Datasheet - production data

**Features**

- Operating conditions
  - Operating power supply: 1.8 V to 3.6 V
  - Temperature range: -40 °C to 85 °C
- Low-power features
  - 5 low-power modes: Wait, Low-power run (5.1 µA), Low-power wait (3 µA), Active-halt with RTC (1.3 µA), Halt (350 nA)
  - Ultra-low leakage per I/O: 50 nA
  - Fast wakeup from Halt: 5 µs
- Advanced STM8 core
  - Harvard architecture and 3-stage pipeline
  - Max freq: 16 MHz, 16 CISC MIPS peak
  - Up to 40 external interrupt sources
- Reset and supply management
  - Low power, ultra-safe BOR reset with 5 selectable thresholds
  - Ultra-low power POR/PDR
  - Programmable voltage detector (PVD)
- Clock management
  - 32 kHz and 1 to 16 MHz crystal oscillators
  - Internal 16 MHz factory-trimmed RC
  - Internal 38 kHz low consumption RC
  - Clock security system
- Low-power RTC
  - BCD calendar with alarm interrupt
  - Digital calibration with +/- 0.5 ppm accuracy
  - LSE security system
  - Auto-wakeup from Halt w/ periodic interrupt
- Memories
  - 8 Kbytes of Flash program memory and 256 bytes of data EEPROM with ECC
  - Flexible write and read protection modes
  - 1 Kbyte of RAM
- DMA
  - 4 channels supporting ADC, SPI, I2C, USART, timers
  - 1 channel for memory-to-memory
- 12-bit ADC up to 1 Msps/10 channels
  - Internal reference voltage
- Timers
  - Two 16-bit timers with 2 channels (used as IC, OC, PWM), quadrature encoder
  - One 8-bit timer with 7-bit prescaler
  - 2 watchdogs: 1 Window, 1 Independent
  - Beeper timer with 1, 2 or 4 kHz frequencies
- Communication interfaces
  - Synchronous serial interface (SPI)
  - Fast I2C 400 kHz SMBus and PMBus
  - USART
- Up to 18 I/Os, all mappable on interrupt vectors
- Development support
  - Fast on-chip programming and non-intrusive debugging with SWIM
  - Bootloader using USART

# 1 Introduction

This document describes the features, pinout, mechanical data and ordering information for the low density STM8L051F3 microcontroller with 8-Kbyte Flash memory density.

For further details on the whole STMicroelectronics low density family please refer to [Section 2.2: Ultra-low-power continuum](#).

For detailed information on device operation and registers, refer to the *STM8L050J3, STM8L051F3, STM8L052C6, STM8L052R8 MCUs and STM8L151/L152, STM8L162, STM8AL31, STM8AL3L lines* reference manual (RM0031).

For information on to the Flash program memory and data EEPROM, refer to the *How to program STM8L and STM8AL Flash program memory and data EEPROM* programming manual (PM0054).

For information on the debug module and SWIM (single wire interface module), refer to the *STM8 SWIM communication protocol and debug module* user manual (UM0470).

For information on the STM8 core, refer to the *STM8 CPU programming manual* (PM0044).

The low density value line devices, including STM8L051F3, provide the following benefits:

- Integrated system
  - 8 Kbytes of low-density embedded Flash program memory
  - 256 bytes of data EEPROM
  - 1 Kbyte of RAM
  - Internal high-speed and low-power low speed RC
  - Embedded reset
- Ultra-low-power consumption
  - 1  $\mu$ A in Active-halt mode
  - Clock gated system and optimized power management
  - Capability to execute from RAM for Low-power wait mode and Low-power run mode
- Advanced features
  - Up to 16 MIPS at 16 MHz CPU clock frequency
  - Direct memory access (DMA) for memory-to-memory or peripheral-to-memory access
- Short development cycles
  - Application scalability across a common family product architecture with compatible pinout, memory map and modular peripherals
  - Wide choice of development tools

These features make STM8L051F3 suitable for a wide range of consumer and mass market applications.

Refer to [Table 1: STM8L051F3 features and peripheral counts](#) and [Section 3: Functional overview](#) for an overview of the complete range of peripherals proposed in this family.

[Figure 1](#) shows the block diagram of the low density STM8L051F3 device.

## 2 Description

STM8L051F3 is member of the STM8L ultra-low-power 8-bit family.

STM8L051F3 features an enhanced STM8 CPU core providing increased processing power (up to 16 MIPS at 16 MHz) while maintaining the advantages of a CISC architecture with improved code density, a 24-bit linear addressing space and an optimized architecture for low-power operations.

The STM8L051F3 MCU includes an integrated debug module with a hardware interface (SWIM) which allows non-intrusive In-Application debugging and ultra-fast Flash programming. It features an embedded data EEPROM and low-power, low-voltage, single-supply program Flash memory.

The device incorporates an extensive range of enhanced I/Os and peripherals, a 12-bit ADC, a real-time clock, two 16-bit timers, one 8-bit timer, as well as standard communication interfaces such as an SPI, an I2C interface, and one USART.

The modular design of the peripheral set allows this device to have the same peripherals that can be found in different ST microcontroller families including 32-bit families. This makes any transition to a different family very easy, supported also by the use of a common set of development tools.

STM8L051F3 as all the value line STM8L ultra-low-power products are based on the same architecture with the same memory mapping and a coherent pinout.

CPU frequency		16 MHz
Operating voltage		1.8 to 3.6 V
Operating temperature		-40 to +85 °C
Package		TSSOP20

1. The number of GPIOs given in this table includes the NRST/PA1 pin but the application can use the NRST/PA1 pin as general purpose output only (PA1).

## 2.2 Ultra-low-power continuum

STM8L051F3 is part of STM8's ultra-low-power value line on which all the devices are pin-to-pin, software and feature compatible. Besides the full compatibility within the STM8L family, the devices are part of STMicroelectronics microcontrollers ultra-low-power strategy which also includes the STM8L001xx, STM8L101xx and STM32L15xxx devices. The STM8L and STM32L families allow a continuum of performance, peripherals, system architecture, and features.

They are all based on STMicroelectronics 0.13  $\mu\text{m}$  ultra-low leakage process.

- Note:
- 1 *STM8L051F3 is pin-to-pin compatible with STM8L101xx devices.*
  - 2 *The STM32L family is pin-to-pin compatible with the general purpose STM32F family. Please refer to STM32L15x documentation for more information on these devices.*

### Performance

All the STMicroelectronics ultra-low-power families incorporate highly energy-efficient cores with both Harvard architecture and pipelined execution: advanced STM8 core for STM8L families and ARM<sup>®</sup> 32-bit Cortex<sup>®</sup>-M3 core for STM32L family. In addition specific care for the design architecture has been taken to optimize the mA/DMIPS and mA/MHz ratios.

This allows the ultra-low-power performance to range from 5 up to 33.3 DMIPs.

### Shared peripherals

The STM8L05xxx, STM8L15xxx and STM32L15xxx devices share identical peripherals which ensure a very easy migration from one family to another:

- Analog peripheral: ADC1
- Digital peripherals: RTC and some communication interfaces

### Common system strategy

To offer flexibility and optimize performance, the STM8L and STM32L devices use a common architecture:

- Same power supply range from 1.8 to 3.6 V
- Architecture optimized to reach ultra-low consumption both in low-power modes and Run mode
- Fast startup strategy from low-power modes
- Flexible system clock
- Ultra-safe reset: same reset strategy for both STM8L and STM32L including power-on reset, power-down reset, brownout reset and programmable voltage detector.

### Features

ST ultra-low-power continuum also lies in feature compatibility:

- More than 10 packages with pin count from 20 to 100 pins and size down to 3 x 3 mm
- Memory density ranging from 4 to 128 Kbytes

### 3.1 Low-power modes

STM8L051F3 as well as all the low density value line STM8L05xxx devices support five low-power modes to achieve the best compromise between low power consumption, short startup time and available wakeup sources:

- **Wait mode:** The CPU clock is stopped, but selected peripherals keep running. An internal or external interrupt or a Reset can be used to exit the microcontroller from Wait mode (WFE or WFI mode).
- **Low-power run mode:** The CPU and the selected peripherals are running. Execution is done from RAM with a low speed oscillator (LSI or LSE). Flash memory and data EEPROM are stopped and the voltage regulator is configured in ultra-low-power mode. The microcontroller enters Low-power run mode by software and can exit from this mode by software or by a reset.  
All interrupts must be masked. They cannot be used to exit the microcontroller from this mode.
- **Low-power wait mode:** This mode is entered when executing a Wait for event in Low-power run mode. It is similar to Low-power run mode except that the CPU clock is stopped. The wakeup from this mode is triggered by a Reset or by an internal or external event (peripheral event generated by the timers, serial interfaces, DMA controller (DMA1) and I/O ports). When the wakeup is triggered by an event, the system goes back to Low-power run mode.  
All interrupts must be masked. They cannot be used to exit the microcontroller from this mode.
- **Active-halt mode:** CPU and peripheral clocks are stopped, except RTC. The wakeup can be triggered by RTC interrupts, external interrupts or reset.
- **Halt mode:** CPU and peripheral clocks are stopped, the device remains powered on. The RAM content is preserved. The wakeup is triggered by an external interrupt or reset. A few peripherals have also a wakeup from Halt capability. Switching off the internal reference voltage reduces power consumption. Through software configuration it is also possible to wake up the device without waiting for the internal reference voltage wakeup time to have a fast wakeup time of 5  $\mu$ s.

## 3.2 Central processing unit STM8

The central processing unit represents the core of the microcontroller; it executes code and controls the peripherals.

### 3.2.1 Advanced STM8 Core

The 8-bit STM8 core is designed for code efficiency and performance with an Harvard architecture and a 3-stage pipeline.

It contains 6 internal registers which are directly addressable in each execution context, 20 addressing modes including indexed indirect and relative addressing, and 80 instructions.

#### Architecture and registers

- Harvard architecture
- 3-stage pipeline
- 32-bit wide program memory bus - single cycle fetching most instructions
- X and Y 16-bit index registers - enabling indexed addressing modes with or without offset and read-modify-write type data manipulations
- 8-bit accumulator
- 24-bit program counter - 16-Mbyte linear memory space
- 16-bit stack pointer - access to a 64-Kbyte level stack
- 8-bit condition code register - 7 condition flags for the result of the last instruction

#### Addressing

- 20 addressing modes
- Indexed indirect addressing mode for lookup tables located anywhere in the address space
- Stack pointer relative addressing mode for local variables and parameter passing

#### Instruction set

- 80 instructions with 2-byte average instruction size
- Standard data movement and logic/arithmetic functions
- 8-bit by 8-bit multiplication
- 16-bit by 8-bit and 16-bit by 16-bit division
- Bit manipulation
- Data transfer between stack and accumulator (push/pop) with direct stack access
- Data transfer using the X and Y registers or direct memory-to-memory transfers

### 3.2.2 Interrupt controller

STM8L051F3 and all the low density value line STM8L05xxx feature a nested vectored interrupt controller:

- Nested interrupts with 3 software priority levels
- 32 interrupt vectors with hardware priority
- Up to 17 external interrupt sources on 11 vectors
- Trap and reset interrupts

### 3.3 Reset and supply management

The power supplies requirements must be defined in order to have a correct microcontroller operation. The reset and supply management controls the microcontroller operation under defined conditions.

#### 3.3.1 Power supply scheme

The device requires a 1.8 V to 3.6 V operating supply voltage ( $V_{DD}$ ). The external power supply pins must be connected as follows:

- $V_{SS1}$ ;  $V_{DD1}$  = 1.8 to 3.6 V: external power supply for I/Os and for the internal regulator. Provided externally through  $V_{DD1}$  pins, the corresponding ground pin is  $V_{SS1}$ .
- $V_{SSA}$ ;  $V_{DDA}$  = 1.8 to 3.6 V: external power supplies for analog peripherals.  $V_{DDA}$  and  $V_{SSA}$  must be connected to  $V_{DD1}$  and  $V_{SS1}$ , respectively.
- $V_{SS2}$ ;  $V_{DD2}$  = 1.8 to 3.6 V: external power supplies for I/Os.  $V_{DD2}$  and  $V_{SS2}$  must be connected to  $V_{DD1}$  and  $V_{SS1}$ , respectively.
- $V_{REF+}$ ,  $V_{REF-}$  (for ADC1): external reference voltage for ADC1. Must be provided externally through  $V_{REF+}$  and  $V_{REF-}$  pin.

#### 3.3.2 Power supply supervisor

The device has an integrated ZEROPOWER power-on reset (POR)/power-down reset (PDR), coupled with a brownout reset (BOR) circuitry. When the microcontroller operates between 1.8 and 3.6 V, BOR is always active and ensures proper operation starting from 1.8 V. After the 1.8 V BOR threshold is reached, the option byte loading process starts, either to confirm or modify default thresholds, or to disable BOR permanently.

Five BOR thresholds are available through option bytes, starting from 1.8 V to 3 V. To reduce the power consumption in Halt mode, it is possible to automatically switch off the internal reference voltage (and consequently the BOR) in Halt mode. The device remains in reset state when  $V_{DD}$  is below a specified threshold,  $V_{POR/PDR}$  or  $V_{BOR}$ , without the need for any external reset circuit.

The device features an embedded programmable voltage detector (PVD) that monitors the  $V_{DD}/V_{DDA}$  power supply and compares it to the  $V_{PVD}$  threshold. This PVD offers 7 different levels between 1.85 V and 3.05 V, chosen by software, with a step around 200 mV. An interrupt can be generated when  $V_{DD}/V_{DDA}$  drops below the  $V_{PVD}$  threshold and/or when  $V_{DD}/V_{DDA}$  is higher than the  $V_{PVD}$  threshold. The interrupt service routine can then generate a warning message and/or put the MCU into a safe state. The PVD is enabled by software.

#### 3.3.3 Voltage regulator

STM8L051F3 as all the low density value line STM8L05xxx embeds an internal voltage regulator for generating the 1.8 V power supply for the core and peripherals.

This regulator has two different modes:

- Main voltage regulator mode (MVR) for Run, Wait for interrupt (WFI) and Wait for event (WFE) modes.
- Low-power voltage regulator mode (LPVR) for Halt, Active-halt, Low-power run and Low-power wait modes.

When entering Halt or Active-halt modes, the system automatically switches from the MVR to the LPVR in order to reduce current consumption.

## 3.4 Clock management

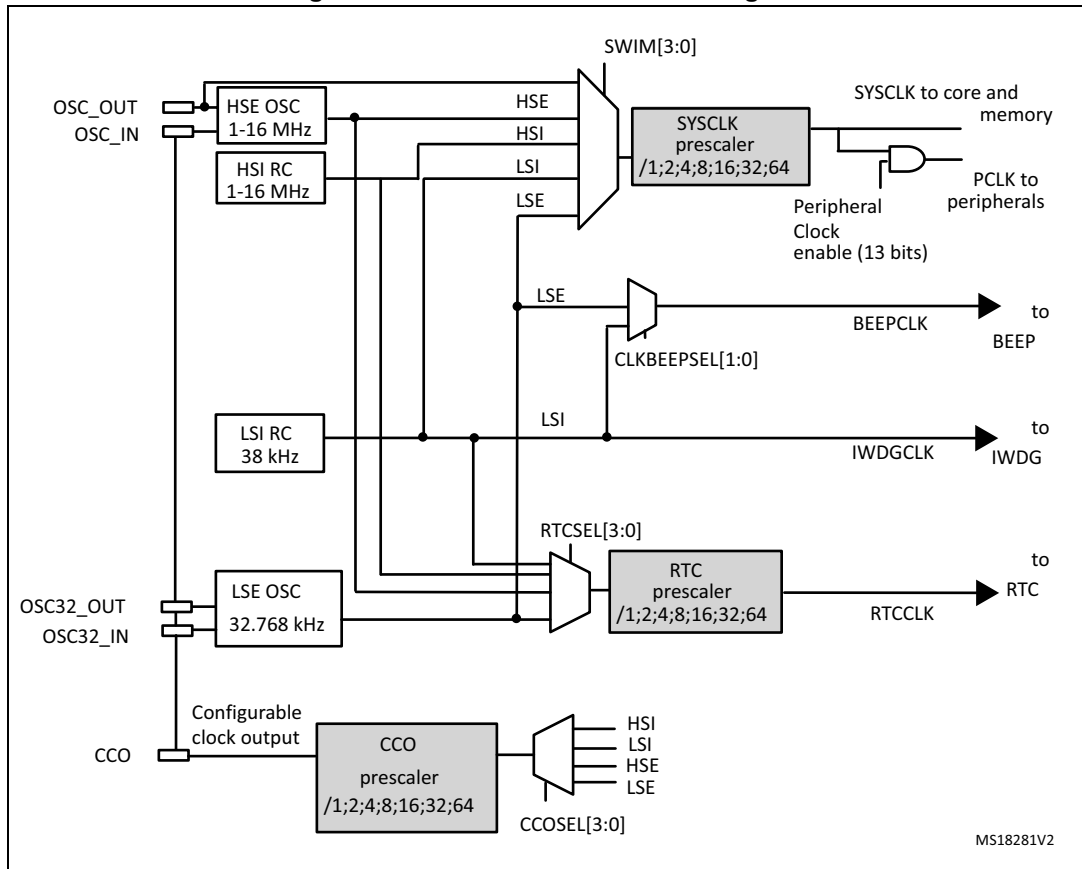

The clock controller distributes the system clock (SYSCLK) coming from different oscillators to the core and the peripherals. It also manages clock gating for low-power modes and ensures clock robustness.

### Features

- **Clock prescaler:** to get the best compromise between speed and current consumption the clock frequency to the CPU and peripherals can be adjusted by a programmable prescaler.
- **Safe clock switching:** Clock sources can be changed safely on the fly in run mode through a configuration register.
- **Clock management:** To reduce power consumption, the clock controller can stop the clock to the core, individual peripherals or memory.
- **System clock sources:** four different clock sources can be used to drive the system clock:
  - 1-16 MHz High speed external crystal (HSE)
  - 16 MHz High speed internal RC oscillator (HSI)
  - 32.768 Low speed external crystal (LSE)
  - 38 kHz Low speed internal RC (LSI)
- **RTC clock sources:** the above four sources can be chosen to clock the RTC whatever the system clock.
- **Startup clock:** After reset, the microcontroller restarts by default with an internal 2 MHz clock (HSI/8). The prescaler ratio and clock source can be changed by the application program as soon as the code execution starts.
- **Clock security system (CSS):** This feature can be enabled by software. If a HSE clock failure occurs, it is automatically switched to HSI.
- **Configurable main clock output (CCO):** This outputs an external clock for use by the application.

Figure 2. STM8L051F3 clock tree diagram

1. The HSE clock source can be either an external crystal/ceramic resonator or an external source (HSE bypass). Refer to Section HSE clock in the *STM8L050J3, STM8L051F3, STM8L052C6, STM8L052R8 MCUs and STM8L151/L152, STM8L162, STM8AL31, STM8AL3L lines* reference manual (RM0031).
2. The LSE clock source can be either an external crystal/ceramic resonator or a external source (LSE bypass). Refer to Section LSE clock in the *STM8L050J3, STM8L051F3, STM8L052C6, STM8L052R8 MCUs and STM8L151/L152, STM8L162, STM8AL31, STM8AL3L lines* reference manual (RM0031).

### 3.5 Low power real-time clock

The real-time clock (RTC) is an independent binary coded decimal (BCD) timer/counter.

Six byte locations contain the second, minute, hour (12/24 hour), week day, date, month, year, in BCD (binary coded decimal) format. Correction for 28, 29 (leap year), 30, and 31 day months are made automatically.

It provides a programmable alarm and programmable periodic interrupts with wakeup from Halt capability.

- Periodic wakeup time using the 32.768 kHz LSE with the lowest resolution (of 61  $\mu$ s) is from min. 122  $\mu$ s to max. 3.9 s. With a different resolution, the wakeup time can reach 36 hours
- Periodic alarms based on the calendar can also be generated from every second to every year

### 3.6 Memories

STM8L051F3 as all the low density value line STM8L05xxx devices have the following main features:

- Up to 1 Kbyte of RAM
- The non-volatile memory is divided into three arrays:
  - 8 Kbytes of low-density embedded Flash program memory
  - 256 bytes of Data EEPROM
  - Option bytes

The EEPROM embeds the error correction code (ECC) feature.

The option byte protects part of the Flash program memory from write and readout piracy.

### 3.7 DMA

A 4-channel direct memory access controller (DMA1) offers a memory-to-memory and peripherals-from/to-memory transfer capability. The 4 channels are shared between the following IPs with DMA capability: ADC1, I2C1, SPI1, USART1, and the three timers.

### 3.8 Analog-to-digital converter

- 12-bit analog-to-digital converter (ADC1) with 10 channels (no fast channel) and internal reference voltage
- Conversion time down to 1  $\mu$ s with  $f_{\text{SYSCLK}} = 16$  MHz
- Programmable resolution
- Programmable sampling time
- Single and continuous mode of conversion
- Scan capability: automatic conversion performed on a selected group of analog inputs
- Analog watchdog
- Triggered by timer

*Note:* ADC1 can be served by DMA1.

### 3.9 System configuration controller and routing interface

The system configuration controller provides the capability to remap some alternate functions on different I/O ports. TIM4 and ADC1 DMA channels can also be remapped.

The highly flexible routing interface controls the routing of internal analog signals to ADC1 and the internal reference voltage  $V_{REFINT}$ .

### 3.10 Timers

STM8L051F3 contains two 16-bit general purpose timers (TIM2 and TIM3) and one 8-bit basic timer (TIM4).

All the timers can be served by DMA1.

[Table 2](#) compares the features of the advanced control, general-purpose and basic timers.

**Table 2. Timer feature comparison**

Timer	Counter resolution	Counter type	Prescaler factor	DMA1 request generation	Capture/compare channels	Complementary outputs
TIM2	16-bit	up/down	Any power of 2 from 1 to 128	Yes	2	None
TIM3					2	
TIM4	8-bit	up	Any power of 2 from 1 to 32768		0	

#### 3.10.1 16-bit general purpose timers (TIM2, TIM3)

- 16-bit autoreload (AR) up/down-counter
- 7-bit prescaler adjustable to fixed power of 2 ratios (1...128)
- 2 individually configurable capture/compare channels
- PWM mode
- Interrupt capability on various events (capture, compare, overflow, break, trigger)
- Synchronization with other timers or external signals (external clock, reset, trigger and enable)

#### 3.10.2 8-bit basic timer (TIM4)

The 8-bit timer consists of an 8-bit up auto-reload counter driven by a programmable prescaler. It can be used for timebase generation with interrupt generation on timer overflow.

### 3.11 Watchdog timers

The watchdog system is based on two independent timers providing maximum security to the applications.

### 3.11.1 Window watchdog timer

The window watchdog (WWDG) is used to detect the occurrence of a software fault, usually generated by external interferences or by unexpected logical conditions, which cause the application program to abandon its normal sequence.

### 3.11.2 Independent watchdog timer

The independent watchdog peripheral (IWDG) can be used to resolve processor malfunctions due to hardware or software failures.

It is clocked by the internal LSI RC clock source, and thus stays active even in case of a CPU clock failure.

## 3.12 Beeper

The beeper function outputs a signal on the BEEP pin for sound generation. The signal is in the range of 1, 2 or 4 kHz.

## 3.13 Communication interfaces

This section describes the three communication interfaces of STM8L050J3: SPI, I2C and USART.

### 3.13.1 SPI

The serial peripheral interfaces (SPI1) provide half/ full duplex synchronous serial communication with external devices.

- Maximum speed: 8 Mbit/s ( $f_{\text{SYSCLK}}/2$ ) both for master and slave
- Full duplex synchronous transfers
- Simplex synchronous transfers on 2 lines with a possible bidirectional data line
- Master or slave operation - selectable by hardware or software
- Hardware CRC calculation
- Slave/master selection input pin

*Note:* SPI1 can be served by the DMA1 Controller.

### 3.13.2 I2C

The I2C bus interface (I2C1) provides multi-master capability, and controls all I2C bus-specific sequencing, protocol, arbitration and timing.

- Master, slave and multi-master capability
- Standard mode up to 100 kHz and fast speed modes up to 400 kHz
- 7-bit and 10-bit addressing modes
- SMBus 2.0 and PMBus support
- Hardware CRC calculation

*Note:* I2C1 can be served by the DMA1 Controller.

### 3.13.3 USART

The USART interface (USART1) allows full duplex, asynchronous communications with external devices requiring an industry standard NRZ asynchronous serial data format. It offers a very wide range of baud rates.

- 1 Mbit/s full duplex SCI
- SPI1 emulation
- High precision baud rate generator
- Smartcard emulation
- IrDA SIR encoder decoder
- Single wire half duplex mode

*Note:* USART1 can be served by the DMA1 Controller.

### 3.14 Infrared (IR) interface

The low density STM8L05xxx devices contain an infrared interface which can be used with an IR LED for remote control functions. Two timer output compare channels are used to generate the infrared remote control signals.

### 3.15 Development support

#### Development tools

Development tools for the STM8 microcontrollers include:

- The STice emulation system offering tracing and code profiling
- The STVD high-level language debugger including C compiler, assembler and integrated development environment
- The STVP Flash programming software

The STM8 also comes with starter kits, evaluation boards and low-cost in-circuit debugging/programming tools.

#### Single wire data interface (SWIM) and debug module

The debug module with its single wire data interface (SWIM) permits non-intrusive real-time in-circuit debugging and fast memory programming.

The Single wire interface is used for direct access to the debugging module and memory programming. The interface can be activated in all device operation modes.

The non-intrusive debugging module features a performance close to a full-featured emulator. Beside memory and peripherals, CPU operation can also be monitored in real-time by means of shadow registers.

If the initial delay is not acceptable for the application there is the option that the firmware reenables the SWIM pin functionality under specific conditions such as during firmware startup or during application run. Once that this procedure is done, the SWIM interface can be used for device debug/programming.

**Bootloader**

STM8L051F3 features a built-in bootloader. See *STM8 bootloader* user manual (UM0560).

The bootloader is used to download application software into the device memories, including RAM, program and data memory, using standard serial interfaces. It is a complementary solution to programming via the SWIM debugging interface.

- At power-up, the PA1/NRST pin is a reset input pin with pull-up. To be used as a general purpose pin (PA1), it can be configured only as output open-drain or push-pull, not as a general purpose input. Refer to Section *Configuring NRST/PA1 pin as general purpose output* in the *STM8L051/L052 Value Line, STM8L151/L152, STM8L162, STM8AL31, STM8AL3L MCU lines* reference manual (RM0031).
- [ ] Alternate function remapping option (if the same alternate function is shown twice, it indicates an exclusive choice not a duplication of the function).
- A pull-up is applied to PB0 and PB4 during the reset phase. These two pins are input floating after reset release.
- In the open-drain output column, 'T' defines a true open-drain I/O (P-buffer and protection diode to V<sub>DD</sub> are not implemented).
- The PA0 pin is in input pull-up during the reset phase and after reset release.
- High Sink LED driver capability available on PA0.

Note: 1 The slope control of all GPIO pins, except true open drain pins, can be programmed. By default, the slope control is limited to 2 MHz.

### 4.1 System configuration options

As shown in [Table 4: STM8L051F3 pin description](#), some alternate functions can be remapped on different I/O ports by programming one of the two remapping registers described in the "Routing interface (RI) and system configuration controller" section in the *STM8L050J3, STM8L051F3, STM8L052C6, STM8L052R8 MCUs and STM8L151/L152, STM8L162, STM8AL31, STM8AL3L lines* reference manual (RM0031).

# 5 Memory and register map

The following sections describe the mapping of the device's memory and peripherals.

## 5.1 Memory mapping

The memory map is shown in *Figure 4*.

Figure 4. Memory map

1. Table 5 lists the boundary addresses for each memory size. The top of the stack is at the RAM end

address.

2. Refer to [Table 7](#) for an overview of hardware register mapping, to [Table 6](#) for details on I/O port hardware registers, and to [Table 8](#) for information on CPU/SWIM/debug module controller registers.

**Table 5. Flash and RAM boundary addresses**

1. The Low-power wait mode is entered when executing a WFE instruction in Low-power run mode. In WFE mode, the interrupt is served if it has been previously enabled. After processing the interrupt, the processor goes back to WFE mode. When the interrupt is configured as a wakeup event, the CPU wakes up and resumes processing.
2. The TLI interrupt is the logic OR between TIM2 overflow interrupt, and TIM4 overflow interrupts.
3. The device is woken up from Halt or Active-halt mode only when the address received matches the interface address.

## 7 Option bytes

Option bytes contain configurations for device hardware features as well as the memory protection of the device. They are stored in a dedicated memory block.

All option bytes can be modified in ICP mode (with SWIM) by accessing the EEPROM address. See [Table 10](#) for details on option byte addresses.

The option bytes can also be modified 'on the fly' by the application in IAP mode, except for the ROP and UBC values which can only be taken into account when they are modified in ICP mode (with the SWIM).

Refer to the *How to program STM8L and STM8AL Flash program memory and data EEPROM programming manual (PM0054)* and the *STM8 SWIM communication protocol and debug module user manual (UM0470)* for information on SWIM programming procedures.

## 8 Electrical parameters

This section describes the quantification of the given device's parameters.

### 8.1 Parameter conditions

Unless otherwise specified, all voltages are referred to  $V_{SS}$ .

#### 8.1.1 Minimum and maximum values

Unless otherwise specified the minimum and maximum values are guaranteed in the worst conditions of ambient temperature, supply voltage and frequencies by tests in production on 100% of the devices with an ambient temperature at  $T_A = 25\text{ °C}$  and  $T_A = T_A \text{ max}$  (given by the selected temperature range).

Data based on characterization results, design simulation and/or technology characteristics is indicated in the table footnotes and are not tested in production. Based on characterization, the minimum and maximum values refer to sample tests and represent the mean value plus or minus three times the standard deviation ( $\text{mean} \pm 3\sigma$ ).

#### 8.1.2 Typical values

Unless otherwise specified, typical data is based on  $T_A = 25\text{ °C}$ ,  $V_{DD} = 3\text{ V}$ . It is given only as design guidelines and is not tested.

Typical ADC accuracy values are determined by characterization of a batch of samples from a standard diffusion lot over the full temperature range, where 95% of the devices have an error less than or equal to the value indicated ( $\text{mean} \pm 2\sigma$ ).

#### 8.1.3 Typical curves

Unless otherwise specified, all typical curves are given only as design guidelines and are not tested.

#### 8.1.4 Loading capacitor

The loading conditions used for pin parameter measurement are shown in [Figure 5](#).

**Figure 5. Pin loading conditions**

### 8.1.5 Pin input voltage

The input voltage measurement on a pin of the device is described in [Figure 6](#).

Figure 6. Pin input voltage

MSv37775V1

## 8.2 Absolute maximum ratings

Stresses above the absolute maximum ratings listed in [Table 12: Voltage characteristics](#), [Table 13: Current characteristics](#), and [Table 14: Thermal characteristics](#) may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect the device's reliability.

The device's mission profile (application conditions) is compliant with the JEDEC JESD47 Qualification Standard, extended mission profiles are available on demand.

Table 12. Voltage characteristics

Symbol	Ratings	Min	Max	Unit
$V_{DD} - V_{SS}$	External supply voltage (including $V_{DDA}$ and $V_{DD2}$ ) <sup>(1)</sup>	- 0.3	4.0	V
$V_{IN}^{(2)}$	Input voltage on true open-drain pins (PC0 and PC1)	$V_{SS} - 0.3$	$V_{DD} + 4.0$	V
	Input voltage on five-volt tolerant (FT) pins (PA7 and PE0)	$V_{SS} - 0.3$	$V_{DD} + 4.0$	
	Input voltage on 3.6 V tolerant (TT) pins	$V_{SS} - 0.3$	4.0	
	Input voltage on any other pin	$V_{SS} - 0.3$	4.0	
$V_{ESD}$	Electrostatic discharge voltage	see <a href="#">Absolute maximum ratings (electrical sensitivity) on page 86</a>		

1. All power ( $V_{DD1}$ ,  $V_{DD2}$ ,  $V_{DDA}$ ) and ground ( $V_{SS1}$ ,  $V_{SS2}$ ,  $V_{SSA}$ ) pins must always be connected to the external power supply.
2.  $V_{IN}$  maximum must always be respected. Refer to [Table 13: Current characteristics](#) for maximum allowed injected current values.

Table 13. Current characteristics

Symbol	Ratings	Max.	Unit
$I_{VDD}$	Total current into $V_{DD}$ power line (source)	80	mA
$I_{VSS}$	Total current out of $V_{SS}$ ground line (sink)	80	

Table 13. Current characteristics (continued)

Symbol	Ratings	Max.	Unit
$I_{IO}$	Output current sunk by IR_TIM pin (with high sink LED driver capability)	80	
	Output current sunk by any other I/O and control pin	25	
	Output current sourced by any I/Os and control pin	- 25	
$I_{INJ(PIN)}$	Injected current on true open-drain pins (PC0 and PC1) <sup>(1)</sup>	- 5 / +0	
	Injected current on five-volt tolerant (FT) pins (PA7 and PE0) <sup>(1)</sup>	- 5 / +0	
	Injected current on 3.6 V tolerant (TT) pins <sup>(1)</sup>	- 5 / +0	
	Injected current on any other pin <sup>(2)</sup>	- 5 / +5	
$\Sigma I_{INJ(PIN)}$	Total injected current (sum of all I/O and control pins) <sup>(3)</sup>	$\pm 25$	

1. Positive injection is not possible on these I/Os. A negative injection is induced by  $V_{IN} < V_{SS}$ .  $I_{INJ(PIN)}$  must never be exceeded. Refer to [Table 13: Current characteristics](#) for maximum allowed input voltage values.
2. A positive injection is induced by  $V_{IN} > V_{DD}$  while a negative injection is induced by  $V_{IN} < V_{SS}$ .  $I_{INJ(PIN)}$  must never be exceeded. Refer to [Table 13: Current characteristics](#) for maximum allowed input voltage values.
3. When several inputs are submitted to a current injection, the maximum  $\Sigma I_{INJ(PIN)}$  is the absolute sum of the positive and negative injected currents (instantaneous values).

Table 14. Thermal characteristics

Symbol	Ratings	Value	Unit
$T_{STG}$	Storage temperature range	-65 to +150	°C
$T_J$	Maximum junction temperature	150	

## 8.3 Operating conditions

Subject to general operating conditions for  $V_{DD}$  and  $T_A$ .

### 8.3.1 General operating conditions

The operating conditions define the conditions under which the device operates correctly according to its specification (see [Table 15](#)).

**Table 15. General operating conditions**

Symbol	Parameter	Conditions	Min.	Max.	Unit
$f_{\text{SYSCLK}}^{(1)}$	System clock frequency	$1.8 \text{ V} \leq V_{DD} < 3.6 \text{ V}$	0	16	MHz
$V_{DD}$	Standard operating voltage	-	1.8	3.6	V
$V_{DDA}$	Analog operating voltage	Must be at the same potential as $V_{DD}$	1.8	3.6	V
$P_D^{(2)}$	Power dissipation at $T_A = 85 \text{ }^\circ\text{C}$	TSSOP20	-	181	mW
$T_A$	Temperature range	$1.8 \text{ V} \leq V_{DD} < 3.6 \text{ V}$	-40	85	$^\circ\text{C}$
$T_J$	Junction temperature range	$-40 \text{ }^\circ\text{C} \leq T_A < 85 \text{ }^\circ\text{C}$	-40	105 <sup>(3)</sup>	$^\circ\text{C}$

1.  $f_{\text{SYSCLK}} = f_{\text{CPU}}$

2. To calculate  $P_{D\text{max}}(T_A)$ , use the formula  $P_{D\text{max}} = (T_{J\text{max}} - T_A) / \Theta_{JA}$  with  $T_{J\text{max}}$  in this table and  $\Theta_{JA}$  in "Thermal characteristics" table.

3.  $T_{J\text{max}}$  is given by the test limit. Above this value, the product behavior is not guaranteed.

### 8.3.2 Embedded reset and power control block characteristics

The reset and power block parameters are described in [Table 16](#) and are derived from tests performed under the ambient temperature conditions summarized in [Table 15: General operating conditions](#).

**Table 16. Embedded reset and power control block characteristics**

### 8.3.3 Supply current characteristics

#### Total current consumption

The MCU is placed under the following conditions:

- All I/O pins in input mode with a static value at V<sub>DD</sub> or V<sub>SS</sub> (no load)
- All peripherals are disabled except if explicitly mentioned.

In the following table, data is based on characterization results, unless otherwise specified.

Subject to general operating conditions for V<sub>DD</sub> and T<sub>A</sub>.

**HSE crystal/ceramic resonator oscillator**

The HSE clock can be supplied with a 1 to 16 MHz crystal/ceramic resonator oscillator. All the information given in this paragraph is based on characterization results with specified typical external components. In the application, the resonator and the load capacitors have to be placed as close as possible to the oscillator pins in order to minimize output distortion and startup stabilization time. Refer to the crystal resonator manufacturer for more details (frequency, package, accuracy...).

**Table 28. HSE oscillator characteristics**

		$C = 10$ pF, $f_{OSC} = 16$ MHz	-	-	2.5 (startup) 0.46 (stabilized) <sup>(3)</sup>	
$g_m$	Oscillator transconductance	-	3.5 <sup>(3)</sup>	-	-	mA/V
$t_{SU(HSE)}^{(4)}$	Startup time	$V_{DD}$ is stabilized	-	1	-	ms

1.  $C=C_{L1}=C_{L2}$  is approximately equivalent to  $2 \times$  crystal  $C_{LOAD}$ .
2. The oscillator selection can be optimized in terms of supply current using a high quality resonator with small  $R_m$  value. Refer to crystal manufacturer for more details
3. Guaranteed by design.
4.  $t_{SU(HSE)}$  is the startup time measured from the moment it is enabled (by software) to a stabilized 16 MHz oscillation. This value is measured for a standard crystal resonator and it can vary significantly with the crystal manufacturer.

**Figure 12. HSE oscillator circuit diagram**

**HSE oscillator critical  $g_m$  formula**

$$g_{m_{crit}} = (2 \times \Pi \times f_{HSE})^2 \times R_m (2C_o + C)^2$$

$R_m$ : Motional resistance (see crystal specification),  $L_m$ : Motional inductance (see crystal specification),  
 $C_m$ : Motional capacitance (see crystal specification),  $C_o$ : Shunt capacitance (see crystal specification),  
 $C_{L1}=C_{L2}=C$ : Grounded external capacitance  
 $g_m \gg g_{m_{crit}}$

**LSE crystal/ceramic resonator oscillator**

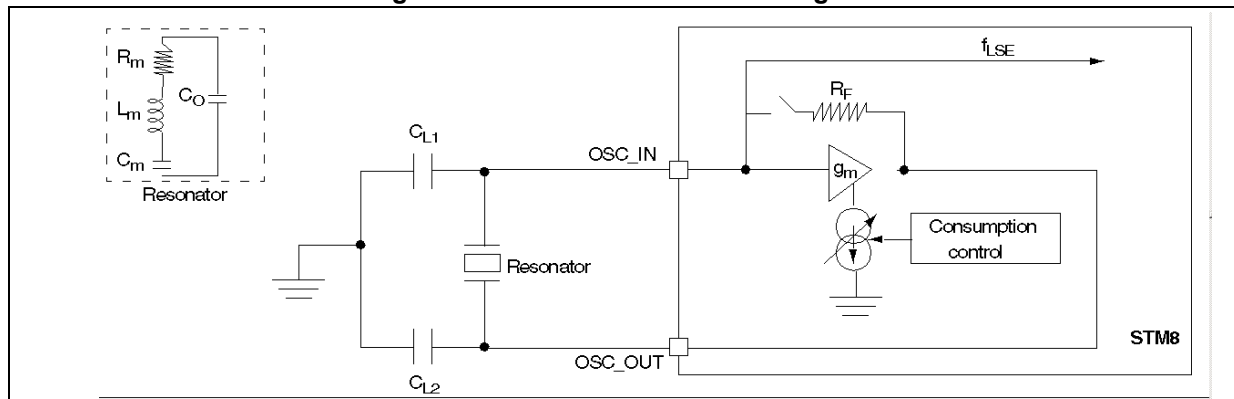

The LSE clock can be supplied with a 32.768 kHz crystal/ceramic resonator oscillator. All the information given in this paragraph is based on characterization results with specified typical external components. In the application, the resonator and the load capacitors have to be placed as close as possible to the oscillator pins in order to minimize output distortion and startup stabilization time. 1. Guaranteed by characterization results.
2. Conforming to JEDEC JESD22a117
3. The physical granularity of the memory is 4 bytes, so cycling is performed on 4 bytes even when a write/erase operation addresses a single byte.
4. Data based on characterization performed on the whole data memory.

### 8.3.6 I/O current injection characteristics

As a general rule, current injection to the I/O pins, due to external voltage below  $V_{SS}$  or above  $V_{DD}$  (for standard pins) should be avoided during normal product operation. However, in order to give an indication of the robustness of the microcontroller in cases when abnormal injection accidentally happens, susceptibility tests are performed on a sample basis during device characterization.

#### Functional susceptibility to I/O current injection

While a simple application is executed on the device, the device is stressed by injecting current into the I/O pins programmed in floating input mode. While current is injected into the I/O pin, one at a time, the device is checked for functional failures.

The failure is indicated by an out of range parameter: ADC error, out of spec current injection on adjacent pins or other functional failure (for example reset, oscillator frequency deviation, LCD levels, etc.).

The test results are given in the following table.

**Table 34. I/O current injection susceptibility**

Symbol	Description	Functional susceptibility		Unit
		Negative injection	Positive injection	
$I_{INJ}$	Injected current on true open-drain pins (PC0 and PC1)	-5	+0	mA
	Injected current on all five-volt tolerant (FT) pins	-5	+0	
	Injected current on all 3.6 V tolerant (TT) pins	-5	+0	
	Injected current on any other pin	-5	+5	

### 8.3.7 I/O port pin characteristics

#### General characteristics

Subject to general operating conditions for  $V_{DD}$  and  $T_A$  unless otherwise specified. All unused pins must be kept at a fixed voltage: using the output mode of the I/O for example or an external pull-up or pull-down resistor.

The reset network shown in Figure 28 protects the device against parasitic resets. The user must ensure that the level on the NRST pin can go below the  $V_{IL(NRST)}$  max. level specified in Table 39. Otherwise the reset is not taken into account internally.

For power consumption sensitive applications, the external reset capacitor value can be reduced to limit the charge/discharge current. If the NRST signal is used to reset the external circuitry, attention must be paid to the charge/discharge time of the external capacitor to fulfill the external devices reset timing conditions. The minimum recommended capacity is 10 nF.

#### SPI1 - Serial peripheral interface

Unless otherwise specified, the parameters given in [Table 40](#) are derived from tests performed under ambient temperature,  $f_{\text{SYSCLK}}$  frequency and  $V_{\text{DD}}$  supply voltage conditions summarized in [Section 8.3.1](#). Refer to I/O port characteristics for more details on the input/output alternate function characteristics (NSS, SCK, MOSI, MISO).

**Table 40. SPI1 characteristics**

**I2C - Inter IC control interface**

Subject to general operating conditions for  $V_{DD}$ ,  $f_{SYSCLK}$ , and  $T_A$  unless otherwise specified.

The STM8L I2C interface (I2C1) meets the requirements of the Standard I2C communication protocol described in the following table with the restriction mentioned below:

Refer to I/O port characteristics for more details on the input/output alternate function characteristics (SDA and SCL).

- $f_{SYSCLK}$  must be at least equal to 8 MHz to achieve max fast I2C speed (400 kHz).
- Data based on standard I2C protocol requirement, not tested in production.

**Note:** For speeds around 200 kHz, the achieved speed can have  $\pm 5\%$  tolerance  
 For other speed ranges, the achieved speed can have  $\pm 2\%$  tolerance  
 The above variations depend on the accuracy of the external components used.

1. The current consumption through  $V_{REF}$  is composed of two parameters:
  - one constant (max 300  $\mu$ A)
  - one variable (max 400  $\mu$ A), only during sampling time + 2 first conversion pulses.  
So, peak consumption is  $300+400 = 700 \mu$ A and average consumption is  $300 + [(4 \text{ sampling} + 2) / 16] \times 400 = 450 \mu$ A at 1MSPs
2.  $V_{REF-}$  or  $V_{DDA}$  must be tied to ground.
3. Guaranteed by design.
4. Minimum sampling and conversion time is reached for maximum  $R_{ext} = 0.5 \text{ k}\Omega$ .
5. The time between 2 conversions, or between ADC ON and the first conversion must be lower than  $t_{IDLE}$ .
6. The  $t_{IDLE}$  maximum value is  $\infty$  on the "Z" revision code of the device.

In the following three tables, data is guaranteed by characterization result, not tested in production.

1. Refer to [Table 47](#) for the values of  $R_{AIN}$  and  $C_{ADC}$ .
2.  $C_{parasitic}$  represents the capacitance of the PCB (dependent on soldering and PCB layout quality) plus the pad capacitance (roughly 7 pF). A high  $C_{parasitic}$  value will downgrade conversion accuracy. To remedy this,  $f_{ADC}$  should be reduced.

**General PCB design guidelines**

Power supply decoupling should be performed as shown in [Figure 36](#) or [Figure 37](#), depending on whether  $V_{REF+}$  is connected to  $V_{DDA}$  or not. Good quality ceramic 10 nF capacitors should be used. They should be placed as close as possible to the chip.

**Figure 36. Power supply and reference decoupling ( $V_{REF+}$  not connected to  $V_{DDA}$ )**

Figure 37. Power supply and reference decoupling ( $V_{REF+}$  connected to  $V_{DDA}$ )

### 8.3.11 EMC characteristics

Susceptibility tests are performed on a sample basis during product characterization.

#### Functional EMS (electromagnetic susceptibility)

Based on a simple running application on the product (toggling 2 LEDs through I/O ports), the product is stressed by two electromagnetic events until a failure occurs (indicated by the LEDs).

- **ESD:** Electrostatic discharge (positive and negative) is applied on all pins of the device until a functional disturbance occurs. This test conforms with the IEC 61000 standard.
- **FTB:** A burst of fast transient voltage (positive and negative) is applied to  $V_{DD}$  and  $V_{SS}$  through a  $100\ \text{pF}$  capacitor, until a functional disturbance occurs. This test conforms with the IEC 61000 standard.

A device reset allows normal operations to be resumed. The test results are given in the table below based on the EMS levels and classes defined in application note AN1709.

#### Designing hardened software to avoid noise problems

EMC characterization and optimization are performed at component level with a typical application environment and simplified MCU software. It should be noted that good EMC performance is highly dependent on the user application and the software in particular.

Therefore it is recommended that the user applies EMC software optimization and prequalification tests in relation with the EMC level requested for his application.

#### Prequalification trials

Most of the common failures (unexpected reset and program counter corruption) can be reproduced by manually forcing a low state on the NRST pin or the Oscillator pins for 1 second.

To complete these trials, ESD stress can be applied directly on the device, over the range of specification values. When unexpected behavior is detected, the software can be hardened to prevent unrecoverable errors occurring (see application note AN1015).

**Table 48. EMS data**

Symbol	Parameter	Conditions	Level/Class	
$V_{FESD}$	Voltage limits to be applied on any I/O pin to induce a functional disturbance	$V_{DD} = 3.3\text{ V}$ , $T_A = +25\text{ }^\circ\text{C}$ , $f_{CPU} = 16\text{ MHz}$ , conforms to IEC 61000	3B	
$V_{EFTB}$	Fast transient voltage burst limits to be applied through 100 pF on $V_{DD}$ and $V_{SS}$ pins to induce a functional disturbance	$V_{DD} = 3.3\text{ V}$ , $T_A = +25\text{ }^\circ\text{C}$ , $f_{CPU} = 16\text{ MHz}$ , conforms to IEC 61000	Using HSI	4A
			Using HSE	2B

**Electromagnetic interference (EMI)**

Based on a simple application running on the product (toggling 2 LEDs through the I/O ports), the product is monitored in terms of emission. This emission test is in line with the norm IEC61967-2 which specifies the board and the loading of each pin.

**Table 49. EMI data <sup>(1)</sup>**

Symbol	Parameter	Conditions	Monitored frequency band	Max vs.	Unit

1. Not tested in production.

**Absolute maximum ratings (electrical sensitivity)**

Based on two different tests (ESD and LU) using specific measurement methods, the product is stressed in order to determine its performance in terms of electrical sensitivity. For more details, refer to the application note AN1181.

**Electrostatic discharge (ESD)**

Electrostatic discharges (a positive then a negative pulse separated by 1 second) are applied to the pins of each sample according to each pin combination. The sample size depends on the number of supply pins in the device (3 parts\*(n+1) supply pin). Two models can be simulated: human body model and charge device model. This test conforms to the JESD22-A114A/A115A standard.

Table 50. ESD absolute maximum ratings

Symbol	Ratings	Conditions	Maximum value <sup>(1)</sup>	Unit
V <sub>ESD(HBM)</sub>	Electrostatic discharge voltage (human body model)	T <sub>A</sub> = +25 °C	2000	V
V <sub>ESD(CDM)</sub>	Electrostatic discharge voltage (charge device model)		500	

1. Guaranteed by characterization results.

### Static latch-up

- LU:** 3 complementary static tests are required on 6 parts to assess the latch-up performance. A supply overvoltage (applied to each power supply pin) and a current injection (applied to each input, output and configurable I/O pin) are performed on each sample. This test conforms to the EIA/JESD 78 IC latch-up standard. For more details, refer to the application note AN1181.

## 9 Package characteristics

### 9.1 ECOPACK®

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK® packages, depending on their level of environmental compliance. ECOPACK® specifications, grade definitions and product status are available at: [www.st.com](http://www.st.com). ECOPACK® is an ST trademark.

## 9.2 Package mechanical data

**Device marking for TSSOP20 – 20-lead thin shrink small outline, 6.5 x 4.4 mm, 0.65 mm pitch**

The following figure gives an example of topside marking orientation versus pin 1/ball A1 identifier location.

Other optional marking or inset/upset marks, which identify the parts throughout supply chain operations, are not indicated below.

1. Parts marked as ES or E or accompanied by an Engineering Sample notification letter are not yet qualified and therefore not approved for use in production. ST is not responsible for any consequences resulting from such use. In no event will ST be liable for the customer using any of these engineering samples in production. ST's Quality department must be contacted prior to any decision to use these engineering samples to run a qualification activity.

## 9.4 Thermal characteristics

The maximum chip junction temperature ( $T_{Jmax}$ ) must never exceed the values given in [Table 15: General operating conditions on page 48](#).

The maximum chip-junction temperature,  $T_{Jmax}$ , in degree Celsius, may be calculated using the following equation:

$$T_{Jmax} = T_{Amax} + (P_{Dmax} \times \Theta_{JA})$$

Where:

- $T_{Amax}$  is the maximum ambient temperature in °C
- $\Theta_{JA}$  is the package junction-to-ambient thermal resistance in °C/W
- $P_{Dmax}$  is the sum of  $P_{INTmax}$  and  $P_{I/Omax}$  ( $P_{Dmax} = P_{INTmax} + P_{I/Omax}$ )
- $P_{INTmax}$  is the product of  $I_{DD}$  and  $V_{DD}$ , expressed in Watts. This is the maximum chip internal power.
- $P_{I/Omax}$  represents the maximum power dissipation on output pins

Where:

$$P_{I/Omax} = \Sigma (V_{OL} * I_{OL}) + \Sigma ((V_{DD} - V_{OH}) * I_{OH}),$$

taking into account the actual  $V_{OL}/I_{OL}$  and  $V_{OH}/I_{OH}$  of the I/Os at low and high level in the application.
