MIC29302A

3A Fast-Response LDO Regulator

General Description

The MIC29302A is a high-current, low-cost, low-dropout voltage regulator that uses Micrel's proprietary Super βeta PNP® process with a PNP pass element. The 3A LDO regulator features 450mV (full load) dropout voltage and very low ground current. Designed for high-current loads, these devices also find applications in lower current, low-dropout critical systems, where their dropout voltages and ground current values are important attributes.

Along with a total accuracy of ±2% (over temperature, line, and load regulation) the regulator features very fast transient recovery from input voltage surges and output load current changes.

The MIC29302A has an adjustable output that can be set by two external resistors to a voltage between 1.24V and 15V. In addition, the device is fully protected against overcurrent faults, reversed input polarity, reversed lead insertion, and overtemperature operation. A TTL logic enable (EN) pin is available in the MIC29302A to shutdown the regulator. When not used, the device can be set to continuous operation by connecting EN to the input (IN). The MIC29302A is available in the standard and 5-pin

TO-263 and TO-252 packages with an operating junction temperature range of –40°C to +125°C.

Datasheets and support documentation can be found on Micrel's website at: www.micrel.com.

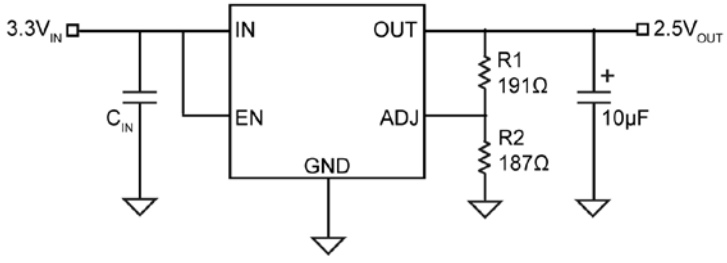
Features

- High-current capability
  - 3A over full temperature range
- Low-dropout voltage of 450mV at full load
- Low ground current
- Accurate 1% guaranteed tolerance
- Extremely fast transient response
- Zero-current shutdown mode
- Error flag signals output out-of-regulation
- Adjustable output voltage
- Packages: TO-263-5L and TO-252-5L

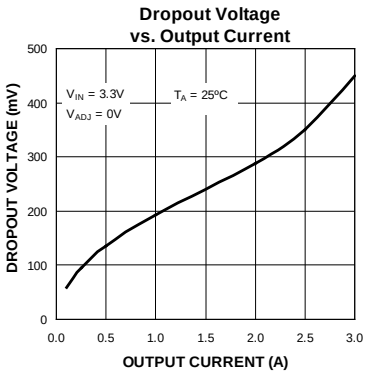
Applications

- Processor peripheral and I/O supplies
- High-efficiency "green" computer systems
- Automotive electronics
- High-efficiency linear lower supplies
- Battery-powered equipment
- PC add-in cards
- High-efficiency post-regulator for switching supply

Typical Application



$$V_{OUT} = 1.242 \times \left(\frac{R1}{R2} + 1\right)$$



Super ßeta PNP is a registered trademark of Micrel, Inc.

Pin Description

Pin Number TO-263	Pin Number TO-252	Pin Name	Pin Function
1	1	EN	Enable (Input): Active-high CMOS compatible control input. Do not float.
2	2	IN	INPUT: Unregulated input, +3V to +16V maximum
3, TAB	3, TAB	GND	GND: TAB is also connected internally to the IC's ground on both packages.
4	4	OUT	OUTPUT: The regulator output voltage
5	5	ADJ	Feedback Voltage: 1.24V feedback from external resistor divider.

Absolute Maximum Ratings[1]

Input Supply Voltage (V_{IN})[1] ..... –20V to +20V
Enable Input Voltage (V_{EN}) ..... –0.3V to V_{IN}
Lead Temperature (soldering, 5 sec.) ..... 260°C
Power Dissipation ..... Internally Limited
Storage Temperature Range ..... –65°C to +150°C
ESD Rating all pins[3]

Operating Ratings[2]

Operating Junction Temperature ..... –40°C to +125°C
Operating Input Voltage ..... 3V to 16V
Package Thermal Resistance
TO-263 (θ_{JC}) ..... 3°C/W
TO-252 (θ_{JC}) ..... 3°C/W
TO-252 (θ_{JA}) ..... 35°C/W
TO-263 (θ_{JA}) ..... 28°C/W

Electrical Characteristics[4]

V_{IN} = 4.2V; I_{OUT} = 100mA; T_A = 25°C, **bold** values indicate –40°C≤ T_J ≤ +125°C, unless noted.

Parameter	Condition	Min.	Typ.	Max.	Units
Output Voltage					
Output Voltage Accuracy[5]	100mA ≤ I_{OUT} ≤3A, (V_{OUT} + 1V) ≤ V_{IN} ≤ 16V	**–2**		**2**	%
Line Regulation	I_{OUT} = 100mA, (V_{OUT} + 1V) ≤ V_{IN} ≤ 16V		0.1	0.5	%
Load Regulation	V_{IN} = V_{OUT} + 1V, 100mA ≤ I_{OUT} ≤ 3A		0.2	1	%
Dropout Voltage[6]	I_{OUT} = 100mA		80	**200**	mV
	I_{OUT} = 750mA		220		
	I_{OUT} = 1.5A		275		
	I_{OUT} = 2.0A		375	**630**	
	I_{OUT} = 2.5A		430	**720**	
	I_{OUT} = 3A		450	**800**	
Ground Current					
Ground Current	I_{OUT} = 750mA, V_{IN} = V_{OUT} + 1V		5	**20**	mA
	I_{OUT} = 1.5A		15		
	I_{OUT} = 3A		60	**150**	
I_{GRNDDO} Ground Pin Current @ Dropout	V_{IN} = 0.5V less than specified V_{OUT} × I_{OUT} = 10mA		2		
Current Limit	V_{OUT} = 0V[7]	3	4		A
e_n, Output Noise Voltage (10Hz to 100kHz	C_L = 10µF		400		μV_{RMS}
I_L = 100mA	C_L = 33µF		260		
Ground Pin Current in Shutdown	Input Voltage V_{IN} = 16V		32		µA

Notes:

1. Exceeding the absolute maximum rating may damage the device.
2. The device is not guaranteed to function outside its operating rating.
3. Devices are ESD sensitive. Handling precautions recommended. Human body model, 1.5kΩ in series with 100pF.
4. Specification for packaged product only
5. Output voltage temperature coefficient is defined as the worst case voltage change divided by the total temperature change.
6. Dropout voltage is defined as the input-to-output differential when output voltage drops to 99% of its normal value with V_{OUT} + 1V applied to V_{IN}.
7. V_{IN} =$V_{OUT\ (nominal)}$ + 1V. For example, use V_{IN} = 4.3V for a 3.3V regulator or use 6V for a 5V regulator. Employ pulse testing procedure for current limit.

Electrical Characteristics[4] (Continued)

V_{IN} = 4.2V; I_{OUT} = 10mA; T_A = 25°C, **bold** values indicate –40°C≤ T_J ≤ +125°C, unless noted.

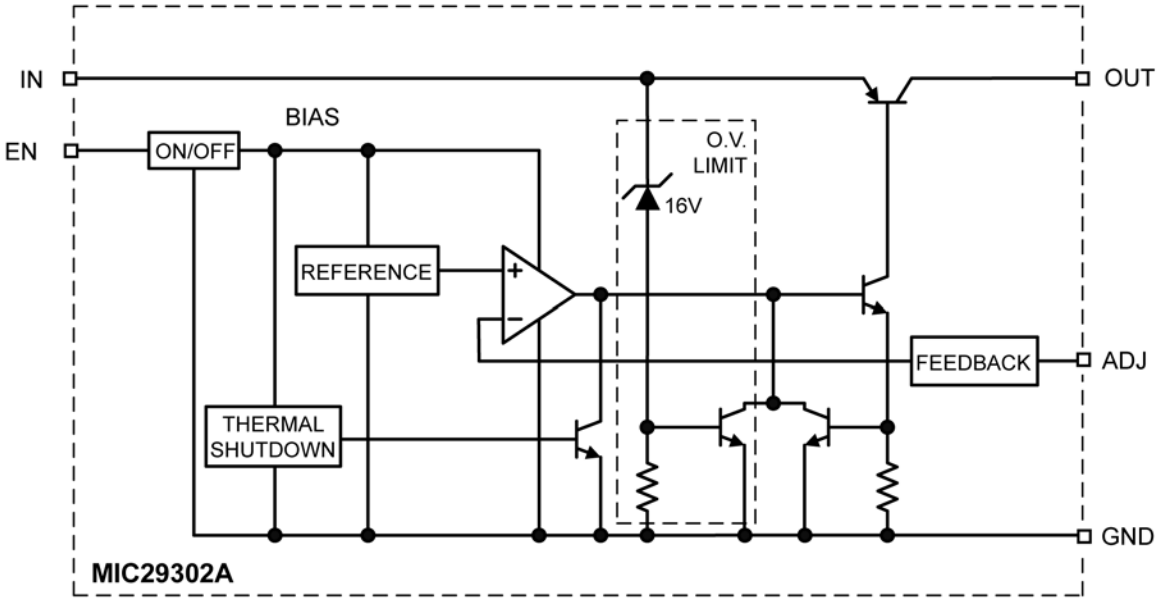
Functional Diagram



Application Information

The MIC29302A is a high-performance, low-dropout voltage regulator suitable for all moderate to high-current voltage regulation applications. Its 450mV typical dropout voltage at full load makes it especially valuable in battery-powered systems and as high efficiency noise filters in post-regulator applications. Unlike older NPN-pass transistor designs, where the minimum dropout voltage is limited by the base-emitter voltage drop and collector-emitter saturation voltage, dropout performance of the PNP output is limited merely by the low V_{CE} saturation voltage.

A trade-off for the low-dropout voltage is a varying base driver requirement. But Micrel's Super ßeta PNP® process reduces this drive requirement to merely 1% of the load current.

The MIC29302A regulator is fully protected from damage due to fault conditions. Current limiting is linear; output current under overload conditions is constant. Thermal shutdown disables the device when the die temperature exceeds the +125°C maximum safe operating temperature. The output structure of the regulators allows voltages in excess of the desired output voltage to be applied without reverse current flow. The MIC29302A offers a logic-level ON/OFF control. When disabled, the device draws nearly zero current.

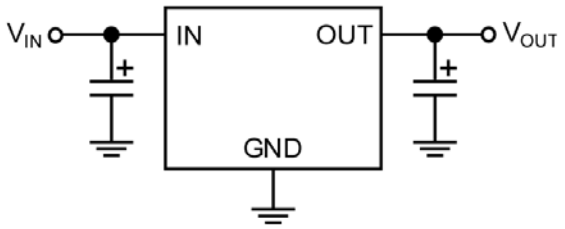


Figure 2. Linear Regulators Require Only Two Capacitors for Operation

Thermal Design

Linear regulators are simple to use. The most complicated set of design parameters to consider are thermal characteristics. Thermal design requires the following application-specific parameters:

- Maximum ambient temperature, T_A
- Output Current, I_{OUT}
- Output Voltage, V_{OUT}
- Input Voltage, V_{IN}

First, we calculate the power dissipation of the regulator from these numbers and the device parameters from this datasheet:

$$P_D = I_{OUT}(1.02V_{IN} - V_{OUT})$$

Where the ground current is approximated by 2% of I_{OUT}. Then the heatsink thermal resistance is determined with this formula:

$$\theta_{SA} = \frac{T_{JMAX} - T_A}{P_D} - (\theta_{JC} + \theta_{CS})$$

where:

$T_{JMAX} \leq 125°C$ and θ_{CS} is between 0°C/W and 2°C/W.

The heatsink may be significantly reduced in applications where the minimum input voltage is known and is large compared to the dropout voltage. A series input resistor can be used to drop excessive voltage and distribute the heat between this resistor and the regulator. The low-dropout properties of Micrel Super βeta PNP® regulators allow very significant reductions in regulator power dissipation and the associated heatsink without compromising performance. When this technique is employed, a capacitor of at least 0.1µF is needed directly between the input and regulator ground.

Please refer to *Application Note 9* and *Application Hint 17* on Micrel's website (www.micrel.com) for further details and examples on thermal design and heatsink specification.

With no heatsink in the application, calculate the junction temperature to determine the maximum power dissipation that will be allowed before exceeding the maximum junction temperature of the MIC29302A. The maximum power allowed can be calculated using the thermal resistance (θ_{JA}) of the D-Pak (TO252) adhering to the following criteria for the PCB design: 2oz. copper and 100mm^2 copper area for the MIC29302A.

For example, given an expected maximum ambient temperature (T_A) of 75°C with V_{IN} = 3.3V, V_{OUT} = 2.5V, and I_{OUT} = 3A, first calculate the expected P_D using:

$$P_D = (3.3V - 2.5V) \times 3A - (3.3V) \times (0.016A) = 2.3472W$$

Next, calcualte the junction temperature for the expected power dissipation:

$$T_J = (\theta_{JA} \times P_D) + T_A = (35°C/W \times 2.3472W) + 75°C = 157.15°C$$

Now determine the maximum power dissipation allowed that would not exceed the IC's maximum junction temperature (125°C) without the use of a heatsink by:

$$P_{D(MAX)} = (T_{J(MAX)} - T_A) / \theta_{JA} = (125°C - 75°C) / (35°C/W) = 1.428W$$

Capacitor Requirements

For stability and minimum output noise, a capacitor on the regulator output is necessary. The value of this capacitor is dependent upon the output current; lower currents allow smaller capacitors. The MIC29302A is stable with a 10µF capacitor at full load.

This capacitor need not be an expensive low-ESR type; aluminum electrolytics are adequate. In fact, extremely low-ESR capacitors may contribute to instability. Tantalum capacitors are recommended for systems where fast load transient response is important.

When the regulator is powered from a source with high AC impedance, a 0.1µF capacitor connected between input and GND is recommended.

Transient Response and 5V to 3.3V Conversion

The MIC29302A has excellent response to variations in input voltage and load current. By virtue of its low dropout voltage, the device does not saturate into dropout as readily as similar NPN-based designs. A 3.3V output Micrel LDO will maintain full speed and performance with an input supply as low as 4.2V, and will still provide some regulation with supplies down to 3.8V, unlike NPN devices that require 5.1V or more for good performance and become nothing more than a resistor under 4.6V of input. Micrel's PNP regulators provide superior performance in "5V to 3.3V" conversion applications than NPN regulators, especially when all tolerances are considered.

Minimum Load Current

The MIC29302A regulator operates within a specified load range. If the output current is too small, leakage currents dominate and the output voltage rises.

A minimum load current of 10mA is necessary for proper regulation and to swamp any expected leakage current across the operating temperature range.

For best performance the total resistance (R1+R2) should be small enough to pass the minimum regulator load current of 10mA.

Adjustable Regulator Design

The output voltage can be programmed anywhere between 1.25V and the 15V. Two resistors are used. The resistor values are calculated by:

$$R_1 = R_2 \times \left(\frac{V_{OUT}}{1.240} - 1 \right)$$

where V_{OUT} is the desired output voltage.

Figure 3 shows component definition. Applications with widely varying load currents may scale the resistors to draw the minimum load current required for proper operation (see "Minimum Load Current" section).

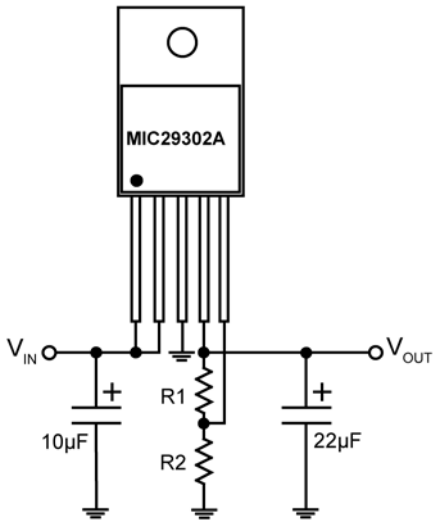

Figure 3. Adjustable Regulator with Resistors

Enable Input

MIC29302A features an enable (EN) input that allows ON/OFF control of the device. Special design allows "zero" current drain when the device is disabled—only microamperes of leakage current flows. The EN input has TTL/CMOS compatible thresholds for simple interfacing with logic, or may be directly tied to V_{IN}. Enabling the regulator requires approximately 20µA of current into the EN pin.

Micrel, Inc. is a leading global manufacturer of IC solutions for the worldwide high performance linear and power, LAN, and timing & communications markets. The Company's products include advanced mixed-signal, analog & power semiconductors; high-performance communication, clock management, MEMs-based clock oscillators & crystal-less clock generators, Ethernet switches, and physical layer transceiver ICs. Company customers include leading manufacturers of enterprise, consumer, industrial, mobile, telecommunications, automotive, and computer products. Corporation headquarters and state-of-the-art wafer fabrication facilities are located in San Jose, CA, with regional sales and support offices and advanced technology design centers situated throughout the Americas, Europe, and Asia. Additionally, the Company maintains an extensive network of distributors and reps worldwide.

Micrel makes no representations or warranties with respect to the accuracy or completeness of the information furnished in this datasheet.
