

# Optocoupler, Phototriac Output, High dV/dt, Low Input Current

23128

## FEATURES

- Low trigger current  $I_{FT} = 0.7 \text{ mA}$  (typ.)
- $I_{TRMS} = 300 \text{ mA}$
- High static  $dV/dt \geq 10\,000 \text{ V}/\mu\text{s}$
- Load voltage up to 800 V
- Material categorization: for definitions of compliance please see [www.vishay.com/doc?99912](http://www.vishay.com/doc?99912)

**RoHS**  
COMPLIANT

## DESCRIPTION

The IL4216, IL4217, and IL4218 product family consists of an optically coupled GaAs IRLED to a photosensitive thyristor system with integrated noise suppression circuit.

The thyristor system enables low trigger currents of 0.7 mA and features a  $dV/dt$  ratio of greater than 10 kV/ $\mu\text{s}$  and load voltages up to 800 V.

The IL4216, IL4217, and IL4218 product family is a perfect microcontroller friendly solution to isolate low voltage logic from high voltage 120 V<sub>AC</sub>, 240 V<sub>AC</sub>, and 380 V<sub>AC</sub> lines and to control resistive, inductive, or capacitive AC loads like motors, solenoids, high power thyristors or TRIACs, and solid-state relays.

**Notes**

- Stresses in excess of the absolute maximum ratings can cause permanent damage to the device. Functional operation of the device is not implied at these or any other conditions in excess of those given in the operational sections of this document. Exposure to absolute maximum ratings for extended periods of the time can adversely affect reliability
- <sup>(1)</sup> Refer to reflow profile for soldering conditions for surface mounted devices (SMD). Refer to wave profile for soldering conditions for through hole devices (DIP)

**Note**

- Minimum and maximum values are testing requirements. Typical values are characteristics of the device and are the result of engineering evaluation. Typical values are for information only and are not part of the testing requirements

**POWER FACTOR CONSIDERATIONS**

A snubber is not needed to eliminate false operation of the TRIAC driver because of the IL4216, IL4217, IL4218 high static and commutating  $dV/dt$  with loads between 1 and 0.8 power factors. When inductive loads with power factors less than 0.8 are being driven, include a RC snubber or a single capacitor directly across the device to damp the peak commutating  $dV/dt$  spike. Normally a commutating  $dV/dt$  causes a turning-off device to stay on due to the stored energy remaining in the turning-off device.
