

2-Kbit 5.0V I²C Serial EEPROM

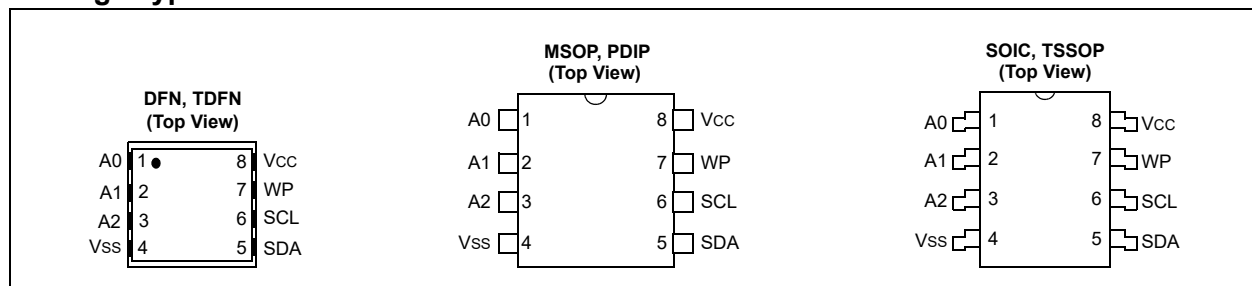

Features

- Single-Supply with Operation from 4.5V to 5.5V
- Low-Power CMOS Technology:
 - Read current: 1 mA, maximum
 - Standby current: 5 μ A, maximum
- Two-Wire Serial Interface, I²C Compatible
- Cascadable up to Eight Devices
- Schmitt Trigger Inputs for Noise Suppression
- Output Slope Control to Eliminate Ground Bounce
- 100 kHz and 400 kHz Clock Compatibility
- Fast Page or Byte Write Time: 1 ms, typical
- Self-Timed Erase/Write Cycle
- 16-Byte Page Write Buffer
- Hardware Write-Protect for Upper Half of the Array (80h-FFh)
- High Reliability:
 - More than one million erase/write cycles
 - Data retention >200 years
 - ESD protection >4,000V
- Factory Programming Available
- RoHS Compliant
- Temperature ranges:
 - Industrial (I): -40°C to +85°C
 - Extended (E): -40°C to +125°C

Packages

8-Lead DFN, 8-Lead MSOP, 8-Lead PDIP,
8-Lead SOIC, 8-Lead TDFN and 8-Lead TSSOP

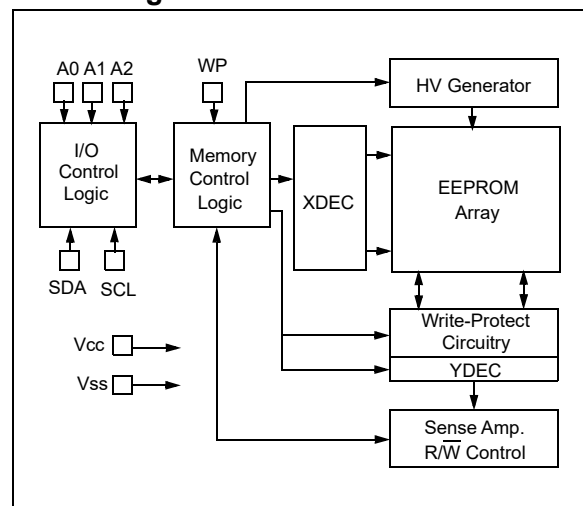

Package Types

Description

The Microchip Technology Inc. 24C02C is a 2-Kbit Serial Electrically Erasable PROM (EEPROM) with a voltage range of 4.5V to 5.5V. The device is organized as a single block of 256 x 8-bit memory with a two-wire serial interface. Low-current design permits operation with maximum standby and active currents of only 5 μ A and 1 mA, respectively. The device has a page write capability for up to 16 bytes of data and has fast write cycle times of only 1 ms for both byte and page writes. Functional address lines allow the connection of up to eight 24C02C devices on the same bus for up to 16 Kbits of contiguous EEPROM memory.

24C02C

1.0 ELECTRICAL CHARACTERISTICS

Absolute Maximum Ratings^(†)

V _{CC}	7.0V
All inputs and outputs w.r.t. V _{SS}	-0.6V to V _{CC} +1.0V
Storage temperature	-65°C to +150°C
Ambient temperature with power applied	-40°C to +125°C
ESD protection on all pins	≥4 kV

† **NOTICE:** Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

TABLE 1-1: DC CHARACTERISTICS

DC CHARACTERISTICS			Electrical Characteristics: Industrial (I): V _{CC} = +4.5V to 5.5V TA = -40°C to +85°C Extended (E): V _{CC} = +4.5V to 5.5V TA = -40°C to +125°C			
Param. No.	Symbol	Characteristics	Min.	Max.	Units	Conditions

			1300	—	ns	I-temp.
13	TOF	Output Fall Time from V _{IH} Minimum to V _{IL} Maximum, C _B ≤ 100 pF	10 + 0.1C _B	250	ns	Note 1
14	TSP	Input Filter Spike Suppression (SDA and SCL pins)	—	50	ns	Note 3
15	TWC	Write Cycle Time (byte or page)	—	1.5	ms	
			—	1	ms	I-temp.
16		Endurance	1,000,000	—	cycles	+25°C, 5.5V, Page Mode (Note 4)

Note 1: Not 100% tested. C_B = total capacitance of one bus line in pF.

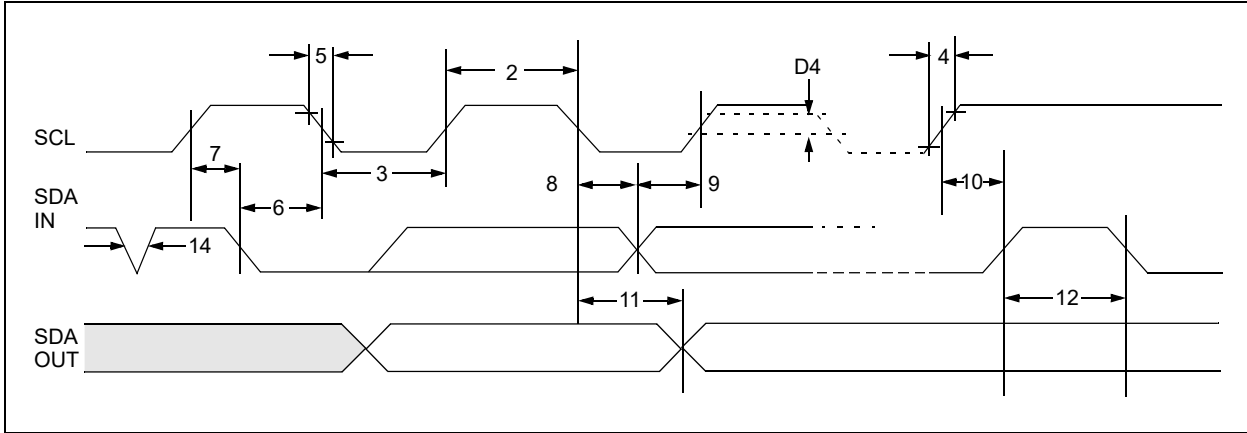

2: As a transmitter, the device must provide an internal minimum delay time to bridge the undefined region (minimum 300 ns) of the falling edge of SCL to avoid unintended generation of Start or Stop conditions.

3: The combined TSP and V_{HYS} specifications are due to new Schmitt Trigger inputs, which provide improved noise spike suppression. This eliminates the need for a T_I specification for standard operation.

4: This parameter is not tested but ensured by characterization.

24C02C

FIGURE 1-1: BUS TIMING DATA

2.0 PIN DESCRIPTIONS

The descriptions of the pins are listed in [Table 2-1](#).

TABLE 2-1: PIN FUNCTION TABLE

Name	DFN/TDFN ⁽¹⁾	MSOP	PDIP	SOIC	TSSOP	Function
A0	1	1	1	1	1	Chip Address Input
A1	2	2	2	2	2	Chip Address Input
A2	3	3	3	3	3	Chip Address Input
Vss	4	4	4	4	4	Ground
SDA	5	5	5	5	5	Serial Address/Data I/O
SCL	6	6	6	6	6	Serial Clock
WP	7	7	7	7	7	Write-Protect Input
Vcc	8	8	8	8	8	Power Supply

Note 1: The exposed pad on the DFN/TDFN package can be connected to Vss or left floating.

2.1 Chip Address Inputs (A0, A1, A2)

The levels on these inputs are compared with the corresponding bits in the client address. The chip is selected if the compare is true.

Up to eight 24C02C devices may be connected to the same bus by using different Chip Select bit combinations. These inputs must be connected to either Vcc or Vss.

2.2 Serial Address/Data Input/Output (SDA)

This is a bidirectional pin used to transfer addresses and data into and data out of the device. Since it is an open-drain terminal, the SDA bus requires a pull-up resistor to Vcc (typical 10 k Ω for 100 kHz, 2 k Ω for 400 kHz).

For normal data transfer, SDA is allowed to change only during SCL low. Changes during SCL high are reserved for indicating the Start and Stop conditions.

2.3 Serial Clock (SCL)

This input is used to synchronize the data transfer from and to the device.

2.4 Write-Protect (WP)

This is the hardware write-protect pin. It must be tied to Vcc or Vss. If tied to Vcc, the hardware write protection is enabled and will protect half of the array (80h-FFh). If the WP pin is tied to Vss, the hardware write protection is disabled.

2.5 Noise Protection

The 24C02C employs a Vcc threshold detector circuit which disables the internal erase/write logic if the Vcc is below 3.8V at nominal conditions.

The SCL and SDA inputs have Schmitt Trigger and filter circuits which suppress noise spikes to assure proper device operation even on a noisy bus.

3.0 FUNCTIONAL DESCRIPTION

The 24C02C supports a bidirectional two-wire bus and data transmission protocol. A device that sends data onto the bus is defined as a transmitter while a device receiving data is defined as a receiver. The bus has to be controlled by a host device that generates the Serial Clock (SCL), controls the bus access and generates the Start and Stop conditions, while the 24C02C works as client. Both host and client can operate as transmitter or receiver, but the host device determines which mode is activated.

4.0 BUS CHARACTERISTICS

The following **bus protocol** has been defined:

- Data transfer may be initiated only when the bus is not busy.
- During data transfer, the data line must remain stable whenever the clock line is high. Changes in the data line while the clock line is high will be interpreted as a Start or Stop condition.

Accordingly, the following bus conditions have been defined ([Figure 4-1](#)).

4.1 Bus Not Busy (A)

Both data and clock lines remain high.

4.2 Start Data Transfer (B)

A high-to-low transition of the SDA line while the clock (SCL) is high determines a Start condition. All commands must be preceded by a Start condition.

4.3 Stop Data Transfer (C)

A low-to-high transition of the SDA line while the clock (SCL) is high determines a Stop condition. All operations must be ended with a Stop condition.

4.4 Data Valid (D)

The state of the data line represents valid data when, after a Start condition, the data line is stable for the duration of the high period of the clock signal.

The data on the line must be changed during the low period of the clock signal. There is one bit of data per clock pulse.

Each data transfer is initiated with a Start condition and terminated with a Stop condition. The number of the data bytes transferred between the Start and Stop conditions is determined by the host device and is theoretically unlimited, although only the last sixteen will be stored when doing a write operation. When an overwrite does occur, it will replace data in a First-In First-Out (FIFO) principle.

4.5 Acknowledge

Each receiving device, when addressed, is required to generate an Acknowledge after the reception of each byte. The host device must generate an extra clock pulse, which is associated with this Acknowledge bit.

Note: The 24C02C does not generate any Acknowledge bits if an internal programming cycle is in progress.

The device that acknowledges has to pull down the SDA line during the Acknowledge clock pulse in such a way that the SDA line is stable-low during the high period of the Acknowledge-related clock pulse. Moreover, setup and hold times must be taken into account. A host must signal an end of data to the client by not generating an Acknowledge bit on the last byte that has been clocked out of the client. In this case, the client (24C02C) will leave the data line high to enable the host to generate the Stop condition ([Figure 4-2](#)).

FIGURE 4-1: DATA TRANSFER SEQUENCE ON THE SERIAL BUS

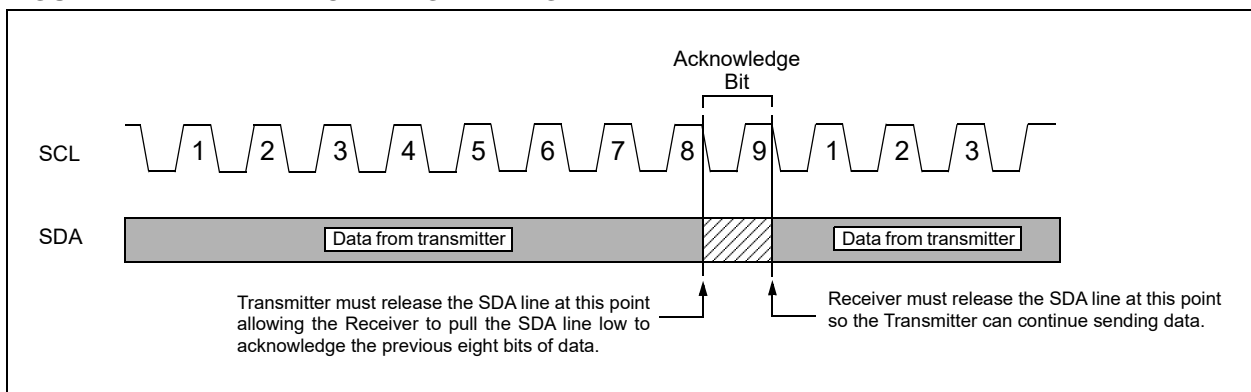

FIGURE 4-2: ACKNOWLEDGE TIMING

24C02C

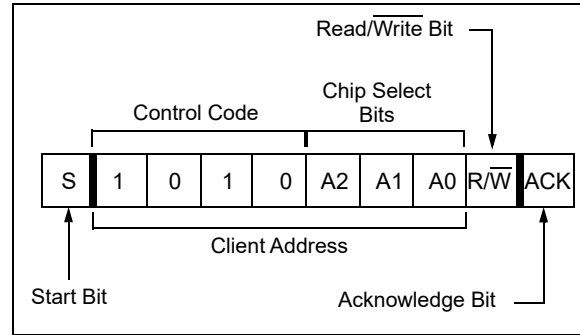

5.0 DEVICE ADDRESSING

A control byte is the first byte received following the Start condition from the host device (Figure 5-1). The control byte consists of a 4-bit control code. For the 24C02C, this is set as '1010' binary for read and write operations. The next three bits of the control byte are the Chip Select bits (A2, A1, A0). The Chip Select bits allow the use of up to eight 24C02C devices on the same bus and are used to select which device is accessed. The Chip Select bits in the control byte must correspond to the logic levels on the corresponding A2, A1 and A0 pins for the device to respond. These bits are in effect the three Most Significant bits of the word address.

The last bit of the control byte defines the operation to be performed. When set to a '1', a read operation is selected and when set to a '0', a write operation is selected. The next byte received defines the address of the first data byte (Figure 5-2).

Following the Start condition, the 24C02C monitors the SDA bus checking the control byte being transmitted. Upon receiving a '1010' code and appropriate Chip Select bits, the client device outputs an Acknowledge signal on the SDA line. Depending on the state of the R/W bit, the 24C02C will select a read or write operation.

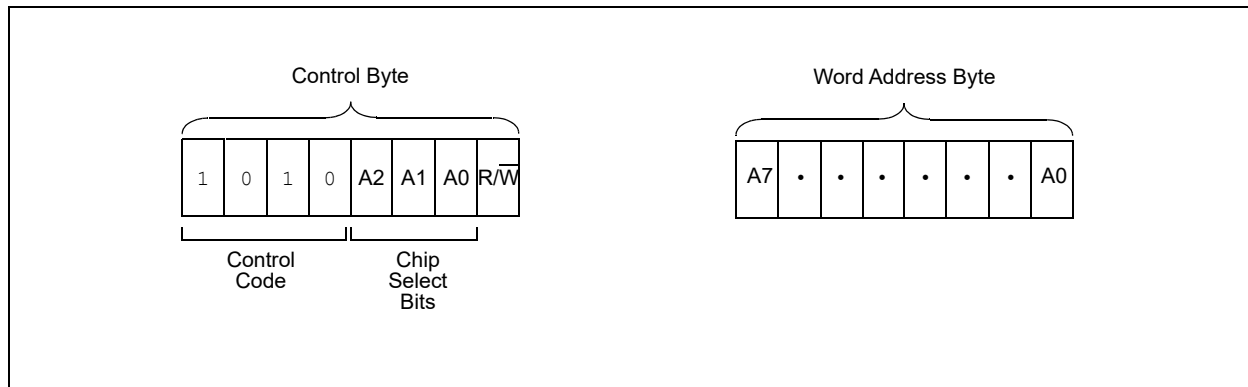

FIGURE 5-1: CONTROL BYTE FORMAT

5.1 Contiguous Addressing Across Multiple Devices

The Chip Select bits A2, A1 and A0 can be used to expand the contiguous address space for up to 16 Kbits by adding up to eight 24C02C devices on the same bus. In this case, software can use A0 of the control byte as address bit A8, A1 as address bit A9 and A2 as address bit A10. It is not possible to write or read across device boundaries.

FIGURE 5-2: ADDRESS SEQUENCE BIT ASSIGNMENTS

6.0 WRITE OPERATIONS

6.1 Byte Write

Following the Start signal from the host, the device code (four bits), the Chip Select bits (three bits) and the R/W bit, which is a logic low, is placed onto the bus by the host transmitter. The device will acknowledge this control byte during the ninth clock pulse. The next byte transmitted by the host is the word address and will be written into the Address Pointer of the 24C02C.

After receiving another Acknowledge signal from the 24C02C, the host device will transmit the data word to be written into the addressed memory location. The 24C02C acknowledges again and the host generates a Stop condition. This initiates the internal write cycle and, during this time, the 24C02C will not generate Acknowledge signals (Figure 6-1). If an attempt is made to write to the protected portion of the array when the hardware write protection has been enabled, the device will acknowledge the command but no data will be written. The write cycle time must be observed even if the write protection is enabled.

6.2 Page Write

The write control byte, word address and the first data byte are transmitted to the 24C02C in the same way as in a byte write. But instead of generating a Stop condition, the host transmits up to 15 additional data bytes to the 24C02C which are temporarily stored in the on-chip page buffer and will be written into the memory after the host has transmitted a Stop condition. After the receipt of each word, the four lower-order Address Pointer bits are internally incremented by one. The higher-order four bits of the word address remains constant. If the host should transmit more than 16 bytes prior to generating the Stop condition, the Address Pointer will roll over and the previously received data will be overwritten.

As with the byte write operation, once the Stop condition is received, an internal write cycle will begin (Figure 6-2). If an attempt is made to write to the protected portion of the array when the hardware write protection has been enabled, the device will acknowledge the command, but no data will be written. The write cycle time must be observed even if the write protection is enabled.

Note: Page write operations are limited to writing bytes within a single physical page, **regardless** of the number of bytes actually being written. Physical page boundaries start at addresses that are integer multiples of the page buffer size (or 'page size') and end at addresses that are integer multiples of page size - 1. If a Page Write command attempts to write across a physical page boundary, the result is that the data wrap around to the beginning of the current page (overwriting data previously stored there), instead of being written to the next page as might be expected. It is therefore necessary for the application software to prevent page write operations that would attempt to cross a page boundary.

6.3 Write Protection

The WP pin must be tied to VCC or VSS. If tied to VCC, the upper half of the array (080-0FF) will be write-protected. If the WP pin is tied to VSS, then write operations to all address locations are allowed.

FIGURE 6-1: BYTE WRITE

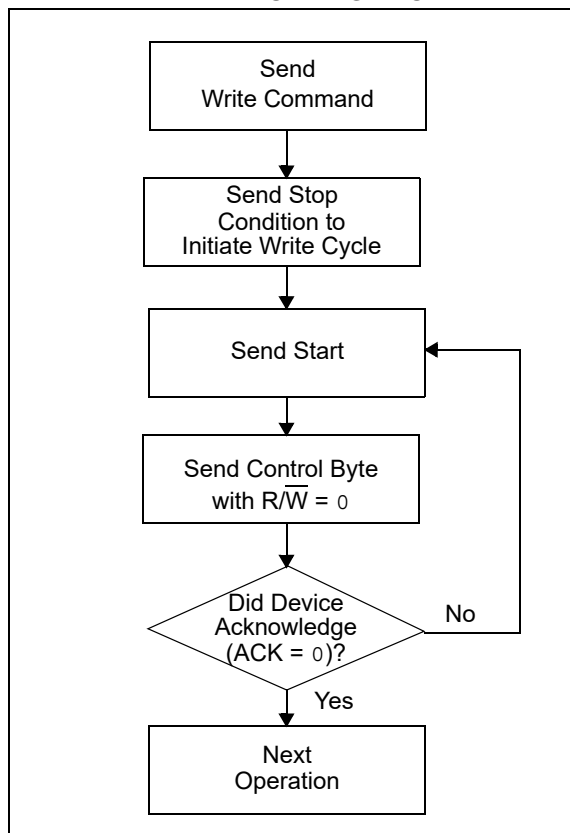

FIGURE 6-2: PAGE WRITE

7.0 ACKNOWLEDGE POLLING

Since the device will not acknowledge during a write cycle, this can be used to determine when the cycle is complete (this feature can be used to maximize bus throughput). Once the Stop condition for a Write command has been issued from the host, the device initiates the internally timed write cycle. ACK polling can be initiated immediately. This involves the host sending a Start condition followed by the control byte for a Write command ($R/\overline{W} = 0$). If the device is still busy with the write cycle, then no ACK will be returned. If no ACK is returned, then the Start bit and control byte must be resent. If the cycle is complete, then the device will return the ACK and the host can then proceed with the next Read or Write command. See Figure 7-1 for flow diagram.

FIGURE 7-1: ACKNOWLEDGE POLLING FLOW

8.0 READ OPERATION

Read operations are initiated in the same way as write operations with the exception that the $\overline{R/W}$ bit of the client address is set to '1'. There are three basic types of read operations: current address read, random read and sequential read.

8.1 Current Address Read

The 24C02C contains an Address Pointer that maintains the address of the last word accessed, internally incremented by one. Therefore, if the previous read access was to address 'n', the next current address read operation would access data from address $n + 1$. Upon receipt of the client address with the $\overline{R/W}$ bit set to '1', the 24C02C issues an Acknowledge and transmits the 8-bit data word. The host will not acknowledge the transfer, but does generate a Stop condition and the 24C02C discontinues transmission (Figure 8.1).

8.2 Random Read

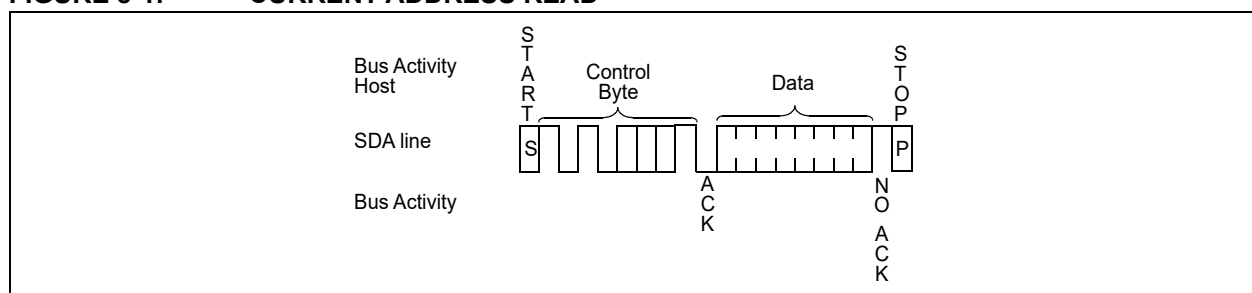

Random read operations allow the host to access any memory location in a random manner. To perform this type of read operation, first the word address must be set. This is done by sending the word address to the 24C02C as part of a write operation. After the word address is sent, the host generates a Start condition following the Acknowledge. This terminates the write operation, but not before the internal Address Pointer is set. The host then issues the control byte again but with the $\overline{R/W}$ bit set to a '1'. The 24C02C will then issue an Acknowledge and transmits the 8-bit data word. The host will not acknowledge the transfer, but does generate a Stop condition and the 24C02C discontinues transmission (Figure 8-2). After this command, the internal Address Pointer will point to the address location following the one that was just read.

8.3 Sequential Read

Sequential reads are initiated in the same way as a random read except that after the 24C02C transmits the first data byte, the host issues an Acknowledge as opposed to a Stop condition in a random read. This directs the 24C02C to transmit the next sequentially addressed 8-bit word (Figure 8-3).

To provide sequential reads, the 24C02C contains an internal Address Pointer which is incremented by one at the completion of each operation. This Address Pointer allows the entire memory contents to be serially read during one operation. The internal Address Pointer will automatically roll over from address FF to address 00.

8-Lead Plastic Small Outline (SN) - Narrow, 3.90 mm (.150 In.) Body [SOIC]

Note: For the most current package drawings, please see the Microchip Packaging Specification located at <http://www.microchip.com/packaging>

Dimension Limits	Units	MILLIMETERS		
		MIN	NOM	MAX
Number of Pins	N	8		
Pitch	e	1.27 BSC		
Overall Height	A	–	–	1.75
Molded Package Thickness	A2	1.25	–	–
Standoff §	A1	0.10	–	0.25
Overall Width	E	6.00 BSC		
Molded Package Width	E1	3.90 BSC		
Overall Length	D	4.90 BSC		
Chamfer (Optional)	h	0.25	–	0.50
Foot Length	L	0.40	–	1.27
Footprint	L1	1.04 REF		
Lead Thickness	c	0.17	–	0.25
Lead Width	b	0.31	–	0.51
Lead Bend Radius	R	0.07	–	–
Lead Bend Radius	R1	0.07	–	–
Foot Angle	θ	0°	–	8°
Mold Draft Angle	θ1	5°	–	15°
Lead Angle	θ2	0°	–	–

Notes:

1. Pin 1 visual index feature may vary, but must be located within the hatched area.
2. § Significant Characteristic
3. Dimensions D and E1 do not include mold flash or protrusions. Mold flash or protrusions shall not exceed 0.15mm per side.
4. Dimensioning and tolerancing per ASME Y14.5M
BSC: Basic Dimension. Theoretically exact value shown without tolerances.
REF: Reference Dimension, usually without tolerance, for information purposes only.
5. Datums A & B to be determined at Datum H.

Microchip Technology Drawing C04-2086 Rev B

APPENDIX A: REVISION HISTORY

Revision K (10/2022)

Updated formatting to current template; Updated DFN, MSOP, PDIP, SOIC, TDFN and TSSOP package drawings; Replaced terminology “Master” and “Slave” with “Host” and “Client”, respectively; Replaced “Automotive (E):” designation with “Extended (E):” designation.

Revision J (08/2008)

Corrections to Table 1-1, DC Characteristics; Updated Table 1-2, AC Characteristics; Revised Figure 1-1; Updated Package Drawings.

Revision H (04/2008)

Replaced Package Drawings; Added TDFN package; Revised Product ID section.

Revision G (03/2007)

Replaced Package Drawings (Rev. AM).

Revision F (02/2007)

Revised Features section; Section 1.0 revised Ambient temperature; Revised Tables 1-1, 1-2, (removed commercial temp); Revised Table 2-1; Replaced On-line Support page; Replaced Package Drawings; Revised Product ID section.

Revision E

Added DFN package.

Revision D

Corrections to Section 1.0, Electrical Characteristics.

THE MICROCHIP WEBSITE

Microchip provides online support via our website at www.microchip.com. This website is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the website contains the following information:

- **Product Support** – Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- **General Technical Support** – Frequently Asked Questions (FAQ), technical support requests, online discussion groups, Microchip consultant program member listing
- **Business of Microchip** – Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

CUSTOMER CHANGE NOTIFICATION SERVICE

Microchip's customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip website at www.microchip.com. Under "Support", click on "Customer Change Notification" and follow the registration instructions.

CUSTOMER SUPPORT

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- Local Sales Office
- Field Application Engineer (FAE)
- Technical Support

Customers should contact their distributor, representative or Field Application Engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

Technical support is available through the website at: <http://microchip.com/support>

PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

<u>PART NO.</u>	<u>I</u> ⁽¹⁾	<u>-</u> <u>X</u>	<u>I</u> <u>X</u> <u>X</u>
Device	Tape and Reel Option	Temperature Range	Package
Device: 24C02C	=	2-Kbit I ² C Serial EEPROM	
Tape and Reel Option: Blank	=	Standard packaging (tube or tray)	
T	=	Tape and Reel ⁽¹⁾	
Temperature Range: I	=	-40°C to +85°C (Industrial)	
E	=	-40°C to +125°C (Extended)	
Package: MC	=	Plastic Dual Flat, No Lead – 2x3x1 mm Body, 8-Lead (DFN)	
MS	=	Plastic Micro Small Outline Package, 8-Lead (MSOP)	
P	=	Plastic Dual In-Line – 300 mil Body, 8-Lead (PDIP)	
SN	=	Plastic Small Outline - Narrow, 3.90 mm Body, 8-Lead (SOIC)	
MNY ⁽²⁾	=	Plastic Dual Flat, No Lead Package - 2x3x0.75 mm Body, 8-Lead (TDFN) (Tape and Reel only)	
ST	=	Plastic Thin Shrink Small Outline – 4.4 mm, 8-Lead (TSSOP)	

Examples:

- a) 24C02C-I/P: 5.0V Serial EEPROM, Industrial Temperature, PDIP package.
- b) 24C02C-E/SN: 5.0V Serial EEPROM, Extended Temperature, SOIC package.
- c) 24C02CT-I/MNY: 5.0V Serial EEPROM, Tape and Reel, Industrial Temperature, TDFN package.
- d) 24C02CT-E/MS: 5.0V Serial EEPROM, Tape and Reel, Extended Temperature, MSOP package.
- e) 24C02C-E/MC: 5.0V Serial EEPROM, Extended Temperature, DFN package.
- f) 24C02CT-E/MNY: 5.0V Serial EEPROM, Tape and Reel, Extended Temperature, TDFN package.

Note 1: Tape and Reel identifier only appears in the catalog part number description. This identifier is used for ordering purposes and is not printed on the device package. Check with your Microchip Sales Office for package availability with the Tape and Reel option.

2: "Y" indicates a Nickel Palladium Gold (NiPdAu) finish.

Note the following details of the code protection feature on Microchip products:

- Microchip products meet the specifications contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is secure when used in the intended manner, within operating specifications, and under normal conditions.
- Microchip values and aggressively protects its intellectual property rights. Attempts to breach the code protection features of Microchip product is strictly prohibited and may violate the Digital Millennium Copyright Act.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of its code. Code protection does not mean that we are guaranteeing the product is "unbreakable" Code protection is constantly evolving. Microchip is committed to continuously improving the code protection features of our products.

This publication and the information herein may be used only with Microchip products, including to design, test, and integrate Microchip products with your application. Use of this information in any other manner violates these terms. Information regarding device applications is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. Contact your local Microchip sales office for additional support or, obtain additional support at <https://www.microchip.com/en-us/support/design-help/client-support-services>.

THIS INFORMATION IS PROVIDED BY MICROCHIP "AS IS". MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION INCLUDING BUT NOT LIMITED TO ANY IMPLIED WARRANTIES OF NON-INFRINGEMENT, MERCHANTABILITY, AND FITNESS FOR A PARTICULAR PURPOSE, OR WARRANTIES RELATED TO ITS CONDITION, QUALITY, OR PERFORMANCE.

IN NO EVENT WILL MICROCHIP BE LIABLE FOR ANY INDIRECT, SPECIAL, PUNITIVE, INCIDENTAL, OR CONSEQUENTIAL LOSS, DAMAGE, COST, OR EXPENSE OF ANY KIND WHATSOEVER RELATED TO THE INFORMATION OR ITS USE, HOWEVER CAUSED, EVEN IF MICROCHIP HAS BEEN ADVISED OF THE POSSIBILITY OR THE DAMAGES ARE FORESEEABLE. TO THE FULLEST EXTENT ALLOWED BY LAW, MICROCHIP'S TOTAL LIABILITY ON ALL CLAIMS IN ANY WAY RELATED TO THE INFORMATION OR ITS USE WILL NOT EXCEED THE AMOUNT OF FEES, IF ANY, THAT YOU HAVE PAID DIRECTLY TO MICROCHIP FOR THE INFORMATION.

Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.
