## EFR32MG1 Mighty Gecko ZigBee® \& Thread SoC Family Data Sheet

The Mighty Gecko ZigBee \& Thread family of SoCs is part of the Wireless Gecko portfolio. Mighty Gecko SoCs are ideal for enabling energy-friendly ZigBee \& Thread networking for loT devices.

## KEY FEATURES

- 32-bit ARM® Cortex®-M4 core with 40 MHz maximum operating frequency
- Scalable Memory and Radio configuration options available in several footprint compatible QFN packages
- 12-channel Peripheral Reflex System enabling autonomous interaction of MCU peripherals
- Autonomous Hardware Crypto Accelerator and Random Number Generator
- Integrated balun for 2.4 GHz and integrated PA with up to 19.5 dBm transmit power for 2.4 GHz and 20 dBm transmit power for Sub-GHz radios
- Integrated DC-DC with RF noise mitigation

## 1. Feature List

The EFR32MG1 highlighted features are listed below.

## - Low Power Wireless System-on-Chip

- High Performance 32-bit 40 MHz ARM Cortex ${ }^{\circledR}$-M4 with DSP instruction and floating-point unit for efficient signal processing
- Up to 256 kB flash program memory
- Up to 32 kB RAM data memory
- 2.4 GHz and Sub-GHz radio operation
- Transmit power:
- 2.4 GHz radio: Up to 19.5 dBm
- Sub-GHz radio: Up to 20 dBm

## - Low Energy Consumption

- 8.7 mA RX current at 2.4 GHz
- 8.2 mA TX current @ 0 dBm output power at 2.4 GHz
- 8.1 mA RX current at 868 MHz
- 34.5 mA TX current @ 14 dBm output power at 868 MHz
- $63 \mu \mathrm{~A} / \mathrm{MHz}$ in Active Mode (EM0)
- $1.4 \mu \mathrm{~A}$ EM2 DeepSleep current (full RAM retention and RTCC running from LFXO)
- $0.58 \mu \mathrm{~A}$ EM4H Hibernate Mode (128 byte RAM retention)
- Wake on Radio with signal strength detection, preamble pattern detection, frame detection and timeout
- High Receiver Performance
- -94 dBm sensitivity @ $1 \mathrm{Mbit} / \mathrm{s}$ GFSK (2.4GHz)
- -121.4 dBm sensitivity at 2.4 kbps GFSK ( 868 MHz )
- Supported Modulation Formats
- 2-FSK / 4-FSK with fully configurable shaping
- Shaped OQPSK / (G)MSK
- Configurable DSSS and FEC
- BPSK / DBPSK TX
- OOK / ASK
- Supported Protocols:
- Proprietary Protocols
- Wireless M-Bus
- Low Power Wide Area Networks

## - Support for Internet Security

- General Purpose CRC
- Random Number Generation
- Hardware Cryptographic Acceleration for AES 128/256, SHA-1, SHA-2 (SHA-224 and SHA-256) and ECC

## - Wide selection of MCU peripherals

- 12-bit 1 Msps SAR Analog to Digital Converter (ADC)
- $2 \times$ Analog Comparator (ACMP)
- Digital to Analog Current Converter (IDAC)
- Up to 31 pins connected to analog channels (APORT) shared between Analog Comparators, ADC, and IDAC
- Up to 31 General Purpose I/O pins with output state retention and asynchronous interrupts
- 8 Channel DMA Controller
- 12 Channel Peripheral Reflex System (PRS)
- 2×16-bit Timer/Counter - $3+4$ Compare/Capture/PWM channels
- 32-bit Real Time Counter and Calendar
- 16-bit Low Energy Timer for waveform generation
- 32-bit Ultra Low Energy Timer/Counter for periodic wake-up from any Energy Mode
- 16-bit Pulse Counter with asynchronous operation
- Watchdog Timer with dedicated RC oscillator @ 50nA
- 2×Universal Synchronous/Asynchronous Receiver/Transmitter (UART/SPI/SmartCard (ISO 7816)/IrDA/I²S)
- Low Energy UART (LEUART ${ }^{\text {TM }}$ )
- $\mathrm{I}^{2} \mathrm{C}$ interface with SMBus support and address recognition in EM3 Stop

## - Wide Operating Range

- 1.85 V to 3.8 V single power supply
- Integrated DC-DC, down to 1.8 V output with up to 200 mA load current for system
- $-40^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$
- QFN32 5x5 mm Package
- QFN48 7x7 mm Package

## 3. System Overview

### 3.1 Introduction

The EFR32 product family combines an energy-friendly MCU with a highly integrated radio transceiver. The devices are well suited for any battery operated application as well as other systems requiring high performance and low energy consumption. This section gives a short introduction to the full radio and MCU system. The detailed functional description can be found in the EFR32 Reference Manual.

A block diagram of the EFR32MG1 family is shown in Figure 3.1 Detailed EFR32MG1 Block Diagram on page 4. The diagram shows a superset of features available on the family, which vary by OPN. For more information about specific device features, consult Ordering Information.

Figure 3.1. Detailed EFR32MG1 Block Diagram

### 3.2 Radio

The Mighty Gecko family features a radio transceiver supporting Bluetooth Smart ${ }^{\circledR}$ and proprietary short range wireless protocols.

### 3.2.1 Antenna Interface

The EFR32MG1 family includes devices which support both single-band and dual-band RF communication over separate physical RF interfaces.

The 2.4 GHz antenna interface consists of two pins (2G4RF_IOP and 2G4RF_ION) that interface directly to the on-chip BALUN. The 2G4RF_ION pin should be grounded externally.

The sub-GHz antenna interface consists of a differential transmit interface (pins SUBGRF_OP and SUBGRF_ON) and a differential receive interface (pinsSUBGRF_IP and SUBGRF_IN).

The external components and power supply connections for the antenna interface typical applications are shown in the RF Matching Networks section.

### 3.2.2 Fractional-N Frequency Synthesizer

The EFR32MG1 contains a high performance, low phase noise, fully integrated fractional-N frequency synthesizer. The synthesizer is used in receive mode to generate the LO frequency used by the down-conversion mixer. It is also used in transmit mode to directly generate the modulated RF carrier.

The fractional-N architecture provides excellent phase noise performance combined with frequency resolution better than 100 Hz , with low energy consumption. The synthesizer has fast frequency settling which allows very short receiver and transmitter wake up times to optimize system energy consumption.

### 3.2.3 Receiver Architecture

The EFR32MG1 uses a low-IF receiver architecture, consisting of a Low-Noise Amplifier (LNA) followed by an I/Q down-conversion mixer, employing a crystal reference. The I/Q signals are further filtered and amplified before being sampled by the IF analog-to-digital converter (IFADC).

The IF frequency is configurable from 150 kHz to 1371 kHz . The IF can further be configured for high-side or low-side injection, providing flexibility with respect to known interferers at the image frequency.

The Automatic Gain Control (AGC) module adjusts the receiver gain to optimize performance and avoid saturation for excellent selectivity and blocking performance. The 2.4 GHz radio is calibrated at production to improve image rejection performance. The sub- GHz radio can be calibrated on-demand by the user for the desired frequency band.

Demodulation is performed in the digital domain. The demodulator performs configurable decimation and channel filtering to allow receive bandwidths ranging from 0.1 to 2530 kHz . High carrier frequency and baud rate offsets are tolerated by active estimation and compensation. Advanced features supporting high quality communication under adverse conditions include forward error correction by block and convolutional coding as well as Direct Sequence Spread Spectrum (DSSS).

A Received Signal Strength Indicator (RSSI) is available for signal quality metrics, for level-based proximity detection, and for RF channel access by Collision Avoidance (CA) or Listen Before Talk (LBT) algorithms. An RSSI capture value is associated with each received frame and the dynamic RSSI measurement can be monitored throughout reception.

The EFR32MG1 features integrated support for antenna diversity to improve link budget for 802.15.4 DSSS-OQPSK PHY configuration in the 2.4 GHz band, using complementary control outputs to an external switch. Internal configurable hardware controls automatic switching between antennae during RF receive detection operations.

### 3.2.4 Transmitter Architecture

The EFR32MG1 uses a direct-conversion transmitter architecture. For constant envelope modulation formats, the modulator controls phase and frequency modulation in the frequency synthesizer. Transmit symbols or chips are optionally shaped by a digital shaping filter. The shaping filter is fully configurable, including the BT product, and can be used to implement Gaussian or Raised Cosine shaping.

Carrier Sense Multiple Access - Collision Avoidance (CSMA-CA) or Listen Before Talk (LBT) algorithms can be automatically timed by the EFR32MG1. These algorithms are typically defined by regulatory standards to improve inter-operability in a given bandwidth between devices that otherwise lack synchronized RF channel access.

### 3.2.5 Wake on Radio

The Wake on Radio feature allows flexible, autonomous RF sensing, qualification, and demodulation without required MCU activity, using a subsystem of the EFR32MG1 including the Radio Controller (RAC), Peripheral Reflex System (PRS), and Low Energy peripherals.

### 3.2.6 RFSENSE

The RFSENSE module generates a system wakeup interrupt upon detection of wideband RF energy at the antenna interface, providing true RF wakeup capabilities from low energy modes including EM2, EM3 and EM4.

RFSENSE triggers on a relatively strong RF signal and is available in the lowest energy modes, allowing exceptionally low energy consumption. RFSENSE does not demodulate or otherwise qualify the received signal, but software may respond to the wakeup event by enabling normal RF reception.

Various strategies for optimizing power consumption and system response time in presence of false alarms may be employed using available timer peripherals.

### 3.2.7 Flexible Frame Handling

EFR32MG1 has an extensive and flexible frame handling support for easy implementation of even complex communication protocols. The Frame Controller (FRC) supports all low level and timing critical tasks together with the Radio Controller and Modulator/Demodulator:

- Highly adjustable preamble length
- Up to 2 simultaneous synchronization words, each up to 32 bits and providing separate interrupts
- Frame disassembly and address matching (filtering) to accept or reject frames
- Automatic ACK frame assembly and transmission
- Fully flexible CRC generation and verification:
- Multiple CRC values can be embedded in a single frame
- 8, 16, 24 or 32 -bit CRC value
- Configurable CRC bit and byte ordering
- Selectable bit-ordering (least significant or most significant bit first)
- Optional data whitening
- Optional Forward Error Correction (FEC), including convolutional encoding / decoding and block encoding / decoding
- Half rate convolutional encoder and decoder with constraint lengths from 2 to 7 and optional puncturing
- Optional symbol interleaving, typically used in combination with FEC
- Symbol coding, such as Manchester or DSSS, or biphase space encoding using FEC hardware
- UART encoding over air, with start and stop bit insertion / removal
- Test mode support, such as modulated or unmodulated carrier output
- Received frame timestamping

### 3.2.8 Packet and State Trace

The EFR32MG1 Frame Controller has a packet and state trace unit that provides valuable information during the development phase. It features:

- Non-intrusive trace of transmit data, receive data and state information
- Data observability on a single-pin UART data output, or on a two-pin SPI data output
- Configurable data output bitrate / baudrate
- Multiplexed transmitted data, received data and state / meta information in a single serial data stream

### 3.2.9 Data Buffering

The EFR32MG1 features an advanced Radio Buffer Controller (BUFC) capable of handling up to 4 buffers of adjustable size from 64 bytes to 4096 bytes. Each buffer can be used for RX, TX or both. The buffer data is located in RAM, enabling zero-copy operations.

### 3.2.10 Radio Controller (RAC)

The Radio Controller controls the top level state of the radio subsystem in the EFR32MG1. It performs the following tasks:

- Precisely-timed control of enabling and disabling of the receiver and transmitter circuitry
- Run-time calibration of receiver, transmitter and frequency synthesizer
- Detailed frame transmission timing, including optional LBT or CSMA-CA

### 3.2.11 Random Number Generator

The Frame Controller (FRC) implements a random number generator that uses entropy gathered from noise in the RF receive chain. The data is suitable for use in cryptographic applications.

Output from the random number generator can be used either directly or as a seed or entropy source for software-based random number generator algorithms such as Fortuna.

### 3.3 Power

The EFR32MG1 has an Energy Management Unit (EMU) and efficient integrated regulators to generate internal supply voltages. Only a single external supply voltage is required, from which all internal voltages are created. An optional integrated DC-DC buck regulator can be utilized to further reduce the current consumption. The DC-DC regulator requires one external inductor and one external capacitor.

AVDD and VREGVDD need to be 1.85 V or higher for the MCU to operate across all conditions; however the rest of the system will operate down to 1.62 V , including the digital supply and $\mathrm{I} / \mathrm{O}$. This means that the device is fully compatible with 1.8 V components. Running from a sufficiently high supply, the device can use the DC-DC to regulate voltage not only for itself, but also for other PCB components, supplying up to a total of 200 mA .

### 3.3.1 Energy Management Unit (EMU)

The Energy Management Unit manages transitions of energy modes in the device. Each energy mode defines which peripherals and features are available and the amount of current the device consumes. The EMU can also be used to turn off the power to unused RAM blocks, and it contains control registers for the dc-dc regulator and the Voltage Monitor (VMON). The VMON is used to monitor multiple supply voltages. It has multiple channels which can be programmed individually by the user to determine if a sensed supply has fallen below a chosen threshold.

### 3.3.2 DC-DC Converter

The DC-DC buck converter covers a wide range of load currents and provides up to $90 \%$ efficiency in energy modes EM0, EM1, EM2 and EM3, and can supply up to 200 mA to the device and surrounding PCB components. Patented RF noise mitigation allows operation of the DC-DC converter without degrading sensitivity of radio components. Protection features include programmable current limiting, short-circuit protection, and dead-time protection. The DC-DC converter may also enter bypass mode when the input voltage is too low for efficient operation. In bypass mode, the DC-DC input supply is internally connected directly to its output through a low resistance switch. Bypass mode also supports in-rush current limiting to prevent input supply voltage droops due to excessive output current transients.

### 3.4 General Purpose Input/Output (GPIO)

EFR32MG1 has up to 31 General Purpose Input/Output pins. Each GPIO pin can be individually configured as either an output or input. More advanced configurations including open-drain, open-source, and glitch-filtering can be configured for each individual GPIO pin. The GPIO pins can be overridden by peripheral connections, like SPI communication. Each peripheral connection can be routed to several GPIO pins on the device. The input value of a GPIO pin can be routed through the Peripheral Reflex System to other peripherals. The GPIO subsystem supports asynchronous external pin interrupts.

### 3.5 Clocking

### 3.5.1 Clock Management Unit (CMU)

The Clock Management Unit controls oscillators and clocks in the EFR32MG1. Individual enabling and disabling of clocks to all peripheral modules is performed by the CMU. The CMU also controls enabling and configuration of the oscillators. A high degree of flexibility allows software to optimize energy consumption in any specific application by minimizing power dissipation in unused peripherals and oscillators.

### 3.5.2 Internal and External Oscillators

The EFR32MG1 supports two crystal oscillators and fully integrates four RC oscillators, listed below.

- A high frequency crystal oscillator (HFXO) with integrated load capacitors, tunable in small steps, provides a precise timing reference for the MCU. Crystal frequencies in the range from 38 to 40 MHz are supported. An external clock source such as a TCXO can also be applied to the HFXO input for improved accuracy over temperature.
- A 32.768 kHz crystal oscillator (LFXO) provides an accurate timing reference for low energy modes.
- An integrated high frequency RC oscillator (HFRCO) is available for the MCU system, when crystal accuracy is not required. The HFRCO employs fast startup at minimal energy consumption combined with a wide frequency range.
- An integrated auxilliary high frequency RC oscillator (AUXHFRCO) is available for timing the general-purpose ADC and the Serial Wire debug port with a wide frequency range.
- An integrated low frequency 32.768 kHz RC oscillator (LFRCO) can be used as a timing reference in low energy modes, when crystal accuracy is not required.
- An integrated ultra-low frequency 1 kHz RC oscillator (ULFRCO) is available to provide a timing reference at the lowest energy consumption in low energy modes.

### 3.6 Counters/Timers and PWM

### 3.6.1 Timer/Counter (TIMER)

TIMER peripherals keep track of timing, count events, generate PWM outputs and trigger timed actions in other peripherals through the PRS system. The core of each TIMER is a 16-bit counter with up to 4 compare/capture channels. Each channel is configurable in one of three modes. In capture mode, the counter state is stored in a buffer at a selected input event. In compare mode, the channel output reflects the comparison of the counter to a programmed threshold value. In PWM mode, the TIMER supports generation of pulse-width modulation (PWM) outputs of arbitrary waveforms defined by the sequence of values written to the compare registers, with optional dead-time insertion available in timer unit TIMER_0 only.

### 3.6.2 Real Time Counter and Calendar (RTCC)

The Real Time Counter and Calendar (RTCC) is a 32-bit counter providing timekeeping in all energy modes. The RTCC includes a Binary Coded Decimal (BCD) calendar mode for easy time and date keeping. The RTCC can be clocked by any of the on-board oscillators with the exception of the AUXHFRCO, and it is capable of providing system wake-up at user defined instances. When receiving frames, the RTCC value can be used for timestamping. The RTCC includes 128 bytes of general purpose data retention, allowing easy and convenient data storage in all energy modes.

### 3.6.3 Low Energy Timer (LETIMER)

The unique LETIMER is a 16 -bit timer that is available in energy mode EM2 Deep Sleep in addition to EM1 Sleep and EM0 Active. This allows it to be used for timing and output generation when most of the device is powered down, allowing simple tasks to be performed while the power consumption of the system is kept at an absolute minimum. The LETIMER can be used to output a variety of waveforms with minimal software intervention. The LETIMER is connected to the Real Time Counter and Calendar (RTCC), and can be configured to start counting on compare matches from the RTCC.

### 3.6.4 Ultra Low Power Wake-up Timer (CRYOTIMER)

The CRYOTIMER is a 32 -bit counter that is capable of running in all energy modes. It can be clocked by either the 32.768 kHz crystal oscillator (LFXO), the 32.768 kHz RC oscillator (LFRCO), or the 1 kHz RC oscillator (ULFRCO). It can provide periodic Wakeup events and PRS signals which can be used to wake up peripherals from any energy mode. The CRYOTIMER provides a wide range of interrupt periods, facilitating flexible ultra-low energy operation.

### 3.6.5 Pulse Counter (PCNT)

The Pulse Counter (PCNT) peripheral can be used for counting pulses on a single input or to decode quadrature encoded inputs. The clock for PCNT is selectable from either an external source on pin PCTNn_SOIN or from an internal timing reference, selectable from among any of the internal oscillators, except the AUXHFRCO. The module may operate in energy mode EM0 Active, EM1 Sleep, EM2 Deep Sleep, and EM3 Stop.

### 3.6.6 Watchdog Timer (WDOG)

The watchdog timer can act both as an independent watchdog or as a watchdog synchronous with the CPU clock. It has windowed monitoring capabilities, and can generate a reset or different interrupts depending on the failure mode of the system. The watchdog can also monitor autonomous systems driven by PRS.

### 3.7 Communications and Other Digital Peripherals

### 3.7.1 Universal Synchronous/Asynchronous Receiver/Transmitter (USART)

The Universal Synchronous/Asynchronous Receiver/Transmitter is a flexible serial I/O module. It supports full duplex asynchronous UART communication with hardware flow control as well as RS-485, SPI, MicroWire and 3-wire. It can also interface with devices supporting:

- ISO7816 SmartCards
- IrDA
- $\mathrm{I}^{2} \mathrm{~S}$

### 3.7.2 Low Energy Universal Asynchronous Receiver/Transmitter (LEUART)

The unique LEUART ${ }^{\text {TM }}$ provides two-way UART communication on a strict power budget. Only a 32.768 kHz clock is needed to allow UART communication up to 9600 baud. The LEUART includes all necessary hardware to make asynchronous serial communication possible with a minimum of software intervention and energy consumption.

### 3.7.3 Inter-Integrated Circuit Interface $\left(I^{2} \mathrm{C}\right)$

The $\mathrm{I}^{2} \mathrm{C}$ module provides an interface between the MCU and a serial $\mathrm{I}^{2} \mathrm{C}$ bus. It is capable of acting as both a master and a slave and supports multi-master buses. Standard-mode, fast-mode and fast-mode plus speeds are supported, allowing transmission rates from 10 $\mathrm{kbit} / \mathrm{s}$ up to $1 \mathrm{Mbit} / \mathrm{s}$. Slave arbitration and timeouts are also available, allowing implementation of an SMBus-compliant system. The interface provided to software by the $I^{2} \mathrm{C}$ module allows precise timing control of the transmission process and highly automated transfers. Automatic recognition of slave addresses is provided in active and low energy modes.

### 3.7.4 Peripheral Reflex System (PRS)

The Peripheral Reflex System provides a communication network between different peripheral modules without software involvement. Peripheral modules producing Reflex signals are called producers. The PRS routes Reflex signals from producers to consumer peripherals which in turn perform actions in response. Edge triggers and other functionality can be applied by the PRS. The PRS allows peripheral to act autonomously without waking the MCU core, saving power.

### 3.8 Security Features

### 3.8.1 GPCRC (General Purpose Cyclic Redundancy Check)

The GPCRC module implements a Cyclic Redundancy Check (CRC) function. It supports both 32-bit and 16-bit polynomials. The supported 32-bit polynomial is $0 \times 04$ C11DB7 (IEEE 802.3), while the 16 -bit polynomial can be programmed to any value, depending on the needs of the application.

### 3.8.2 Crypto Accelerator (CRYPTO)

The Crypto Accelerator is a fast and energy-efficient autonomous hardware encryption and decryption accelerator. EFR32 devices support AES encryption and decryption with 128- or 256-bit keys, ECC over both GF(P) and GF(2m), SHA-1 and SHA-2 (SHA-224 and SHA-256).

Supported block cipher modes of operation for AES include: ECB, CTR, CBC, PCBC, CFB, OFB, GCM, CBC-MAC, GMAC and CCM.
Supported ECC NIST recommended curves include P-192, P-224, P-256, K-163, K-233, B-163 and B-233.
The CRYPTO is tightly linked to the Radio Buffer Controller (BUFC) enabling fast and efficient autonomous cipher operations on data buffer content. It allows fast processing of GCM (AES), ECC and SHA with little CPU intervention. CRYPTO also provides trigger signals for DMA read and write operations.

### 3.9 Analog

### 3.9.1 Analog Port (APORT)

The Analog Port (APORT) is an analog interconnect matrix allowing access to many analog modules on a flexible selection of pins. Each APORT bus consists of analog switches connected to a common wire. Since many clients can operate differentially, buses are grouped by $\mathrm{X} / \mathrm{Y}$ pairs.

### 3.9.2 Analog Comparator (ACMP)

The Analog Comparator is used to compare the voltage of two analog inputs, with a digital output indicating which input voltage is higher. Inputs are selected from among internal references and external pins. The tradeoff between response time and current consumption is configurable by software. Two 6-bit reference dividers allow for a wide range of internally-programmable reference sources. The ACMP can also be used to monitor the supply voltage. An interrupt can be generated when the supply falls below or rises above the programmable threshold.

### 3.9.3 Analog to Digital Converter (ADC)

The ADC is a Successive Approximation Register (SAR) architecture, with a resolution of up to 12 bits at up to 1 Msps. The output sample resolution is configurable and additional resolution is possible using integrated hardware for averaging over multiple samples. The ADC includes integrated voltage references and an integrated temperature sensor. Inputs are selectable from a wide range of sources, including pins configurable as either single-ended or differential.

### 3.9.4 Digital to Analog Current Converter (IDAC)

The Digital to Analog Current Converter can source or sink a configurable constant current. This current can be driven on an output pin or routed to the selected ADC input pin for capacitive sensing. The full-scale current is programmable between $0.05 \mu \mathrm{~A}$ and $64 \mu \mathrm{~A}$ with several ranges consisting of various step sizes.

### 3.10 Reset Management Unit (RMU)

The RMU is responsible for handling reset of the EFR32MG1. A wide range of reset sources are available, including several power supply monitors, pin reset, software controlled reset, core lockup reset, and watchdog reset.

### 3.11 Core and Memory

### 3.11.1 Processor Core

The ARM Cortex-M processor includes a 32-bit RISC processor integrating the following features and tasks in the system:

- ARM Cortex-M4 RISC processor achieving 1.25 Dhrystone MIPS/MHz
- Memory Protection Unit (MPU) supporting up to 8 memory segments
- Up to 256 kB flash program memory
- Up to 32 kB RAM data memory
- Configuration and event handling of all modules
- 2-pin Serial-Wire debug interface

### 3.11.2 Memory System Controller (MSC)

The Memory System Controller (MSC) is the program memory unit of the microcontroller. The flash memory is readable and writable from both the Cortex-M and DMA. The flash memory is divided into two blocks; the main block and the information block. Program code is normally written to the main block, whereas the information block is available for special user data and flash lock bits. There is also a read-only page in the information block containing system and device calibration data. Read and write operations are supported in energy modes EM0 Active and EM1 Sleep.

### 3.11.3 Linked Direct Memory Access Controller (LDMA)

The Linked Direct Memory Access (LDMA) controller features 8 channels capable of performing memory operations independently of software. This reduces both energy consumption and software workload. The LDMA allows operations to be linked together and staged, enabling sophisticated operations to be implemented.

### 3.12 Memory Map

The EFR32MG1 memory map is shown in the figures below. RAM and flash sizes are for the largest memory configuration.

### 3.13 Configuration Summary

The features of the EFR32MG1 are a subset of the feature set described in the device reference manual. The table below describes device specific implementation of the features. Remaining modules support full configuration.

Table 3.1. Configuration Summary

| Module | Configuration | Pin Connections |
| :--- | :--- | :--- |
| USART0 | IrDA SmartCard | US0_TX, US0_RX, US0_CLK, US0_CS |
| USART1 | IrDA I2s SmartCard | US1_TX, US1_RX, US1_CLK, US1_CS |
| TIMER0 | with DTI. | TIM0_CC[2:0], TIM0_CDTI[2:0] |
| TIMER1 |  | TIM1_CC[3:0] |

## 4. Electrical Specifications

### 4.1 Electrical Characteristics

All electrical parameters in all tables are specified under the following conditions, unless stated otherwise:

- Typical values are based on $\mathrm{T}_{\mathrm{AMB}}=25^{\circ} \mathrm{C}$ and $\mathrm{V}_{\mathrm{DD}}=3.3 \mathrm{~V}$, by production test and/or technology characterization.
- Radio performance numbers are measured in conducted mode, based on Silicon Laboratories reference designs using output pow-er-specific external RF impedance-matching networks for interfacing to a $50 \Omega$ antenna.
- Minimum and maximum values represent the worst conditions across supply voltage, process variation, and operating temperature, unless stated otherwise.

Refer to Table 4.2 General Operating Conditions on page 17 for more details about operational supply and temperature limits.

### 4.1.1 Absolute Maximum Ratings

Stresses above those listed below may cause permanent damage to the device. This is a stress rating only and functional operation of the devices at those or any other conditions above those indicated in the operation listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability. For more information on the available quality and reliability data, see the Quality and Reliability Monitor Report at http://www.silabs.com/support/quality/pages/default.aspx.

Table 4.1. Absolute Maximum Ratings

| Parameter | Symbol | Test Condition | Min | Typ | Max | Unit |
| :--- | :--- | :--- | :---: | :---: | :---: | :---: |
| Junction Temperature | $T_{J}$ |  | -40 | - | 105 | ${ }^{\circ} \mathrm{C}$ |

## Note:

1. When a GPIO pin is routed to the analog module through the APORT, the maximum voltage = IOVDD.

### 4.1.2 Operating Conditions

When assigning supply sources, the following requirements must be observed:

- VREGVDD must be the highest voltage in the system
- VREGVDD = AVDD
- DVDD $\leq$ AVDD
- IOVDD $\leq$ AVDD
- RFVDD $\leq$ AVDD
- PAVDD $\leq$ AVDD

### 4.1.2.1 General Operating Conditions

|  |  | 1 wait-states (MODE $=$ WS1) ${ }^{3}$ | - | - | 40 | MHz |

## Note:

1. VREGVDD must be tied to AVDD. Both VREGVDD and AVDD minimum voltages must be satisfied for the part to operate.
2. The minimum voltage required in bypass mode is calculated using $R_{B Y P}$ from the DCDC specification table. Requirements for other loads can be calculated as $V_{\text {DVDD_min }}+l_{\text {LOAD }}{ }^{*} R_{\text {BYP_max }}$
3. In MSC_READCTRL register

## Note:

1. Due to internal dropout, the DC-DC output will never be able to reach its input voltage, $\mathrm{V}_{\text {VREGVDD }}$
2. LP mode controller is a hysteretic controller that maintains the output voltage within the specified limits
3. In EMU_DCDCMISCCTRL register
4. Drive levels are defined by configuration of the PFETCNT and NFETCNT registers. Light Drive: PFETCNT=NFETCNT=3; Medium Drive: PFETCNT=NFETCNT=7; Heavy Drive: PFETCNT=NFETCNT=15.

## Note:

1. Per Bluetooth Core_4.2, Section 3.2.2, exceptions are allowed in up to three bands of 1 MHz width, centered on a frequency which is an integer multiple of 1 MHz . These exceptions shall have an absolute value of -20 dBm or less.
2. For 2456 MHz , a maximum output power of 15 dBm is used to achieve this value.
3. For 2480 MHz , a maximum duty cycle of $20 \%$ is used to achieve this value.

## Note:

1. Reference signal is defined as O-QPSK DSSS per 802.15.4, Frequency range $=2400-2483.5 \mathrm{MHz}$, Symbol rate $=62.5 \mathrm{ksym}-$ bols/s
2. Receive sensitivity on 802.15 .4 channel 14 is -98 dBm
3. Reference sensitivity level is -85 dBm
4. Filter is characterized as a symmetric bandpass centered on the adjacent channel having a 3 dB bandwidth of 4.6 MHz and stopband rejection better than 26 dB beyond 3.15 MHz from the adjacent carrier.
5. Due to low-IF frequency, there is some overlap of adjacent channel and image channel bands. Adjacent channel CW blocker tests place the Interferer center frequency at the Desired frequency $\pm 5 \mathrm{MHz}$ on the channel raster, whereas the image rejection test places the CW interferer near the image frequency of the Desired signal carrier, regardless of the channel raster.

The total ACMP current is the sum of the contributions from the ACMP and its internal voltage reference as given as:
$I_{\text {ACMPTOTAL }}=I_{\text {ACMP }}+I_{\text {ACMPREF }}$
$I_{\text {ACMPREF }}$ is zero if an external voltage reference is used.

## 5. Typical Connection Diagrams

### 5.1 Power

Typical power supply connections for direct supply, without using the internal DC-DC converter, are shown in the following figure.

Figure 5.1. EFR32MG1 Typical Application Circuit: Direct Supply Configuration without DC-DC converter

Typical power supply circuits using the internal DC-DC converter are shown below. The MCU operates from the DC-DC converter supply. For low RF transmit power applications less than 13 dBm , the RF PA may be supplied by the DC-DC converter. For OPNs supporting high power RF transmission, the RF PA must be directly supplied by VDD for RF transmit power greater than 13 dBm .

Figure 5.2. EFR32MG1 Typical Application Circuit: Configuration with DC-DC converter (PAVDD from VDCDC)

Figure 5.3. EFR32MG1 Typical Application Circuit: Configuration with DC-DC converter (PAVDD from VDD)

### 5.2 RF Matching Networks

Typical RF matching network circuit diagrams are shown in Figure 5.4 Typical 2.4 GHz RF impedance-matching network circuits on page 100 for applications in the 2.4 GHz band, and in Figure 5.5 Typical Sub-GHz RF impedance-matching network circuits on page 101 for applications in the sub-GHz band. Application-specific component values can be found in the EFR32 Reference Manual. For low RF transmit power applications less than 13 dBm , the two-element match is recommended. For OPNs supporting high power RF transmission, the four-element match is recommended for high RF transmit power (> 13 dBm ).

Typical RF matching network circuit diagrams are shown in Figure 5.5 Typical Sub-GHz RF impedance-matching network circuits on page 101 for applications in the sub-GHz band. Application-specific component values can be found in the EFR32 Reference Manual. For low RF transmit power applications less than 13 dBm , the two-element match is recommended. For OPNs supporting high power RF transmission, the four-element match is recommended for high RF transmit power (>13dBm).

### 5.3 Other Connections

Other components or connections may be required to meet the system-level requirements. Application Note AN0002: "Hardware Design Considerations" contains detailed information on these connections. Application Notes can be accessed on the Silicon Labs website (www.silabs.com/32bit-appnotes).

### 6.1.1 QFN48 2.4 GHz and Sub-GHz GPIO Overview

The GPIO pins are organized as 16-bit ports indicated by letters (A, B, C...), with individual pins on each port indicated by a number from 15 down to 0 .

## Note:

1. GPIO with 5 V tolerance are indicated by $(5 \mathrm{~V})$.
2. The pins PA2, PA3, PA4, PB11, PB12, PB13, PD13, PD14, and PD15 will not be 5V tolerant on all future devices. In order to preserve upgrade options with full hardware compatibility, do not use these pins with 5 V domains.

### 6.2.1 QFN48 2.4 GHz GPIO Overview

The GPIO pins are organized as 16-bit ports indicated by letters (A, B, C...), with individual pins on each port indicated by a number from 15 down to 0 .

## Note:

1. GPIO with 5 V tolerance are indicated by ( 5 V ).
2. The pins PA2, PA3, PA4, PB11, PB12, PB13, PD13, PD14, and PD15 will not be 5V tolerant on all future devices. In order to preserve upgrade options with full hardware compatibility, do not use these pins with 5 V domains.

### 6.3.1 QFN32 2.4 GHz GPIO Overview

The GPIO pins are organized as 16-bit ports indicated by letters (A, B, C...), with individual pins on each port indicated by a number from 15 down to 0 .

## Note:

1. GPIO with 5 V tolerance are indicated by ( 5 V ).
2. The pins PB11, PB12, PB13, PD13, PD14, and PD15 will not be 5V tolerant on all future devices. In order to preserve upgrade options with full hardware compatibility, do not use these pins with 5 V domains.

### 6.4 Alternate Functionality Overview

A wide selection of alternate functionality is available for multiplexing to various pins. The following table shows the name of the alternate functionality in the first column, followed by columns showing the possible LOCATION bitfield settings.
Note: Some functionality, such as analog interfaces, do not have alternate settings or a LOCATION bitfield. In these cases, the pinout is shown in the column corresponding to LOCATION 0.

### 6.5 Analog Port (APORT) Client Maps

The Analog Port (APORT) is an infrastructure used to connect chip pins with on-chip analog clients such as analog comparators, ADCs, DACs, etc. The APORT consists of a set of shared buses, switches, and control logic needed to configurably implement the signal routing. A complete description of APORT functionality can be found in the Reference Manual.

Client maps for each analog circuit using the APORT are shown in the following tables. The maps are organized by bus, and show the peripheral's port connection, the shared bus, and the connection from specific bus channel numbers to GPIO pins.

In general, enumerations for the pin selection field in an analog peripheral's register can be determined by finding the desired pin connection in the table and then combining the value in the Port column (APORT $\qquad$ ), and the channel identifier $(\mathrm{CH}$ $\qquad$ ). For example, if pin PF7 is available on port APORT2X as CH 23 , the register field enumeration to connect to PF7 would be APORT2XCH23. The shared bus used by this connection is indicated in the Bus column.

| 1. All dimensions shown are in millimeters (mm) unless otherwise noted. |  |
| 2. This Land Pattern Design is based on the IPC-7351 guidelines. |  |
| 3. All metal pads are to be non-solder mask defined (NSMD). Clearance between the solder mask and the metal pad is to be 60 um |  |
| minimum, all the way around the pad. |  |
| 4. A stainless steel, laser-cut and electro-polished stencil with trapezoidal walls should be used to assure good solder paste release. |  |
| 5. The stencil thickness should be 0.125 mm (5 mils). |  |
| 6. The ratio of stencil aperture to land pad size can be 1:1 for all perimeter pads. |  |
| 7. A 4x4 array of 0.75 mm square openings on a 1.00 mm pitch can be used for the center ground pad. |  |
| 8. A No-Clean, Type-3 solder paste is recommended. |  |
| 9. The recommended card reflow profile is per the JEDEC/IPC J-STD-020 specification for Small Body Components. |  |

### 7.3 QFN48 Package Marking

## $\longrightarrow$

## EFR32 PPPPPPPPP YYWWTTTTTT \#

Figure 7.3. QFN48 Package Marking

The package marking consists of:

- PPPPPPPPP - The part number designation.

1. Family Code (B|M|F)
2. G (Gecko)
3. Series (1, 2,...)
4. Performance Grade ( $\mathrm{P}|\mathrm{B}| \mathrm{V}$ )
5. Feature Code (1 to 7)
6. TRX Code ( $3=\operatorname{TXRX}|2=\mathrm{RX}| 1=\mathrm{TX}$ )
7. Band ( $1=$ Sub-GHz | $2=2.4 \mathrm{GHz} \mid 3=$ Dual-band)
8. Flash ( $\mathrm{E}=1024 \mathrm{~K}|\mathrm{~F}=512 \mathrm{~K}| \mathrm{G}=256 \mathrm{~K}|\mathrm{~F}=128 \mathrm{~K}| \mathrm{E}=64 \mathrm{~K} \mid \mathrm{D}=32 \mathrm{~K}$ )
9. Temperature Grade ( $G=-40$ to $85 \mid I=-40$ to 125)

- YY - The last 2 digits of the assembly year.
- WW - The 2-digit workweek when the device was assembled.
- TTTTTT - A trace or manufacturing code. The first letter is the device revision.
- \# - Bootloader revision number.

## 9. Revision History

### 9.1 Revision 1.1

## 2016-Oct-26

- Ordering Information: Removed Encryption column. All products in family include full encryption capabilites. Previously EFR32MG1V devices listed as "AES only".
- System Overview Sections: Minor wording and typographical error fixes.
- Electrical Characteristics: Minor wording and typographical error fixes.
- "Sub-GHz Receiver Characteristics for 433 MHz Band" table in Electrical Characteristics: Corrected Sensitivity spec error where data for 50 kbps and 2.4 kbps were swapped.
- "HFRCO and AUXHFRCO" table in Electrical Characteristics: f_HFRCO symbol changed to f_HFRCO_ACC.
- Pinout tables: APORT channel details removed from "Analog" column. This information is now found in the APORT client map sections.
- Updated APORT client map sections.

### 9.2 Revision 1.0

2016-Jul-22

- Electrical Characteristics: Minimum and maximum value statement changed to cover full operating temperature range.
- Finalized Specification Tables. Tables with condition/min/typ/max or footnote changes include:
- Absolute Maximum Ratings
- General Operating Conditions
- DC-DC Converter
- Current Consumption Using Radio 3.3V with DC-DC
- RF Transmitter General Characteristics for 2.4 GHz Band
- RF Receiver General Characteristics for 2.4 GHz Band
- RF Receiver Characteristics for Bluetooth Smart in the 2.4 GHz Band
- RF Transmitter Characteristics for 802.15.4 DSSS-OQPSK in the 2.4 GHz Band
- RF Receiver Characteristics for 802.15.4 DSSS-OQPSK in the 2.4 GHz Band
- Sub-GHz RF Transmitter characteristics for 868 MHz Band
- Sub-GHz RF Transmitter characteristics for 490 MHz Band
- Sub-GHz RF Receiver characteristics for 490 MHz Band
- Sub-GHz RF Receiver characteristics for 433 MHz Band
- HFRCO and AUXHFRCO
- ADC
- IDAC
- Updated Typical Performance Graphs.
- Added external ground note to 2G4RF_ION pin descriptions.
- Added note for 5 V tolerance to pinout GPIO Overview sections.
- Updated OPN decoder with latest revision.
- Updated Package Marking text with latest descriptions.

### 9.3 Revision 0.97

2016-06-06

- Added dual-band and sub-GHz OPNs.

### 9.4 Revision 0.951

2016-06-03

- Electrical specification tables updated with additional characterization data.

### 9.5 Revision 0.95

2016-04-11

- All OPNs changed to rev C0. Note the following:
- All OPNs ending in -BO are Engineering Samples based on an older revision of silicon and are being removed from the OPN table. These older revisions should be used for evaluation only and will not be supported for production.
- OPNs ending in -C0 are the Current Revision of Silicon and are intended for production.
- Electrical specification tables updated with latest characterization data and production test limits.

### 9.6 Revision 0.9

2016-01-12

- Updated electrical specifications with latest characterization data.
- Added thermal characteristics table.
- Updated OPN decoder figure to include extended family options.

### 9.7 Revision 0.8

2015-12-01

- Engineering samples note added to ordering information table.
- Updated electrcal specifications with latest available data.

### 9.8 Revision 0.75

2015-11-3

- Consolidated individual device datasheets into single-family document.
- Re-formatted ordering information table and OPN decoder.
- Updated block diagrams for front page and system overview.
- Removed extraneous sections from DC-DC and wake-on-radio from system overview.
- Updated table formatting for electrical specifications to tech pubs standards.
- Updated electrcal specifications with latest available data.
- Added I2C and USART SPI timing tables.
- Moved DC-DC graph to typical performance curves.
- Updated APORT tables and APORT references to correct nomenclature.

### 9.9 Revision 0.7

2015-08-31
Outcome of comprehensive review cycle of EFR32BG Datasheets. Major changes span the following sections

- Section 2: Ordering Information
- Section 3.3.4: Receiver Architecture
- Section 3.3.5: Transmitter Architecture
- Section 4: Electrical Characteristics
- Section 4.3.1: General Operating Conditions
- Section 4.4: DC-DC Converter
- Section 4.5: Current Consumption
- Section 4.9.1: RF Transmitter Characteristics for 2.4 GHz Band
- Section 4.9.2: RF Receiver General Characteristics for 2.4 GHz Band
- Section 4.9.3: RF Transmitter Characteristics for Bluetooth Smart in 2.4 GHz Band
- Section 4.9.4: RF Receiver Characteristics for Bluetooth Smart in 2.4 GHz Band
- Section 4.11.1: LFXO
- Section 4.11.2: HFXO
- Section 4.12: GPIO
- Section 4.13: VMON
- Section 4.14: ADC
- Section 4.15: IDAC
- Section 4.16: Analog Comparator
- Section 5: Application Circuits
- Section 6.5: QFNxx Package
- Section 6.7: QFNxx Package Marking

## Disclaimer

Silicon Labs intends to provide customers with the latest, accurate, and in-depth documentation of all peripherals and modules available for system and software implementers using or intending to use the Silicon Labs products. Characterization data, available modules and peripherals, memory sizes and memory addresses refer to each specific device, and "Typical" parameters provided can and do vary in different applications. Application examples described herein are for illustrative purposes only. Silicon Labs reserves the right to make changes without further notice and limitation to product information, specifications, and descriptions herein, and does not give warranties as to the accuracy or completeness of the included information. Silicon Labs shall have no liability for the consequences of use of the information supplied herein. This document does not imply or express copyright licenses granted hereunder to design or fabricate any integrated circuits. The products are not designed or authorized to be used within any Life Support System without the specific written consent of Silicon Labs. A "Life Support System" is any product or system intended to support or sustain life and/or health, which, if it fails, can be reasonably expected to result in significant personal injury or death. Silicon Labs products are not designed or authorized for military applications. Silicon Labs products shall under no circumstances be used in weapons of mass destruction including (but not limited to) nuclear, biological or chemical weapons, or missiles capable of delivering such weapons.
