## Single-Channel, 1024-Position, Digital Rheostat with I ${ }^{2} \mathrm{C}$ Interface and 50-TP Memory

## FEATURES

Single-channel, 1024-position resolution
$10 \mathrm{k} \Omega$ nominal resistance
50-times programmable (50-TP) wiper memory
Rheostat mode temperature coefficient: $35 \mathrm{ppm} /{ }^{\circ} \mathrm{C}$
2.7 V to 5.5 V single-supply operation
$\pm 2.5 \mathrm{~V}$ to $\pm 2.75 \mathrm{~V}$ dual-supply operation for ac or bipolar operations
$I^{2} \mathrm{C}$-compatible interface
Wiper setting and memory readback
Power on refreshed from memory
Resistor tolerance stored in memory
Thin LFCSP, 10 -lead, $\mathbf{3 ~ m m \times 3 ~ m m \times 0 . 8 ~ m m ~ p a c k a g e ~}$
Compact MSOP, 10 -lead $3 \mathrm{~mm} \times 4.9 \mathrm{~mm} \times 1.1 \mathrm{~mm}$ package

## APPLICATIONS

Mechanical rheostat replacements
Op-amp: variable gain control
Instrumentation: gain, offset adjustment
Programmable voltage to current conversions
Programmable filters, delays, time constants
Programmable power supply
Sensor calibration

## GENERAL DESCRIPTION

The AD5175 is a single-channel, 1024-position digital rheostat that combines industry leading variable resistor performance with nonvolatile memory (NVM) in a compact package.

This device supports both dual-supply operation at $\pm 2.5 \mathrm{~V}$ to $\pm 2.75 \mathrm{~V}$ and single-supply operation at 2.7 V to 5.5 V , and offers 50 -times programmable ( $50-\mathrm{TP}$ ) memory.
The AD5175 device wiper settings are controllable through the $\mathrm{I}^{2} \mathrm{C}$-compatible digital interface. Unlimited adjustments are allowed before programming the resistance value into the 50-TP memory. The AD5175 does not require any external

FUNCTIONAL BLOCK DIAGRAM

Figure 1.
voltage supply to facilitate fuse blow and there are 50 opportunities for permanent programming. During 50-TP activation, a permanent blow fuse command freezes the resistance position (analogous to placing epoxy on a mechanical rheostat).

The AD5175 is available in a $3 \mathrm{~mm} \times 3 \mathrm{~mm} 10$-lead LFCSP package and in a 10 -lead MSOP package. The part is guaranteed to operate over the extended industrial temperature range of $-40^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$.

## AD5175

| Parameter | Symbol | Test Conditions/Comments | Min | Typ ${ }^{1}$ | Max | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| DYNAMIC CHARACTERISTICS ${ }^{4,10}$ |  |  |  |  |  |  |
| Bandwidth |  | $-3 \mathrm{~dB}, \mathrm{R}_{A W}=5 \mathrm{k} \Omega$, Terminal W, see Figure 23 |  | 700 |  | kHz |
| Total Harmonic Distortion |  | $\mathrm{V}_{\mathrm{A}}=1 \mathrm{Vrms}, \mathrm{f}=1 \mathrm{kHz}, \mathrm{R}_{\mathrm{Aw}}=5 \mathrm{k} \Omega$ |  | -90 |  |  |
| Resistor Noise Density |  | $\mathrm{R}_{\text {WB }}=5 \mathrm{k} \Omega, \mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}, \mathrm{f}=10 \mathrm{kHz}$ |  | 13 |  | $\mathrm{nV} / \sqrt{ } \mathrm{Hz}$ |

${ }^{1}$ Typical specifications represent average readings at $25^{\circ} \mathrm{C}, \mathrm{V}_{\mathrm{DD}}=5 \mathrm{~V}$, and $\mathrm{V}_{S S}=0 \mathrm{~V}$.
${ }^{2}$ Resistor position nonlinearity error (R-INL) is the deviation from the ideal value measured between the maximum resistance and the minimum resistance wiper positions. R-DNL measures the relative step change from ideal between successive tap positions.
${ }^{3}$ The maximum current in each code is defined by $l_{A W}=\left(V_{D D}-1\right) / R_{A W}$.
${ }^{4}$ Guaranteed by design and not subject to production test.
${ }^{5}$ See Figure 8 for more details.
${ }^{6}$ Resistor Terminal A and Resistor Terminal W have no limitations on polarity with respect to each other. Dual-supply operation enables ground referenced bipolar signal adjustment.
${ }^{7}$ Different from operating current; the supply current for the fuse program lasts approximately 55 ms .
${ }^{8}$ Different from operating current; the supply current for the fuse read lasts approximately 500 ns .
${ }^{9} \mathrm{P}_{\text {DISS }}$ is calculated from ( $\left.\mathrm{I}_{\mathrm{DD}} \times \mathrm{V}_{D D}\right)+\left(\mathrm{I}_{\mathrm{IS}} \times \mathrm{V}_{S S}\right)$.
${ }^{10}$ All dynamic characteristics use $\mathrm{V}_{\mathrm{DD}}=+2.5 \mathrm{~V}, \mathrm{~V}_{\mathrm{SS}}=-2.5 \mathrm{~V}$.

## INTERFACE TIMING SPECIFICATIONS

$\mathrm{V}_{\mathrm{DD}}=2.7 \mathrm{~V}$ to 5.5 V ; all specifications $\mathrm{T}_{\mathrm{MIN}}$ to $\mathrm{T}_{\mathrm{MAX}}$, unless otherwise noted.

| $\mathrm{t}_{\text {Power-up }}{ }^{6}$ |  |  | 2 | ms | Power-on 50-TP restore time |

${ }^{1}$ Maximum bus capacitance is limited to 400 pF .
${ }^{2}$ The SDA and SCL timing is measured with the input filters enabled. Switching off the input filters improves the transfer rate but has a negative effect on EMC behavior of the part.
${ }^{3}$ Input filtering on the SCL and SDA inputs suppresses noise spikes that are less than 50 ns for fast mode.
${ }^{4}$ Refer to $\mathrm{t}_{\text {RDAC_R-PERF }}$ and $\mathrm{t}_{\text {RDAC_NORMAL }}$ for RDAC register write operations.
${ }^{5}$ Refer to $\mathrm{t}_{\text {MEMORY_READ }}$ and $\mathrm{t}_{\text {MEMORY_PROGRAM }}$ for memory commands operations.
${ }^{6}$ Maximum time after $V_{D D}-V_{S S}$ is equal to 2.5 V .

## ABSOLUTE MAXIMUM RATINGS

$\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$, unless otherwise noted.
Table 3.

| Parameter | Rating |
| :---: | :---: |
| VDD to GND | -0.3 V to +7.0 V |
| Vss to GND | +0.3 V to -7.0 V |
| $V_{\text {DD }}$ to $V_{S S}$ | 7 V |
| $\mathrm{V}_{\mathrm{A}}, \mathrm{V}_{\mathrm{w}}$ to GND | $\mathrm{V}_{S S}-0.3 \mathrm{~V}, \mathrm{~V}_{\mathrm{DD}}+0.3 \mathrm{~V}$ |
| Digital Input and Output Voltage to GND | -0.3 V to $\mathrm{V}_{\mathrm{DD}}+0.3 \mathrm{~V}$ |
| EXT_CAP to $\mathrm{V}_{\text {ss }}$ | 7 V |
| $\mathrm{I}_{\mathrm{A},} \mathrm{I}_{\mathrm{w}}$ |  |
| Pulsed ${ }^{1}$ |  |
| Frequency > 10 kHz | $\pm 6 \mathrm{~mA} / \mathrm{d}^{2}$ |
| Frequency $\leq 10 \mathrm{kHz}$ | $\pm 6 \mathrm{~mA} / \sqrt{ } \mathrm{d}^{2}$ |
| Continuous | $\pm 6 \mathrm{~mA}$ |
| Operating Temperature Range ${ }^{3}$ | $-40^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$ |
| Maximum Junction Temperature ( T, Maximum) | $150^{\circ} \mathrm{C}$ |
| Storage Temperature Range | $-65^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$ |
| Reflow Soldering |  |
| Peak Temperature | $260^{\circ} \mathrm{C}$ |
| Time at Peak Temperature | 20 sec to 40 sec |
| Package Power Dissipation | ( $\mathrm{T}_{\text {max }}-\mathrm{T}_{\mathrm{A}}$ ) $/ \theta_{\text {JA }}$ |

${ }^{1}$ Maximum terminal current is bounded by the maximum current handling of the switches, maximum power dissipation of the package, and maximum applied voltage across any two of the A and W terminals at a given resistance.
${ }^{2}$ Pulse duty factor.
${ }^{3}$ Includes programming of 50-TP memory.

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## THERMAL RESISTANCE

$\theta_{\text {JA }}$ is defined by JEDEC specification JESD-51 and the value is dependent on the test board and test environment.

Table 4. Thermal Resistance

| Package Type | $\boldsymbol{\theta}_{\mathrm{JA}}$ | $\boldsymbol{\theta}_{\boldsymbol{\prime} \mathbf{c}}$ | Unit |
| :--- | :--- | :--- | :--- |
| 10-Lead LFCSP | 50 | 3 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| 10-Lead MSOP | $135^{1}$ | $\mathrm{~N} / \mathrm{A}$ | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |

${ }^{1}$ JEDEC 2S2P test board, still air ( $0 \mathrm{~m} / \mathrm{sec}$ airflow).

## ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

## PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

Figure 4. MSOP Pin Configuration

Figure 5. LFCSP Pin Configuration

Table 5. Pin Function Descriptions

| Pin No. | Mnemonic | Description |
| :---: | :---: | :---: |
| 1 | $V_{D D}$ | Positive Power Supply. Decouple this pin with $0.1 \mu \mathrm{~F}$ ceramic capacitors and $10 \mu \mathrm{~F}$ capacitors. |
| 2 | A | Terminal $A$ of RDAC. $\mathrm{V}_{S S} \leq \mathrm{V}_{\text {A }} \leq \mathrm{V}_{\text {DD }}$. |
| 3 | W | Wiper Terminal of RDAC. $\mathrm{V}_{\text {S }} \leq \mathrm{V}_{\mathrm{W}} \leq \mathrm{V}_{\mathrm{DD}}$. |
| 4 | $\mathrm{V}_{\text {ss }}$ | Negative Supply. Connect to 0 V for single-supply applications. Decouple this pin with $0.1 \mu \mathrm{~F}$ ceramic capacitors and $10 \mu \mathrm{~F}$ capacitors. |
| 5 | EXT_CAP | External Capacitor. Connect a $1 \mu \mathrm{~F}$ capacitor between EXT_CAP and $\mathrm{V}_{\text {ss. }}$. This capacitor must have a voltage rating of $\geq 7 \mathrm{~V}$. |
| 6 | GND | Ground Pin, Logic Ground Reference. |
| 7 | $\overline{\text { RESET }}$ | Hardware Reset Pin. Refreshes the RDAC register with the contents of the 50-TP memory register. Factory default loads midscale until the first 50-TP wiper memory location is programmed. $\overline{\operatorname{RESET}}$ is active low. Tie $\overline{\text { RESET }}$ to $V_{D D}$ if not used. |
| 8 | SDA | Serial Data Line. This pin is used in conjunction with the SCL line to clock data into or out of the 16-bit input registers. It is a bidirectional, open-drain data line that should be pulled to the supply with an external pull-up resistor. |
| 9 | SCL | Serial Clock Line. This pin is used in conjunction with the SDA line to clock data into or out of the 16 -bit input registers. |
| $10$ | ADDR | Tristate Address Input. Sets the two least significant bits (Bit A1, Bit A0) of the 7-bit slave address (see Table 6). |
| EPAD | Exposed Pad | Leave floating or connected to $V_{s s}$ |

## THEORY OF OPERATION

The AD5175 is designed to operate as a true variable resistor for analog signals within the terminal voltage range of $\mathrm{V}_{\text {SS }}<\mathrm{V}_{\text {TERM }}$ $<V_{\text {DD }}$. The RDAC register contents determine the resistor wiper position. The RDAC register acts as a scratchpad register, which allows unlimited changes of resistance settings. The RDAC register can be programmed with any position setting using the $\mathrm{I}^{2} \mathrm{C}$ interface. When a desirable wiper position is found, this value can be stored in a 50-TP memory register. Thereafter, the wiper position is always restored to that position for subsequent power-up. The storing of 50-TP data takes approximately 350 ms ; during this time, the AD5175 is locked and does not acknowledge any new command thereby preventing any changes from taking place. The acknowledge bit can be polled to verify that the fuse program command is complete.

## SERIAL DATA INTERFACE

The AD5175 has a 2 -wire $\mathrm{I}^{2} \mathrm{C}$-compatible serial interface. It can be connected to an $\mathrm{I}^{2} \mathrm{C}$ bus as a slave device under the control of a master device; see Figure 3 for a timing diagram of a typical write sequence.

The AD5175 supports standard ( 100 kHz ) and fast ( 400 kHz ) data transfer modes. Support is not provided for 10-bit addressing and general call addressing.
The AD5175 has a 7-bit slave address. The five MSBs are 01011 and the two LSBs are determined by the state of the ADDR pin. The facility to make hardwired changes to ADDR allows the user to incorporate up to three of these devices on one bus, as outlined in Table 6.

The 2-wire serial bus protocol operates as follows: The master initiates a data transfer by establishing a start condition, which is when a high-to-low transition on the SDA line occurs while SCL is high. The next byte is the address byte, which consists of the 7 -bit slave address and a R/W bit. The slave device corresponding to the transmitted address responds by pulling SDA low during the ninth clock pulse (this is termed the acknowledge bit). At this stage, all other devices on the bus remain idle while the selected device waits for data to be written to, or read from, its shift register.
Data is transmitted over the serial bus in sequences of nine clock pulses (eight data bits followed by an acknowledge bit). The transitions on the SDA line must occur during the low period of SCL and remain stable during the high period of SCL.
When all data bits have been read or written, a stop condition is established. In write mode, the master pulls the SDA line high during the $10^{\text {th }}$ clock pulse to establish a stop condition. In read mode, the master issues a no acknowledge for the ninth clock pulse, that is, the SDA line remains high. The master then brings the SDA line low before the $10^{\text {th }}$ clock pulse, and then high during the $10^{\text {th }}$ clock pulse to establish a stop condition.

## SHIFT REGISTER

For the AD5175, the shift register is 16 bits wide, as shown in Figure 2. The 16 -bit word consists of two unused bits, which should be set to 0 , followed by four control bits and 10 RDAC data bits, and data is loaded MSB first (Bit D9). The four control bits determine the function of the software command (Table 7).
Figure 25 shows a timing diagram of a typical AD5175 write sequence.
The command bits ( Cx ) control the operation of the digital potentiometer and the internal 50-TP memory. The data bits $(\mathrm{Dx})$ are the values that are loaded into the decoded register.

Table 6. Device Address Selection

| ADDR Pin | A1 | A0 | 7-Bit I ${ }^{2}$ C Device Address |
| :--- | :--- | :--- | :--- |
| GND | 1 | 1 | 0101111 |
| VDD | 0 | 0 | 0101100 |
| NC (No Connection) ${ }^{1}$ | 1 | 0 | 0101110 |

[^1]
## WRITE OPERATION

It is possible to write data for the RDAC register or the control register. When writing to the AD5175, the user must begin with a start command followed by an address byte $(R / \bar{W}=0)$, after which the AD5175 acknowledges that it is prepared to receive data by pulling SDA low.

Two bytes of data are then written to the RDAC, the most significant byte followed by the least significant byte; both of these data bytes are acknowledged by the AD5175. A stop condition follows. The write operations for the AD5175 are shown in Figure 25.
A repeated write function gives the user flexibility to update the device a number of times after addressing the part only once, as shown in Figure 26.

Figure 25. Write Command

## AD5175

Figure 26. Multiple Write

## READ OPERATION

When reading data back from the AD5175, the user must first issue a readback command to the device, this begins with a start command followed by an address byte $(\mathrm{R} / \overline{\mathrm{W}}=0)$, after which the AD5175 acknowledges that it is prepared to receive data by pulling SDA low.
Two bytes of data are then written to the AD5175, the most significant byte followed by the least significant byte; both of these data bytes are acknowledged by the AD5175. A stop condition follows. These bytes contain the read instruction,
which enables readback of the RDAC register, 50-TP memory, or the control register. The user can then read back the data beginning with a start command followed by an address byte ( $\mathrm{R} / \overline{\mathrm{W}}=1$ ), after which the device acknowledges that it is prepared to transmit data by pulling SDA low. Two bytes of data are then read from the device, as shown in Figure 27. A stop condition follows. If the master does not acknowledge the first byte, the second byte is not transmitted by the AD5175.

Figure 27. Read Command

## AD5175

## RDAC REGISTER

The RDAC register directly controls the position of the digital rheostat wiper. For example, when the RDAC register is loaded with all 0 s , the wiper is connected to Terminal A of the variable resistor. It is possible to both write to and read from the RDAC register using the $\mathrm{I}^{2} \mathrm{C}$ interface. The RDAC register is a standard logic register; there is no restriction on the number of changes allowed.

## 50-TP MEMORY BLOCK

The AD5175 contains an array of 50-TP programmable memory registers, which allow the wiper position to be programmed up to 50 times. Table 11 shows the memory map. Command 3 in Table 7 programs the contents of the RDAC register to memory. The first address to be programmed is Location 0x01, see Table 11, and the AD5175 increments the 50-TP memory address for each subsequent program until the memory is full. Programming data to $50-\mathrm{TP}$ consumes approximately 4 mA for 55 ms , and takes approximately 350 ms to complete, during which time the shift register is locked preventing any changes from taking place. Bit C2 of the control register in Table 10 can be polled to verify that the fuse program command was successful. No change in supply voltage is required to program the $50-\mathrm{TP}$ memory; however, a $1 \mu \mathrm{~F}$ capacitor on the EXT_CAP pin is required as shown in Figure 29.

Prior to 50-TP activation, the AD5175 presets to midscale on power-up. It is possible to read back the contents of any of the $50-\mathrm{TP}$ memory registers through the $\mathrm{I}^{2} \mathrm{C}$ interface by using Command 5 in Table 7. The lower six LSB bits, D0 to D5 of the data byte, select which memory location is to be read back. A binary encoded version address of the most recently programmed wiper memory location can be read back using Command 6 in Table 7. This can be used to monitor the spare memory status of the 50-TP memory block.

## WRITE PROTECTION

On power-up, serial data input register write commands for both the RDAC register and the 50-TP memory registers are disabled. The RDAC write protect bit (Bit C1) of the control register (see Table 9 and Table 10), is set to 0 by default. This disables any change of the RDAC register content regardless of the software commands, except that the RDAC register can be refreshed from the 50-TP memory using the software reset, Command 4, or through the hardware by the $\overline{\text { RESET }}$ pin. To enable programming of the variable resistor wiper position (programming the RDAC register), the write protect bit (Bit C1) of the control register must first be programmed. This is accomplished by loading the serial data input register with Command 7 (see Table 7). To enable programming of the 50-TP memory block, Bit C0 of the control register, which is set to 0 by default, must first be set to 1 .

Table 7. Command Operation Truth Table

[^3]
## 50-TP MEMORY WRITE-ACKNOWLEDGE POLLING

After each write operation to the 50-TP registers, an internal write cycle begins. The $\mathrm{I}^{2} \mathrm{C}$ interface of the device is disabled. To determine if the internal write cycle is complete and the $I^{2} \mathrm{C}$ interface is enabled, interface polling can be executed. $\mathrm{I}^{2} \mathrm{C}$ interface polling can be conducted by sending a start condition followed by the slave address and the write bit. If the $\mathrm{I}^{2} \mathrm{C}$ interface responds with an acknowledge (ACK), the write cycle is complete and the interface is ready to proceed with further operations. Otherwise, $\mathrm{I}^{2} \mathrm{C}$ interface polling can be repeated until it completes.

## RESET

The AD5175 can be reset through software by executing Command 4 (see Table 7) or through hardware on the low pulse of the $\overline{\text { RESET }}$ pin. The reset command loads the RDAC register with the contents of the most recently programmed 50-TP memory location. The RDAC register loads with midscale if no 50-TP memory location has been previously programmed. Tie $\overline{\text { RESET }}$ to $V_{D D}$ if the $\overline{\text { RESET }}$ pin is not used.

## SHUTDOWN MODE

The AD5175 can be shut down by executing the software shutdown command, Command 9 (see Table 7), and setting the LSB to 1 . This feature places the RDAC in a zero-powerconsumption state where Terminal A is disconnected from the wiper terminal. It is possible to execute any command from Table 7 while the AD5175 is in shutdown mode. The part can be taken out of shutdown mode by executing Command 9 and setting the LSB to 0 , or by issuing a software or hardware reset.

## RDAC ARCHITECTURE

To achieve optimum performance, Analog Devices, Inc., has patented the RDAC segmentation architecture for all the digital potentiometers. In particular, the AD5175 employs a three-stage segmentation approach, as shown in Figure 28. The AD5175 wiper switch is designed with the transmission gate CMOS topology.

## PROGRAMMING THE VARIABLE RESISTOR

## Rheostat Operation

The nominal resistance between Terminal W and Terminal A, $\mathrm{R}_{\mathrm{wA}}$, is available in $10 \mathrm{k} \Omega$ and has 1024-tap points accessed by the wiper terminal. The 10 -bit data in the RDAC latch is decoded to select one of the 1024 possible wiper settings. As a result, the general equation for determining the digitally programmed output resistance between the W terminal and A terminal is

$$
\begin{equation*}
R_{W A}(D)=\frac{D}{1024} \times R_{W A} \tag{1}
\end{equation*}
$$

where:
$D$ is the decimal equivalent of the binary code loaded in the 10-bit RDAC register.
$R_{W A}$ is the end-to-end resistance.
In the zero-scale condition, a finite total wiper resistance of $120 \Omega$ is present. Regardless of which setting the part is operating in, take care to limit the current between the A terminal to W terminal, and W terminal to B terminal, to the maximum continuous current of $\pm 6 \mathrm{~mA}$, or the pulse current specified in Table 3. Otherwise, degradation or possible destruction of the internal switch contact can occur.

## Calculate the Actual End-to-End Resistance

The resistance tolerance is stored in the internal memory during factory testing. The actual end-to-end resistance can, therefore, be calculated (which is valuable for calibration, tolerance matching, and precision applications).

The resistance tolerance in percentage is stored in fixed-point format, using a 16-bit sign magnitude binary. The sign bit $(0=$ negative and $1=$ positive) and the integer part is located in Address 0x39, as shown in Table 11. Address 0x3A contains the fractional part, as shown in Table 12.

That is, if the data readback from Address $0 \times 39$ is 0000001010 and data from Address $0 \times 3 \mathrm{~A}$ is 0010110000 , then the end-to-end resistance can be calculated as follows.
For Memory Location 0x39,
DB[9:8]: XX = don't care
$\mathrm{DB}[7]: 0=$ negative
DB[6:0]: $0001010=10$
For Memory Location 0x3A,
DB[9:8]: XX = don't care
$\mathrm{DB}[7: 0]: 10110000=176 \times 2^{-8}=0.6875$
Therefore, tolerance $=-10.6875 \%$ and $\mathrm{R}_{\mathrm{WA}}(1023)=8.931 \mathrm{k} \Omega$.

## EXT_CAP CAPACITOR

A $1 \mu \mathrm{~F}$ capacitor to $\mathrm{V}_{\text {ss }}$ must be connected to the EXT_CAP pin (see Figure 29) on power-up and throughout the operation of the AD5175.

Figure 29. EXT_CAP Hardware Setup

## TERMINAL VOLTAGE OPERATING RANGE

The positive $V_{D D}$ and negative $V_{S S}$ power supplies of the AD5175 define the boundary conditions for proper 2-terminal digital resistor operation. Supply signals present on Terminal A and Terminal W that exceed $\mathrm{V}_{\mathrm{DD}}$ or $\mathrm{V}_{\mathrm{SS}}$ are clamped by the internal forward-biased diodes (see Figure 30).

Figure 30. Maximum Terminal Voltages Set by $V_{D D}$ and $V_{S S}$
The ground pin of the AD5175 is primarily used as a digital ground reference. To minimize the digital ground bounce, join the AD5175 ground terminal remotely to the common ground. The digital input control signals to the AD5175 must be referenced to the device ground pin (GND) and satisfy the logic level defined in the Specifications section. An internal level shift circuit ensures that the common-mode voltage range of the three terminals extends from $V_{S s}$ to $V_{D D}$, regardless of the digital input level.

## POWER-UP SEQUENCE

Because there are diodes to limit the voltage compliance at Terminal A and Terminal W (see Figure 30), it is important to power $\mathrm{V}_{\mathrm{DD}} / \mathrm{V}_{\text {SS }}$ first before applying any voltage to Terminal A and Terminal W; otherwise, the diode is forward-biased such that $\mathrm{V}_{\mathrm{DD}} / \mathrm{V}_{\text {SS }}$ are powered unintentionally. The ideal power-up sequence is $V_{s s}, G N D, V_{D D}$, digital inputs, $V_{A}$, and $V_{w}$. The order of powering $\mathrm{V}_{\mathrm{A}}, \mathrm{V}_{\mathrm{W}}$, and digital inputs is not important as long as they are powered after $\mathrm{V}_{\mathrm{DD}} / \mathrm{V}_{\mathrm{Ss}}$.
As soon as $V_{D D}$ is powered, the power-on preset activates, which first sets the RDAC to midscale and then restores the last programmed $50-\mathrm{TP}$ value to the RDAC register.

Table 12. End-to-End Resistance Tolerance Bytes

| Memory Map Address | Data Byte ${ }^{1}$ |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
