in some types of pattern boards. It is highly recommended to connect schottky diode, D1, between VOUT pin and GND to prevent the IC from being destroyed.

R1540x Typical Application for IC Chip Breakdown Prevention

Electromagnetic Noise Immunity

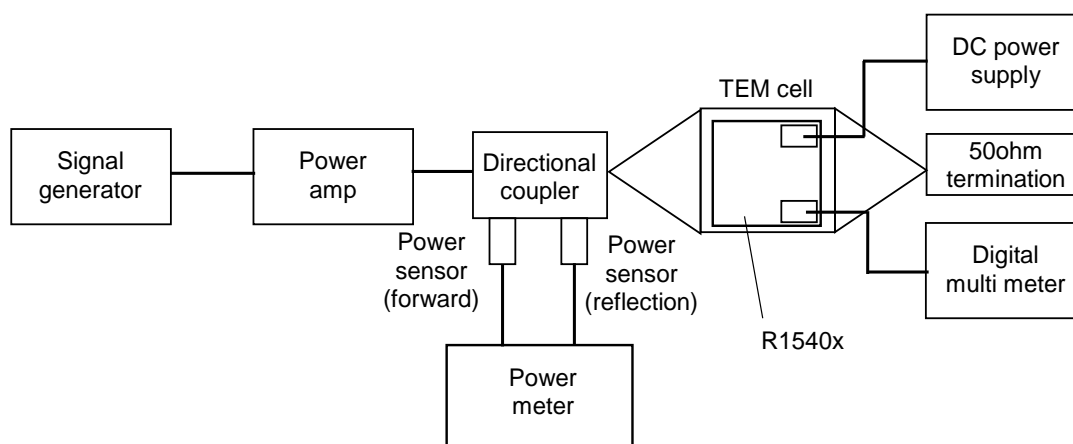

An output voltage may linearly varies in some regulators due to electromagnetic noise. R1540x adopts the techniques on its circuits to prevent this voltage variation. The noise immunity test indicated below was conducted to confirm that R1540x is fairly robust to electromagnetic noise over a broad frequency band.
