Double channel high side driver with analog current sense for automotive applications

Features

Max transient supply voltage	V_{CC}	41 V
Operating voltage range	V_{CC}	4.5 to 36 V
Max on-state resistance (per ch.)	R_{ON}	50 mΩ
Current limitation (typ)	I_{LIMH}	18 A
Off-state supply current	I_S	2 µA(1)

1. Typical value with all loads connected

- Main
  - Inrush current active management by power limitation
  - Very low standby current
  - 3.0 V CMOS compatible input
  - Optimized electromagnetic emission
  - Very low electromagnetic susceptibility
  - In compliance with the 2002/95/ec european directive
- Diagnostic functions
  - Proportional load current sense
  - High current sense precision for wide range currents
  - Current sense disable
  - Thermal shutdown indication
  - Very low current sense leakage
- Protections
  - Undervoltage shutdown
  - Overvoltage clamp
  - Load current limitation
  - Self limiting of fast thermal transients
  - Protection against loss of ground and loss of V_{CC}
  - Thermal shutdown
  - Reverse battery protection (see *Application schematic on page 21*)
  - Electrostatic discharge protection

Applications

- All types of resistive, inductive and capacitive loads
- Suitable as LED driver

Description

The VND5050AJ-E, VND5050AK-E is a monolithic device made using STMicroelectronics VIPower M0-5 technology. It is intended for driving resistive or inductive loads with one side connected to ground. Active V_{CC} pin voltage clamp protects the device against low energy spikes (see ISO7637 transient compatibility table).

This device integrates an analog current sense which delivers a current proportional to the load current (according to a known ratio) when CS_DIS is driven low or left open. When CS_DIS is driven high, the current sense pin is in a high impedance condition.

Output current limitation protects the device in overload condition. In case of long overload duration, the device limits the dissipated power to safe level up to thermal shutdown intervention. Thermal shutdown with automatic restart allows the device to recover normal operation as soon as fault condition disappears.

2.1 Absolute maximum ratings

Stressing the device above the rating listed in the “Absolute maximum ratings” table may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the Operating sections of this specification is not implied. Exposure to the conditions in table below for extended periods may affect device reliability. Refer also to the STMicroelectronics SURE Program and other relevant quality document.

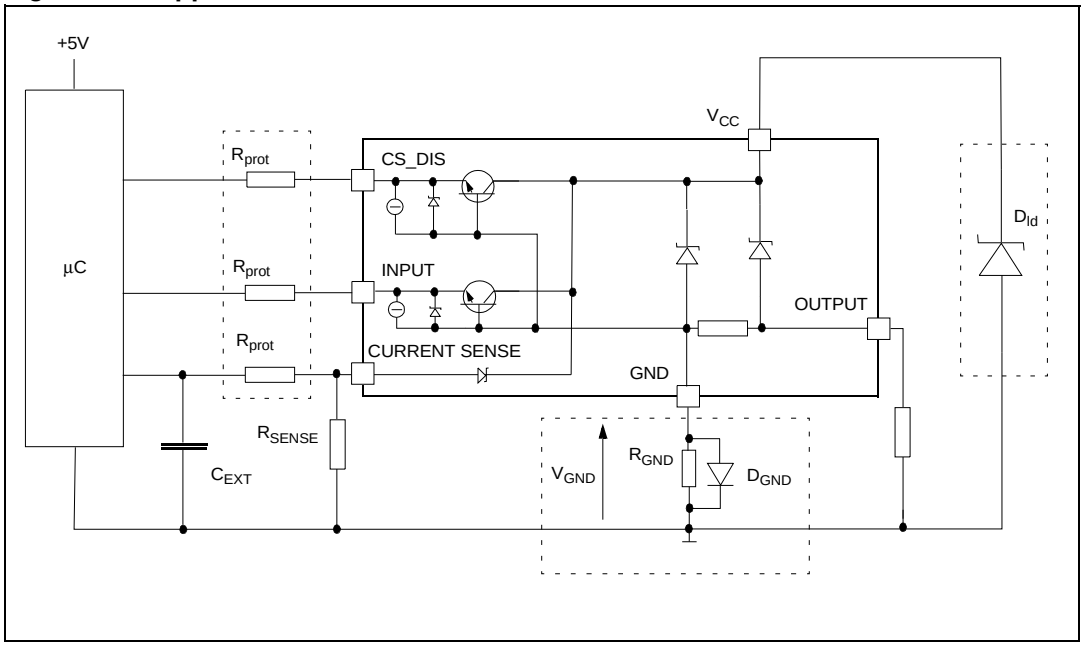
3 Application information

Figure 26. Application schematic



Note: Channel 2 has the same internal circuit as channel 1.

3.1 GND protection network against reverse battery

3.1.1 Solution 1: resistor in the ground line (R_{GND} only)

This can be used with any type of load.

The following is an indication on how to dimension the R_{GND} resistor.

1. $R_{GND} \leq 600mV / (I_{S(on)max})$.
2. $R_{GND} \geq (-V_{CC}) / (-I_{GND})$

where $-I_{GND}$ is the DC reverse ground pin current and can be found in the absolute maximum rating section of the device datasheet.

Power Dissipation in R_{GND} (when V_{CC}<0: during reverse battery situations) is:

$P_D = (-V_{CC})^2/R_{GND}$

This resistor can be shared amongst several different HSDs. Please note that the value of this resistor should be calculated with formula (1) where $I_{S(on)max}$ becomes the sum of the maximum on-state currents of the different devices.

Please note that if the microprocessor ground is not shared by the device ground then the R_{GND} will produce a shift ($I_{S(on)max} * R_{GND}$) in the input thresholds and the status output values. This shift will vary depending on how many devices are ON in the case of several high side drivers sharing the same R_{GND}.

If the calculated power dissipation leads to a large resistor or several devices have to share the same resistor then ST suggests to utilize Solution 2 (see below).

3.1.2 Solution 2: diode (D_{GND}) in the ground line

A resistor (R_{GND}=1kΩ) should be inserted in parallel to D_{GND} if the device drives an inductive load.

This small signal diode can be safely shared amongst several different HSDs. Also in this case, the presence of the ground network will produce a shift (≈600mV) in the input threshold and in the status output values if the microprocessor ground is not common to the device ground. This shift will not vary if more than one HSD shares the same diode/resistor network.

3.2 Load dump protection

D_{ld} is necessary (Voltage Transient Suppressor) if the load dump peak voltage exceeds the V_{CC} max DC rating. The same applies if the device is subject to transients on the V_{CC} line that are greater than the ones shown in the ISO 7637-2: 2004(E) table.

3.3 Microcontroller I/Os protection

If a ground protection network is used and negative transient are present on the V_{CC} line, the control pins will be pulled negative. ST suggests to insert a resistor (R_{prot}) in line to prevent the µC I/Os pins to latch-up.

The value of these resistors is a compromise between the leakage current of µC and the current required by the HSD I/Os (Input levels compatibility) with the latch-up limit of µC I/Os.

$-V_{CCpeak}/I_{latchup} \leq R_{prot} \leq (V_{OH\mu C}-V_{IH}-V_{GND}) / I_{IHmax}$

Calculation example:

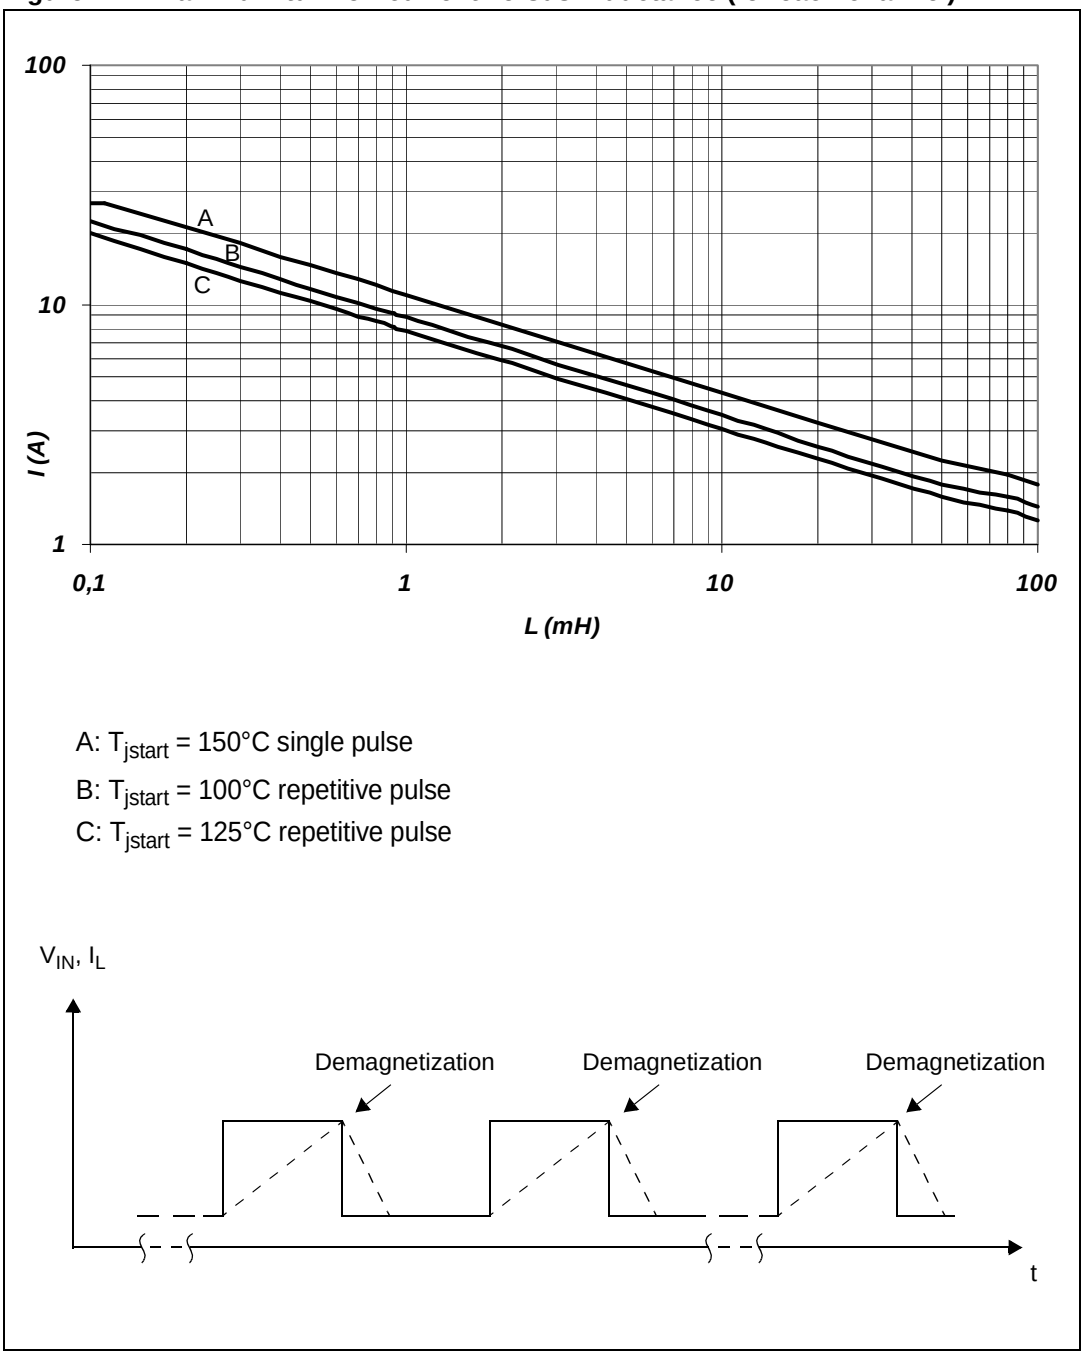
For V_{CCpeak}= - 100V and $I_{latchup} \geq$ 20mA; $V_{OH\mu C} \geq$ 4.5V

5kΩ ≤ R_{prot} ≤ 180kΩ.

Recommended values: R_{prot} =10kΩ, C_{EXT}=10nF.

3.4 Maximum demagnetization energy (V_{CC} = 13.5V)

Figure 27. Maximum turn-off current versus inductance (for each channel)



Note: Values are generated with R_L =0 Ω.In case of repetitive pulses, T_{jstart} (at beginning of each demagnetization) of every pulse must not exceed the temperature specified above for curves A and B.

6 Revision history

Table 19. Document revision history

Date	Revision	Changes
30-Mar-2006	1	Initial release.
14-Apr-2006	2	PowerSSO-24 dimensions table update.
26-Apr-2007	3	Reformatted *Figure 31* title corrected
14-May-2007	4	*Table 4*: corrected E_{MAX} value. *Table 10*: added dk1/k1, dk2/k2, dk3/k3, $\Delta t_{DSENSE2H}$. Added *Figure 5*. Updated *Figure 6*. Added *Figure 7*. *Table 12*: Updated test level values III and IV for test pulse 5b and notes. Added *Section 3.4: Maximum demagnetization energy (VCC = 13.5V)*.
01-Jun-2007	5	*Figure 31: Thermal fitting model of a double channel HSD in PowerSSO-12™*, *Figure 35: Thermal fitting model of a double channel HSD in PowerSSO-24™*: added notes.
04-Dec-2007	6	Updated *Table 10: Current sense (8V<V_{CC}<16V)*: – changed $t_{DSENSE2H}$ max value from 300 µs to 250µs. – added I_{OL} parameter. Updated *Section 4.1: PowerSSO-12™ thermal data*: – Changed *Figure 29: Rthj-amb vs PCB copper area in open box free air condition (one channel on)*. – Changed *Figure 30: PowerSSO-12™ thermal impedance junction ambient single pulse (one channel on)*. – Updated *Table :* : R3 value changed from 7 to 4 °C/W. R4 values changed from 10 /10 /10 to 8 /8 /7 °C/W.
12-Feb-2008	7	Corrected typing error in *Table 10: Current sense (8V<V_{CC}<16V)*: changed I_{OL} test condition from V_{IN} = 0V to V_{IN} = 5V.
16-Jun-2009	8	*Table 18: PowerSSO-24™ mechanical data*: – Deleted A (min) value – Changed A (max) value from 2.47 to 2.45 – Changed A2 (max) value from 2.40 to 2.35 – Changed a1 (max) value from 0.075 to 0.1 – Added F and k rows
21-Jul-2009	9	Updated *Figure 37: PowerSSO-24™ package dimensions*. Updated *Table 18: PowerSSO-24™ mechanical data*: – Deleted G1 row – Added O, Q, S, T, and U rows
23-Sep-2013	10	Updated Disclaimer.
