**Description**

The AT27C010/L chip family is a low-power, high performance 1,048,576 bit Ultraviolet Erasable and Electrically Programmable Read Only Memory (EPROM) organized as 128K x 8 bits. They require only one 5 V power supply in normal read mode operation. Any byte can be accessed in less than 45 ns, eliminating the need for speed reducing WAIT states on high performance microprocessor systems.

Two power versions are offered. In read mode, the AT27C010 typically consumes 25 mA while the AT27C010L takes only 8 mA. Standby mode supply current for both parts is typically less than 10  $\mu$ A. *(continued)*

## Description (Continued)

The AT27C010/L comes in a choice of industry standard JEDEC-approved packages including: one-time programmable (OTP) plastic PDIP, PLCC, and TSOP, as well as windowed ceramic Cerdip and LCC. All devices feature two line control (CE, OE) to give designers the flexibility to prevent bus contention.

With high density 128K byte storage capability, the AT27C010/L allow firmware to be stored reliably and to be accessed by the system without the delays of mass storage media.

Atmel's 27C010/L have additional features to ensure high quality and efficient production use. The Rapid Programming Algorithm reduces the time required to program the part and guarantees reliable programming. Programming time is typically only 100  $\mu$ s/byte. The Integrated Product Identification Code electronically identifies the device and manufacturer. This feature is used by industry standard programming equipment to select the proper programming algorithms and voltages.

## Erase Characteristics

The entire memory array of the AT27C010/L is erased (all outputs read as  $V_{OH}$ ) after exposure to ultraviolet light at a wavelength of 2537Å. Complete erasure is assured after a minimum of 20 minutes exposure using 12,000  $\mu$ W/cm<sup>2</sup> intensity lamps spaced one inch away from the chip. Minimum erase time for lamps at other intensity ratings can be calculated from the minimum integrated erasure dose of 15 W-sec/cm<sup>2</sup>. To prevent unintentional erasure, an opaque label is recommended to cover the clear window on any UV erasable EPROM which will be subjected to continuous fluorescent indoor lighting or sunlight.

\*NOTICE: Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

### Notes:

- Minimum voltage is -0.6 V dc which may undershoot to -2.0 V for pulses of less than 20 ns. Maximum output pin voltage is  $V_{CC} + 0.75$  V dc which may overshoot to +7.0 V for pulses of less than 20 ns.

- Two identifier bytes may be selected. All Ai inputs are held low ( $V_{IL}$ ), except A9 which is set to  $V_H$  and A0 which is toggled low ( $V_{IL}$ ) to select the Manufacturer's Identification byte and high ( $V_{IH}$ ) to select the Device Code byte.

## A.C. Waveforms for Read Operation <sup>(1)</sup>

### Notes:

1. Timing measurement references are 0.8 V and 2.0 V. Input AC driving levels are 0.45 V and 2.4 V, unless otherwise specified. Timing measurement reference is 1.5 V for -45 and -55 parts. Input AC driving levels are 0.0 V and 3.0 V for -45 and -55 parts, unless otherwise specified.
2.  $\overline{OE}$  may be delayed up to  $t_{CE-tOE}$  after the falling edge of  $\overline{CE}$  without impact on  $t_{CE}$ .
3.  $\overline{OE}$  may be delayed up to  $t_{ACC-tOE}$  after the address is valid without impact on  $t_{ACC}$ .
4. This parameter is only sampled and is not 100% tested.
5. Output float is defined as the point when data is no longer driven.

	Typ	Max	Units	Conditions
$C_{IN}$	4	8	pF	$V_{IN} = 0$ V
$C_{OUT}$	8	12	pF	$V_{OUT} = 0$ V

Notes: 1. Typical values for nominal supply voltage. This parameter is only sampled and is not 100% tested.

## Programming Waveforms <sup>(1)</sup>

### Notes:

1. The Input Timing Reference is 0.8 V for  $V_{IL}$  and 2.0 V for  $V_{IH}$ .
2.  $t_{OE}$  and  $t_{DFP}$  are characteristics of the device but must be accommodated by the programmer.
3. When programming the AT27C010/L a 0.1- $\mu\text{F}$  capacitor is required across  $V_{PP}$  and ground to suppress spurious voltage transients.

**Rapid Programming Algorithm**

A 100 μs PGM pulse width is used to program. The address is set to the first location. V<sub>CC</sub> is raised to 6.5 V and V<sub>PP</sub> is raised to 13.0 V. Each address is first programmed with one 100 μs PGM pulse without verification. Then a verification / reprogramming loop is executed for each address. In the event a byte fails to pass verification, up to 10 successive 100 μs pulses are applied with a verification after each pulse. If the byte fails to verify after 10 pulses have been applied, the part is considered failed. After the byte verifies properly, the next address is selected until all have been checked. V<sub>PP</sub> is then lowered to 5.0 V and V<sub>CC</sub> to 5.0 V. All bytes are read again and compared with the original data to determine if the device passes or fails.
