1, 0	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.

24.3.49 Interrupt Flag Register (INTHOLD)

The interrupt flag register (INTHOLD) consists of various interrupt flags.

Bit:	7	6	5	4	3	2	1	0
	ISEC	ITARG	ISY	IERR	IBUF	IREADY	-	-
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	ISEC	0	R/W	ISEC Interrupt Flag Writing 0 to this bit is only possible after 1 has been read from it.
6	ITARG	0	R/W	ITARG Interrupt Flag Writing 0 to this bit is only possible after 1 has been read from it.
5	ISY	0	R/W	ISY Interrupt Flag Writing 0 to this bit is only possible after 1 has been read from it.
4	IERR	0	R/W	IERR Interrupt Flag Writing 0 to this bit is only possible after 1 has been read from it.
3	IBUF	0	R/W	IBUF Interrupt Flag Writing 0 to this bit is only possible after 1 has been read from it.
2	IREADY	0	R/W	IREADY Interrupt Flag Writing 0 to this bit is only possible after 1 has been read from it.
1, 0	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.

24.3.50 Interrupt Source Mask Control Register (INHINT)

The interrupt source mask control register (INHINT) controls masking of various interrupt requests in the CD-ROM decoder.

Bit:	7	6	5	4	3	2	1	0
	INH ISEC	INH ITARG	INH ISY	INH IERR	INH IBUF	INH IREADY	PREINH REQDM	PREINH IREADY
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	INHISEC	0	R/W	ISEC Interrupt Mask When set to 1, inhibits ISEC interrupt requests.
6	INHITARG	0	R/W	ITARG Interrupt Mask When set to 1, inhibits ITARG interrupt requests.
5	INHISY	0	R/W	ISY Interrupt Mask When set to 1, inhibits ISY interrupt requests.
4	INHIERR	0	R/W	IERR Interrupt Mask When set to 1, inhibits IERR interrupt requests.
3	INHIBUF	0	R/W	IBUF Interrupt Mask When set to 1, inhibits IBUF interrupt requests.
2	INHIREADY	0	R/W	IREADY Interrupt Mask When set to 1, inhibits IREADY interrupt requests.
1	PREINHREQDM	0	R/W	Inhibits setting of the DMA-transfer-request interrupt source flag for the output data stream. When this bit is set to 1, the DMA-transfer-request interrupt source is not retained.
0	PREINHIREADY	0	R/W	Inhibits setting of the IREADY interrupt flag. When this bit is set to 1, the IREADY interrupt source is not retained.

24.3.51 CD-ROM Decoder Stream Data Input Register (STRMDIN0)

The CD-ROM decoder stream data input register (STRMDIN0) holds the higher 2 bytes (from MSB) of the 4 bytes of data that is to be input to the CD-ROM decoder.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	STRMDIN[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	STRMDIN[31:16]	All 0	R/W	Indicates the higher 2 bytes (from MSB) of the 4-bytes of data that is to be input to the CD-ROM decoder. The CD-ROM decoder has a 4-byte wide data window as a data input register to handle the data input to this register as a stream data. The amount of data for one sector is 2352 bytes.

24.3.52 CD-ROM Decoder Stream Data Input Register (STRMDIN2)

The CD-ROM decoder stream data input register (STRMDIN2) holds the lower 2 bytes (from LSB) of the 4 bytes of data that is to be input to the CD-ROM decoder.

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	STRMDIN[15:0]	All 0	R/W	Indicates the lower 2 bytes (from LSB) of the 4-bytes of data that is to be input to the CD-ROM decoder. The CD-ROM decoder has a 4-byte wide data window as a data input register to handle the data input to this register as a stream data. The amount of data for one sector is 2352 bytes.

24.3.53 CD-ROM Decoder Stream Data Output Register (STRMDOUT0)

The CD-ROM decoder stream data output register (STRMDOUT0) holds 2 bytes that is to be output from the CD-ROM decoder.

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	STRMDOUT [15:0]	H'0000	R	Indicates 2 bytes that are to be output from the CD-ROM decoder. The CD-ROM decoder has a 2-byte wide data window or set of registers for the output of decoded data. Every time the relevant register is accessed, further data of access size are output sequentially in the output format that is separately defined. The amount of data for one sector is 2768 bytes. Always read 2768 bytes.

24.4 Operation

24.4.1 Endian Conversion for Data in the Input Stream

Stream data must be input to the core of the CD-ROM decoder in order according to the CD-ROM data format specifications. In some systems, however, the order of the data from the serial sound interface may have to be changed or the data will have been padded before transfer. To cope with this, the stream data input control section is capable of swapping the order of the data and preventing the input of padding data to the core of the CD-ROM decoder. These functions are controlled through the serial sound interface data control register (SSI).

Figure 24.6 shows a case where the upper and lower 16 bits of the data, consisting of padding data plus the first 2 bytes of sync code, that is, H'000000FF, are swapped (H'00FF0000) and input to the CD-ROM decoder as the stream data.

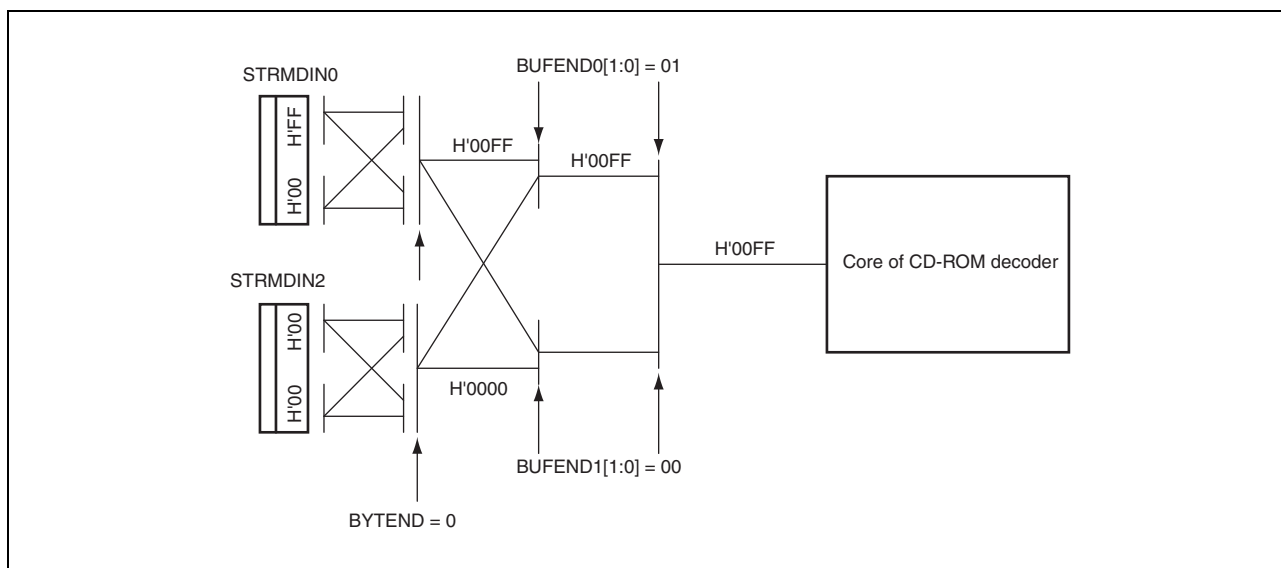

Figure 24.6 Example of Padded Stream Data Control by the SSI Register

Figure 24.7 shows a case of input stream data that has no padding (H'12345678). The upper and lower 16 bits of data are swapped (H'56781234) for input to the CD-ROM decoder.

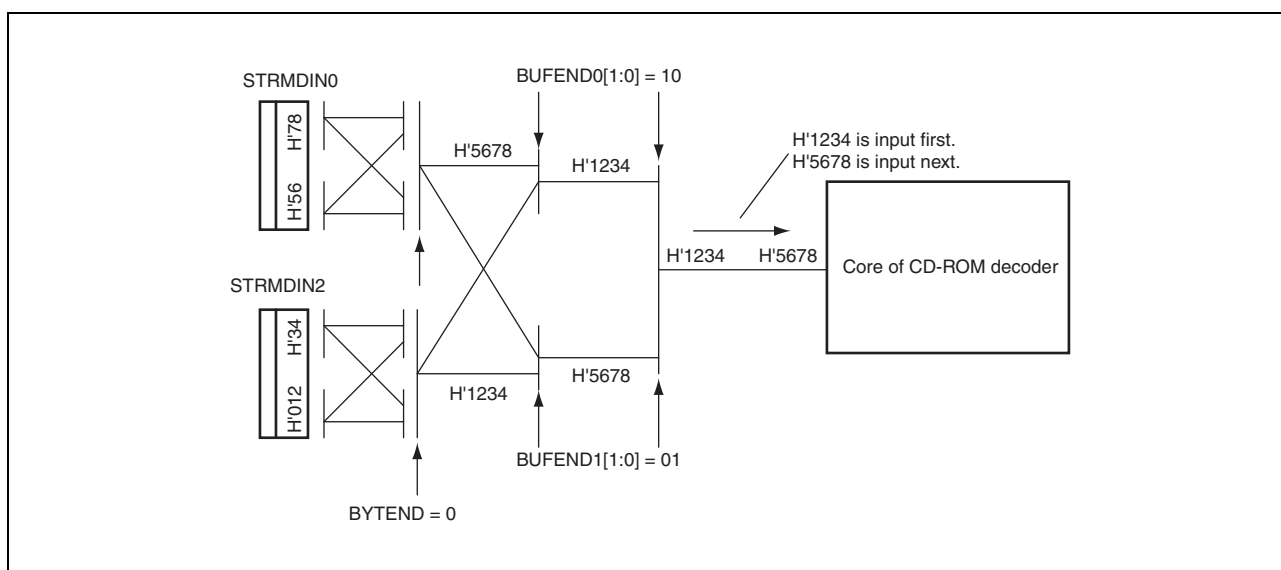

Figure 24.7 Example of Non-Padded Stream Data Control by the SSI Register

24.4.2 Sync Code Maintenance Function

Each sector of CD-ROM data consists of 2352 bytes starting with H'00FFFFFFFFFFFFFFFFF00 (sync code). However, a scratch on the disc or some other factor might lead to erroneous recognition of the sync code sequence at the wrong time. Conversely, a sync code might not be detected at a point where it should be detected. As a solution to these problems, the CD-ROM decoder of this LSI has a sync-code maintenance function, which operates to ignore sync codes detected at abnormal times and maintain the appearance of the sync code at the expected times when it is not actually detected on the disc.

The operating modes of the sync-code maintenance function are listed below. For details on the settings, refer to section 24.3.2, Sync Code-Based Synchronization Control Register (CROMSY0), and Table 24.2.

- Automatic sync maintenance mode
- External sync mode
- Interpolated sync mode
- Interpolated sync plus external sync mode

(1) Automatic Sync Maintenance Mode

In automatic sync maintenance mode, the sync code is ignored if detected within the one-sector (2352-byte) period. Furthermore, if a sync code is not detected at the point where a next sector should start, sync code maintenance is applied. If synchronization timing has changed, re-synchronization is performed at the point where a sync code is detected within 2352 bytes after the change.

Therefore, this mode is effective in rejecting abnormal sync patterns and following changes in synchronization timing. Note, however, that this mode cannot achieve synchronization with the first sector after a change to the synchronization timing.

Figure 24.8 shows operation in the case of normal sync-code detection, Figure 24.9 shows a case where a sync code is detected before a current one-sector period has elapsed, and Figure 24.10 shows the case where the actual sync code is only detected some time after a full one-sector period has elapsed.

Figure 24.8 Operation in Automatic Sync Maintenance Mode (Normal Timing)

Figure 24.9 Operation in Automatic Sync Maintenance Mode (When an Abnormally Short Sector is Encountered)

Figure 24.10 Operation in Automatic Sync Maintenance Mode (When an Abnormally Long Sector is Encountered)

(2) External Sync Mode

In external sync mode, synchronization is always based on the sync codes in the incoming data. Even if the next sync code is not detected at the 2352nd byte, decoding does not proceed until the next sync code is detected.

Accordingly, this mode is effective in that it strictly follows the external synchronization timing. Note, however, that decoding will not be performed normally when the sync-code pattern is input with abnormal timing.

Figure 24.11 shows the operation in external sync mode.

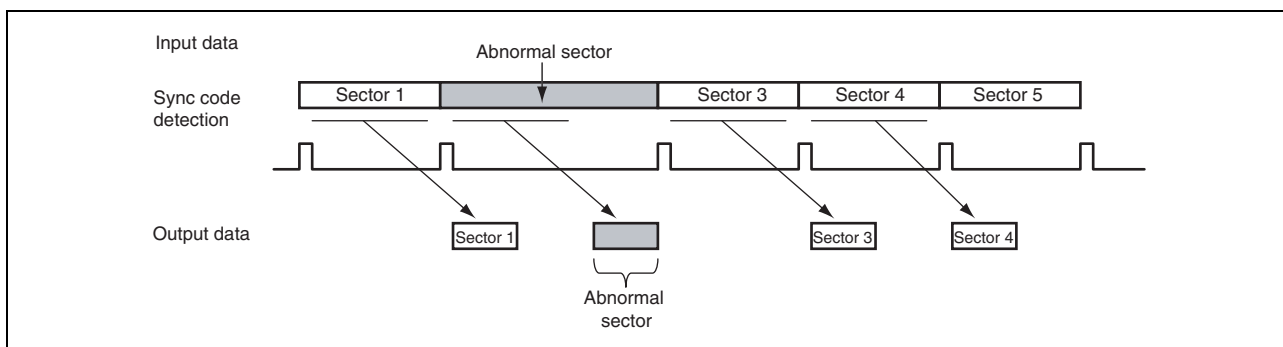

Figure 24.11 Operation in External Sync Mode

(3) Interpolated Sync Mode

In interpolated sync mode, synchronization is always driven by the internal counter after a sync code pattern has been detected at the start of decoding. Accordingly, this mode is effective when the sync patterns have been damaged.

However, decoding becomes incorrect after a change to the synchronization timing, since the change in timing is not followed.

Figure 24.12 shows the operation in interpolated sync mode.

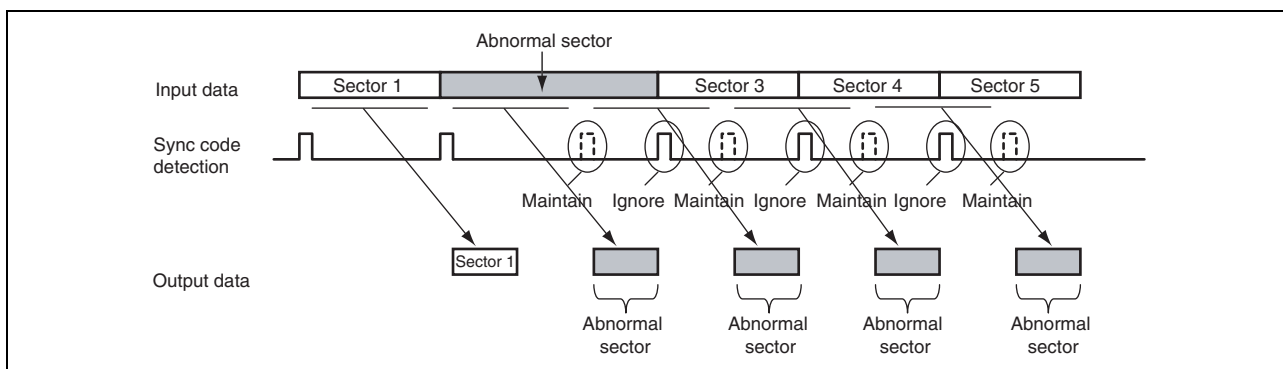

Figure 24.12 Operation in Interpolated Sync Mode

(4) Interpolated Sync Plus External Sync Mode

In interpolated sync plus external sync mode, synchronization is based on the detected sync code patterns as long as they are present, and if a sync pattern is not detected at the 2352nd byte, the sync code maintenance is applied.

Synchronization in this mode is more quickly responsive to changes in synchronization timing than synchronization in the automatic sync maintenance mode.

However, decoding still becomes incorrect when a sync pattern is input with abnormal timing.

Figure 24.13 and Figure 24.14 show the operation in interpolated sync plus external sync mode in the cases of abnormally short and long sectors, respectively.

Figure 24.13 Operation in Interpolated Sync Plus External Sync Mode (When an Abnormally Short Sector is Encountered)

Figure 24.14 Operation in Interpolated Sync Plus External Sync Mode (When an Abnormally Long Sector is Encountered)

24.4.3 Error Correction

The CD-ROM decoder handles data in the formats containing information relevant to error correction, including the EDC, P parity, and Q parity. The CD-ROM decoder includes the following functions for use in error correction.

- Syndrome calculation
- ECC correction
- EDC checking

(1) Syndrome Calculation

After the data of a sector in Mode 1 or Form 1 of Mode 2 has been input, the ECC is used in correction if any error is detected (the result of syndrome calculation is non-zero). After correction, the results of syndrome operation for the corrected data are output to bits ST_ECCP (P parity) and ST_ECCQ (Q parity) in the CROMST6 register, respectively.

(2) ECC correction and EDC Checking

For CD-ROM format data that contains EDC, P-parity, and Q-parity fields, the CD-ROM decoder performs EDC checking and ECC correction. Supported correction modes are P correction, Q correction, PQ correction (P correction followed by Q correction), and QP correction (Q correction followed by P correction). In PQ and QP correction modes, up to three iterations of correction are possible (the number of iterations is limited by the playback speed).

The EDC check is performed twice, before and after correction.

The mode of ECC correction and EDC checking is specified by bits MD_DEC[2:0] in the CROMCTL1 register. When the PQ or QP correction mode is selected, the number of iterations of correction is specified by bits MD_PQREP[1:0] in the CROMCTL1 register.

When the automatic mode/form detection function is in use, the sector mode determines whether or not ECC correction and EDC checking can be performed. For sectors in Mode 0 and Mode 2 (non-XA), which include neither parity bits nor EDC, ECC correction and EDC checking are not performed. For sectors in Form 2 of Mode 2, ECC correction is not performed.

(a) ECC Correction

When ECC correction is in use and an error in a sector is identified as non-correctable, the CD-ROM decoder generates an IERR interrupt and sets the ST_ECCNG bit of the CROMST6 register to 1. The CD-ROM detector also sets this bit to 1 on detecting a short sector.

While the NO_ECC bit of the CROMCTL4 register is set to 1, a 'pass' result in pre-ECC correction EDC checking makes the CD-ROM decoder skip ECC correction, regardless of the results of the syndrome operation.

(b) EDC Checking

When EDC checking is in use, checking is in line with the specified or detected sector mode and form, depending on whether or not automatic sector mode and form detection is selected.

The results of EDC checking before and after correction are reflected in the ST_EDC1 and ST_EDC2 bits of the CROMST6 register, respectively. If EDC checking after ECC correction indicates that an error remains, an IERR interrupt is generated.

24.4.4 Automatic Decoding Stop Function

Decoding can be stopped automatically in response to an error during the decoding of CD-ROM data.

The possible conditions for automatically stopping the decoding process are listed below. The applicable conditions are specified in the CROMCTL3 register.

- An error is found to be not correctable by ECC correction.
- Post-ECC correction EDC checking indicates that an error remains.
- A change of the sector mode or form
- A non-sequential MSF (minutes, seconds, frames (1/75 second)) value

When automatic stopping is set up and any of the above conditions is encountered in a certain sector, the decoding is stopped after the results of decoding for that sector have been output.

After decoding has been stopped in response to a condition specified in the CROMCTL3 register, the condition can be identified by reading the CBUFST1 register.

The CD-ROM decoder has buffer space for two sectors. If input of the data stream continues and the output stream of data is not read, the CD-ROM decoder stops at the point where the data of a third sector starts to be input. At this time, the BUF_NG bit in the CBUFST2 register is set to 1, but no interrupt is generated. Once the BUF_NG bit in the CBUFST2 register has been set to 1, recovery can only be accomplished by using the LOGICRST bit in the ROMDECRST register to reset the CD-ROM decoder function. When the LOGICRST bit in the ROMDECRST register is set to 1, a reset signal is output and any registers in which settings have been made are cleared to their initial values.

24.4.5 Buffering Format

Figure 24.15 shows the format of the output data stream produced by CD-ROM decoding.

A 2-byte-wide window register STRMDOUT0 is provided for the output. When this window register is accessed after decoding of a CD-ROM sector has finished, the bytes of data are output in order from the sync code.

Figure 24.15 Output Data Stream Format

The meanings of bits in the two-byte status field shown in Figure 24.15 are given below. The values of the non-assigned bits are undefined.

Status															
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PERR	QERR	EDCE	—	—	—	—	—	SD	SY		FM[2:0]		HD	—	—

[Legend]

PERR: Indicates that a P-parity error remains.

QERR: Indicates that a Q-parity error remains.

EDCE: Indicates that a remaining error was detected in post-ECC correction EDC checking.

SD: Indicates that a short sector was encountered.

SY: Indicates that a sync code was interpolated.

FM: Indicates the data format.

001: Mode 0

010: Mode 1

011: Long (format with no EDC and ECC)

100: Mode 2 (non-XA)

101: Mode 2 Form 1

110: Mode 2 Form 2

HD: Header continuity (minutes, seconds, and frames (1 frame = 1/75 second) are non-sequential)

The value of the storage flag field in Figure 24.15 is incremented every time the data for one sector are output. The value starts at H'0000 and wraps back around to H'0000 after it reaches H'FFFF. Note that the upper byte and lower byte in the storage flag are swapped.

24.4.6 Target-Sector Buffering Function

In the CD-ROM decoder, the sector for output can be designated in two ways: automatic buffering, where the CD-ROM decoder itself detects the presence of target sector that has been set beforehand, and manual buffering, where the target sector for output is designated by software and the software also recognizes the sectors buffered in the CD-ROM decoder.

The following describes the procedures for setting the registers in the CD-ROM decoder to set up automatic or manual buffering.

(1) Setting Up Automatic Buffering

Figure 24.16 shows an example of setting up the automatic buffering. Set the relevant CD-ROM decoder registers and start input of the data stream; the CD-ROM decoder then detects the target sector and starts the output of the stream data.

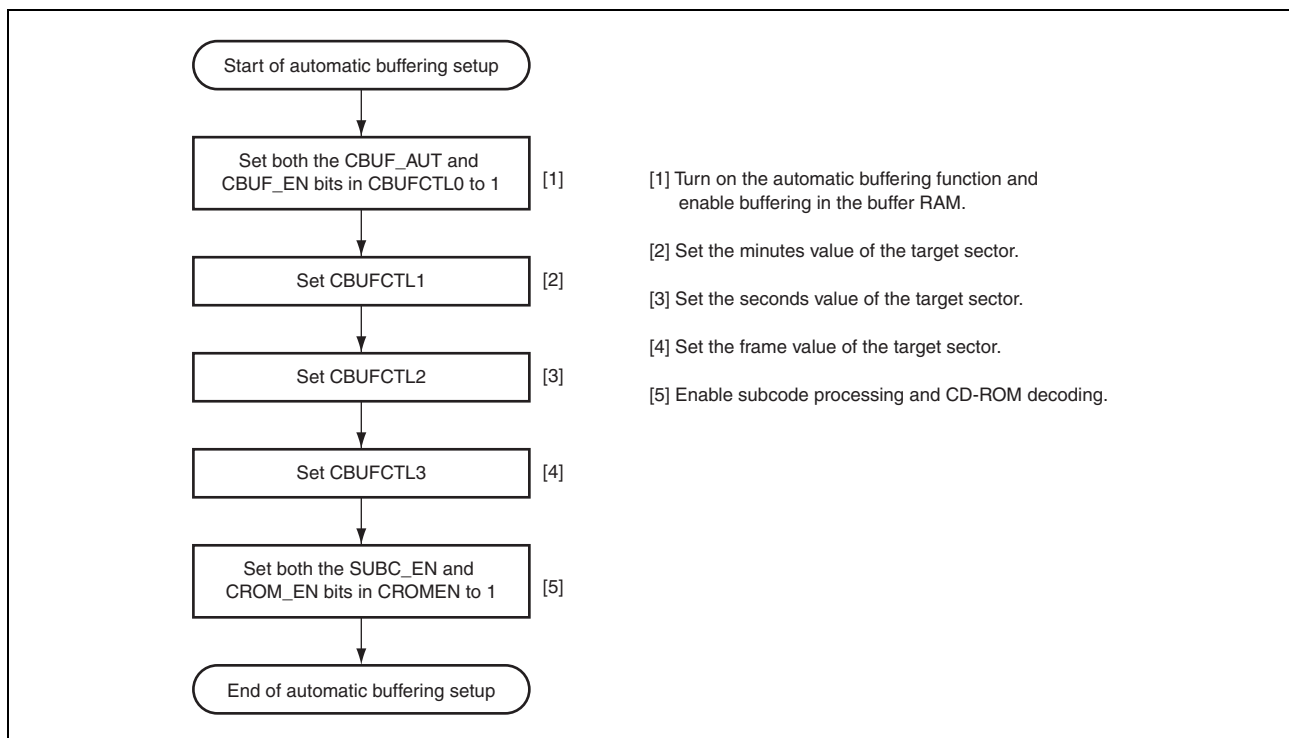

Figure 24.16 Example of Setting Up Automatic Buffering

(2) Setting Up Manual Buffering

Figure 24.17 shows an example of setting up manual buffering. Each time an ISEC interrupt is generated, the software checks whether or not the sector is the target sector and starts buffering when the target sector is found.

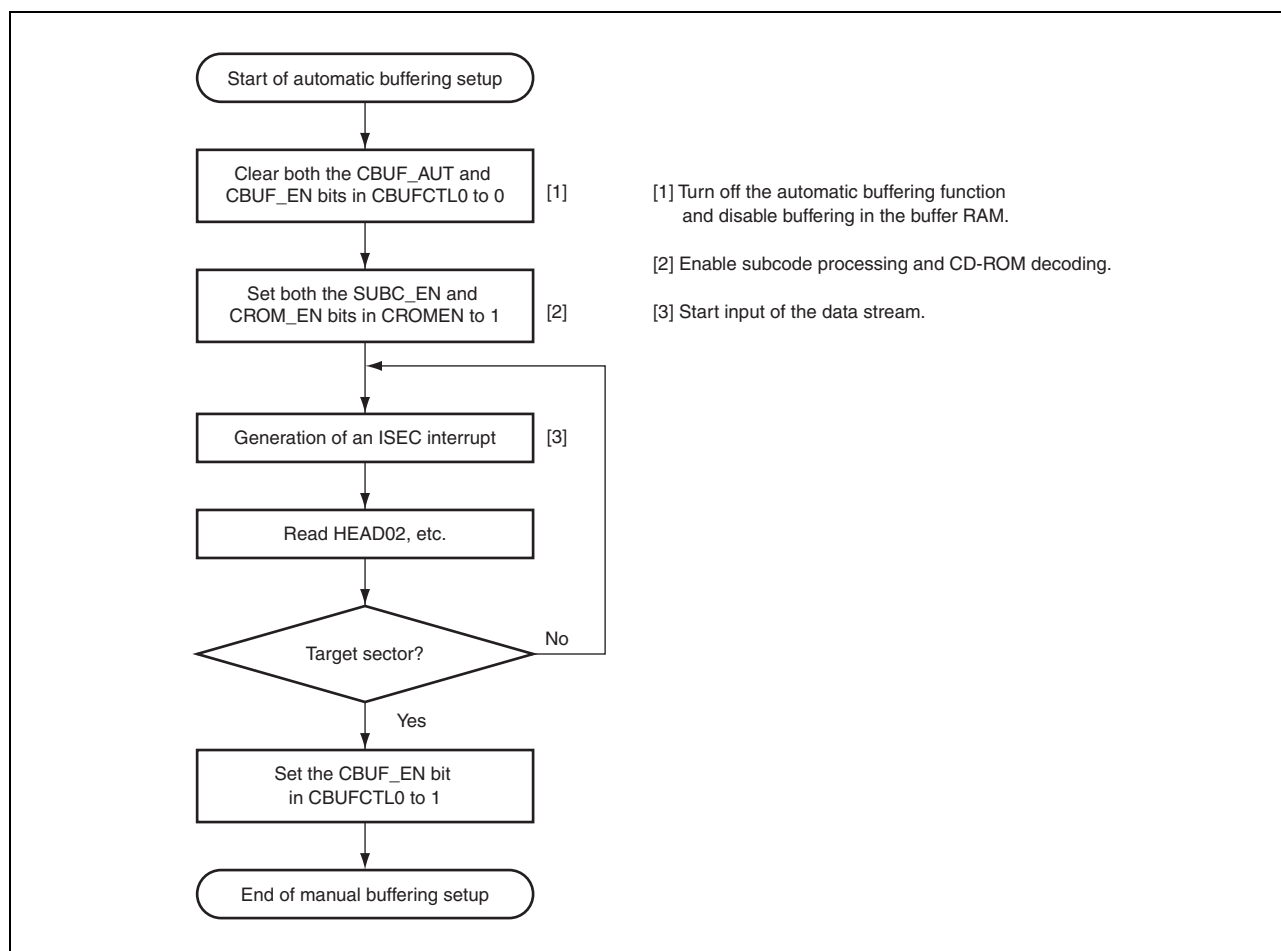

Figure 24.17 Example of Setting Up Manual Buffering

24.5 Interrupt Sources

24.5.1 Interrupt and DMA Transfer Request Signals

Table 24.3 lists the interrupt signals and DMA transfer request signal generated by the CD-ROM decoder, along with the meanings and the modules to which the signals are connected.

Table 24.3 Interrupt and DMA Transfer Request Signals

Name	Condition	Connected To
ISEC	Transition from sector to sector	Interrupt controller
ITARG	Access to a CD-ROM sector that is not the expected target sector	Interrupt controller
ISY	A sync code from the CD-ROM with abnormal timing	Interrupt controller
IERR	An error that was not correctable by ECC correction or an error indicated by EDC checking after ECC correction	Interrupt controller
IBUF	State changes in data transfer to the buffer	Interrupt controller
IREADY	Request for data transfer to the buffer for CD-ROM	Interrupt controller
DMA transfer request	Request for data transfer to the buffer for CD-ROM	Direct memory access controller

(1) ISEC Interrupt

This interrupt is generated when the sync code indicates a transition from sector to sector.

(2) ITARG Interrupt

This interrupt is generated when the stream data transferred from the CD-DSP is not the data of the target sector. The CD-ROM decoder checks the time data in the subcode. In correct operation, data transfer is expected to start slightly before the target sector. An ITARG interrupt is generated in the following cases.

- When data of a sector preceding the target sector by quite a few sectors have been transferred
- When data of a sector that comes after the target sector have been transferred

For the generation of this interrupt, ITARG is detected from the subcode. However, this interrupt has no meaning in this LSI because CD-ROM data are transferred from the serial sound interface.

(3) ISY Interrupt

This interrupt can be generated in the following cases.

- When a sync code was detected at a position where the value in the word counter (counter for checking sync code intervals) was not correct and the sync code was ignored
- When a sync code has not been detected although the word counter has reached the final value and a sync code has been interpolated (for sync maintenance)
- When a sync code was detected at a position where the value in the word counter (counter for checking sync code intervals) was not correct and the sync code was used in resynchronization
- When a sync code has not been detected although the word counter has reached the final value, so the period taken up by the sector has been prolonged
- When the sector has been processed as a short sector with the aid of interpolated sync codes
- When the sector has been processed as a long sector with the aid of interpolated sync codes

(4) IERR Interrupt

This interrupt is generated in the following cases.

- When ECC correction was incapable of correcting an error
- When ECC correction was OK but the subsequent EDC check indicated an error

(5) IBUF Interrupt

This interrupt is generated when the following transitions occur.

- Data transfer to the buffer → Data transfer complete (searching for data for the next transfer)
- Data for transfer to the buffer are being searched for → Data transfer started

(6) IREADY Interrupt

This interrupt is generated when decoding of data for one sector is completed. This interrupt should be used to start the CPU buffering stream data for output to SDRAM.

(7) DMA Transfer Request

The source of direct memory access controller activation is the same as that of IREADY. An interrupt request is generated when output stream data for one sector becomes ready, and after the 2768 bytes of data shown in figure 24.15 have been transferred, the request signal is negated. This is because a certain amount of time is required before the output data for the next sector is ready, so the transfer request from the direct memory access controller should be turned off between transfers.

24.5.2 Timing of Status Registers Updates

The status information registers of the CD-ROM decoder are updated on each ISEC interrupt. The sector for which information is reflected in the status registers is selected by the ER0SEL bit of the CROMCTL4 register.

24.6 Usage Notes

24.6.1 Stopping and Resuming Buffering Alone during Decoding

When the data of the output stream are not being read out but operation of the CD-ROM decoder has continued until the buffers are full, the BUF_NG bit in the CBUFST2 register is set to 1; after that, the CD-ROM decoder becomes incapable of operation.

To stop buffering alone, clear the CBUF_EN bit in the CBUFCTL0 register to 0. If the automatic buffering function is in use, clear the CBUF_AUT bit in the CBUFCTL0 register to 0 at the same time. In this case, the sectors currently in the buffers must be read out.

To resume automatic buffering, set the CBUF_AUT and CBUF_EN bits in the CBUFCTL0 register to 1 at the same time.

24.6.2 Setting Sync Code Status Register (CROMST0)

1. When the ST_SECS bit in the CROMST0 register becomes 1, stop decoding immediately and retry from one sector before the sector that was being decoded.
2. When the ST_SECL bit in the CROMST0 register becomes 1, stop decoding immediately and retry from two sectors before the sector that was being decoded.

24.6.3 Link Blocks

The CD-ROM decoder uses the header information before ECC correction to detect link blocks. Accordingly, an input data stream that contains an error may be erroneously detected as a link block. To prevent this, the following measures should be implemented in software.

- During buffering (BUF_ACT = 1 in the CBUFST0 register), check the LINK_OUT1 bit in the CROMST5 register on each ISEC interrupt. If it is set to 1, check to see if an IERR interrupt has also occurred; if an IERR interrupt has not occurred, save the MFS values from the HEAD20 to HEAD23 registers. If an IERR interrupt has occurred, do not save the MSF values.
- Perform the following processing for seven sectors (indicated by ISEC being generated seven times) after finding that the LINK_OUT1 bit has been set to 1.
- In either of cases 1 and 2 below,
 1. LINK_ON = 1 (in the CROMST5 register) is confirmed at each ISEC interrupt, and LINK_ON = 1 is detected again within the subsequent two-sector period
 2. LINK_ON = 1 was not detected at any ISEC interrupt

forcibly stop decoding, set the CROMSY0 register to place the decoder in external sync mode, and retry decoding by specifying the MSF value stored as described above + 7 (immediately after a link block) as the MSF value for the target sector.

The start sector address will be the address where RUN_OUT is stored + 7.

24.6.4 Stopping and Resuming CD-DSP Operation

When stopping and then resuming the stream data input to the CD-ROM decoder, if the input data stream does not stop immediately before a sync code and is then resumed, the CD-ROM decoder may recognize the data as incorrect. This happens because the system holds the data up to the point where input was stopped and the data that is input from the point of resumption at the same time. Take care on this point when stopping and then resuming input.

24.6.5 Note on Clearing the IREADY Flag

To clear the IREADY flag to 0 in interrupt processing etc., be sure to read one sector of data (2768 bytes) beforehand. If the IREADY flag is cleared to 0 before reading of one sector of data is complete, decoding of the subsequent sectors will not be possible. For recovery from this situation, write 1 to the LOGICRST bit in the CD-ROM decoder reset control register (ROMDECRST), and then clear the bit to 0.

24.6.6 Note on Stream Data Transfer (1)

If reading of the output data stream is slower than writing of the input data stream, the buffer of the CD-ROM decoder will overflow. This causes the CD-ROM decoder to abnormally stop.

When DMA transfer is in use, ensure that reading of the output data stream is faster than writing of the input data stream by making settings as listed below.

- Set a larger transfer size for reading of the output data stream than for writing of the input data stream.
- Give reading of the output data stream higher priority than writing of the input data stream.
- Set a smaller interval count for reading of the output data stream than for writing of the input data stream.

When the CPU handles transfer, ensure that reading of the output data stream is faster than writing of the input data stream by taking similar measures to those in the case of DMA transfer.

24.6.7 Note on Stream Data Transfer (2)

When reading the stream data, be sure to use either the direct memory access controller or the CPU. If both the direct memory access controller and the CPU are used for reading, the stream data may not be recognized as being in the CD-ROM format.

24.6.8 Note on Software Reset

For transitions to the software reset state by the LOGICRST bit in the ROMDECRST register, see [section 42.3.6, Software Reset](#). However, where the procedure refers to the SRST bit, read this as the LOGICRST bit.

25. LIN Interface

This module is only incorporated in the RZ/A1L.

This section contains a generic description of the LIN Interface (RLIN3). The first part of this section describes all specific properties of this product, such as the register base addresses, etc. The remainder of the section describes the functions and registers of RLIN3.

25.1 Features

25.1.1 Channels

This LSI has following number of channels of the LIN Interface.

Table 25.1 Channels of RLIN3n

LIN Interface	RZ/A1L
Channels	1
Name	RLIN30

Index n

Throughout this section, the channel of the LIN Interface (RLIN3) is identified by the index “n” (n = 0), for example, RLIN3nLMD for the LIN mode register.

25.1.2 Register Addresses

The register base address of the LIN interface is listed in the following table.

All LIN interface register addresses are given as address offsets to the individual base address.

Table 25.2 Register Base Addresses

Base Address Name	Base Address
<RLIN30_base>	FCFE 9000 _H

25.1.3 Clock Supply

The following clock is provided for the LIN interface.

Table 25.3 RLIN3n Clock Supply

RLIN3n	Clock	Connected to
RLIN3n	LIN Communication Clock Source	P0φ

25.1.4 Interrupts and DMA

The LIN Interface can generate the following interrupt and DMA requests:

Table 25.4 RLIN3n Interrupt and DMA Requests

RLIN3n signal	Function
RLIN30	
LIN0_INT_M	LIN0 interrupt
LIN0_INT_T	LIN0 transmission interrupt
LIN0_INT_R	LIN0 successful reception interrupt
LIN0_INT_S	LIN0 status error interrupt

25.1.5 I/O Signals

The I/O signals of the LIN Interface are used for various purposes, as listed in Table 25.5.

Table 25.5 RLIN3n I/O Signals

Name	Function
RLIN30	
Port RLIN30RX	RLIN30 receive data input
Port RLIN30TX	RLIN30 transmit data output

25.2 Function

The LIN Interface is a hardware LIN communication controller that supports LIN Specification Package Revision 1.3, 2.0, 2.1, 2.2, and SAEJ2602, and automatically performs frame communication and error determination.

The LIN master mode is only available.

LIN master

- LIN reset mode
- LIN mode (LIN master mode)
 - LIN wake-up mode
 - LIN operation mode
- LIN self-test mode

Table 25.6 gives the LIN Interface specifications and Figure 25.1 shows a block diagram of the LIN Interface.

Table 25.6 LIN Interface Specifications

Item	Specifications			
	Channel count	1		
LIN communication function	Protocol	LIN Specification Package Revision 1.3, 2.0, 2.1, 2.2, and SAEJ2602		
	Variable frame structure	Master	<ul style="list-style-type: none"> Break transmission width: 13 to 28 Tbits Break delimiter transmission width: 1 to 4 Tbits Transmission inter-byte space width (header): 0 to 7 Tbits (space between Sync field and ID field)*¹ Transmission response space width: 0 to 7 Tbits*¹ Transmission inter-byte space width: 0 to 3 Tbits (space between data bytes in response area) Transmit wake-up width: 1 to 16 Tbits 	
			Checksum	<ul style="list-style-type: none"> Automatic operation for both transmission and reception Classic or enhanced selectable (for each frame)
			Response field data byte count	Variable from 0 to 8 bytes Multi-byte (9 or more bytes) response transmission and reception also possible
			Frame communication modes	Master <ul style="list-style-type: none"> Mode in which header transmission and response transmission/reception is started with a single transmission start request Mode in which header transmission and response transmission are started with separate transmission start requests (frame separate mode) (Setting of the frame separate mode is prohibited in this product.)
			Wake-up transmission and reception	LIN wake-up mode provided <ul style="list-style-type: none"> Wake-up transmission (1 to 16 Tbits) Wake-up reception Low-level width of input signals measured
	Status	Master <ul style="list-style-type: none"> Successful frame/wake-up transmission Successful header transmission Successful frame/wake-up reception*² Successful data 1 reception Error detection Operation mode (LIN reset mode, LIN wake-up mode, LIN operation mode, LIN self-test mode) 		
	Error status	Master <ul style="list-style-type: none"> Bit error Checksum error Frame timeout error/response timeout error Physical bus error Framing error Response preparation error 		
	Baud rate selection	Baud rate conforming to the LIN specifications generated using baud rate generator		
	Test mode	Self-test mode for user evaluation		
Interrupt function	Master <ul style="list-style-type: none"> Successful header/frame/wake-up transmission Successful frame/wake-up reception*² Error detection 			

Note 1. Since the same register is used for setting, the inter-byte space (header) = response space.

Note 2. For wake-up reception, the low level width of the input signal is indicated.

25.2.1 Block Diagram

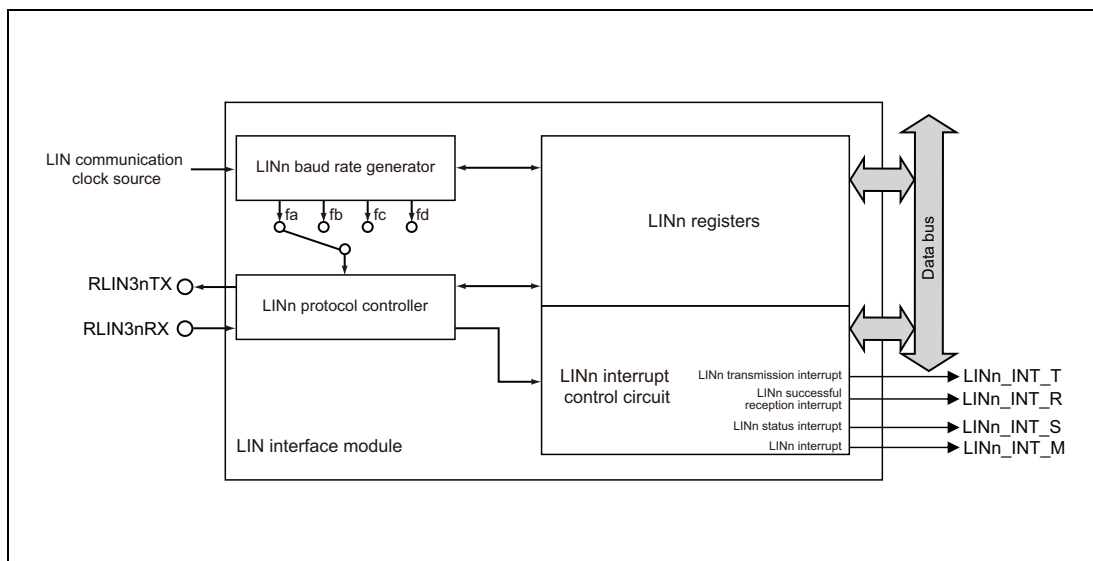

Figure 25.1 LIN Interface Block Diagram

25.2.2 Description of Blocks

- RLIN3nTX, RLIN3nRX: LIN Interface I/O pins
- LINn baud rate generator: Generates the LIN Interface communication clock signal.
- LINn registers: LIN Interface registers
- LINn interrupt controller: Controls interrupt requests generated by the LIN Interface

25.3 Registers

Table 25.7 lists the LIN Interface registers.

Table 25.7 List of LIN Interface Registers

Register Name	Symbol
LIN wake-up baud rate selector register	RLN3nLWBR
LIN baud rate prescaler 0 register	RLN3nLBRP0
LIN baud rate prescaler 1 register	RLN3nLBRP1
LIN self-test control register	RLN3nLSTC
LIN mode register	RLN3nLMD
LIN break field configuration register	RLN3nLBFC
LIN space configuration register	RLN3nLSC
LIN wake-up configuration register	RLN3nLWUP
LIN interrupt enable register	RLN3nLIE
LIN error detection enable register	RLN3nLEDE
LIN control register	RLN3nLCUC
LIN transmission control register	RLN3nLTRC
LIN mode status register	RLN3nLMST
LIN status register	RLN3nLST
LIN error status register	RLN3nLEST
LIN data field configuration register	RLN3nLDFC
LIN ID buffer register	RLN3nLIDB
LIN checksum buffer register	RLN3nLCBR
LIN data buffer 1 register	RLN3nLDBR1
LIN data buffer 2 register	RLN3nLDBR2
LIN data buffer 3 register	RLN3nLDBR3
LIN data buffer 4 register	RLN3nLDBR4
LIN data buffer 5 register	RLN3nLDBR5
LIN data buffer 6 register	RLN3nLDBR6
LIN data buffer 7 register	RLN3nLDBR7
LIN data buffer 8 register	RLN3nLDBR8

Note: When writing to a register not used, write 00_H.

25.3.1 LIN Master Related Registers

25.3.1.1 RLN3nLWBR — LIN Wake-up Baud Rate Select Register

Access: This register can be read/written in 8-bit units.

Address: <RLN3n_base> + 01_H

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	NSPB[3:0]				LPRS[2:0]			LWBR0
Initial value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.8 RLN3nLWBR register contents

Bit Position	Bit Name	Function
7 to 4	NSPB[3:0]	Bit Sampling Count Select b7 b4 0 0 0 0: 16 sampling 1 1 1 1: 16 sampling Settings other than the above are prohibited.
3 to 1	LPRS[2:0]	Prescaler Clock Select b3 b1 0 0 0: 1/1 0 0 1: 1/2 Other than above: Setting prohibited
0	LWBR0	Wake-up Baud Rate Select 0: In LIN wake-up mode, the clock specified by the LCKS bit setting in the RLN3nLMD register is used (when LIN1.3 is used). 1: In LIN wake-up mode, the clock fa is used regardless of the setting of the LCKS bit in the RLN3nLMD register (when LIN2.x is used).

Set the RLN3nLWBR register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

NSPB[3:0] bits (bit sampling count select bits)

These bits select the number of sampling in one Tbit (reciprocal of the baud rate).

In LIN master mode, set these bits to 0000_B or 1111_B (16 sampling).

LPRS[2:0] bits (prescaler clock select bits)

These bits select the frequency division ratio for the prescaler.

LWBR0 bit (wake-up baud rate select bit)

When LIN Specification Package Revision 1.3 is used, set the LWBR0 bit in the RLN3nLWBR register to 0. This allows the 2.5-Tbit or longer low-level width of the input signal to be measured. When LIN Specification Package Revision 2.x is used, set the LWBR0 bit to 1. Setting the LWBR0 bit to 1 selects fa as the LIN system clock (fLIN) during LIN wake-up mode regardless of the setting of the RLN3nLMD.LCKS bit (the LCKS bit is not changed). This allows the 2.5-Tbit or longer low-level width of the input signal to be measured.

Setting the baud rate to 19200 bps while fa is selected allows the 130 μs or longer low-level width of the input signal to be detected during LIN wake-up mode regardless of the setting of the RLN3nLMD.LCKS bit.

25.3.1.2 RLN3nLBRP0 — LIN Baud Rate Prescaler 0 Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 02_H

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	LBRP0[7:0]							
Initial value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.9 RLN3nLBRP0 register contents

Bit Position	Bit Name	Function
7 to 0	LBRP0[7:0]	Assuming that the value set in this register is N (4 to 255), the baud rate prescaler divides the frequency of the prescaler clock by N + 1. Setting Range: 04 _H to FF _H Note: Set the LPRS and LBRP0 bits so that the frequency of the prescaler clock becomes no more than that of the clock source for LIN communications divided by nine.

Set the RLN3nLBRP0 register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

The value set in this register is used to control the frequency of baud rate clock sources fa, fb, and fc.

Assuming that the value set in this register is N, baud rate prescaler 0 divides the frequency of the clock that is selected by the LPRS bits by N + 1.

25.3.1.3 RLN3nLBRP1 — LIN Baud Rate Prescaler 1 Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 03_H

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	LBRP1[7:0]							
Initial value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.10 RLN3nLBRP1 register contents

Bit Position	Bit Name	Function
7 to 0	LBRP1[7:0]	Assuming that the value set in this register is M (4 to 255), the baud rate prescaler divides the frequency of the prescaler clock by M + 1. Setting Range: 04 _H to FF _H Note: Set the LPRS and LBRP1 bits so that the frequency of the prescaler clock becomes no more than that of the clock source for LIN communications divided by nine.

Set the RLN3nLBRP1 register when the OMM0 bit in the RLN2uunLcMST register is 0_B (in LIN reset mode).

The value set in this register is used to control the frequency of baud rate clock source fd.

Assuming that the value set in this register is M, baud rate prescaler 1 divides the frequency of the clock that is selected by the LPRS bits (prescaler clock select bits) by M + 1.

25.3.1.4 RLN3nLSTC — LIN Self-Test Control Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 04_H

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
				—				LSTM
Initial value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 25.11 RLN3nLSTC register contents

Bit Position	Bit Name	Function
7 to 1	Reserved	Writing A7 _H , 58 _H , and 01 _H successively to the RLN3nLSTC register places the module into LIN self-test mode.
0	LSTM	LIN Self-Test Mode 0: The module is not in LIN self-test mode 1: The module is in LIN self-test mode.

The RLN3nLSTC register cancels protection of LIN self-test mode.

Set the RLN3nLSTC register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

Writing A7_H, 58_H, and 01_H successively to the RLN3nLSTC register places the module into LIN self-test mode.

When successive writing is completed thus placing LIN self-test mode to be entered, the LSTM bit is set to 1.

Do not write any other value during successive writing.

For making transition to LIN self-test mode, refer to [Section 25.8, LIN Self-Test Mode](#).

When read, bits 6 to 1 return 000000_B, and bit 7 returns an undefined value.

LSTM bit (LIN self test mode bit)

When transition to LIN self-test mode is completed, the LSTM bit is set to 1.

For leaving LIN self-test mode, refer to [Section 25.8, LIN Self-Test Mode](#).

Writing 1 to this bit does not affect the value of the RLN3nLSTC register if it is not a part of successive writing of A7_H, 58_H, and 01_H.

25.3.1.5 RLN3nLMD — LIN Mode Register

Access: This register can be read/written in 8-bit units.

Address: <RLN3n_base> + 08_H

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	LRDNFS	LIOS	LCKS[1:0]		LMD[1:0]	
Initial value	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.12 RLN3nLMD register contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, an initial value is returned. When written, write an initial value.
5	LRDNFS	LIN Reception Data Noise Filtering Disable 0: The noise filter is enabled. 1: The noise filter is disabled.
4	LIOS	LIN Interrupt Output Select 0: LINn interrupt is used. 1: LINn transmission interrupt, LINn successful reception interrupt, and LINn status error interrupt are used.
3, 2	LCKS[1:0]	LIN System Clock Select b3 b2 0 0: fa (Clock generated by baud rate prescaler 0) 0 1: fb (1/2 clock generated by baud rate prescaler 0) 1 0: fc (1/8 clock generated by baud rate prescaler 0) 1 1: fd (1/2 clock generated by baud rate prescaler 1)
1, 0	LMD[1:0]	LIN Mode Select b1 b0 0 0: LIN master mode

Set the RLN3nLMD register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

LRDNFS bit (LIN reception data noise filtering disable bit)

The LRDNFS bit enables or disables the noise filter when receiving data.

With 0 set, the noise filter is enabled when receiving data.

With 1 set, the noise filter is disabled when receiving data.

LIOS bit (LIN interrupt output select bit)

The LIOS bit selects the number of interrupt outputs from the LIN Interface.

With 0 set, the LINn interrupt is generated from the LIN Interface.

With 1 set, the LINn transmission interrupt, LINn successful reception interrupt, and LINn status interrupt are generated from the LIN Interface.

For each interrupt source, refer to Section 25.4, Interrupt Sources.

LCKS[1:0] bits (LIN system clock select bits)

The LCKS bits select the clock to be input to the protocol controller.

With 00_B set, the protocol controller is provided with fa (clock generated by baud rate prescaler 0).

With 01_B set, the protocol controller is provided with f_b (1/2 clock generated by baud rate prescaler 0).

With 10_B set, the protocol controller is provided with f_c (1/8 clock generated by baud rate prescaler 0).

With 11_B set, the protocol controller is provided with f_d (1/2 clock generated by baud rate prescaler 1).

With 1_B is set in the LWBR0 bit in the RLN3nLWBR register (LIN 2.x is used), and the RLN3nLMST register is 01_H (LIN wake-up mode), the protocol controller is provided with f_a regardless of the setting of the bit (the LCKS bit is not changed).

LMD[1:0] bits (LIN mode select bits)

The LMD bits select the LIN Interface mode.

To use the LIN Interface as an LIN master, set these bits to 00_B .

25.3.1.6 RLN3nLBFC — LIN Break Field Configuration Register

Access: This register can be read/written in 8-bit units.

Address: <RLN3n_base> + 09_H

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	BDT[1:0]		BLT[3:0]			
Initial value	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.13 RLN3nLBFC register contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, an initial value is returned. When written, write an initial value.
5, 4	BDT[1:0]	Break Delimiter (High level) width select bit b5 b4 0 0: 1 Tbit 0 1: 2 Tbits 1 0: 3 Tbits 1 1: 4 Tbits
3 to 0	BLT[3:0]	Transmit Break (Low level) width select bit b3 b0 0 0 0 0: 13 Tbits 0 0 0 1: 14 Tbits 0 0 1 0: 15 Tbits : 1 1 1 0: 27 Tbits 1 1 1 1: 28 Tbits

Set the RLN3nLBFC register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

Some combinations of the set values result in the length of a frame exceeding the timeout time. Set the appropriate values in this register.

BDT[1:0] bit (Transmission Break Delimiter high level width setting bit)

This bit is used to set the break high **level** width of transmission frame header.

1 Tbit to 4 Tbits can be set.

BLT[3:0] bit (Transmission Break Low level width setting bit)

This BLT bits set the break low **level** width of transmission frame header.

13 Tbits to 28 Tbits can be set.

25.3.1.7 RLN3nLSC — LIN Space Configuration Register

Access: This register can be read/written in 8-bit units.

Address: <RLN3n_base> + 0A_H

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	IBS[1:0]		—	IBHS[2:0]		
Initial value	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R/W	R/W	R/W

Table 25.14 RLN3nLSC register contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, an initial value is returned. When written, write an initial value.
5, 4	IBS[1:0]	Inter-Byte Space Select b5 b4 0 0: 0 Tbit 0 1: 1 Tbit 1 0: 2 Tbits 1 1: 3 Tbits
3	Reserved	When read, an initial value is returned. When written, write an initial value.
2 to 0	IBHS[2:0]	Inter-Byte Space (Header)/Response Space Select b2 b0 0 0 0: 0 Tbit 0 0 1: 1 Tbit 0 1 0: 2 Tbits 0 1 1: 3 Tbits 1 0 0: 4 Tbits 1 0 1: 5 Tbits 1 1 0: 6 Tbits 1 1 1: 7 Tbits

Set the RLN3nLSC register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

Some combinations of the set values result in the length of a frame or a response exceeding the timeout time. Set the appropriate values in this register.

IBS[1:0] bits (inter-byte space select bits)

The IBS bits set the width of the inter-byte space of the transmission frame response field.

0 Tbit to 3 Tbits can be set.

These bits are enabled only during response transmission; these are disabled during response reception.

IBHS[2:0] bits (inter-byte space (header)/response space select bits)

The IBHS bits set the width of the inter-byte space (header) of the transmission frame header field and the response space.

0 Tbit to 7 Tbits can be set.

The response space setting is enabled only during response transmission; setting is disabled during response reception.

The inter-byte space (header) is equal to the response space.

25.3.1.8 RLN3nLWUP — LIN Wake-up Configuration Register

Access: This register can be read/written in 8-bit units.

Address: <RLN3n_base> + 0B_H

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	WUTL[3:0]				—	—	—	—
Initial value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R	R	R	R

Table 25.15 RLN3nLWUP register contents

Bit Position	Bit Name	Function
7 to 4	WUTL[3:0]	Wake-up Transmission Low level Width Select b7 b4 0 0 0 0: 1 Tbit 0 0 0 1: 2 Tbits 0 0 1 0: 3 Tbits 0 0 1 1: 4 Tbits : 1 1 0 0: 13 Tbits 1 1 0 1: 14 Tbits 1 1 1 0: 15 Tbits 1 1 1 1: 16 Tbits
3 to 0	Reserved	When read, an initial value is returned. When written, write an initial value.

Set the RLN3nLWUP register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

WUTL[3:0] bits (wake-up transmission low level width select bits)

The WUTL bits set the low level width of the wake-up signal transmission.

1 Tbit to 16 Tbits can be set.

While 1 is set in the LWBR0 bit in the RLN3nLWBR register (LIN 2.x is used), fa is selected as the LIN system clock (fLIN) regardless of the setting of the RLN3nLMD.LCKS bit (the LCKS bit is not changed).

25.3.1.9 RLN3nLIE — LIN Interrupt Enable Register

Access: This register can be read/written in 8-bit units.

Address: <RLN3n_base> + 0C_H

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	SHIE	ERRIE	FRCIE	FTCIE
Initial value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 25.16 RLN3nLIE register contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, an initial value is returned. When written, write an initial value.
3	SHIE	Successful Header Transmission Interrupt Request Enable 0: Disables successful header transmission interrupt request. 1: Enables successful header transmission interrupt request.
2	ERRIE	Error Detection Interrupt Request Enable 0: Disables error detection interrupt request. 1: Enables error detection interrupt request.
1	FRCIE	Successful Frame/Wake-up Reception Interrupt Request Enable 0: Disables successful frame/wake-up reception interrupt request. 1: Enables successful frame/wake-up reception interrupt request.
0	FTCIE	Successful Frame/Wake-up Transmission Interrupt Request Enable 0: Disables successful frame/wake-up transmission interrupt request. 1: Enables successful frame/wake-up transmission interrupt request.

Set the RLN3nLIE register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

SHIE bit (successful header transmission interrupt enable bit)

The SHIE bit enables or disables interrupt request upon successful transmission of a header.

With 0 set, the interrupt request for LIN_n transmission is not generated when the HTRC flag in the RLN3nLST register is set to 1.

With 1 set, the interrupt request for LIN_n transmission is generated when the HTRC flag in the RLN3nLST register is set to 1.

ERRIE bit (error detection interrupt request enable bit)

The ERRIE bit enables or disables interrupt request upon detection of an error.

With 0 set, the interrupt request for LIN_n status is not generated when the ERR flag in the RLN3nLST register is set to 1.

With 1 set, the interrupt request for LIN_n status is generated when the ERR flag in the RLN3nLST register is set to 1.

Interrupt sources can be the bit error, physical bus error, frame/response timeout error, framing error, checksum error, and response preparation error.

Detection of the bit error, physical bus error, frame/response timeout error, and framing error can be enabled or disabled using the RLN3nLEDE register.

FRCIE bit (successful frame/wake-up reception interrupt request enable bit)

The FRCIE bit enables or disables interrupt request upon successful reception of a frame or a wake-up signal (counting of low level width of the input signal).

With 0 set, the interrupt request for successful LINn reception is not generated when the FRC flag in the RLN3nLST register is set to 1.

With 1 set, the interrupt request for successful LINn reception is generated when the FRC flag in the RLN3nLST register is set to 1.

FTCIE bit (successful frame/wake-up transmission interrupt request enable bit)

The FTCIE bit enables or disables interrupt request upon successful transmission of a frame or a wake-up signal.

With 0 set, the interrupt request for LINn transmission is not generated when the FTC flag in the RLN3nLST register is set to 1.

With 1 set, the interrupt request for LINn transmission is generated when the FTC flag in the RLN3nLST register is set to 1.

25.3.1.10 RLN3nLEDE —LIN Error Detection Enable Register

Access: This register can be read/written in 8-bit units.

Address: <RLN3n_base> + 0D_H

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	LTES	—	—	—	FERE	FTERE	PBERE	BERE
Initial value	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R/W	R/W	R/W	R/W

Table 25.17 RLN3nLEDE register contents

Bit Position	Bit Name	Function
7	LTES	Timeout Error Select 0: Frame timeout error 1: Response timeout error
6 to 4	Reserved	When read, an initial value is returned. When written, write an initial value.
3	FERE	Framing Error Detection Enable 0: Disables framing error detection. 1: Enables framing error detection.
2	FTERE	Timeout Error Detection Enable 0: Disables frame/response timeout error detection. 1: Enables frame/response timeout error detection.
1	PBERE	Physical Bus Error Detection Enable 0: Disables physical bus error detection. 1: Enables physical bus error detection.
0	BERE	Bit Error Detection Enable 0: Disables bit error detection. 1: Enables bit error detection.

Set the RLN3nLEDE register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

LTES bit (timeout error select bit)

The LTES bit selects the specific timeout function to be used.

With 0 set, the timeout function applies to frame timeout.

With 1 set, the timeout function applies to response timeout.

For details of the timeout error, refer to Section 25.7.6, Error Status.

FERE bit (framing error detection enable bit)

The FERE bit enables or disables detection of the framing error.

With 0 set, the framing error is not detected.

With 1 set, the framing error is detected.

When this bit is set to 1, the detection result is indicated in the FER flag in the RLN3nLEST register.

For details of the framing error, refer to Section 25.7.6, Error Status.

FTERE bit (timeout error detection enable bit)

The FTERE bit enables or disables detection of the frame timeout error or the response timeout error.

With 0 set, the frame timeout error or response timeout error is not detected.

With 1 set, the frame timeout error or response timeout error is detected.

When this bit is set to 1, the detection result is indicated in the FTER flag in the RLN3nLEST register.

With the LTES bit, either the frame timeout error or response timeout error can be selected.

Do not use the timeout error if response data of 9 bytes or more is to be transmitted or received.

For details of the timeout error, refer to [Section 25.7.6, Error Status](#).

PBERE bit (physical bus error detection enable bit)

The PBERE bit enables or disables detection of the physical bus error.

With 0 set, the physical bus error is not detected.

With 1 set, the physical bus error is detected.

When this bit is set to 1, the detection result is indicated in the PBER flag in the RLN3nLEST register.

For details of the physical bus error, refer to [Section 25.7.6, Error Status](#).

BERE bit (bit error detection enable bit)

The BERE bit enables or disables detection of the bit error.

With 0 set, the bit error is not detected.

With 1 set, the bit error is detected.

When this bit is set to 1, the detection result is indicated in the BER flag in the RLN3nLEST register.

For details of the bit error, refer to [Section 25.7.6, Error Status](#).

25.3.1.11 RLN3nLCUC — LIN Control Register

Access: This register can be read/written in 8-bit units.

Address: <RLN3n_base> + 0E_H

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	OM1	OM0
Initial value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 25.18 RLN3nLCUC register contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, an initial value is returned. When written, write an initial value.
1	OM1	LIN Mode Select 0: LIN wake-up mode is caused. 1: LIN operation mode is caused.
0	OM0	LIN Reset 0: LIN reset mode is caused. 1: LIN reset mode is canceled.

Set the RLN3nLCUC register to 01_H to cause a transition to LIN wake-up mode after canceling LIN reset mode, and set the register to 03_H to cause a transition to LIN operation mode.

In LIN self-test mode, set the RLN3nLCUC register to 03h after a transition to LIN self-test mode is completed.

After a value is written to this register, confirm that the value written is actually indicated in the RLN3nLMST register before writing another value.

OM1 bit (LIN mode select bit)

The OM1 bit selects the specific LIN operation mode (either LIN wake-up mode or LIN operation mode) after canceling LIN reset mode.

With 0 set, LIN wake-up mode is caused.

With 1 set, LIN operation mode is caused.

This bit is valid only when the OMM0 bit in the RLN3nLMST register is 1.

Writing a value to this bit is disabled while the FTS bit in the RLN3nLTRC register is 1.

OM0 bit (LIN reset bit)

The OM0 bit selects either causing a transition to LIN reset mode or canceling LIN reset mode.

With 0 set, LIN reset mode is caused.

With 1 set, LIN reset mode is canceled.

25.3.1.12 RLN3nLTRC — LIN Transmission Control Register

Access: This register can be read/written in 8-bit units.

Address: <RLN3n_base> + 10_H

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	RTS	FTS
Initial value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 25.19 RLN3nLTRC register contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, an initial value is returned. When written, write an initial value.
1	RTS	Response Transmission/Reception Start 0: Response transmission/reception is stopped in frame separate mode. 1: Response transmission/reception is started in frame separate mode. Note: Setting of the frame separate mode is prohibited in this product.
0	FTS	Frame Transmission/wake-up Transmission /Reception Start 0: Frame Transmission/wake-up transmission /reception is stopped. 1: Frame Transmission/wake-up transmission reception is started.

RTS bit (response transmission/reception start bit)

Set the RTS bit to 1 in frame separate mode after header transmission is started (FTS bit is 1) and response transmission data is ready. Once set, this bit is automatically cleared to 0 upon completion of frame communication (including error detection) or transition to LIN reset mode.

Only 1 can be written to this bit; 0 cannot be written. To write 1 to this bit, write 02_H to the RLN3nLTRC register using the store instruction.

Writing a value to this bit is disabled when the OMM0 bit of the RLN3nLMST register is 0_B (in LIN reset mode).

Writing a value to this bit is disabled when the FTS bit is 0 (frame transmission or wake-up transmission/reception is halted).

When response data of 9 bytes or more is to be transmitted or received, set this bit to 1 each time a data group (variable from 0 to 8 bytes) is transmitted or received. Once set, this bit is automatically cleared to 0 upon completion of data group communication or transition to LIN reset mode.

FTS bit (frame transmission/wake-up transmission/reception start bit)

Set the FTS bit to 1 to start frame transmission and reception.

Also set this bit to 1 to allow wake-up transmission and wake-up reception (counting of the low level width of the input signal).

Only 1 can be written to this bit; 0 cannot be written. Writing a value to this bit is disabled when the OMM0 bit of the RLN3nLMST register is 0_B (in LIN reset mode).

This bit is set to 0 upon completion of frame or wake-up communication (including error detection) and transition to LIN reset mode.

25.3.1.13 RLN3nLMST — LIN Mode Status Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 11_H

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	OMM1	OMM0
Initial value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 25.20 RLN3nLMST register contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, an initial value is returned. When written, write an initial value.
1	OMM1	LIN Mode Status Monitor 0: The module is in LIN wake-up mode. 1: The module is in LIN operation mode.
0	OMM0	LIN Reset Status Monitor 0: The module is in LIN reset mode. 1: The module is not in LIN reset mode.

OMM1 bit (LIN mode status monitor)

The OMM1 bit indicate the current operating mode.

OMM0 bit (LIN reset status monitor)

The OMM0 bit indicates the current operating mode.

25.3.1.14 RLN3nLST — LIN Status Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 12_H

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	HTRC	D1RC	—	—	ERR	—	FRC	FTC
Initial value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R/W	R/W

Table 25.21 RLN3nLST register contents

Bit Position	Bit Name	Function
7	HTRC	Successful Header Transmission Flag 0: Header transmission has not been completed. 1: Header transmission has been completed.
6	D1RC	Successful Data 1 Reception Flag These bits are always read as 0. The write value should always be 0.
5, 4	Reserved	When read, an initial value is returned. When written, write an initial value.
3	ERR	Error Detection Flag 0: No error has been detected. 1: Error has been detected.
2	Reserved	When read, an initial value is returned. When written, write an initial value.
1	FRC	Successful Frame/Wake-up Reception Flag 0: Frame or wake-up reception has not been completed. 1: Frame or wake-up reception has been completed.
0	FTC	Successful Frame/Wake-up Transmission Flag 0: Frame or wake-up transmission has not been completed. 1: Frame or wake-up transmission has been completed.

The RLN3nLST register is automatically cleared to 00_H upon transition to LIN reset mode and start of the next communication (when the FTS bit of the RLN3nLTRC register is 1).

In LIN reset mode, this register cannot be written to. In LIN reset mode, the register retains 00_H. To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the store instruction.

HTRC flag (successful header transmission flag)

Only 0 can be written to the HTRC flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

The HTRC flag is set to 1 upon completion of header transmission. Here, an interrupt request for LINn transmission is generated if the SHIE bit in the RLN3nLIE register is 1 (interrupt is enabled). To clear the bit to 0 before the next communication (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode.

D1RC flag (successful data 1 reception flag)

Only 0 can be written to the D1RC flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

The D1RC flag is set to 1 upon completion of data 1 reception. Here, an interrupt request is not generated. To clear the bit to 0 before the next communication (when the value of the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode.

When response data of 9 bytes or more is to be received, this bit is set to 1 each time data 1 of a data group (variable from 0 to 8 bytes) is received. Write 0 before starting reception of the next data group.

ERR flag (error detection flag)

The ERR flag is set to 1 upon detection of an error (when the value of any of the flags of the RLN3nLEST registers is 1). Here, an interrupt request for LINn status is generated if the ERRIE bit in the RLN3nLIE register is 1 (interrupt is enabled). To clear the bit to 0 before the next communication (when the value of the FTS bit of the RLN3nLTRC register is 1), write 0 to the RPER, CSER, FER, FTER, PBER, and BER flags in the RLN3nLEST register in LIN operation mode or LIN wake-up mode. This clears the ERR flag to 0.

FRC flag (successful frame/wake-up reception flag)

Only 0 can be written to the FRC flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

The FRC flag is set to 1 upon completion of frame or wake-up reception. Here, an interrupt request for successful LINn reception is generated if the FRCIE bit in the RLN3nLIE register is 1 (interrupt is enabled). To clear the bit to 0 before the next communication (when the value of the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode or LIN wake-up mode.

When response data of 9 bytes or more is to be received, this bit is set to 1 each time a data group (variable from 0 to 8 bytes) is received. Write 0 before starting reception of the next data group.

FTC flag (successful frame/wake-up transmission flag)

Only 0 can be written to the FTC flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

The FTC flag is set to 1 upon completion of frame or wake-up transmission. Here, an interrupt request for LINn transmission is generated if the FTCIE bit in the RLN3nLIE register is 1 (interrupt is enabled). To clear the bit to 0 before the next communication (when the value of the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode or LIN wake-up mode.

When response data of 9 bytes or more is to be transmitted, this bit is set to 1 each time a data group (variable from 0 to 8 bytes) is transmitted. Write 0 before starting transmission of the next data group.

25.3.1.15 RLN3nLEST — LIN Error Status Register

Access: This register can be read/written in 8-bit units.

Address: <RLN3n_base> + 13_H

Initial value: 00H

Bit	7	6	5	4	3	2	1	0
	RPER	—	CSER	—	FER	FTER	PBER	BER
Initial value	0	0	0	0	0	0	0	0
R/W	R/W	R	R/W	R	R/W	R/W	R/W	R/W

Table 25.22 RLN3nLEST register contents

Bit Position	Bit Name	Function
7	RPER	Response Preparation Error Flag 0: Response preparation error has not been detected. 1: Response preparation error has been detected.
6	Reserved	When read, an initial value is returned. When written, write an initial value.
5	CSER	Checksum Error Flag 0: Checksum error has not been detected. 1: checksum error has been detected.
4	Reserved	When read, an initial value is returned. When written, write an initial value.
3	FER	Framing Error Flag 0: Framing error has not been detected. 1: Framing error has been detected.
2	FTER	Timeout Error Flag 0: Frame/response timeout error has not been detected. 1: Frame/response timeout error has been detected.
1	PBER	Physical Bus Error Flag 0: Physical bus error has not been detected. 1: Physical bus error has been detected.
0	BER	Bit Error Flag 0: Bit error has not been detected. 1: Bit error has been detected.

The RLN3nLEST register is automatically cleared to 00_H upon transition to LIN reset mode and start of the next communication (when the value of the FTS bit of the RLN3nLTRC register is 1).

In LIN reset mode, this register cannot be written to. In LIN reset mode, the register retains 00_H.

When the FTS bit in the RLN3nLTRC register is 1 (frame transmission or wake-up transmission/reception is started), do not write a value to this register. To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the store instruction.

RPER flag (response preparation error flag)

Only 0 can be written to the RPER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

The RPER flag is set to 1 upon response preparation error detection. To clear the bit to 0 before the next communication (when the value of the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode.

CSER flag (checksum error flag)

Only 0 can be written to the CSER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

The CSER flag is set to 1 upon checksum error detection. To clear the bit to 0 before the next communication (when the value of the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode.

FER flag (framing error flag)

Only 0 can be written to the FER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

The FER flag is set to 1 upon frame timeout detection when the FERE bit of the RLN3nLEDE register is 1 (frame timeout detection enabled). To clear the bit to 0 before the next communication (when the value of the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode.

FTER flag (timeout error flag)

Only 0 can be written to the FTER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

The FTER flag is set to 1 upon frame timeout error or response timeout error detection when the FTERE bit of the RLN3nLEDE register is 1 (frame/response timeout error detection enabled). To clear the bit to 0 before the next communication (when the value of the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode.

PBER flag (physical bus error flag)

Only 0 can be written to the PBER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

The PBER flag is set to 1 upon physical bus error detection when the PBERE bit of the RLN3nLEDE register is 1 (physical bus error detection enabled). To clear the bit to 0 before the next communication (when the value of the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode or LIN wake-up mode.

BER flag (bit error flag)

Only 0 can be written to the BER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

The BER flag is set to 1 upon bit error detection when the BERE bit of the RLN3nLEDE register is 1 (bit error detection enabled). To clear the bit to 0 before the next communication (when the value of the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode or LIN wake-up mode.

25.3.1.16 RLN3nLDFC — LIN Data Field Configuration Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 14_H

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	LSS	FSM	CSM	RFT	RFDL[3:0]			
Initial value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.23 RLN3nLDFC register contents

Bit Position	Bit Name	Function
7	LSS	Transmission/Reception Continuation Select 0: The data group to be transmitted/received next is the last one. 1: The data group to be transmitted/received next is not the last one. (Checksum is not included.)
6	FSM	Frame Separate Mode Select 0: Frame separate mode is not set. 1: Frame separate mode is set. Note: Setting of the frame separate mode is prohibited in this product.
5	CSM	Checksum Select 0: Classic checksum mode 1: Enhanced checksum mode
4	RFT	Response Field Communication Direction Select 0: Reception 1: Transmission
3 to 0	RFDL[3:0]	Response Field Length Select b3 b0 0 0 0 0: 0 byte (+ checksum) 0 0 0 1: 1 byte (+ checksum) 0 0 1 0: 2 bytes (+ checksum) : 0 1 1 1: 7 bytes (+ checksum) 1 0 0 0: 8 bytes (+ checksum) Settings other than the above are prohibited.

LSS bit (transmission/reception continuation select bit)

The LSS bit indicates that the data group to be transmitted or received next is not the last data group when response data of 9 bytes or more is to be transmitted or received. With 0 set, data and checksum are transmitted or received because the next data group to be transmitted or received is the last one.

With 1 set, only data is transmitted or received, and the checksum is not included because the next data group to be transmitted or received is not the last one.

Set the LSS bit only when the FSM bit is 1 (frame separate mode) and response data of 9 bytes or more is to be transmitted or received.

Set the LSS bit only when the RTS bit in the RLN3nLTRC is 0 (response transmit/receive is stopped).

FSM bit (frame separate mode select bit)

The FSM bit sets the response communication mode.

With 0 set, frame separate mode is not selected. In this case, after header transmission is started (the FTS bit in the RLN3nLTRC register is 1), response is transmitted/received without the RTS bit in the RLN3nLTRC register being set.

With 1 set, frame separate mode is selected. If the RTS bit of the RLN3nLTRC register is set to 1 during header transmission, response transmission is executed after header transmission is completed.

For response reception which is 8 bytes or less (the RFT bit is 0), set the FSM bit to 0.

When causing a transition to LIN self-test mode, set this bit to 0 before transition.

For details of frame separate mode, refer to **Section 25.7.3.1, Transmission of LIN Frames**. Set this bit when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted).

When response data of 9 bytes or more is to be transmitted or received, set the FSM bit to 1.

CSM bit (checksum select bit)

The CSM bit sets the checksum mode.

With 0 set, classic checksum mode is selected.

With 1 set, enhanced checksum mode is selected.

When the timeout error is used (the FTERE bit in the RLN3nLEDE register is 1), the specific timeout time depends on the setting of this bit. For details of the bit error, refer to **Section 25.7.6, Error Status**.

Set this bit when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted).

When response data of 9 bytes or more is to be transmitted or received, do not change the CSM bit setting after the first data group through the last data group.

During communication of response data of 9 bytes or more, only the last data group (the LSS bit is 0) includes the checksum, and no other groups (the LSS bit is 1) include the checksum.

RFT bit (response field communication direction select bit)

The RFT bits set the direction of the response field/wake-up signal communication.

With 0 set, reception is performed in the response field. In LIN wake-up mode, wake-up reception is performed (low level width of the input signal is counted).

With 1 set, transmission is performed in the response field. In LIN wake-up mode, wake-up transmission is performed.

Set this bit when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted).

When response data of 9 bytes or more is to be transmitted or received, do not change the RFT bit setting after the first data group through the last data group.

RFDL[3:0] bits (response field length select bits)

The RFDL bits set the length of the response field data.

The data length can be 0 to 8 bytes excluding the checksum size.

To transmit response data with the FSM bit set to 0 (not frame separate mode), set the RFDL bits before header transmission (the FTS bit in the RLN3nLTRC register is 0).

To transmit response data with the FSM bit set to 1 (frame separate mode), set the RFDL bits before response transmission (the FTS bit in the RLN3nLTRC register is 0).

To receive response data, set the RFDL bits before header transmission (the FTS bit in the RLN3nLTRC register is 0).

When response data of 9 bytes or more is to be transmitted or received, set the RFDL bits before data group transmission/reception (RTS bit in the RLN3nLTRC register is 0).

Only the last data group (the LSS bit is 0) includes the checksum, and no other groups (the LSS bit is 1) include the checksum.

25.3.1.17 RLN3nLIDB — LIN ID Buffer Register

Access: This register can be read/written in 8-bit units.

Address: <RLN3n_base> + 15_H

Initial value: 00_H

Table 25.24 RLN3nLIDB register contents

Bit Position	Bit Name	Function
7	IDP1	Parity Setting (P1) Sets the parity bit (P1) to be transmitted in the ID field.
6	IDP0	Parity Setting (P0) Sets the parity bit (P0) to be transmitted in the ID field.
5 to 0	ID[5:0]	ID Setting Sets the 6-bit ID value to be transmitted in the ID field.

Set the RLN3nLIDB register when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted).

In LIN self-test mode, this register operates as follows:

Write the value to be transmitted before communication. After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.

For details about the LIN self-test mode, see Section 25.8, LIN Self-Test Mode.

IDP[1:0] bits (parity setting bits)

The IDP bits set the parity bits (P0 and P1) to be transmitted in the ID field of the LIN frame (IDP0 for P0 and IDP1 for P1). Since parity is not automatically calculated, set the calculation result. Note that if the erroneous result is set, it is transmitted as is.

ID[5:0] bits (ID setting bits)

The ID bit sets the 6-bit ID value to be transmitted in the ID field of the LIN frame.

25.3.1.18 RLN3nLCBR — LIN Checksum Buffer Register

Access: This register can only be read in 8-bit units. In LIN self-test mode, this register can be read/written in 8-bit units.

Address: <RLN3n_base> + 16_H

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	CKSM[7:0]							
Initial value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.25 RLN3nLCBR register contents

Bit Position	Bit Name	Function
7 to 0	CKSM[7:0]	Holds the checksum value transmitted or received.

In LIN mode, this register operates as follows:

- When the RFT bit in the RLN3nLDFC register is 1 (transmission):
The value transmitted can be read from the register. Read the value after transmission is completed.
Writing to this register is invalid.
- When the RFT bit in the RLN3nLDFC register is 0 (reception):
The value received can be read from the register. Read the value after reception is completed.
Writing to this register is invalid.

In LIN self-test mode, this register operates as follows:

- When the RFT bit in the RLN3nLDFC register is 1 (transmission):
After completion of the frame transmission (after loopback), the reversed value of the received value can be read.
- When the RFT bit in the RLN3nLDFC register is 0 (reception):
Write the value to be received before communication. After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.
For details about the LIN self-test mode, see Section 25.8, LIN Self-Test Mode.

Set the RLN3nLCBR register when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted).

When response data of 9 bytes or more is to be transmitted or received, the checksum is appended only to the last data group; this register is not updated for the other data groups.

25.3.1.19 RLN3nLDBRm — LIN Data Buffer m Register (m = 1 to 8)

Access: This register can be read/written in 8-bit units.

Address: RLN3nLDBR1: <RLIN3n_base> + 18_H
 RLN3nLDBR2: <RLIN3n_base> + 19_H
 RLN3nLDBR3: <RLIN3n_base> + 1A_H
 RLN3nLDBR4: <RLIN3n_base> + 1B_H
 RLN3nLDBR5: <RLIN3n_base> + 1C_H
 RLN3nLDBR6: <RLIN3n_base> + 1D_H
 RLN3nLDBR7: <RLIN3n_base> + 1E_H
 RLN3nLDBR8: <RLIN3n_base> + 1F_H

Initial value: 00_H

Table 25.26 RLN3nLDBRm (m = 1 to 8) register contents

Bit Position	Bit Name	Function
7 to 0	LDB[7:0]	Sets the data to be transmitted or allows the received data to be read. Setting Range: 00 _H to FF _H

For response transmission:

The LDBR_n registers set the data to be transmitted in the response field.

Use these registers with the following settings.

- RFT in RLN3nLDFC register is 1 (transmission)
- FSM in RLN3nLDFC register is 0 (not frame separate mode)
- FTS bit in RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted)

or

- RFT in RLN3nLDFC register is 1 (transmission)
- FSM in RLN3nLDFC register is 1 (frame separate mode)
- RTS in RLN3nLTRC register is 0 (response transmission/reception is halted)

For response reception:

The LDBR_n registers hold the data received in the response field.

The received data is overwritten. If an error is detected, the data up to the byte in which the error was detected are stored in the register. Do not read these registers when the FTS bit is 1 (frame transmission or wake-up transmission/reception is started)

For transmission of response data of 9 bytes or more:

Use the LDBRn registers with the following settings.

- RFT in RLN3nLDFC register is 1 (transmission)
- FSM in RLN3nLDFC register is 1 (frame separate mode)
- RTS in RLN3nLTRC register is 0 (response transmission/reception is halted)

For reception of response data of 9 bytes or more:

Do not read these registers when the RTS bit is 1 (response transmission/reception is started).

In LIN self-test mode, these registers operate as follows:

Write the value to be transmitted before communication. After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.

For details about the LIN self-test mode, see [Section 25.8, LIN Self-Test Mode](#).

25.4 Interrupt Sources

The LIN Interface generates four types of interrupt requests.

- LINn transmission interrupt
- LINn successful reception interrupt
- LINn status interrupt
- LINn interrupt

Setting the LIOS bit in the RLN3nLMD register to 0 allows to perform logical OR operation on all of the interrupt sources, outputting the interrupt request from the LINn interrupt.

Setting the LIOS bit in the RLN3nLMD register to 1 allows to output the LINn transmission interrupt, LINn successful reception interrupt, or LINn status interrupt depending on the interrupt request.

Table 25.27 lists the sources for each interrupt.

Table 25.27 Interrupt Sources

		LIOS bit in RLN3nLMD register is 0		LIOS bit in RLN3nLMD register is 1	
		LINn Interrupt	LINn Transmission Interrupt	LINn Successful Reception Interrupt	LINn Status Interrupt
LIN mode	LIN master mode	<ul style="list-style-type: none"> • Successful frame transmission • Successful frame reception • Successful wake-up transmission • Successful wake-up reception • Successful header transmission • Bit error • Physical bus error • Frame/response timeout error • Framing error • Checksum error • Response preparation error 	<ul style="list-style-type: none"> • Successful frame transmission • Successful wake-up transmission • Successful header transmission 	<ul style="list-style-type: none"> • Successful wake-up reception • Successful wake-up reception 	<ul style="list-style-type: none"> • Bit error • Physical bus error • Frame/response timeout error • Framing error • Checksum error • Response preparation error

Each interrupt request is output when the corresponding bit in the RLN3nLIE register is 1 (interrupt is enabled) and the corresponding flag in the RLN3nLST register is 1.

25.5 Modes

The LIN Interface provides the following three modes, depending upon the specific function to be performed:

- LIN reset mode
- LIN mode (LIN master mode)
- LIN self-test mode

The supply of clocks to the LIN Interface is stopped in LIN reset mode, which reduces power consumption.

Figure 25.2 shows mode transitions. Table 25.28 describes mode transition conditions. Table 25.29 lists operations available in each mode.

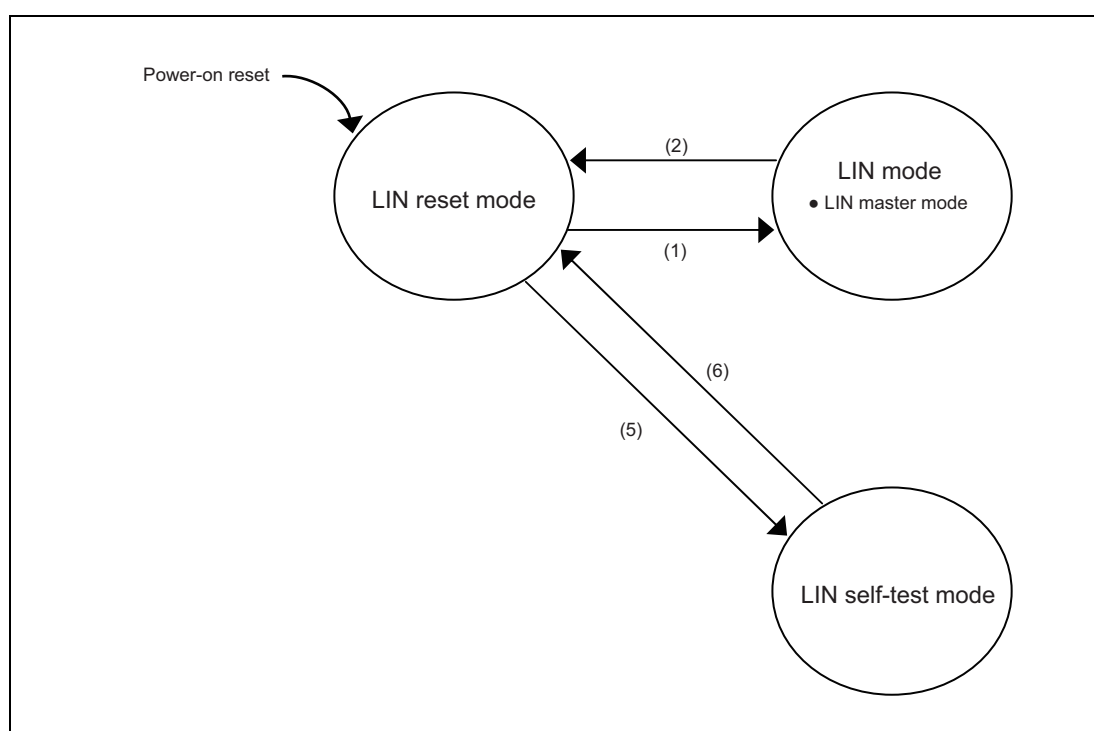

Figure 25.2 Mode Transitions

Table 25.28 Transition Condition of Each Mode

Mode transition	Transition condition
1 LIN reset mode → LIN mode (LIN master mode)	RLN3nLMD.LMD = 00 _B and RLN3nLCUC.OM1, OM0 = 01 _B or 11 _B
2 LIN mode → LIN reset mode	RLN3nLCUC.OM0 = 0 _B
5 LIN reset mode → LIN self-test mode	See Section 25.8, LIN Self-Test Mode.
6 LIN self-test mode → LIN reset mode	See Section 25.8, LIN Self-Test Mode.

Table 25.29 Operations Available in Each Mode

LIN mode	
LIN master mode	LIN self-test mode
Header transmission	Self test
Response transmission	
Response reception	
Wake-up transmission	
Wake-up reception	
Error detection	

Whether a transition has been caused to LIN reset mode or LIN mode can be verified by reading the LMD bits in the RLN3nLMD register or the OMM0 bit in the RLN3nLMST register.

For a description of the LIN self-test mode, see Section 25.8, LIN Self-Test Mode.

25.6 LIN Reset Mode

Setting the OM0 bit in the RLN3nLCUC register to 0 (LIN reset mode) causes a transition to LIN reset mode. The change to LIN reset mode can be verified by determining that the OMM0 bit in the RLN3nLMST register has been set to 0 (LIN reset mode). In this mode, the LIN communication function is halted.

When a DMA channel is activated by a LIN transfer request at the time of a transition to LIN reset mode, stop the channel.

For stopping a DMA channel, see Section 9., Direct Memory Access Controller.

From LIN reset mode, transitions to LIN mode and LIN self-test mode can be made.

When the mode changes to LIN reset mode, the following registers are initialized to their reset values, and as long as LIN reset mode is in effect, they retain their initial values.

- RLN3nLTRC register
- RLN3nLST register
- RLN3nLEST register

The following registers retain their previous values even when a transition to LIN reset mode is made:

- RLN3nLWBR register
- RLN3nLBRP0 register
- RLN3nLBRP1 register
- RLN3nLMD register
- RLN3nLBFC register
- RLN3nLSC register
- RLN3nLWUP register
- RLN3nLIE register
- RLN3nLEDE register
- RLN3nLDFC register
- RLN3nLIDB register
- RLN3nLCBR register
- RLN3nLDBRm register (m = 1 to 8)

25.7 LIN Mode

LIN mode can operate in the LIN master mode.

In LIN master mode, the following operations can be performed: header transmission, response transmission, response reception, wake-up transmission, wake-up reception, and error detection. In LIN reset mode, setting the LMD bits in the RLN3nLMD register to 00_B (LIN master mode) and the OM1 and OM0 bits in the RLN3nLCUC register to either 01_B or 11_B sets LIN master mode, turning the OMM1 and OMM0 bits in the RLN3nLMST register to either 01_B to 11_B.

The LIN mode provides the following two operation modes:

- LIN operation mode
- LIN wake-up mode

Figure 25.3 shows the transition of operation modes. Table 25.30 describes the transition conditions of operation modes.

Figure 25.3 Transition of Operation Modes

Table 25.30 Transition Conditions of Operation Modes

Operation mode transition		Transition condition
(1) LIN reset mode	→ LIN mode - LIN operation mode	RLN3nLMD.LMD = 00 _B and RLN3nLCUC.OM1, OM0 = 11 _B
(2) LIN reset mode	→ LIN mode - LIN wake-up mode	RLN3nLMD.LMD = 00 _B and RLN3nLCUC.OM1, OM0 = 01 _B
(3) LIN mode -LIN operation mode -LIN wake-up mode	→ LIN reset mode	RLN3nLCUC.OM0 = 0 _B
(4) LIN mode *1 -LIN operation mode	→ LIN mode - LIN wake-up mode	RLN3nLCUC.OM1, OM0 = 01 _B
(5) LIN mode *1 -LIN wake-up mode	→ LIN mode - LIN operation mode	RLN3nLCUC.OM1, OM0 = 11 _B

Note 1. Transition between LIN operation mode and LIN wake-up mode cannot be made when communication is going on (when the FTS bit in the RLN3nLTRC register is 1).

(1) LIN Operation Mode

In LIN operation mode, frame processing (header transmission, header reception, response transmission, response reception, and error detection) can be performed.

During a transition from LIN reset mode to LIN mode, setting the OM1 and OM0 bits in the RLN3nLCUC register to 11_B changes the mode to LIN operation mode, changing the OMM1 and OMM0 bits in the RLN3nLMST register to 11_B. Communication settings should be performed after the RLN3nLMST register has become 11_B.

(2) LIN Wake-up Mode

In LIN wake-up mode, wake-up signal processing (wake-up transmission, wake-up reception, and error detection) can be performed.

During a transition from LIN reset mode to LIN mode, setting the OM1 and OM0 bits in the RLN3nLCUC register to 01_B changes the mode to LIN wake-up mode, changing the OMM1 and OMM0 bits in the RLN3nLMST register to 01_B. Communication settings should be performed after the RLN3nLMST register has become 01_B.

25.7.1 LIN Master Mode

25.7.1.1 Header Transmission

Figure 25.4 shows the operation of the LIN Interface (LIN master mode) in header transmission. Table 25.31 provides processing in header transmission.

Figure 25.4 Operation in Header Transmission

Table 25.31 Processing in Header Transmission

Software processing	LIN Interface processing
(1) <ul style="list-style-type: none"> • Sets a baud rate • Sets noise filter ON/OFF • Enables interrupt • Enables error detection • Sets frame configuration parameters • Changes the LIN Interface to the LIN master mode: LIN operation mode • Sets information on the frame to be transmitted (ID, parity, data length, response direction, Checksum method, and transmission data) 	Waits for the setting of the FTS bit in the RLN3nLTRC register by software (idle)
(2) Sets the FTS bit in the RLN3nLTRC register to 1 (frame transmission or wake-up transmission/reception started)	Transmits a break.

(5)	<ul style="list-style-type: none"> Receives the checksum when the start bit is detected. Determines the checksum. Sets the successful frame/wake-up reception flag. Sets the RTS bit in the RLN3nLTRC register to 0 (response transmission/reception stopped).
(6) <ul style="list-style-type: none"> Processing after communication Reads the received data. Checks the RLN3nLST register, and clears flags. 	Idle

Note: For information about error detection, refer to Section 25.7.6, Error Status.

25.7.2 Data Transmission/Reception

25.7.2.1 Data Transmission

One bit of data is transmitted per 1 Tbit.

The data that is transmitted returns to the reception data input pin via the LIN transceiver. The received data and the transmitted data is compared bit by bit, and the results are stored in the BER flag in the RLIN3nLEST register (see Section 25.7.6, Error Status).

In LIN mater mode, 1 Tbit is generated to be 16 fLIN, and thus the sampling point for received data is at the 13th clock cycle (81.25% position).

Figure 25.7 shows an example of data transmission timing.

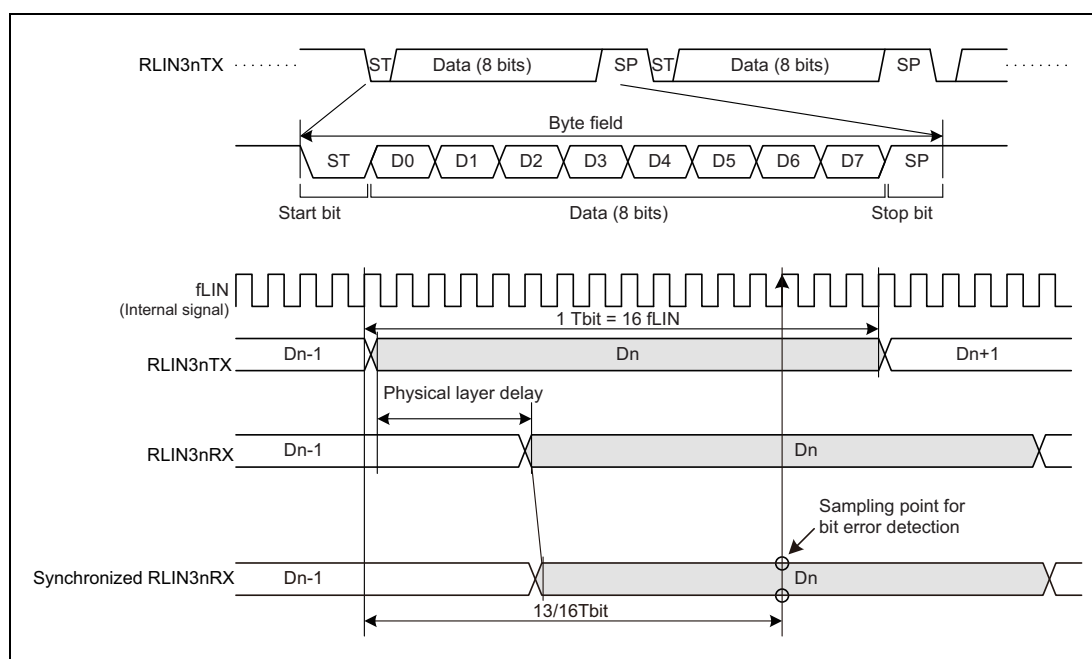

Figure 25.7 Example of Data Transmission Timing (LIN Master Mode)

25.7.2.2 Data Reception

Data reception is performed by using the synchronized RLIN3nRX signal (an internal signal) that is the input from the RLIN3nRX pin synchronized with prescaler clock.

The byte field is synchronized at the falling edge of the start bit for the synchronized RLIN3nRX signal. After the falling edge is detected, sampling is performed again a specified period of time later, and the falling edge is recognized as a start bit if the synchronized RLIN3nRX signal is low level. The falling edge is not recognized as a start bit if the RLIN3nRX signal after the clearing of the resetting is low-level-fixed or if a high level is detected on re-sampling.

After the start bit is detected, the system samples 1 bit per Tbit.

The LIN Interface has a noise filter function with respect to reception data. If the LRDNFS bit in the RLN3nLMD register is 0, the LIN Interface uses a noise filter, and for a sampling value the value determined by a 3-sampling majority rule on prescaler clocks is used. If the LRDNFS bit in the RLN3nLMD register is 1, the LIN Interface does not use a noise filter, and for a sampling value the value of the synchronized RLIN3nRX value at the sampling position is used as is.

Figure 25.8 shows an example of data reception timing.

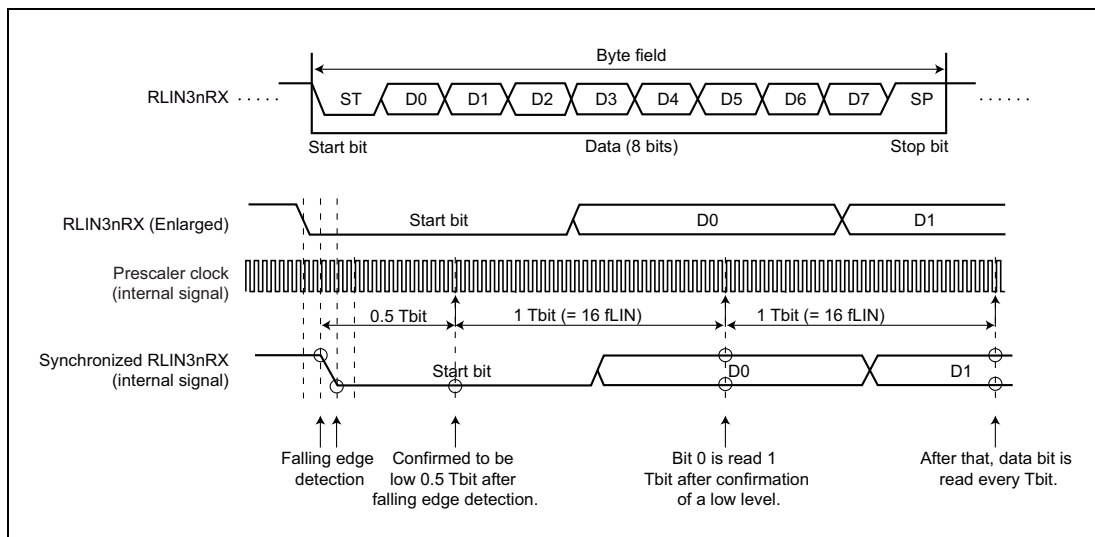

Figure 25.8 Example of Data Reception Timing

25.7.3 Transmission/Reception Data Buffering

This section explains the buffer processing that takes place when the LIN Interface sends or receives data continuously.

25.7.3.1 Transmission of LIN Frames

For an 8-byte transmission, the contents stored in registers RLN3nLDBR1 to RLN3nLDBR8 are sequentially transmitted to data areas 1 to 8 of the LIN frame. In the case of a 4-bytes transmission, the contents stored in registers RLN3nLDBR1 to RLN3nLDBR4 are transmitted to data areas 1 to 4 of the LIN frame, but the contents of registers RLN3nLDBR5 to RLN3nLDBR8 are not transmitted. The transmitted checksum data is stored in the RLN3nLCBR register.

Figure 25.9 depicts the LIN transmission processing and the required buffer.

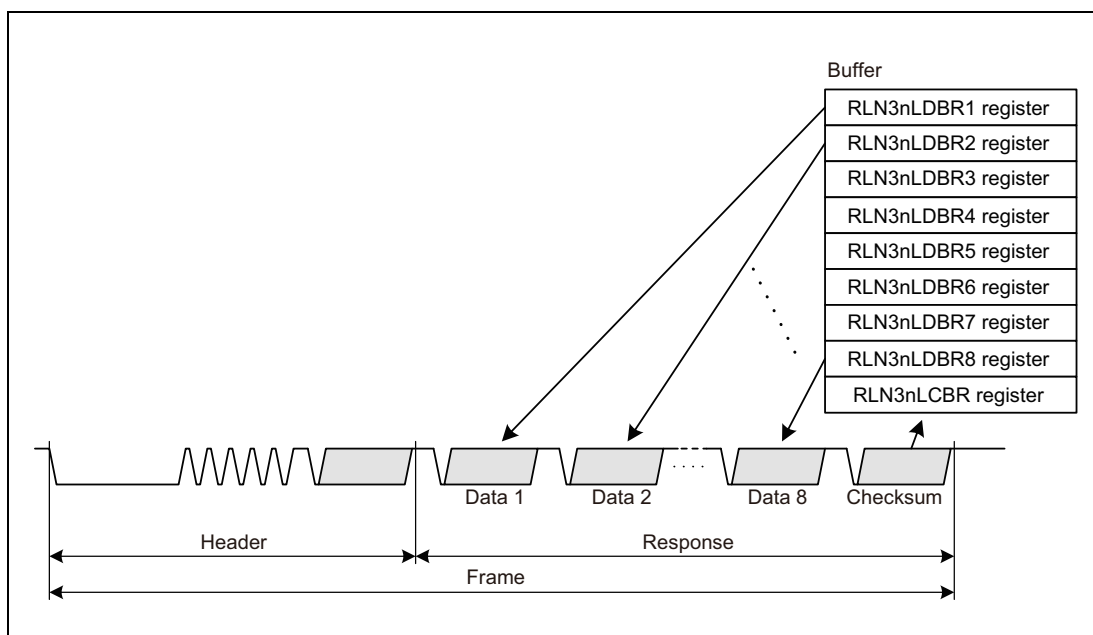

Figure 25.9 LIN Transmission Processing and Required Buffer

(1) Frame Separate Mode

Setting the FSM bit in the RLN3nLDFC register to 1 turns on the frame separate mode.

In frame separate mode, a header and a response are transmitted when prompted by separate transmission start requests.

When the transmission of a header is finished, the HTRC flag in the RLN3nLST register turns 1 (successful header transmission).

Use frame separate mode when sending or receiving response data of 9 bytes or greater in LIN master mode.

25.7.3.2 Reception of LIN Frames

For an 8-byte reception, the contents of data areas 1 to 8 of the LIN frame is stored in registers RLN3nRLN3nLDBR1 to RLN3nLDBR8, respectively, upon receipt of a stop bit. In the case of a 4-byte reception, the contents of data areas 1 to 4 of the LIN frame are stored in registers RLN3nLDBR1 to RLN3nLDBR4, respectively; however, no data is stored in registers RLN3nLDBR5 to RLN3nLDBR8. Also, the received checksum data is stored in the RLN3nLCBR register.

Figure 25.10 depicts the LIN reception processing and the required buffer.

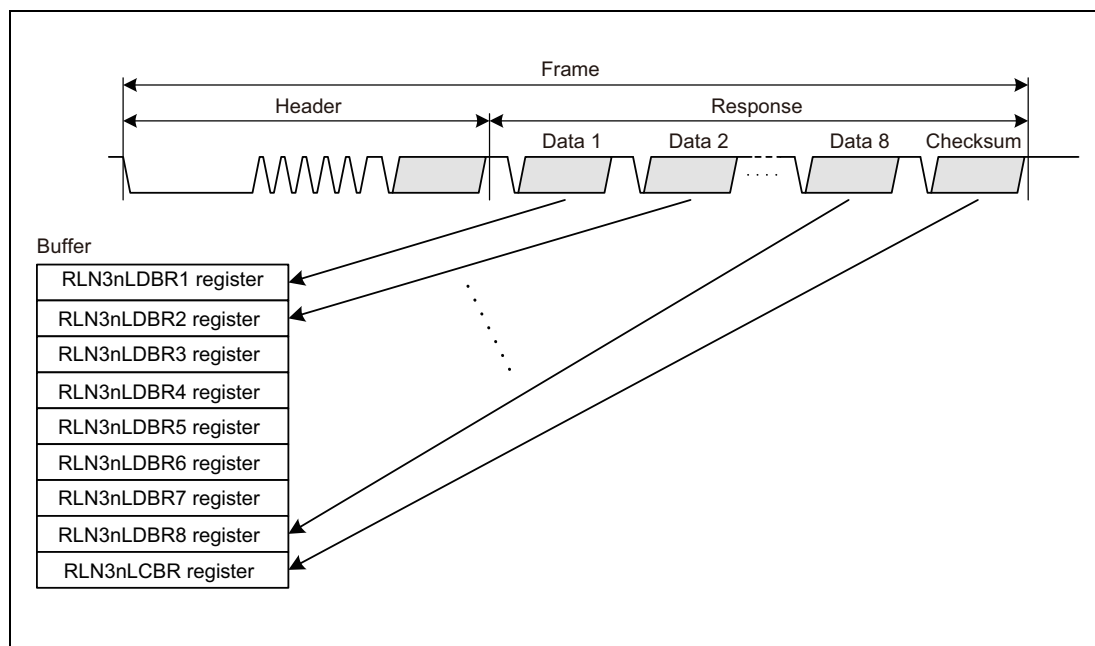

Figure 25.10 LIN Reception Processing and Required Buffer

(1) Reception of Data 1

When the reception of the first byte of data is finished, the D1RC flag in the RLN3nLST register turns 1 (successful data 1 reception).

25.7.3.3 Multi-Byte Response Transmission/Reception Function

Normally in LIN communications, a response is 9 bytes or less including a checksum field; however, responses in 10 bytes or greater can also be sent and received.

In such a case, the bit error, framing error, response preparation error detection, and auto checksum functions are enabled.

If the data length is greater than 8 bytes, the LSS bit in RLN3nLDFC register should be set to 1 (indicating that the next data group to be sent or received is not the final data group) in the first data group (variable in 0 to 8 bytes) before sending or receiving the data group. After the transmission or reception, the user should determine whether the next data group is the final data group. If it is the final data group, the LSS bit should be set to 0 (indicating that the next data group to be sent or received is the final data group, and a checksum should be appended to the final data group).

By changing the RFDL bit in RLN3nLDFC register settings when the RTS bit in RLN3nLTRC register is 0, the user can change the data length for each data group.

When performing multi-byte response transmission/reception in LIN master mode, set the FSM bit in RLN3nLDFC register in the RLN3nLDFC register to 1 (frame separate mode).

25.7.4 Wake-up Transmission/Reception

The wake-up transmission/reception can be used in LIN wake-up mode.

25.7.4.1 Wake-up Transmission

In LIN wake-up mode, setting the RCDS bit in the RLN3nLDFC register to 1 (transmission) and the FTS bit in the RLN3nLTRC register to 1 (header reception or wake-up transmission/reception started) causes a wake-up signal to be output from the output pin. The low level width of the wake-up signal should be set using the WUTL[3:0] bits in the RLN3nLWUP register.

However, if the LWBR0 bit of the RLN3nLWBR register is 1 (LIN2.x use), the LIN system clock (fLIN) becomes low level width at fa regardless of the setting of the LCKS bit of the RLN3nLMD register.

By setting the baud rate to 19200 bps while fa is selected and the WUTL[3:0] bits of the RLN3nLWUP register to 0100_B (5 Tbits), 260 μs low width can be output in LIN wake-up mode regardless of the setting of the LCKS bit of the RLN3nLMD register.

If a wake-up low is output without any bit error, the FTC flag in the RLN3nLST register turns 1 (successful frame response or wake-up transmission); when the FTCIE bit in the RLN3nLIE register is 1 (successful frame response/wakeup transmission interrupt enabled), an interrupt request is generated.

If RLN3nLEDE.BERE is set and a bit error is detected, wake-up transmission is canceled and the BER flag in the RLN3nLEST register is set to 1 (bit error detection).

When RLN3nLEDE.PBERE is set, set RLN3nLEST.PBER flag to 1 (physical bus error detection) at the same time of a bit error.

Figure 25.11 shows the wake-up transmission timing.

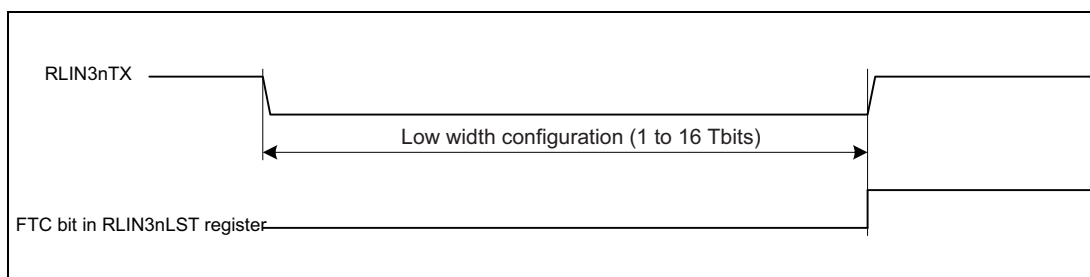

Figure 25.11 Wake-up Transmission Timing

25.7.4.2 Wake-up Reception

The detection of a wake-up involves the use of an input signal low level width count function.

The input signal low level width count function measures the low width of the input signal to the RLIN3nTX pin, using the same sampling point as data reception. The function can measure the input signal low level width of 2.5 Tbits or greater.

By setting the LWBR0 bit in the RLN3nLWBR register, operation is executed without changing the baud rate generator setting at a transition between LIN operation mode and LIN wake-up mode.

When LIN Specification Package Revision 1.3 is used, set the LWBR0 bit in the RLN3nLWBR register to 0. When LIN Specification Package Revision 2.x is used, set the LWBR0 bit to 1. Setting the LWBR0 bit to 1 selects the LIN system clock (fLIN) to fa regardless of the setting of the LCKS bit in the RLN3nLMD register. (The LCKS bit is not changed). By setting the baud rate to 19200 bps while fa is selected, the 130 μs or longer low-level width of the input signal to be measured regardless of the setting of the LCKS bit in the RLN3nLMD register.

When using the wake-up reception function, in LIN wake-up mode set the RFT bit in the RLN3nLDFC register to 0 (response reception), and then the FTS bit in the RLN3nLTRC register to 1 (frame transmission (header reception) or wake-up transmission/reception started).

When the low level width to be measured is reached, the FRC flag in the RLN3nLST register turns 1 (successful frame response/wake-up reception). If the FRCIE bit in the RLN3nLIE register is 1 (successful frame response or wake-up reception interrupt enabled), an interrupt request for successful LINn reception is generated.

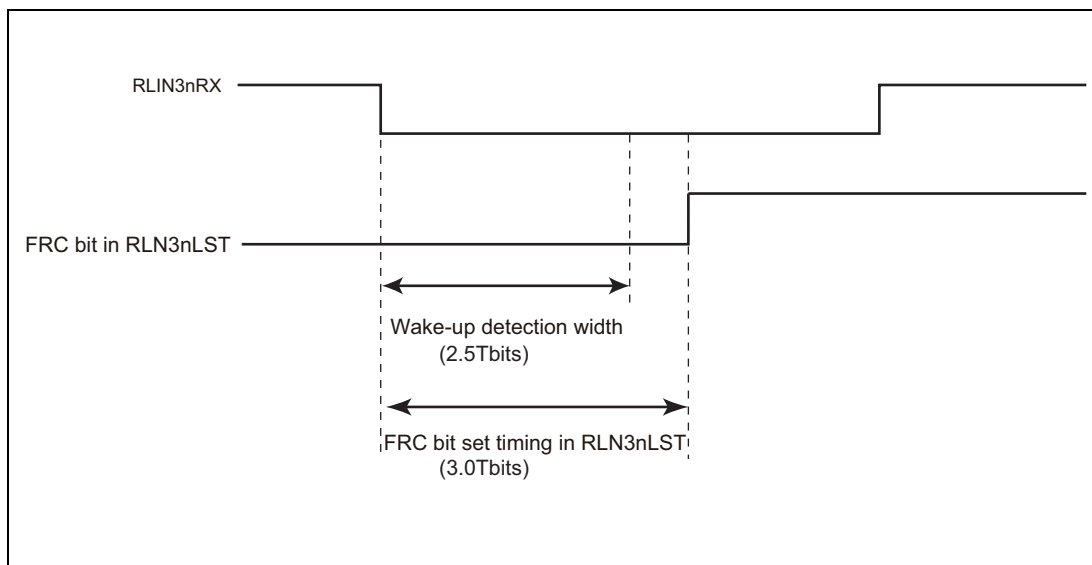

Figure 25.12 Input Signal Low level Count Function

25.7.4.3 Wakeup Collision

If the master node and the slave node transmit wakeup signals simultaneously, a collision will occur on the LIN bus, though a collision of wakeup signals is not detected in the LIN interface.

25.7.5 Status

During LIN mode operation, the LIN Interface can detect seven types of statuses.

The four statuses, successful frame/wake-up transmission, successful frame/wake-up reception, error detection, successful header transmission/header reception, can generate interrupt requests.

Table 25.34 shows the types of statuses available in LIN master mode.

Table 25.34 Types of Statuses in LIN Master Mode

Status	Status set condition	Status clear condition	Operation mode capable of status detection	Corresponding bit	Interrupt
Reset	After the OM0 bit in the RLN3nLCUC register is set to LIN reset mode (OM0 = 0), if the LIN Interface enters LIN reset mode.	After the OM0 bit in the RLN3nLCUC register is set to 0 (LIN reset mode is canceled), if LIN reset mode is canceled.	All modes	OMM0 bit in RLN3nLMST register	—
Operation mode	After the OM1 bit in the RLN3nLCUC register is set to LIN operation mode, if actually the LIN Interface enters LIN operation mode.	After the OM1 bit in the RLN3nLCUC register is set to LIN wake-up mode, if actually the LIN Interface enters LIN wake-up mode.	<ul style="list-style-type: none"> LIN operation mode LIN wake-up mode 	OMM1 bit in RLN3nLMST register	—
Frame/wake-up transmission end	When a frame (header transmission + response transmission), a wake-up signal, or a data group is transmitted successfully.	<ul style="list-style-type: none"> When another communication is started (When the FTS bit in the RLN3nLTRC register is set) When cleared by software After transition to LIN reset mode 	<ul style="list-style-type: none"> LIN operation mode LIN wake-up mode 	FTC flag in RLN3nLST register	√
Frame/wake-up reception end	When a frame (header transmission + response reception), a wake-up signal, or a data group is received successfully.	<ul style="list-style-type: none"> When another communication is started (When the FTS bit in the RLN3nLTRC register is set) When cleared by software After transition to LIN reset mode 	<ul style="list-style-type: none"> LIN operation mode LIN wake-up mode 	FRC flag in RLN3nLST register	√
Error detection	If any of the RPER flag, CSER flag, FER flag, FTER flag, PBER flag, and BER flags in the RLN3nLEST register turns 1 (error detected).	<ul style="list-style-type: none"> When another communication is started (When the FTS bit in the RLN3nLTRC register is set) When cleared by software After transition to LIN reset mode 	<ul style="list-style-type: none"> LIN operation mode LIN wake-up mode 	ERR flag in RLN3nLST register	√
Data 1 reception end	The RFT bit in the RLN3nLDFC register is 0 (reception) and the first byte of the response field or the first byte of each data group is received.*2	<ul style="list-style-type: none"> When another communication is started (When the FTS bit in the RLN3nLTRC register is set) When cleared by software After transition to LIN reset mode 	LIN operation mode	D1RC flag in RLN3nLST register	—
Header transmission end	When a header field is transmitted successfully.	<ul style="list-style-type: none"> When another communication is started When cleared by software After transition to LIN reset mode 	LIN operation mode	HTRC flag in RLN3nLST register	√

Note 1. In LIN operation mode, the ERR flag in the RLN3nLST register is cleared to 0 by writing 0 to the RPER flag, CSER flag, FER flag, FTER flag, PBER flag or BER flags in the RLN3nLEST register.

Note 2. Not detected when the RFDL [3:0] bits in the RLN3nLDFC register are 0000_B (0-byte + checksum).

25.7.6 Error Status

25.7.6.1 LIN Master Mode

(1) Types of Error Statuses

The LIN Interface can detect six types of error statuses in LIN master mode. The condition of these error statuses can be checked by means of the corresponding bits in the RLN3nLEST register.

All error statuses represent interrupt events.

Table 25.35 shows the types of error statuses.

Table 25.35 Types of Error Statuses in LIN Master Mode

Status	Error detection condition	Operation mode capable of error detection	Communication	Enable/disable detection	Corresponding bit
Bit error	The transmitted data and the data on the LIN bus monitored by the receive pin do not match*1*2	<ul style="list-style-type: none"> LIN operation mode LIN wake-up mode 	Cancel	√	BER flag in RLN3nLEST register
Physical bus error	<ul style="list-style-type: none"> LIN bus is detected to be high level when sending a break LIN bus is detected to be low level when sending a break delimiter LIN bus is detected to be high level when sending a wake-up 	<ul style="list-style-type: none"> LIN operation mode LIN wake-up mode 	Cancel	√	PBER flag in RLN3nLEST register
Timeout error	A frame or response transmission/reception does not terminate within a given time*3	LIN operation mode	Cancel	√	FTER flag in RLN3nLEST register
Framing error	In response field reception, a stop bit of each data byte is low level	LIN operation mode	Cancel	√	FER flag in RLN3nLEST register
Checksum error	In response field reception, the result of checksum test gives an error	LIN operation mode	—	×	CSER flag in RLN3nLEST register
Response preparation error	<p>One of the following conditions occurs in frame separate mode during a multi-byte response reception:</p> <ul style="list-style-type: none"> The first reception data byte is received after completion of header transmission but before a response transmission/reception request is set The first reception data byte is received after the completion of previous data group reception before a transmission/reception request for another data group is set 	LIN operation mode	Cancel	×	RPER flag in RLN3nLEST register

Note 1. If a bit error is detected, the process is canceled after a stop bit is sent. If a bit error is detected in a non-data area, such as an inter-byte space, the transmission is canceled immediately after that area. If a bit error is detected during the transmission of a wake-up, the transmission of the wake-up is canceled after the error-causing bit is sent.

Note 2. In a multi-byte response transmission, bit errors are detected also between data groups.

Note 3. The timeout time depends on the response field data length (the RFDL [3:0] bits in the RLN3nLDFC register) and the checksum selection (the CSM bit in the RLN3nLDFC register), and this can be calculated according to the following formula.

When the setting of the FSM bit in the RLN3nLDFC register is 1 (i.e., frame separation mode), the timeout time is that for eight bytes until the RTS bit of the RLN3nLTRC register is set. Once the RTS bit is set, the timeout time is re-set to the time based on the response field data length (the RFDL[3:0] bits in the RLN3nLDFC register).

[Frame timeout]

On classic selection (when the CSM bit in RLN3nLDFC is 0):

Timeout time = 49 + (number of data bytes + 1) × 14 [Tbit]

On enhanced selection (when the CSM bit in RLN3nLDFC is 1):
 Timeout time = $48 + (\text{number of data bytes} + 1) \times 14$ [Tbit]
 The aforementioned timeout time is a time greater than the TFRAME_MAX of LIN Specification Package Revision 1.3 on classic selection, or the TFRAME_MAX of LIN Specification Package Revision 2.x on enhanced selection.
 [Response timeout]
 Timeout time = $(\text{number of data bytes} + 1) \times 14$ [Tbit]
 When an error is detected, time-out error detection function stops.

The error status is cleared when the next communication is started (when the FTS bit in the RLN3nLTRC register is set), by software, or at a transition to LIN reset mode.

(2) Target Time Area for LIN Error Detection

Figure 25.13 shows the time domain in which the LIN Interface in master mode performs monitoring for error detection.

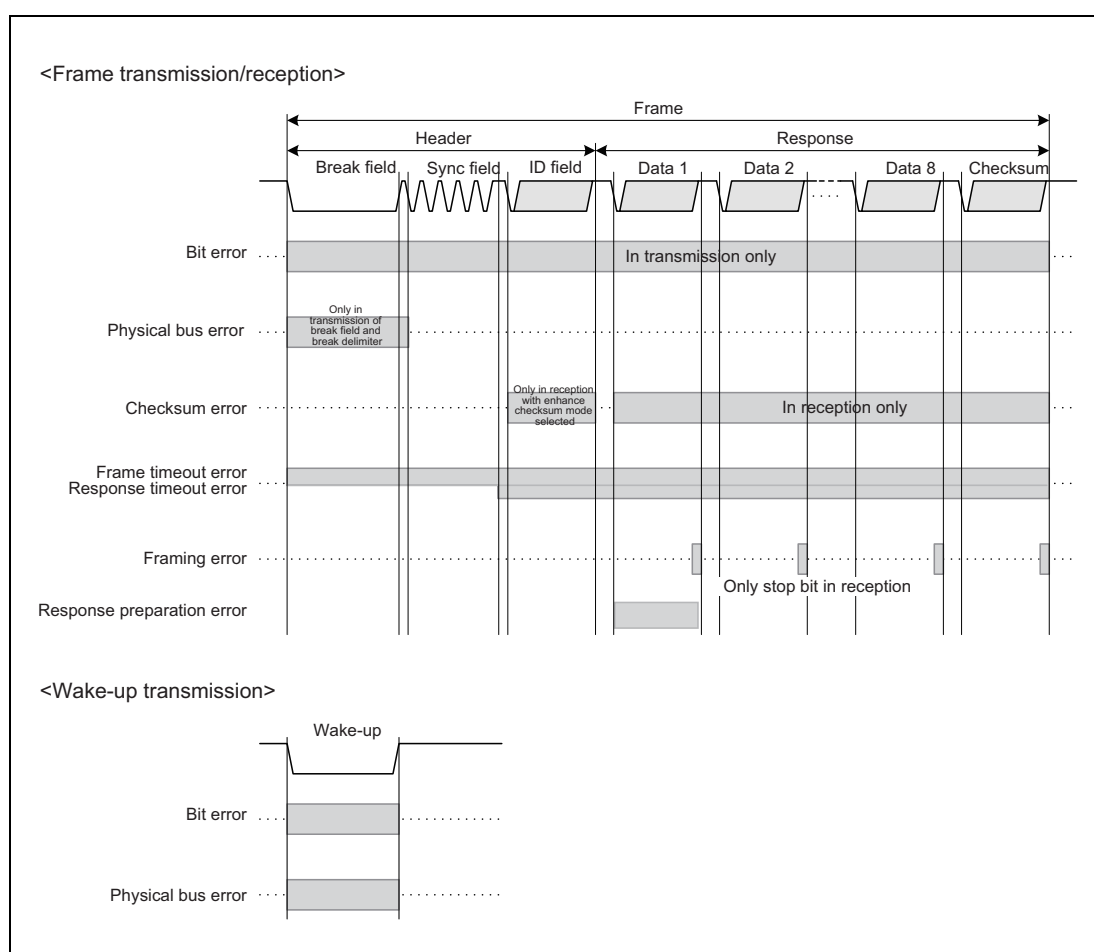

Figure 25.13 Target Time Area for LIN Error Detection (LIN Master Mode)

25.8 LIN Self-Test Mode

When the LIN interface enters the LIN self-test mode, RLIN3nTX and RLIN3nRX are disconnected from external pins and RLIN3nTX and RLIN3nRX are connected in the LIN interface. Therefore, the frame transmitted from RLIN3nTX is looped back to RLIN3nRX.

The LIN self-test mode can perform tests exclusively in LIN mode.

The self-test can be performed in the following two types.

- LIN master self-test mode (transmission): Header transmission and response transmission
- LIN master self-test mode (reception): Header transmission and response reception

In LIN self-test mode, the operate is at the fastest baud rate, regardless of the setting of the baud rate generator,

Regardless of the setting of the baud rate related registers, the baud rate operates at the LIN communication clock source/16 [bps]. (The NSPB bits in the RLN3nLWBR register should be set to 0000_B or 1111_B.)

(The LPRS bits in the RLN3nLWBR register should be set to 000_B.)

In addition, in LIN self-mode, the following functions are not supported.

- LIN wake-up mode
- Frame separate mode
- Multi-byte response transmission/reception
- Frame/response timeout error

Figure 25.14 Connection in LIN Reset Mode and LIN Mode

Figure 25.15 Connection in LIN Self-Test Mode

25.8.1 Change to LIN Self-Test Mode

Writing to the RLN3nLSTC register makes a transition to the LIN self-test mode.

When the LSTM bit in the RLN3nLSTC register is set to 1, the shift to the LIN self-test mode is checked.

When changing to LIN self-test mode, be sure to execute a specific sequence. In that sequence, information must be written three times consecutively to the LIN self-test control register, as follows:

- Change to LIN reset mode
 - Set the OM0 bit in the RLN3nLCUC register to 0 (LIN reset mode).
 - Read the OMM0 bit in the RLN3nLMST register; verify that it is 0 (LIN reset mode).
- Select a LIN mode
 - LMD bits in RLN3nLMD = 00_B (LIN master mode)
- 1st write: RLN3nLSTC register = 1010 0111_B (A7_H)
- 2nd write: RLN3nLSTC register = 0101 1000_B (58_H)
- 3rd write: RLN3nLSTC register = 0000 0001_B (01_H)
- Verify the transition to LIN self-test mode
 - Read the LSTM bit in the RLN3nLSTC register; verify that it is 1 (LIN self-test mode).

If the key of the first write (A7_H) is written twice by mistake, the transition to LIN self-test mode is canceled. The above sequence should be retried from the step of first write. In addition, if a write to another LIN-related register is performed during transition to LIN self-test mode (three consecutive write operations to the RLN3nLSTC register), the transition is also canceled.

25.8.2 Transmission in LIN Master Self-Test Mode

To execute a self-test on LIN master transmission, perform the procedure below:

- Set the baud rate, noise filter, and interrupt output related registers.
 RLN3nLWBR register = 0000000xB
 RLN3nLBRP0 register = xxxxxxxxB*¹
 RLN3nLBRP1 register = xxxxxxxxB*¹
 RLN3nLMD register = 00xxx00B*¹
- Set the interrupt enable and error enable related registers.
 RLN3nLIE register = 0000xxxxB*²
 RLN3nLEDE register = x000x0xxxB
- Set the break field and space related registers.
 RLN3nLBFC register = 00xxxxxB
 RLN3nLSC register = 00xx0xxxB
- Cancel the LIN reset mode.
 Write 11_B to the OM1 and OM0 bits in the RLN3nLCUC register, and check that the OMM1 and OMM0 bits in the RLN3nLMST register are 11_B.
- Set the transmit frame related registers.
 RLN3nLDFC register = 00x1xxxxB
 RLN3nLIDB register = xxxxxxxxB
 RLN3nLDRB1 to RLN3nLDRB8 registers = xxxxxxxxB
- Header transmission → response transmission started
 Set the FTS bit in the RLN3nLTRC register to 1 (frame transmission or wake-up transmission/reception started).
 The LIN master self-test mode (transmission) is executed. In this mode, interrupts are generated, and status and error status are also updated. The checksum is automatically calculated by the LIN interface. To suspend the LIN master self-test mode (transmission) being executed, write 0 (LIN reset mode) to the OM0 bit in the RLN3nLCUC register for transition to LIN reset mode.
- When the transmission is completed, the reversed value of the looped-back frame data is stored in the RLN3nLIDB, RLN3nLDBRm (m = 1 to 8), and RLN3nLCBR registers (the data is reversed before being stored because the transmitted value should be compared with the looped-back value). Then, the FTS bit in the RLN3nLTRC register is cleared.
- If the transmission fails to complete due to an error, the applicable error flag is set and the FTS bit in the RLN3nLTRC register is cleared.

Note: x: Don't care

Note 1. The following register settings are not reflected to the operation of the LIN self-test mode: the RLN3nLBRP0 register, the RLN3nLBRP1 register, and the LCKS bit in the RLN3nLMD register. Therefore, those settings are not necessary.

Note 2. When the successful header transmission interrupt and the successful frame transmission interrupt are used in the same interrupt processing, if the software processing of the successful header transmission interrupt is not completed before the generation of the successful frame transmission interrupt, the SHIE bit in the RLN3nLIE register should not be set to 1 (successful header transmission interrupt enabled). The time required from the set of the successful header transmission flag to the set of the successful frame/wake-up transmission flag is calculated by the following formula.

$$10 \times (\text{number of data bytes} + 1) [\text{Tbit}]$$

$$1 \text{ Tbit} = \text{LIN communication clock source} \times 16$$

25.8.3 Reception in LIN Master Self-Test Mode

To execute a self-test on LIN master reception, perform the procedure below:

- Set the baud rate, noise filter, and interrupt output related registers.
 - RLN3nLWBR register = 0000000x_B
 - RLN3nLBRP0 register = xxxxxxxx_B^{*1}
 - RLN3nLBRP1 register = xxxxxxxx_B^{*1}
 - RLN3nLMD register = 00xxxx00_B^{*1}
- Set the interrupt enable and error enable related registers.
 - RLN3nLIE register = 0000xxxx_B^{*2}
 - RLN3nLEDE register = x000x0xx_B
- Set the break field and space related registers.
 - RLN3nLBFC register = 00xxxxxx_B
 - RLN3nLSC register = 00xx0xxx_B^{*1}
- Cancel the LIN reset mode.

Write 11_B to the OM1 and OM0 bits in the RLN3nLCUC register, and check that the OMM1 and OMM0 bits in the RLN3nLMST register are 11_B.
- Set the reception frame related registers.
 - RLN3nLDFC register = 00x0xxxx_B^{*3}
 - RLN3nLIDB register = xxxxxxxx_B
 - RLN3nLDBR1 to RLN3nLDBR8 registers = xxxxxxxx_B
 - RLN3nLCBR register = xxxxxxxx_B

Since the checksum value to be transmitted is not automatically calculated, set the calculation value to the RLN3nLCBR register. If an incorrect checksum is set at this time, the checksum error can be tested.
- Header transmission → response reception started

Set the FTS bit in the RLN3nLTRC register to 1 (frame transmission or wake-up transmission/reception started).

The LIN master self-test mode (reception) is executed. In this mode, interrupts are generated, and status and error status are also updated. To suspend the LIN master self-test mode (reception) being executed, write 0 (LIN reset mode) to the OM0 bit in the RLN3nLCUC register for transition to LIN reset mode.
- When the reception is completed, the reversed value of the looped-back frame data is stored in the RLN3nLIDB, RLN3nLDBRm (m = 1 to 8), and RLN3nLCBR registers (the data is reversed before being stored because the set value should be compared with the looped-back value). Then, the FTS bit in the RLN3nLTRC register is cleared.
- If the reception fails to complete due to an error, the applicable error flag is set and the FTS bit in the RLN3nLTRC register is cleared.

Note: x: Don't care

Note 1. The following register settings are not reflected to the operation of the LIN self-test mode: the RLN3nLBRP0 register, the RLN3nLBRP1 register, the LCKS bit in the RLN3nLMD register, and the IBS bit in the RLN3nLSC register. Therefore, those settings are not necessary.

Note 2. When the successful header transmission interrupt and the successful frame reception interrupt are used in the same interrupt processing, if the software processing of the successful header transmission interrupt is not completed before the generation of the successful frame reception interrupt, the SHIE bit in the RLN3nLIE register should not be set to 1 (successful header transmission interrupt enabled).

The time required from the set of the successful header transmission flag to the set of the successful frame/wake-up reception flag is calculated by the following formula.

$$10 \times (\text{number of data bytes} + 1) [\text{Tbit}]$$

$$1 \text{ Tbit} = \text{LIN communication clock source} \times 16$$

Note 3. When the reception is in self-test mode, be sure to set the response field length (RFDL bits) to at least 1 byte.

25.8.4 Terminating LIN Self-Test Mode

To terminate LIN self-test mode, perform the procedure below:

- Write 0 (LIN reset mode) to the OM0 bit in the RLN3nLCUC register.
If the OMM1 and OMM0 bits in the RLN3nLMST register are not 11_B, write 11_B to the OM1 and OM0 bits in the RLN3nLCUC register. After confirming that the OMM1 and OMM0 bits in the RLN3nLMST register have turned 11_B, change to LIN reset mode.
- Verify the cancelation of LIN self-test mode.
Read the LSTM bit in the RLN3nLSTC register; confirm that it is not 0 (not in LIN self-test)
- Verify the transition to LIN reset mode.
Read the OMM0 bit in the RLN3nLMST register; verify that it is 0 (LIN reset mode).

25.9 Baud Rate Generator

The prescaler clock is obtained by frequency-dividing the LIN communication clock source by the prescaler, and the LIN system clock (fLIN) is obtained by frequency-dividing the prescaler clock by the baud rate generator. The clock obtained by frequency-dividing the LIN system clock (fLIN) by the number of samples is the baud rate. The reciprocal of this baud rate is called the bit time (Tbit).

The LIN Interface has two kinds of baud rate generators. The baud rate generators switch over according to the mode used.

25.9.1 LIN Master Mode

Figure 25.16 shows a block diagram of baud rate generation in LIN master mode.

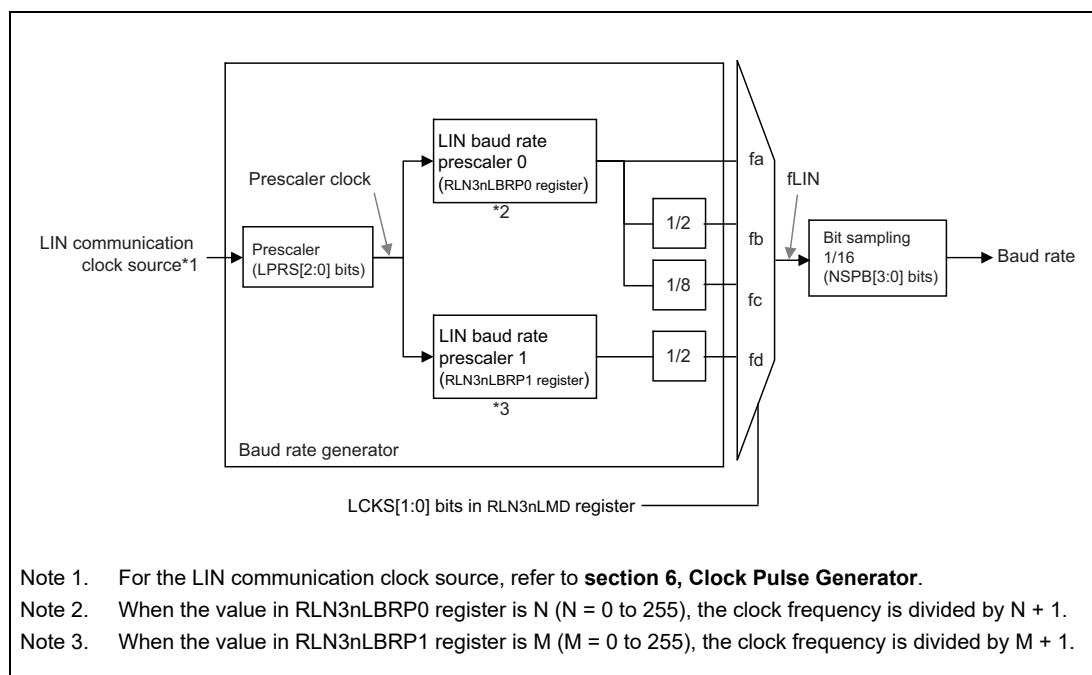

Figure 25.16 Block Diagram of Baud Rate Generation in LIN Master Mode

By setting the RLN3nLBRP0 register so that fa is 307200 Hz (= 19200 × 16), the resulting bit rates are fa = 19200 × 16, fb = 9600 × 16 and fc = 2400 × 16. These bit rates are frequency-divided by 16 in the bit timing generator, enabling bit rates of 19200 bps, 9600 bps and 2400 bps to be generated. Also, by setting the RLN3nLBRP1 register so that fd is 166672 Hz (= 10417 × 16), the resulting bit rate is fd = 10417 × 16. This bit rate is frequency-divided by 16 in the bit timing generator, enabling 10417 bps to be generated.

The equation for calculating the baud rate is given below.

Baud rate of LIN master

$$\begin{aligned}
 &= \{\text{Frequency of LIN communication clock source}\} \times (\text{RLN3nLWBR.LPRS}[2:0] \text{ selection clock}) \\
 &\quad \div (\text{RLN3nLBRP0} + 1) \div 16 \text{ [bps]} \text{ (When } f_a \text{ is selected for } f_{\text{LIN}}) \\
 &= \{\text{Frequency of LIN communication clock source}\} \times (\text{RLN3nLWBR.LPRS}[2:0] \text{ selection clock}) \\
 &\quad \div (\text{RLN3nLBRP0} + 1) \div 2 \div 16 \text{ [bps]} \text{ (When } f_b \text{ is selected for } f_{\text{LIN}}) \\
 &= \{\text{Frequency of LIN communication clock source}\} \times (\text{RLN3nLWBR.LPRS}[2:0] \text{ selection clock}) \\
 &\quad \div (\text{RLN3nLBRP0} + 1) \div 8 \div 16 \text{ [bps]} \text{ (When } f_c \text{ is selected for } f_{\text{LIN}})
 \end{aligned}$$

$$= \{\text{Frequency of LIN communication clock source}\} \times (\text{RLN3nLWBR.LPRS}[2:0] \text{ selection clock}) \\ \div (\text{RLN3nLBRP1} + 1) \div 2 \div 16 \text{ [bps]} \text{ (When fd is selected for fLIN)}$$

25.9.2 Noise Filter

The LIN Interface has a noise filter for reducing erroneous receiving of data due to noise. By setting the LRDNFS bit in the RLN3nLMD register to 0 (to use the noise filter), the noise filter is activated. The noise filter samples the level of the synchronized RLIN3nRX with the prescaler clock, and outputs the sampling value determined by a 3-sampling majority rule. The value of each bit of the receive data is determined based on the noise filter output.

Figure 25.17 shows the configuration of the noise filter, Figure 25.18 an example of a noise filter circuit, and Figure 25.19 the determination of the received data when the noise filter is used.

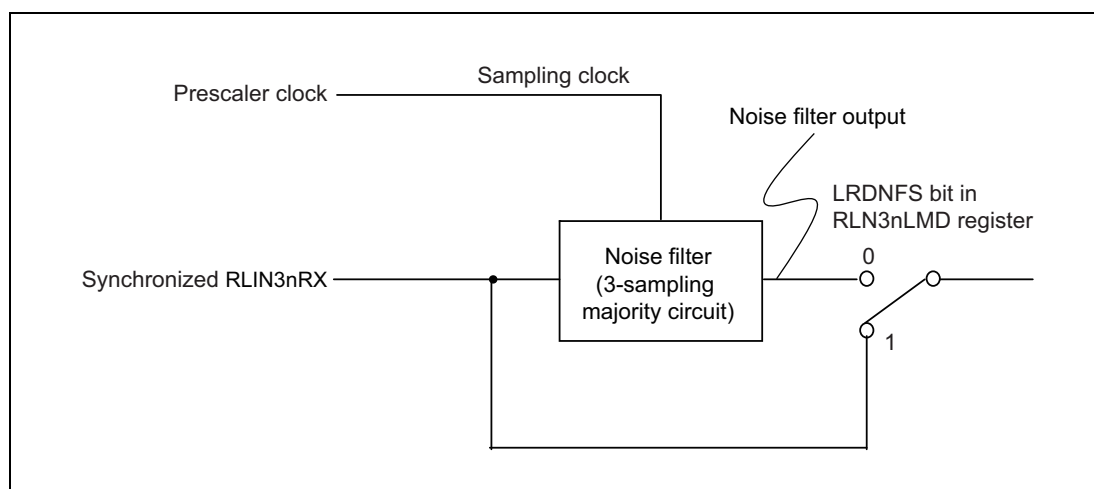

Figure 25.17 Configuration of Noise Filter

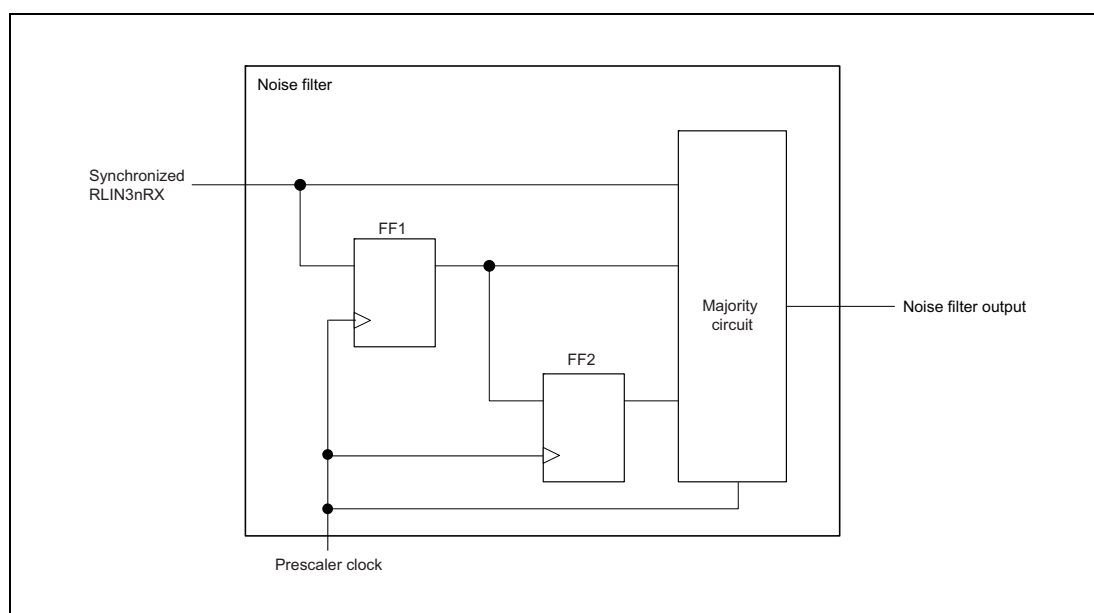

Figure 25.18 Example of Noise Filter Circuit

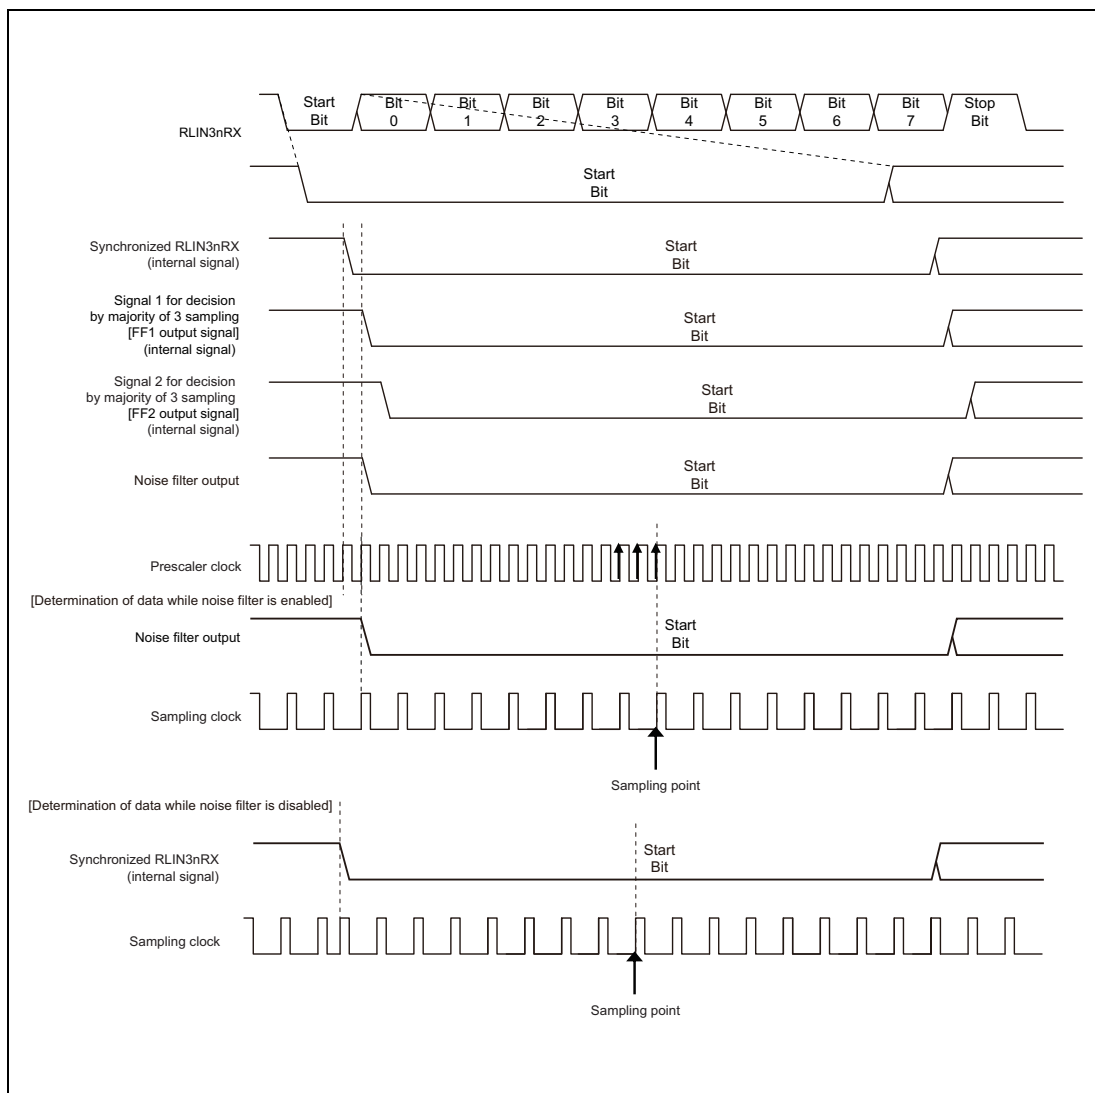

Figure 25.19 Determination of Received Data when Noise Filter is Used

26. Ethernet Controller

This LSI has an on-chip Ethernet controller (ETHER) conforming to the Ethernet or the IEEE802.3 MAC (Media Access Control) layer standard. Connecting a physical-layer LSI (PHY-LSI) complying with this standard enables the ETHER to perform transmission and reception of Ethernet/IEEE802.3 frames. The Ethernet controller in this LSI has one MAC layer interface port, which can be made to perform transmission and reception independently.

The ETHER can transfer the transmitted or received Ethernet frame data to and from the transmit/receive buffer in the memory at high speed using a dedicated direct memory access controller (E-DMAC).

26.1 Features

- MAC (Media Access Control) function
 - Constructs/deconstructs data frames (frame format conforming to IEEE802.3, 2000 Edition)
 - Supports transfer at 10 and 100 Mbps
 - Supports full-duplex mode
 - One channel (ETHER0)
 - Flow control conforming to IEEE802.3x
 - Supports one PHY interface conforming to IEEE802.3
 - MII (Media Independent Interface)
 - Upward protocol support (checksum) function
- E-DMAC (Direct Memory Access Controller for Ethernet controller) function
 - Data transfer between ETHER and external/internal memory
 - One channel
 - 32-byte burst transfer
 - Supports single-frame/single-descriptor operation and single-frame/multi-descriptor (multi-buffer) operation
 - Transfer data width: 32 bits
 - Transmit/receive FIFO (for transmission: 2 Kbytes, for reception: 4 Kbytes)
 - Function for calculating the intelligent checksum value

Figure 26.1 shows the configuration of the ETHER.

Figure 26.1 Configuration of ETHER

26.2 Input/Output Pins

Table 26.1 lists the pin configuration of the ETHER.

Table 26.1 Pin Configuration

Name	Abbreviation	I/O	Function
Transmit clock	ET_TXCLK*1	Input	ET_TXEN, ET_TXD[3:0] timing reference signal
Transmit enable	ET_TXEN*1	Output	Indicates that transmit data is ready on ET_TXD[3:0]
MII transmit data	ET_TXD[3:0]*1	Output	MII transmit data
Collision detection	ET_COL*1	Input	Collision detection signal
Transmit error	ET_TXER*1	Output	Not asserted in the ETHER
Receive clock	ET_RXCLK*1	Input	ET_RXDV, ET_RXD[3:0], ET_RXER timing reference signal
Receive data valid	ET_RXDV*1	Input	Indicates that valid receive data is on ET_RXD[3:0]
MII receive data	ET_RXD[3:0]*1	Input	MII receive data
Receive error	ET_RXER*1	Input	Identifies error state occurred during data reception
Carrier detection	ET_CRD*1	Input	Carrier detection signal
Management data clock	ET_MDC*1	Output	Reference clock signal for information transfer via ET_MDIO
Management data I/O	ET_MDIO*1	I/O	Bidirectional signal for exchange of management information between STA and PHY

Note 1. MII signal conforming to IEEE802.3u

26.3 Register Descriptions

Table 26.2 shows the configuration of registers of the ETHER.

Table 26.2 Register Configuration

26.3.1 Software Reset Register (ARSTR)

ARSTR resets all blocks (E-MAC, TSU, and E-DMAC) in the ETHER. By writing 1 to the ARST bit in this register, a software reset is issued to all blocks of the ETHER (for 256 cycles of internal bus clock B ϕ). The ARST bit is always read as 0. While a software reset is issued, register access to all blocks of the ETHER is prohibited.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	ARST	0	R/W	Software Reset When 1 is written to this bit, a software reset is issued to all blocks of the ETHER (for 256 cycles of internal bus clock B ϕ). Writing 0 does not affect this bit. This bit is always read as 0. While a software reset is issued, register access to all blocks of the ETHER is prohibited. The following registers are not initialized by a software reset. TSU_ADRH0 to TSU_ADRH31, TSU_ADRL0 to TSU_ADRL31, TXNLCR0, TXALCR0, RXNLCR0, RXALCR0

26.3.2 E-MAC Mode Register (ECMR)

ECMR is a 32-bit readable/writable register that specifies the operating mode of the ETHER. The settings in this register are normally made in the initialization process following a reset.

The operating mode setting must not be changed while the transmitting and receiving functions are enabled. To switch the operating mode, return the E-MAC and E-DMAC to their initial states by means of the SWRT and SWRR bits in EDMR before making settings again.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	MCT	—	—	—	—	—	—	RE	TE	—	—	—	DM	PRM
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R	R	R	R	R	R	R/W	R/W	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26	TRCCM	0	R/W	Counter Clear Mode Sets the method for clearing the counter register. Refer to the description of each register. 0: Cleared to 0 when the relevant register is written 1: Cleared to 0 when the relevant register is read
25, 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23	RCSC	0	R/W	Checksum Calculation Specifies whether to perform automatic calculation (hardware calculation) of the checksum of the receive frame data unit. 0: Checksum is not automatically calculated 1: Checksum is automatically calculated Note that the checksum calculation of a frame with a VLAN tag is not supported. For details, see section 26.6.1, Checksum Calculation of Ethernet Frames.
22	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
21	DPAD	0	R/W	Data Padding 0: Padding is inserted to data less than 60 bytes so it is transmitted as 60-byte data 1: Padding is not inserted to data less than 60 bytes and it is transmitted without changes
20	RZPF	0	R/W	PAUSE Frame Reception with TIME = 0 0: Reception of a PAUSE frame whose TIME parameter value is 0 is disabled 1: Reception of a PAUSE frame whose TIME parameter value is 0 is enabled
19	ZPF	0	R/W	PAUSE Frame Usage with TIME = 0 Enable 0: Control of a PAUSE frame whose TIME parameter value is 0 is disabled. The next frame is not transmitted until the time specified by the Timer value has elapsed. If a PAUSE frame whose time specified by the Timer value is 0 is received, that PAUSE frame is discarded. 1: Control of a PAUSE frame whose TIME parameter value is 0 is enabled. When the data size in the receive FIFO becomes smaller than the FCFT setting before the time specified by the Timer value elapses, an automatic PAUSE frame with a Timer value of 0 is transmitted. On receiving a PAUSE frame with a Timer value of 0, the transmission wait state is canceled.

Bit	Bit Name	Initial Value	R/W	Description
18	PFR	0	R/W	PAUSE Frame Receive Mode 0: PAUSE frame is not transferred to E-DMAC 1: PAUSE frame is transferred to E-DMAC
17	RXF	0	R/W	Operating Mode for Receiving Port Flow Control 0: PAUSE frame detection is disabled 1: Flow control for the receiving port is enabled
16	TXF	0	R/W	Operating Mode for Transmitting Port Flow Control 0: Flow control for the transmitting port is disabled (Automatic PAUSE frame is not transmitted) 1: Flow control for the transmitting port is enabled (Automatic PAUSE frame is transmitted as required)
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13	MCT	0	R/W	Multicast Address Frame Receive Mode 0: Frames other than the multicast address set by the CAM entry table 0 to 31 (H/L) registers are received. However, if the on-chip CAM entry table reference is disabled, all multicast address frames are received. 1: Only the multicast address set by the CAM entry table 0 to 31 (H/L) registers is received.
12 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
6	RE	0	R/W	Reception Enable If a switch is made from receiving function enabled (RE = 1) to disabled (RE = 0) while a frame is being received, the receiving function will be enabled until reception of the corresponding frame is completed. 0: Receiving function is disabled 1: Receiving function is enabled
5	TE	0	R/W	Transmission Enable If a switch is made from transmitting function enabled (TE = 1) to disabled (TE = 0) while a frame is being transmitted, the transmitting function will be enabled until transmission of the corresponding frame is completed. 0: Transmitting function is disabled 1: Transmitting function is enabled
4 to 2	—	0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	DM	0	R/W	Full-duplex Transfer Enable 0: Full-duplex transfer function is disabled. 1: Full-duplex transfer function is enabled.
0	PRM	0	R/W	Promiscuous Mode Setting this bit enables all Ethernet frames to be received. All Ethernet frames means all receivable frames, irrespective of differences or enabled/disabled status (destination address, broadcast address, multicast bit, etc.). 0: ETHER performs normal operation 1: ETHER performs promiscuous mode operation

Note: • All bits, except for TE and RE, should be changed while the transmitting function is disabled (TE = 0) and the receiving function is disabled (RE = 0).

26.3.3 E-MAC Status Register (ECSR)

ECSR is a 32-bit readable/writable register that indicates the status in the E-MAC. This status can be notified to the CPU by interrupts. When 1 is written to the PFR0I and ICD bits, the corresponding flags can be cleared. Writing 0 does not affect the flag. For bits that generate interrupts, the interrupt can be enabled or disabled by the corresponding bit in ECSIPR.

The interrupts generated due to this status register are indicated in the ECI bit in EESR of the E-DMAC.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	PFR0I	0	R/W	PAUSE Frame Retransmit Retry Over Indicates whether the retransmit count for retransmitting a PAUSE frame when flow control is enabled has exceeded the retransmit upper-limit set in the automatic PAUSE frame retransmit count register (TPAUSER). 0: PAUSE frame retransmit count has not exceeded the upper limit 1: PAUSE frame retransmit count has exceeded the upper limit
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	ICD	0	R/W	Illegal Carrier Detection Indicates that the PHY-LSI has detected an illegal carrier on the line. If a change in the signal input from the PHY-LSI occurs in a period shorter than the software recognition period, the correct information may not be obtained. Refer to the timing specification for the PHY-LSI used. 0: PHY-LSI has not detected an illegal carrier on the line 1: PHY-LSI has detected an illegal carrier on the line

26.3.4 E-MAC Interrupt Permission Register (ECSIPR)

ECSIPR is a 32-bit readable/writable register that enables or disables the interrupt sources indicated by ECSR. Each bit can disable or enable interrupts corresponding to the bits in ECSR.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	PFR IP	0	R/W	PAUSE Frame Retransmit Interrupt Enable 0: Interrupt notification by the PFR IP bit is disabled 1: Interrupt notification by the PFR IP bit is enabled
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	ICDIP	0	R/W	Illegal Carrier Detect Interrupt Enable 0: Interrupt notification by the ICD bit is disabled 1: Interrupt notification by the ICD bit is enabled

26.3.5 PHY Interface Register (PIR)

PIR is a 32-bit readable/writable register that provides a means of accessing the PHY-LSI internal registers via the MII.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	MDI	MDO	MMD	MDC
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	—	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	MDI	Undefined	R	MII Management Data-In Indicates the level of the ET_MDIO pin.
2	MDO	0	R/W	MII Management Data-Out Outputs the value set in this bit from the ET_MDIO pin when the MMD bit is 1.
1	MMD	0	R/W	MII Management Mode Specifies the data read/write direction with respect to the MII. 0: Read direction is specified 1: Write direction is specified
0	MDC	0	R/W	MII Management Data Clock Outputs the value set in this bit from the MDC pin and supplies the MII with the management data clock. For the method of accessing the MII registers, see section 26.5.2, Accessing MII Registers.

26.3.6 MAC Address High Register (MAHR)

MAHR is a 32-bit readable/writable register that specifies the upper 32 bits of the 48-bit MAC address. The settings in this register are normally made in the initialization process after a reset. The MAC address setting must not be changed while the transmitting and receiving functions are enabled. Return the E-MAC and E-DMAC to their initial states by means of the SWRT and SWRR bits in EDMR before making settings again.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MA[47:32]

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	MA[47:16]	All 0	R/W	MAC Address Bits 47 to 16 These bits are used to set the upper 32 bits of the MAC address. If the MAC address is 01-23-45-67-89-AB (hexadecimal), set H'01234567 in this register.

26.3.7 MAC Address Low Register (MALR)

MALR is a 32-bit readable/writable register that specifies the lower 16 bits of the 48-bit MAC address. The settings in this register are normally made in the initialization process after a reset. The MAC address setting must not be changed while the transmitting and receiving functions are enabled. Return the E-MAC and E-DMAC to their initial states by means of the SWRT and SWRR bits in EDMR before making settings again.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	MA[15:0]	All 0	R/W	MAC Address Bits 15 to 0 These bits are used to set the lower 16 bits of the MAC address. If the MAC address is 01-23-45-67-89-AB (hexadecimal), set H'000089AB in this register.

26.3.8 Receive Frame Length Register (RFLR)

RFLR is a 32-bit readable/writable register that specifies the maximum frame length (in bytes) that can be received by this LSI. The settings in this register must not be changed while the receiving function is enabled.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RFL[17:16]
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RFL[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
17 to 0	RFL[17:0]	All 0	R/W	Receive Frame Length The frame data described here refers to all fields from the destination address up to the CRC data. Frame contents from the destination address up to the data are actually transferred to memory. CRC data is not included in the transfer. When data that exceeds the specified value is received, the part of data that exceeds the specified value is discarded. H'00000 to H'005EE: 1,518 bytes H'005EF: 1,519 bytes H'005F0: 1,520 bytes : : H'007FF: 2,047 bytes H'00800: 2,048 bytes : : H'01000: 4,096 bytes : : H'10000: 65,536 bytes : : H'20000 to H'3FFFF: 131,072 bytes

26.3.9 CRC Error Frame Receive Counter Register (CEFCR)

CEFCR is a 32-bit counter that indicates the number of times a frame with a CRC error was received. When the value in this register reaches H'FFFFFFFF, count-up is halted. This register is cleared to 0 when it is read with the TRCCM bit in ECMR set to 1. When the TRCCM bit in ECMR is 0, writing to this register will clear it regardless of the value written.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CEFC[31:0]	All 0	R/W	CRC Error Frame Count These bits indicate the number of CRC error frames received.

Note: • When count-up and count-clearing of this register value occur simultaneously, count-clearing is performed.

26.3.10 Frame Receive Error Counter Register (FRECR)

FRECR is a 32-bit counter that indicates the number of frames for which a receive error was generated by the RXER pin input from the PHY-LSI. FRECR is incremented each time the RXER pin becomes active. When the value in this register reaches H'FFFFFFFF, count-up is halted. This register is cleared to 0 when it is read with the TRCCM bit in ECMR set to 1. When the TRCCM bit in ECMR is 0, writing to this register will clear it regardless of the value written.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	FRECR[31:0]	All 0	R/W	Frame Receive Error Count These bits indicate the number of errors during frame reception.

Note: • When count-up and count-clearing of this register value occur simultaneously, count-clearing is performed.

26.3.11 Too-Short Frame Receive Counter Register (TSFRCR)

TSFRCR is a 32-bit counter that indicates the number of frames received with a length fewer than 64 bytes. When the value in this register reaches H'FFFFFFFF, count-up is halted. This register is cleared to 0 when it is read with the TRCCM bit in ECMR set to 1. When the TRCCM bit in ECMR is 0, writing to this register will clear it regardless of the value written.

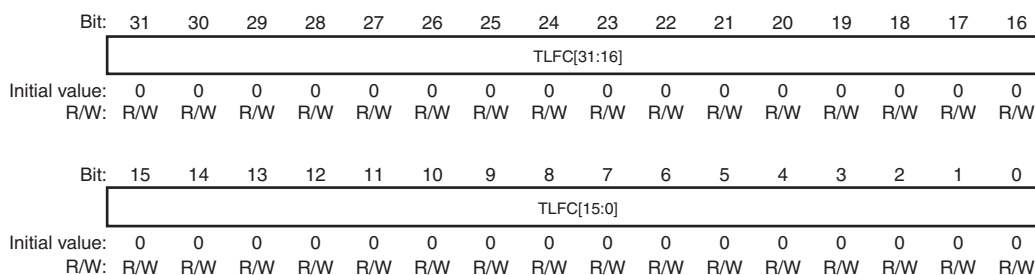

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TSFC[31:0]	All 0	R/W	Too-Short Frame Receive Count These bits indicate the number of frames received with a length of less than 64 bytes.

Note: • When count-up and count-clearing of this register value occur simultaneously, count-clearing is performed.

26.3.12 Too-Long Frame Receive Counter Register (TLFRCR)

TLFRCR is a 32-bit counter that indicates the number of frames received with a length exceeding the value specified by the receive frame length register (RFLR). When the value in this register reaches H'FFFFFFFF, count-up is halted. This register is not incremented when a frame containing residual bits is received. In this case, the reception of the frame is indicated in the residual-bit frame receive counter register (RFRCR). This register is cleared to 0 when it is read with the TRCCM bit in ECMR set to 1. When the TRCCM bit in ECMR is 0, writing to this register will clear it regardless of the value written.

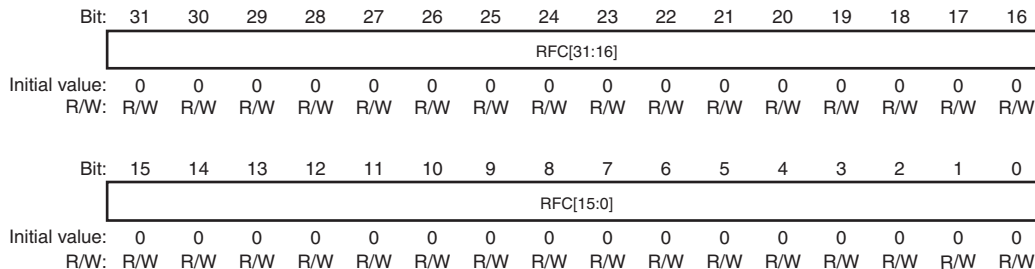

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TLFC[31:0]	All 0	R/W	Too-Long Frame Receive Count These bits indicate the number of frames received with a length exceeding the value in RFLR.

Note: • When count-up and count-clearing of this register value occur simultaneously, count-clearing is performed.

26.3.13 Residual-Bit Frame Receive Counter Register (RFCR)

RFCR is a 32-bit counter that indicates the number of frames received containing residual bits (less than an 8-bit unit). When the value in this register reaches H'FFFFFFFF, count-up is halted. This register is cleared to 0 when it is read with the TRCCM bit in ECMR set to 1. When the TRCCM bit in ECMR is 0, writing to this register will clear it regardless of the value written.

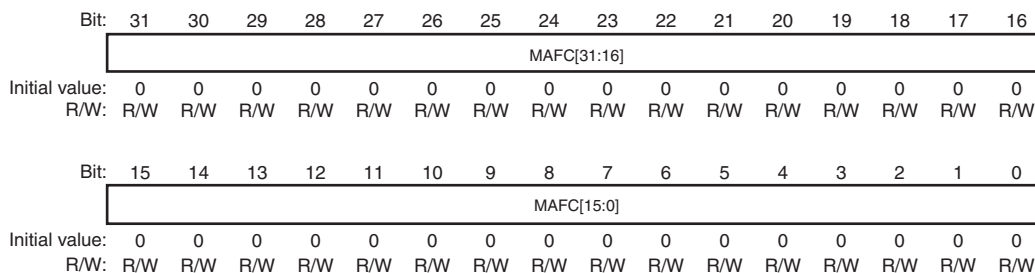

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	RFC[31:0]	All 0	R/W	Residual-Bit Frame Receive Count These bits indicate the number of frames received containing residual bits.

Note: • When count-up and count-clearing of this register value occur simultaneously, count-clearing is performed.

26.3.14 Multicast Address Frame Receive Counter Register (MAFCR)

MAFCR is a 32-bit counter that indicates the number of frames received with a specified multicast address. When the value in this register reaches H'FFFFFFFF, count-up is halted. This register is cleared to 0 when it is read with the TRCCM bit in ECMR set to 1. When the TRCCM bit in ECMR is 0, writing to this register will clear it regardless of the value written.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	MAFC[31:0]	All 0	R/W	Multicast Address Frame Count These bits indicate the number of multicast frames received.

Note: • When count-up and count-clearing of this register value occur simultaneously, count-clearing is performed.

26.3.15 Automatic PAUSE Frame Register (APR)

APR is used to set the TIME parameter value of an automatic PAUSE frame. When an automatic PAUSE frame is transmitted, the value set in this register is used as the TIME parameter of the PAUSE frame.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	AP[15:0]	All 0	R/W	Automatic PAUSE These bits set the TIME parameter value of an automatic PAUSE frame. One bit is equivalent to 512 bit-time. When flow control is enabled in transmission (PAUSE frame transmission) (TXF bit in ECMR = 1), set a value other than H'0000 in these bits. H'0000: — H'0001: 512 × 1 bit-time H'0002: 512 × 2 bit-time : : H'FFFF: 512 × 65,535 bit-time Note: The bit-time becomes as follows according to the transfer speed. 100 Mbps: 1 bit-time = 10 ns 10 Mbps: 1 bit-time = 100 ns

26.3.16 Manual PAUSE Frame Register (MPR)

MPR is used to set the TIME parameter value of a manual PAUSE frame. When a manual PAUSE frame is transmitted, the value set in this register is used as the TIME parameter of the PAUSE frame.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	MP[15:0]	All 0	R/W	Manual PAUSE These bits set the TIME parameter value of a manual PAUSE frame. One bit is equivalent to 512 bit-time. H'0000: — H'0001: 512 × 1 bit-time H'0002: 512 × 2 bit-time : : H'FFFF: 512 × 65,535 bit-time Note: The bit-time becomes as follows according to the transfer speed. 100 Mbps: 1 bit-time = 10 ns 10 Mbps: 1 bit-time = 100 ns

26.3.17 Automatic PAUSE Frame Retransmit Count Register (TPAUSER)

TPAUSER is used to set the upper limit for the number of times to retransmit an automatic PAUSE frame. The settings in this register must not be changed while the transmitting function is enabled.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

15 to 0	TPAUSE[15:0]	All 0	R/W	Upper Limit for Automatic PAUSE Frame Retransmission H'0000: Retransmit count is unlimited H'0001: Retransmit count is 1 : : H'FFFF: Retransmit count is 65,535

26.3.18 PAUSE Frame Transmit Counter Register (PFTCR)

PFTCR is a 16-bit counter that indicates the number of times a PAUSE frame is transmitted. This register is cleared to 0 when it is read.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PFTXC[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	PFTXC[15:0]	All 0	R	PAUSE Frame Transmit Count These bits indicate the total number of automatic PAUSE frames and manual PAUSE frames transmitted.

Note: • When count-up and count-clearing of this register value occur simultaneously, count-clearing is performed.

26.3.19 PAUSE Frame Receive Counter Register (PFRCR)

PFRCR is a 16-bit counter that indicates the number of times a PAUSE frame is received. This register is cleared to 0 when it is read.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PFRXC[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	PFRXC[15:0]	All 0	R	PAUSE Frame Receive Count These bits indicate the number of PAUSE frames received when flow control is enabled in reception (RXF bit in ECCR = 1).

Note: • When count-up and count-clearing of this register value occur simultaneously, count-clearing is performed.

26.3.20 TSU Counter Reset Register (TSU_CTRST)

TSU_CTRST clears the transmit, receive, and relay frame counters to 0.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CTRST	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	CTRST	0	R/W	TSU Counter Reset When 1 is written to this bit, the values of registers TXNLCR0, TXALCR0, RXNLCR0, and RXALCR0 are cleared to 0. Writing 0 does not affect this bit. This bit is always read as 0.
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

26.3.21 CAM Entry Table Specification Enable Register (Common) (TSU_FWSLC)

When the CAM function is in use, you can use the TSU_POST1 to TSU_POST4 registers to specify which of among the CAM entry tables are for reference or reference to all tables. The TSU_FWSLC register enables or disables this action of the settings of the TSU_POST1 to TSU_POST4 registers.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	POST ENU	POST ENL	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13	POSTENU	0	R/W	This bit enables the settings for CAM entry tables 0 to 15 in the POST bits of the TSU_POST1 and TSU_POST2 registers. 0: The settings of the POST bits are disabled (CAM entry tables 0 to 15 are referred to on reception of frames). 1: The settings of the POST bits are enabled (whether to refer to each of CAM entry tables is determined by the settings of the corresponding POST bit).
12	POSTENL	0	R/W	This bit enables the settings for CAM entry tables 16 to 31 in the POST bits of the TSU_POST3 and TSU_POST4 registers. 0: The settings of the POST bits are disabled (CAM entry tables 16 to 31 are not referred to on reception of frames). 1: The settings of the POST bits are enabled (whether to refer to each of CAM entry tables is determined by the settings of the corresponding POST bit).
11 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

26.3.22 VLANtag Set Register (TSU_VTAG0)

TSU_VTAG0 enables or disables the frame receive/discard evaluation function based on the VLAN number, and also sets the VLAN number.

Bit	Bit Name	Initial Value	R/W	Description
31	VTAG0	0	R/W	Port 0 VLANtag Evaluation Function 0: Disables receive/discard evaluation for frames based on the VLAN number 1: Enables receive/discard evaluation for frames based on the VLAN number
30 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	VID0[11:0]	All 0	R/W	V-LAN ID Setting (VID) These bits set the VLAN number received by receive frames.

26.3.23 CAM Entry Table Busy Register (TSU_ADSBSY)

When CAM entry table registers (TSU_ADRH0 to TSU_ADRH31 and TSU_ADRL0 to TSU_ADRL31) are set by register writing, the ADSBSY bit in this register is set to 1 (when the process of reflecting the contents of the CAM entry table registers in the CAM controller is completed inside the TSU, the ADSBSY bit is automatically restored to 0).

Access to TSU_ADRH0 to TSU_ADRH31 and TSU_ADRL0 to TSU_ADRL31 is prohibited, while the ADSBSY bit in this register is set to 1. This register is a read-only status register, which must not be written to.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	ADSBSY	0	R	CAM Entry Table Setting Busy When TSU_ADRH0 to TSU_ADRH31 and TSU_ADRL0 to TSU_ADRL31 are set by register writing, this bit is set to 1. When the process of reflecting the contents of the CAM entry table registers in the CAM controller is completed inside the TSU, this bit is automatically restored to 0. Access to TSU_ADRH0 to TSU_ADRH31 and TSU_ADRL0 to TSU_ADRL31 is prohibited, while this bit is set to 1. Writing to this register is also prohibited.

26.3.24 CAM Entry Table Enable Register (TSU_TEN)

TSU_TEN enables or disables the settings of TSU_ADRH0 to TSU_ADRH31 and TSU_ADRL0 to TSU_ADRL31.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

26.3.25 CAM Entry Table POST 1 Register (TSU_POST1)

When the CAM function is in use, you can use the TSU_POST1 to TSU_POST4 registers to specify which of the CAM entry tables are for reference. The TSU_POST1 register specifies the conditions for reference to TSU_ADRH0 to TSU_ADRH7 and TSU_ADRL0 to TSU_ADRL7. The setting of this register is effective when the POSTENU bit of the TSU_FWSLC register is set to 1.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	POST0	—	—	—	POST1	—	—	—	POST2	—	—	—	POST3	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	POST4	—	—	—	POST5	—	—	—	POST6	—	—	—	POST7	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	POST0	0	R/W	Specifies whether reference is or is not made to CAM entry table 0. Setting this bit to 1 selects the condition below. POST0: CAM entry table 0 is referred to on reception of frames.
30 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27	POST1	0	R/W	Specifies whether reference is or is not made to CAM entry table 1. Setting this bit to 1 selects the condition below. POST1: CAM entry table 1 is referred to on reception of frames.
26 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23	POST2	0	R/W	Specifies whether reference is or is not made to CAM entry table 2. Setting this bit to 1 selects the condition below. POST2: CAM entry table 2 is referred to on reception of frames.
22 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
19	POST3	0	R/W	Specifies whether reference is or is not made to CAM entry table 3. Setting this bit to 1 selects the condition below. POST3: CAM entry table 3 is referred to on reception of frames.
18 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	POST4	0	R/W	Specifies whether reference is or is not made to CAM entry table 4. Setting this bit to 1 selects the condition below. POST4: CAM entry table 4 is referred to on reception of frames.
14 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11	POST5	0	R/W	Specifies whether reference is or is not made to CAM entry table 5. Setting this bit to 1 selects the condition below. POST5: CAM entry table 5 is referred to on reception of frames.
10 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	POST6	0	R/W	Specifies whether reference is or is not made to CAM entry table 6. Setting this bit to 1 selects the condition below. POST6: CAM entry table 6 is referred to on reception of frames.
6 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	POST7	0	R/W	Specifies whether reference is or is not made to CAM entry table 7. Setting this bit to 1 selects the condition below. POST7: CAM entry table 7 is referred to on reception of frames.

Bit	Bit Name	Initial Value	R/W	Description
2 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

26.3.26 CAM Entry Table POST 2 Register (TSU_POST2)

When the CAM function is in use, you can use the TSU_POST1 to TSU_POST4 registers to specify which of the CAM entry tables are for reference. The TSU_POST2 register specifies the conditions for reference to TSU_ADRH8 to TSU_ADRH15 and TSU_ADRL8 to TSU_ADRL15. The setting of this register is effective when the POSTENU bit of the TSU_FWSLC register is set to 1.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	POST8	—	—	—	POST9	—	—	—	POST10	—	—	—	POST11	—	—	—

R/W:	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	POST8	0	R/W	Specifies whether reference is or is not made to CAM entry table 8. Setting this bit to 1 selects the condition below. POST8: CAM entry table 8 is referred to on reception of frames.
30 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27	POST9	0	R/W	Specifies whether reference is or is not made to CAM entry table 9. Setting this bit to 1 selects the condition below. POST9: CAM entry table 9 is referred to on reception of frames.
26 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23	POST10	0	R/W	Specifies whether reference is or is not made to CAM entry table 10. Setting this bit to 1 selects the condition below. POST10: CAM entry table 10 is referred to on reception of frames.
22 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
19	POST11	0	R/W	Specifies whether reference is or is not made to CAM entry table 11. Setting this bit to 1 selects the condition below. POST11: CAM entry table 11 is referred to on reception of frames.
18 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	POST12	0	R/W	Specifies whether reference is or is not made to CAM entry table 12. Setting this bit to 1 selects the condition below. POST12: CAM entry table 12 is referred to on reception of frames.
14 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11	POST13	0	R/W	Specifies whether reference is or is not made to CAM entry table 13. Setting this bit to 1 selects the condition below. POST13: CAM entry table 13 is referred to on reception of frames.
10 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
7	POST14	0	R/W	Specifies whether reference is or is not made to CAM entry table 14. Setting this bit to 1 selects the condition below. POST14: CAM entry table 14 is referred to on reception of frames.
6 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	POST15	0	R/W	Specifies whether reference is or is not made to CAM entry table 15. Setting this bit to 1 selects the condition below. POST15: CAM entry table 15 is referred to on reception of frames.
2 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

26.3.27 CAM Entry Table POST 3 Register (TSU_POST3)

When the CAM function is in use, you can use the TSU_POST1 to TSU_POST4 registers to specify which of the CAM entry tables are for reference. The TSU_POST3 register specifies the conditions for reference to TSU_ADRH16 to TSU_ADRH23 and TSU_ADRL16 to TSU_ADRL23. The setting of this register is effective when the POSTENL bit of the TSU_FWSLC register is set to 1.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	POST16	—	—	—	POST17	—	—	—	POST18	—	—	—	POST19	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	POST16	0	R/W	Specifies whether reference is or is not made to CAM entry table 16. Setting this bit to 1 selects the condition below. POST16: CAM entry table 16 is referred to on reception of frames.
30 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27	POST17	0	R/W	Specifies whether reference is or is not made to CAM entry table 17. Setting this bit to 1 selects the condition below. POST17: CAM entry table 17 is referred to on reception of frames.
26 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23	POST18	0	R/W	Specifies whether reference is or is not made to CAM entry table 18. Setting this bit to 1 selects the condition below. POST18: CAM entry table 18 is referred to on reception of frames.
22 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
19	POST19	0	R/W	Specifies whether reference is or is not made to CAM entry table 19. Setting this bit to 1 selects the condition below. POST19: CAM entry table 19 is referred to on reception of frames.
18 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	POST20	0	R/W	Specifies whether reference is or is not made to CAM entry table 20. Setting this bit to 1 selects the condition below. POST20: CAM entry table 20 is referred to on reception of frames.

Bit	Bit Name	Initial Value	R/W	Description
14 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11	POST21	0	R/W	Specifies whether reference is or is not made to CAM entry table 21. Setting this bit to 1 selects the condition below. POST21: CAM entry table 21 is referred to on reception of frames.
10 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	POST22	0	R/W	Specifies whether reference is or is not made to CAM entry table 22. Setting this bit to 1 selects the condition below. POST22: CAM entry table 22 is referred to on reception of frames.
6 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	POST23	0	R/W	Specifies whether reference is or is not made to CAM entry table 23. Setting this bit to 1 selects the condition below. POST23: CAM entry table 23 is referred to on reception of frames.
2 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

26.3.28 CAM Entry Table POST 4 Register (TSU_POST4)

When the CAM function is in use, you can use the TSU_POST1 to TSU_POST4 registers to specify which of the CAM entry tables are for reference. The TSU_POST4 register specifies the conditions for reference to TSU_ADRH24 to TSU_ADRH31 and TSU_ADRL24 to TSU_ADRL31. The setting of this register is effective when the POSTENL bit of the TSU_FWSLC register is set to 1.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	POST24	—	—	—	POST25	—	—	—	POST26	—	—	—	POST27	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	POST24	0	R/W	Specifies whether reference is or is not made to CAM entry table 24. Setting this bit to 1 selects the condition below. POST24: CAM entry table 24 is referred to on reception of frames.
30 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27	POST25	0	R/W	Specifies whether reference is or is not made to CAM entry table 25. Setting this bit to 1 selects the condition below. POST25: CAM entry table 25 is referred to on reception of frames.
26 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23	POST26	0	R/W	Specifies whether reference is or is not made to CAM entry table 26. Setting this bit to 1 selects the condition below. POST26: CAM entry table 26 is referred to on reception of frames.
22 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
19	POST27	0	R/W	Specifies whether reference is or is not made to CAM entry table 27. Setting this bit to 1 selects the condition below. POST27: CAM entry table 27 is referred to on reception of frames.
18 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	POST28	0	R/W	Specifies whether reference is or is not made to CAM entry table 28. Setting this bit to 1 selects the condition below. POST28: CAM entry table 28 is referred to on reception of frames.
14 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11	POST29	0	R/W	Specifies whether reference is or is not made to CAM entry table 29. Setting this bit to 1 selects the condition below. POST29: CAM entry table 29 is referred to on reception of frames.
10 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	POST30	0	R/W	Specifies whether reference is or is not made to CAM entry table 30. Setting this bit to 1 selects the condition below. POST30: CAM entry table 30 is referred to on reception of frames.
6 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	POST31	0	R/W	Specifies whether reference is or is not made to CAM entry table 31. Setting this bit to 1 selects the condition below. POST31: CAM entry table 31 is referred to on reception of frames.
2 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

26.3.29 CAM Entry Table 0H to 31H Registers (TSU_ADRH0 to TSU_ADRH31)

TSU_ADRH0 to TSU_ADRH31 are entry tables referred to by the CAM in reception and relay. Each of these registers sets the upper 32 bits of the 48-bit MAC address. Maximum 32 entries of MAC addresses can be registered.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	ADRHn[31:0] (n: 0 to 31)	All 0	R/W	MAC Address Bits These bits set the upper 32 bits of the MAC address. When the MAC address is 01-23-45-67-89-AB (displayed in hexadecimal), set H'01234567 in this register.

Note: • Set the CAM entry tables following the procedure below.

1. Check that the ADSBSY bit in TSU_ADSBSY is cleared to 0.
2. Set the upper 32 bits of the MAC addresses by TSU_ADRH0 to TSU_ADRH31.
3. Set the lower 16 bits of the MAC addresses by TSU_ADRL0 to TSU_ADRL31.

26.3.30 CAM Entry Table 0L to 31L Registers (TSU_ADRL0 to TSU_ADRL31)

TSU_ADRL0 to TSU_ADRL31 are entry tables referred to by the CAM in reception and relay. Each of these registers sets the lower 16 bits of the 48-bit MAC address. Maximum 32 entries of MAC addresses can be registered.

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	ADRLn[15:0] (n: 0 to 31)	All 0	R/W	MAC Address Bits These bits set the lower 16 bits of the MAC address. When the MAC address is 01-23-45-67-89-AB (displayed in hexadecimal), set H'000089AB in this register.

Note: • Set the CAM entry tables following the procedure below.

1. Check that the ADSBSY bit in TSU_ADSBSY is cleared to 0.
2. Set the upper 32 bits of the MAC addresses by TSU_ADRH0 to TSU_ADRH31.
3. Set the lower 16 bits of the MAC addresses by TSU_ADRL0 to TSU_ADRL31.

26.3.31 Transmit Frame Counter Register (Normal Transmission Only) (TXNLCR0)

TXNLCR0 is a 32-bit counter indicating the number of frames successfully transmitted in the E-MAC. When the value in this register reaches H'FFFFFFFF, count-up is halted. The counter is cleared to 0 by reading from this register. This register cannot be written to.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	NTC0[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	NTC0[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	NTC0[31:0]	All 0	R	Transmit Frame Counter Bits These bits indicate the number of frames successfully transmitted.

Note: • When count-up and count-clearing of this register value occur simultaneously, count-clearing is performed.

26.3.32 Transmit Frame Counter Register (Normal and Erroneous Transmission) (TXALCR0)

TXALCR0 is a 32-bit counter indicating the number of frames transmitted in the E-MAC, including the number of frames erroneously transmitted. When the value in this register reaches H'FFFFFFFF, count-up is halted. The counter is cleared to 0 by reading from this register. This register cannot be written to.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TC0[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TC0[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TC0[31:0]	All 0	R	Transmit Frame Counter Bits These bits indicate the number of frames successfully transmitted and erroneously transmitted.

Note: • When count-up and count-clearing of this register value occur simultaneously, count-clearing is performed.

26.3.33 Receive Frame Counter Register (Normal Reception Only) (RXNLCR0)

RXNLCR0 is a 32-bit counter indicating the number of frames successfully received in the E-MAC. When the value in this register reaches H'FFFFFFFF, count-up is halted. The counter is cleared to 0 by reading from this register. This register cannot be written to.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	NRC0[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	NRC0[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	NRC0[31:0]	All 0	R	Receive Frame Counter Bits These bits indicate the number of frames successfully received.

Note: • When count-up and count-clearing of this register value occur simultaneously, count-clearing is performed.

26.3.34 Receive Frame Counter Register (Normal and Erroneous Reception) (RXALCR0)

RXALCR0 is a 32-bit counter indicating the number of frames received in the E-MAC, including the number of frames erroneously received. When the value in this register reaches H'FFFFFFFF, count-up is halted. The counter is cleared to 0 by reading from this register. This register cannot be written to.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RC0[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RC0[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	RC0[31:0]	All 0	R	Receive Frame Counter Bits These bits indicate the number of frames successfully received and erroneously received.

Note: • When count-up and count-clearing of this register value occur simultaneously, count-clearing is performed.

26.3.35 E-DMAC Start Register (EDSR)

EDSR specifies activation of the transmitting unit and receiving unit of the E-DMAC. This register can only be written to, and the read values are invalid.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ENT	ENR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	ENT	0	W	E-DMAC Transmitting Unit Start 0: Stops the E-DMAC transmitting unit 1: Starts the E-DMAC transmitting unit
0	ENR	0	W	E-DMAC Receiving Unit Start 0: Stops the E-DMAC receiving unit 1: Starts the E-DMAC receiving unit

26.3.36 E-DMAC Mode Register (EDMR)

EDMR is a 32-bit readable/writable register that specifies E-DMAC resetting and the transmit/receive descriptor length. This register is to be set before the transmitting or receiving function is enabled (before the TR bit in EDTRR or the RR bit in EDRRR is set to 1). However, the SWRR and SWRT bits can be written to even after the transmitting or receiving function is enabled. If a software reset is executed with this register during data transmission, abnormal data may be transmitted on the line. Execute a software reset with this register before specifying the transmit/receive descriptor length or modifying the settings of TDLAR, RDLAR, and so forth, the setting of ECMR (E-MAC mode register), and the settings of registers related to the E-DMAC and E-MAC operation.

To execute a software reset with this register, 1 must be written to both the SWRT and SWRR bits simultaneously. Writing 1 to the SWRT and SWRR bits initializes the E-MAC registers and E-DMAC registers, except for TDLAR, RDLAR, and RMFCR of the E-DMAC. The TSU registers (registers whose names are prefixed with TSU_) are not initialized. The SWRT and SWRR bits in EDMR0 initializes the registers related to the E-DMAC and E-MAC. Note that during the period a software reset is issued (for 64 cycles of the internal bus clock Bck), accesses to all Ethernet-related registers are prohibited.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
6	DE	0	R/W	Transmit/Receive Frame Endian Sets the endian mode for DMA transfer of frame data between the transmit/receive FIFO and transmit/receive buffer. 0: Big endian (longword access) 1: Little endian (longword access)
5, 4	DL[1:0]	00	R/W	Transmit/Receive Descriptor Length These bits specify the descriptor length. (See section 26.4.1, Descriptors and Descriptor List.) 00: 16 bytes 01: 32 bytes 10: 64 bytes 11: Setting prohibited
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	SWRT	0	R/W	Software Reset of Transmit FIFO Controller [Writing] 0: Disabled 1: Software reset started [Reading] 0: Software reset not executed (or completed) 1: Software reset being executed
0	SWRR	0	R/W	Software Reset of Receive FIFO Controller [Writing] 0: Disabled 1: Software reset started [Reading] 0: Software reset not executed (or completed) 1: Software reset being executed

26.3.37 E-DMAC Transmit Request Register (EDTRR)

EDTRR is a 32-bit readable/writable register that issues transmit directives to the E-DMAC. After writing 11 to bits TR[1:0] in this register, the E-DMAC reads the transmit descriptor at the address specified by TDLAR. If the TACT bit of this transmit descriptor is set to 1 (valid), transmit DMA transfer by the E-DMAC starts. When DMA transfer based on the first transmit descriptor is completed, the E-DMAC reads the next transmit descriptor. If the TACT bit of that transmit descriptor is set to 1 (valid), the E-DMAC continues transmit DMA operation. If the TACT bit of a transmit descriptor is cleared to 0 (invalid), the E-DMAC clears bits TR[1:0] and stops transmit DMA operation.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TR[1:0]
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	TR[1:0]	00	R/W	Transmit Request 00, 01, 10: Transmission-halted state If 00, 01, or 10 is written to these bits, the E-DMAC stops DMA transfer of the currently processed transmit descriptor, reads the next transmit descriptor, and then clears these bits. (Write-back is completed for the valid transmit descriptors that have been detected up till then.) The E-DMAC clears these bits when transmit descriptor empty occurs, or transmission of a transmit descriptor has completed. (Write-back is completed for the valid transmit descriptors that have been detected up till then.) 11: Transmit DMA operation by E-DMAC After writing 11 to these bits, the E-DMAC starts reading a transmit descriptor.

26.3.38 E-DMAC Receive Request Register (EDRRR)

EDRRR is a 32-bit readable/writable register that issues receive directives to the E-DMAC. After writing 1 to the RR bit in this register, the E-DMAC reads the receive descriptor at the address specified by RDLAR. If the RACT bit of this receive descriptor is set to 1 (valid), and the receive FIFO holds a receive frame, the E-DMAC starts receive DMA transfer. When DMA transfer based on the first receive descriptor is completed, the E-DMAC reads the next receive descriptor. If the RACT bit of that receive descriptor is set to 1 (valid), the E-DMAC continues receive DMA operation. However, if the receive FIFO holds no receive data, the E-DMAC places receive DMA operation in the standby state. If the RACT bit of the receive descriptor is cleared to 0 (invalid), the E-DMAC clears the RR bit and stops receive DMAC operation.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	RR	0	R/W	Receive Request 0: Receiving function is disabled*1 If 0 is written to this bit, the E-DMAC stops receive operation after DMA transfer of one frame has completed and then clears this bit. The E-DMAC clears this bit when receive descriptor empty occurs. 1: Receive descriptor is read, and the E-DMAC is ready to receive.

Note 1. If the receiving function is disabled during frame reception, write-back is not performed successfully to the receive descriptor. Following pointers to read a receive descriptor become abnormal and the E-DMAC cannot operate successfully. In this case, to make E-DMAC reception enabled again, execute a software reset by the SWRT and SWRR bits in EDMR0. To disable the E-DMAC receiving function without executing a software reset, specify the RE bit in ECMR0. Next, after the E-DMAC has completed the reception and write-back to the receive descriptor has been confirmed, disable the receiving function using this register.

26.3.39 Transmit Descriptor List Start Address Register (TDLAR)

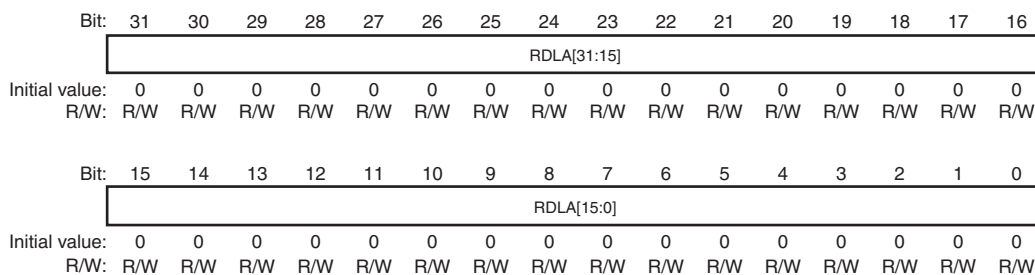

TDLAR is a 32-bit readable/writable register that specifies the start address of the transmit descriptor list. Descriptors have a boundary configuration in accordance with the descriptor length indicated by the DL bits in EDMR. This register must not be modified during transmission. Modifications to this register should only be made in the transmission-halted state specified by bits TR[1:0] (= 00) in the E-DMAC transmit request register (EDTRR).

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TDLA[31:0]	All 0	R/W	Transmit Descriptor Start Address The lower bits are set according to the specified descriptor length. 16-byte boundary: TDLA[3:0] = 0000 32-byte boundary: TDLA[4:0] = 00000 64-byte boundary: TDLA[5:0] = 000000

26.3.40 Receive Descriptor List Start Address Register (RDLAR)

RDLAR is a 32-bit readable/writable register that specifies the start address of the receive descriptor list. Descriptors have a boundary configuration in accordance with the descriptor length indicated by the DL bits in EDMR. This register must not be modified during reception. Modifications to this register should only be made while reception is disabled by the RR bit (= 0) in the E-DMAC receive request register (EDRRR).

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	RDLA[31:0]	All 0	R/W	Receive Descriptor Start Address The lower bits are set according to the specified descriptor length. 16-byte boundary: RDLA[3:0] = 0000 32-byte boundary: RDLA[4:0] = 00000 64-byte boundary: RDLA[5:0] = 000000

26.3.41 E-MAC/E-DMAC Status Register (EESR)

EESR is a 32-bit readable/writable register that shows communications status information on the E-DMAC in combination with the E-MAC. The information in this register is reported in the form of interrupt sources. Individual bits are cleared by writing 1 (however, bit 22 (ECI) is a read-only bit that is not cleared by writing 1) and are not affected by writing 0. Each interrupt source can also be masked by means of the corresponding bit in the E-MAC/E-DMAC status interrupt permission register (EESIPR).

The interrupt generated by this status register is ETHERI. For interrupt priorities, see section 7.4, Interrupt Sources.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R	R	R	R	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31, 30	TWB[1:0]	00	R/W	Write-Back Complete Indicates that write-back from the E-DMAC to the corresponding descriptor after frame transmission has completed. This operation is enabled only when the TWBI bit in the transmit descriptor that includes the end of the transmit frame is set to 1. 00: Write-back has not completed, or no transmission directive 11: Write-back has completed Others: Setting disabled
29	TC[1]	0	R/W	Frame Transmission Complete Indicates, in combination with the TC[0] bit, that all the data specified by the transmit descriptor has been transmitted from the E-MAC. This bit is set to 1 on assuming the completion of transmission. This is when transmission of one frame is completed and the transmit descriptor valid bit (TACT) of the next transmit descriptor not being set in single-frame/single-descriptor operation or when the last data of a frame has been transmitted and the transmit descriptor valid bit (TACT) of the next descriptor not being set in multi-buffer frame processing based on single-frame/multi-descriptor operation. After frame transmission has completed, the E-DMAC writes the transmission status back to the relevant descriptor. TC[1:0] 00: Transmission has not completed, or no transmission directive 11: Transmission has completed Others: Setting disabled
28	TUC	0	R/W	Transmit Underflow Frame Write-Back Complete 0: Write-back has not completed for the frame causing transmit underflow 1: Write-back has completed for the frame causing transmit underflow
27	ROC	0	R/W	Receive Overflow Frame Write-Back Complete 0: Write-back has not completed for the frame causing receive overflow 1: Write-back has completed for the frame causing receive overflow
26	TABT	0	R/W	Transmit Abort Detect Indicates that the E-MAC aborts transmitting a frame because of failures during frame transmission. 0: Frame transmission has not been aborted or no transmission directive 1: Frame transmission has been aborted
25	RABT	0	R/W	Receive Abort Detect Indicates that the E-MAC aborts receiving a frame because of failures during frame reception. 0: Frame reception has not been aborted or no reception directive 1: Frame reception has been aborted

Bit	Bit Name	Initial Value	R/W	Description
24	RFCOF	0	R/W	Receive Frame Counter Overflow Indicates that the frame counter in the receive FIFO has overflowed. 0: Receive frame counter has not overflowed 1: Receive frame counter has overflowed
23	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
22	ECI	0	R	E-MAC Status Register Source This bit is a read-only bit. When the source of an ECSR interrupt is cleared, this bit is also cleared. 0: E-MAC status interrupt source has not been detected 1: E-MAC status interrupt source has been detected
21	TC[0]	0	R/W	Frame Transmission Complete Indicates, in combination with the TC[1] bit, that all the data specified by the transmit descriptor has been transmitted from the E-MAC. For details, see the description of the TC[1] bit.
20	TDE	0	R/W	Transmit Descriptor Empty Indicates that the transmit descriptor valid bit (TACT) of a transmit descriptor read by the E-DMAC is not set if the previous descriptor does not represent the end of a frame in multi-buffer frame processing based on single-frame/multi-descriptor operation. As a result, an incomplete frame may be sent. 0: Transmit descriptor active bit TACT = 1 detected 1: Transmit descriptor active bit TACT = 0 detected When transmit descriptor empty (TDE = 1) occurs, execute a software reset and initiate transmission. In this case, transmission starts from the address that is stored in the transmit descriptor list start address register (TDLAR).
19	TFUF	0	R/W	Transmit FIFO Underflow Indicates that an underflow has occurred in the transmit FIFO during frame transmission. Incomplete data is sent onto the line. 0: Underflow has not occurred 1: Underflow has occurred
18	FR	0	R/W	Frame Reception Indicates that a frame has been received and the receive descriptor has been updated. This bit is set to 1 each time a frame is received. 0: Frame has not been received 1: Frame has been received
17	RDE	0	R/W	Receive Descriptor Empty Indicates that the RACT bit of a receive descriptor read by the E-DMAC for receive DMA operation is cleared to 0 (invalid). When receive descriptor empty (RDE = 1) occurs, reception can be resumed by setting the RACT bit (cleared to 0) of the receive descriptor to 1 and then writing 1 to the RR bit in EDRRR. 0: Receive descriptor active bit RACT = 1 detected 1: Receive descriptor active bit RACT = 0 detected
16	RFOF	0	R/W	Receive FIFO Overflow Indicates that the receive FIFO has overflowed during frame reception. 0: Overflow has not occurred 1: Overflow has occurred
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10, 9	—	Undefined	R	Reserved The write value should always be 0.
8	—	0	R	Reserved The write value should always be 0.
7	RMAF	0	R/W	Receive Multicast Address Frame 0: Multicast address frame has not been received 1: Multicast address frame has been received
6, 5	—	All 0	R	Reserved The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
4	RRF	0	R/W	Receive Residual-Bit Frame 0: Residual-bit frame has not been received 1: Residual-bit frame has been received
3	RTLFL	0	R/W	Receive Too-Long Frame Indicates that a frame whose byte size exceeds the upper limit for the receive frame length set by RFLR has been received. 0: Too-long frame has not been received 1: Too-long frame has been received
2	RTSFL	0	R/W	Receive Too-Short Frame Indicates that a frame of fewer than 64 bytes has been received. 0: Too-short frame has not been received 1: Too-short frame has been received
1	PRE	0	R/W	PHY-LSI Receive Error 0: PHY-LSI receive error has not been detected 1: PHY-LSI receive error has been detected
0	CERF	0	R/W	CRC Error on Received Frame 0: CRC error has not been detected 1: CRC error has been detected

26.3.42 E-MAC/E-DMAC Status Interrupt Permission Register (EESIPR)

EESIPR is a 32-bit readable/writable register that enables interrupts corresponding to individual bits in the E-MAC/E-DMAC status register (EESR). An interrupt is enabled by writing 1 to the corresponding bit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

0	CERFIP	0	R/W	CRC Error on Received Frame Interrupt Enable 0: CRC error interrupt is disabled 1: CRC error interrupt is enabled

26.3.43 Transmit/Receive Status Copy Enable Register (TRSCER)

TRSCER specifies whether the information for the transmit and receive state reported by bits 26, 25, and 10 to 0 in the E-MAC/E-DMAC status register (EESR) is to be reflected in the TFE or RFE bit of the corresponding descriptor. The bits in this register correspond to bits 26, 25, and 10 to 0 in EESR. When a bit is cleared to 0, the transmit status (bits 26 and 10 to 8 in EESR) is reflected in the TFE bit of the transmit descriptor, and the receive status (bits 25 and 7 to 0 in EESR) is reflected in the RFE bit of the receive descriptor. In this case, the state of a status bit set to 1 is reflected as the TFE or RFE bit set to 1. When a bit is set to 1, the occurrence of the corresponding source is not reflected in the descriptor. After this LSI is reset, all bits are cleared to 0.

Bit	Bit Name	Initial Value	R/W	Description
0	CERFCE	0	R/W	CERF Bit Copy Directive 0: Reflects the CERF bit status in the RFE bit of the receive descriptor 1: Occurrence of the corresponding source is not reflected in the RFE bit of the receive descriptor

26.3.44 Receive Missed-Frame Counter Register (RMFCR)

RMFCR is a 16-bit counter that indicates the number of frames that could not be saved in the receive buffer and so were discarded during reception. When the receive FIFO overflows, the receive frames in the FIFO are discarded. The number of frames discarded at this time is counted. When the value in this register reaches H'0000FFFF, count-up is halted. Clear the counter by writing H'00000000 in this register. Note that a value other than H'00000000 must not be written to this register.

15 to 0	MFC[15:0]	All 0	R/W	Missed-Frame Counter These bits indicate the number of frames that are discarded and not transferred to the receive buffer during reception.

26.3.45 Transmit FIFO Threshold Register (TFTR)

TFTR is a 32-bit readable/writable register that specifies the transmit FIFO threshold at which the first transmission is started. The actual threshold is 4 times the set value. The E-MAC starts transmission when the amount of data in the transmit FIFO exceeds the number of bytes specified by this register, when the transmit FIFO is full, or when one frame of data write is performed. This register must not be written to during transmission (bits TR[1:0] in EDTRR = 11).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	TFT[10:0]	All 0	R/W	Transmit FIFO Threshold A value in 32-byte units and smaller than the FIFO size specified by FDR must be set as the transmit FIFO threshold. H'000: Store and forward modes H'008: 32 bytes H'010: 64 bytes H'018: 128 bytes : : H'07F: 508 bytes H'080: 512 bytes : : H'0FF: 1,020 bytes H'100: 1,024 bytes : : H'1FF: 2,044 bytes H'200: 2,048 bytes

Note: • When starting transmission before one frame of data write has completed, take care no underflow occurs.

26.3.46 FIFO Depth Register (FDR)

FDR is a 32-bit readable/writable register that specifies the sizes of the transmit and receive FIFOs.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

10 to 8	TFD[2:0]	All 1	R/W	Transmit FIFO Size Specifies 256 bytes to 2 Kbytes in 256-byte units as the size of the transmit FIFO whose maximum size is 2 Kbytes. The setting must not be changed after transmission/reception has started. H'00: 256 bytes H'01: 512 bytes : : H'07: 2048 bytes
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4 to 0	RFD[4:0]	All 1	R/W	Receive FIFO Size Specifies 256 bytes to 4 Kbytes in 256-byte units as the size of the receive FIFO whose maximum size is 4 Kbytes. The setting must not be changed after transmission/reception has started. H'00: 256 bytes H'01: 512 bytes : : H'0F: 4096 bytes

26.3.47 Receiving Method Control Register (RMCR)

RMCR is a 32-bit readable/writable register that specifies the control method for the RE bit in ECMR while a frame is received. This register must be set during the receiving-halted state.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	RNC	0	R/W	Receive Enable Control Sets whether to continue frame reception. 0: Upon completion of reception of one frame, the E-DMAC writes the receive status to the descriptor and clears the RR bit in EDRRR to 0. 1: Upon completion of reception of one frame, the E-DMAC writes (writes back) the receive status to the descriptor. In addition, the E-DMAC reads the next descriptor and prepares for reception of the next frame.

26.3.48 Receive Descriptor Fetch Address Register (RDFAR)

RDFAR stores the descriptor start address that is required when the E-DMAC fetches descriptor information from the receive descriptor. Which receive descriptor information is used for processing by the E-DMAC can be recognized by monitoring addresses displayed in this register. The address from which the E-DMAC is actually fetching a descriptor may be different from the value read from this register. In the initial setting, set the address of the receive descriptor at which receive processing is to be started.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RDFAR[31:16]

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	RDFAR[31:0]	All 0	R/W	Receive Descriptor Fetch Address Writing to these bits during the reception is prohibited.

26.3.49 Receive Descriptor Finished Address Register (RDFXR)

RDFXR stores the start address of the receive descriptor for which the E-DMAC has just completed the write-back processing. Up to which receive descriptor has been processed by the E-DMAC can be recognized by monitoring addresses displayed in this register. In the initial setting, set the address of the descriptor immediately before the descriptor that is pointed to by the address in RDFAR.

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	RDLF	0	R/W	Receive Descriptor Queue Last Flag Indicates whether the receive descriptor for which the E-DMAC has just completed the write-back processing and whose start address is stored in RDFXR is at the end of the receive descriptor queue (descriptor list). 0: Not the last descriptor in the receive descriptor queue 1: Last descriptor in the receive descriptor queue

26.3.51 Transmit Descriptor Fetch Address Register (TDFAR)

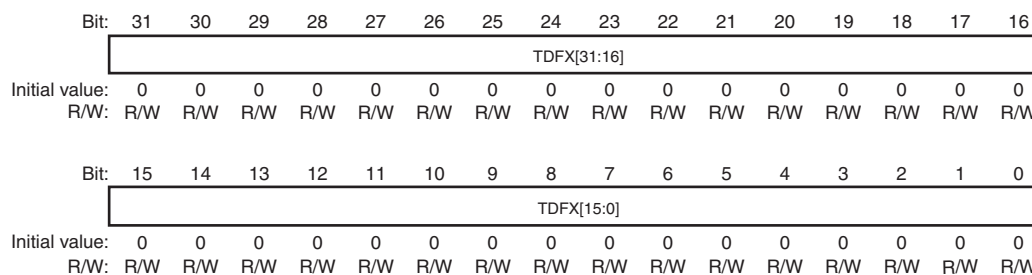

TDFAR stores the descriptor start address that is required when the E-DMAC fetches descriptor information from the transmit descriptor. Which transmit descriptor information is used for processing by the E-DMAC can be recognized by monitoring addresses displayed in this register. The address from which the E-DMAC is actually fetching a descriptor may be different from the value read from this register. In the initial setting, set the address of the transmit descriptor at which transmit processing is to be started.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TDFAR[31:0]	All 0	R/W	Transmit Descriptor Fetch Address Writing to these bits during transmission is prohibited.

26.3.52 Transmit Descriptor Finished Address Register (TDFXR)

TDFXR stores the start address of the transmit descriptor for which the E-DMAC has just completed the write-back processing. Up to which transmit descriptor has been processed by the E-DMAC can be recognized by monitoring addresses displayed in this register. In the initial setting, set the address of the transmit descriptor immediately before the descriptor that is pointed to by the address in TDFAR.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TDFXR[31:0]	All 0	R/W	Transmit Descriptor Finished Address Writing to these bits during transmission is prohibited.

26.3.53 Transmit Descriptor Final Flag Register (TDFFR)

TDFFR indicates whether the transmit descriptor for which the E-DMAC has just completed the write-back processing and whose start address is stored in TDFXR is at the end of the transmit descriptor queue (descriptor list).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	TDLF	0	R/W	Transmit Descriptor Queue Last Flag Indicates whether the transmit descriptor for which the E-DMAC has just completed the write-back processing and whose start address is stored in TDFXR is at the end of the transmit descriptor queue (descriptor list). 0: Not the last descriptor in the transmit descriptor queue 1: Last descriptor in the transmit descriptor queue

26.3.54 Overflow Alert FIFO Threshold Register (FCFTR)

FCFTR is a 32-bit readable/writable register that sets the flow control of the E-MAC. The threshold can be set by the size of the receive FIFO data (bits RFD[7:0]) and the number of receive frames (bits RFF[4:0]).

If the same receive FIFO size as set by the FIFO depth register (FDR) is set when flow control is turned on according to the RFD setting condition, flow control is turned on with (FIFO data size – 64) bytes. For instance, when the RFD bits in FDR is 7 and the RFD bits in this register is 7, flow control is turned on when (2,048 – 64) bytes of data is stored in the receive FIFO. The value set in the RFD bits in this register should be equal to or less than that set in the RFD bits in FDR. Flow control is turned on when either of the setting conditions of bits RFF[4:0] and bits RFD[7:0] is satisfied. Flow control is turned off when neither of the conditions is satisfied (release).

20 to 16	RFF[4:0]	H'17	R/W	Receive FIFO Overflow Alert Signal Output Threshold H'00: When one receive frame has been stored in the receive FIFO H'01: When two receive frames have been stored in the receive FIFO : : H'16: When 23 receive frames have been stored in the receive FIFO H'17: When 24 receive frames have been stored in the receive FIFO
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	RFD[7:0]	H'FF	R/W	Receive FIFO Overflow Alert Signal Output Threshold H'00: When (256 – 32) bytes of data is stored in the receive FIFO H'01: When (512 – 32) bytes of data is stored in the receive FIFO : : H'06: When (1,792 – 32) bytes of data is stored in the receive FIFO H'07: When (2,048 – 64) bytes of data is stored in the receive FIFO

26.3.55 Receive Data Padding Insert Register (RPADIR)

RPADIR is a 32-bit readable/writable register that inserts padding in receive data. To change the settings of this register, execute a software reset by means of the SWRT and SWRR bits in the E-DMAC mode register (EDMR) before making settings again.

26.3.56 Intelligent Checksum Mode Register (CSMR)

CSMR is a readable 32-bit register that specifies the intelligent checksum operation mode. This register must be set while reception is halted.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CSEBL	CSMD	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	1	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	SB[5:0]					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	1	0	1	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	CSELB	1	R	Intelligent Checksum Calculation Operation Setting 0: The result of checksum calculation is not written back to the receive descriptor. 1: The result of checksum calculation is written back to the receive descriptor.
30	CSMD	1	R/W	Intelligent Checksum Calculation Mode Setting 0: After having skipped the number of bytes specified in SB[5:0], counting from the beginning of the MAC-layer packet, the checksum is calculated for all subsequent data 1: MAC- or IP-layer packets are detected and checksums are calculated for upper-layer protocol packets such as TCP or UDP.
29 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5 to 0	SB[5:0]*1	011010	R/W	Intelligent Checksum Calculation Skip Bytes These bits specify the number of bytes to be skipped for checksum calculation, counting from the beginning of the data received in the E-DMAC. When padding bytes are to be added, specify the checksum start position to cover the amount or extent of padding. H'00: 0 bytes (meaning checksum calculation is performed from the beginning of the packet.) H'02: 2 bytes : : H'1A: 26 bytes H'3E: 62 bytes

Note 1. These bits should only be set when CSEL is 1 and CSMD is 0; otherwise, set to H'00.

26.3.57 Intelligent Checksum Skipped Bytes Monitor Register (CSSBM)

CSSBM is a 32-bit readable register that holds the number of bytes that have been skipped in received packets being handled by the E-DMAC. The number of skipped bytes can be monitored through this register. The amount of data received in E-DMAC may not match the number of skipped bytes.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5 to 0	SBM[5:0]	000000	R	Number of Skipped Bytes These bits are read-only. Writing is prohibited. These bits are initialized when the beginning of a packet for reception is detected.

Note: • This register is only valid when CSEL is 1 and CSMD is 0.

26.3.58 Intelligent Checksum Monitor Register (CSSMR)

CSSMR is a 32-bit register that holds the checksum value of received packets being handled by the E-DMAC. The checksum value can be monitored through this register. The amount of data received in E-DMAC may not match the number of skipped bytes.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CS[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5 to 0	CS[15:0]	000000	R	Intelligent Checksum Value These bits are read-only. Writing is prohibited. These bits are initialized when the beginning of a packet for reception is detected.

Note: • This register is only valid when CSEL = 1 and CSMD = 0.

26.4 Operation

The ETHER consists of the following three function units:

- DMA transfer controller (E-DMAC): DMA transfer between the transmit/receive buffer in the memory and the transmit/receive FIFO
- MAC controller (E-MAC): Transmission/reception processing between the transmit/receive FIFO and the MII
- Transfer Switching Unit (TSU): CAM processing

Using its direct memory access (DMA) function, the E-DMAC performs DMA transfer of frame data between a user-specified Ethernet frame transmission/reception data storage destination (accessible memory space: transmit buffer/receive buffer) and the transmit/receive FIFO in the E-DMAC. The user cannot read and write data from and to the transmit/receive FIFO directly via the CPU.

To enable the E-DMAC to perform DMA transfer, information (data) including a transmit/receive data storage address and so forth, referred to as a descriptor, is required. The E-DMAC reads transmit data from the transmit buffer or writes receive data to the receive buffer according to the descriptor information. By arranging multiple descriptors as a descriptor row (list) (to be placed in a readable/writable memory space), multiple Ethernet frames can be transmitted or received continuously.

The E-MAC constructs an Ethernet frame using the data written to the transmit FIFO and transmits the frame to the MII. It also performs a CRC check of an Ethernet frame received from the MII and deconstructs the frame to write to the receive FIFO. The E-MAC supports the MII format for interface to the PHI-LSI connected externally to this LSI. The TSU, which is placed between the E-DMAC and E-MAC, references the CAM entry table to select one of the following tasks according to the Ethernet frame destination address (DA) input to the E-MAC.

- Receives data and writes to the receive FIFO.
- Discards data.

Figure 26.2 shows the frame data path and an overview of each setting.

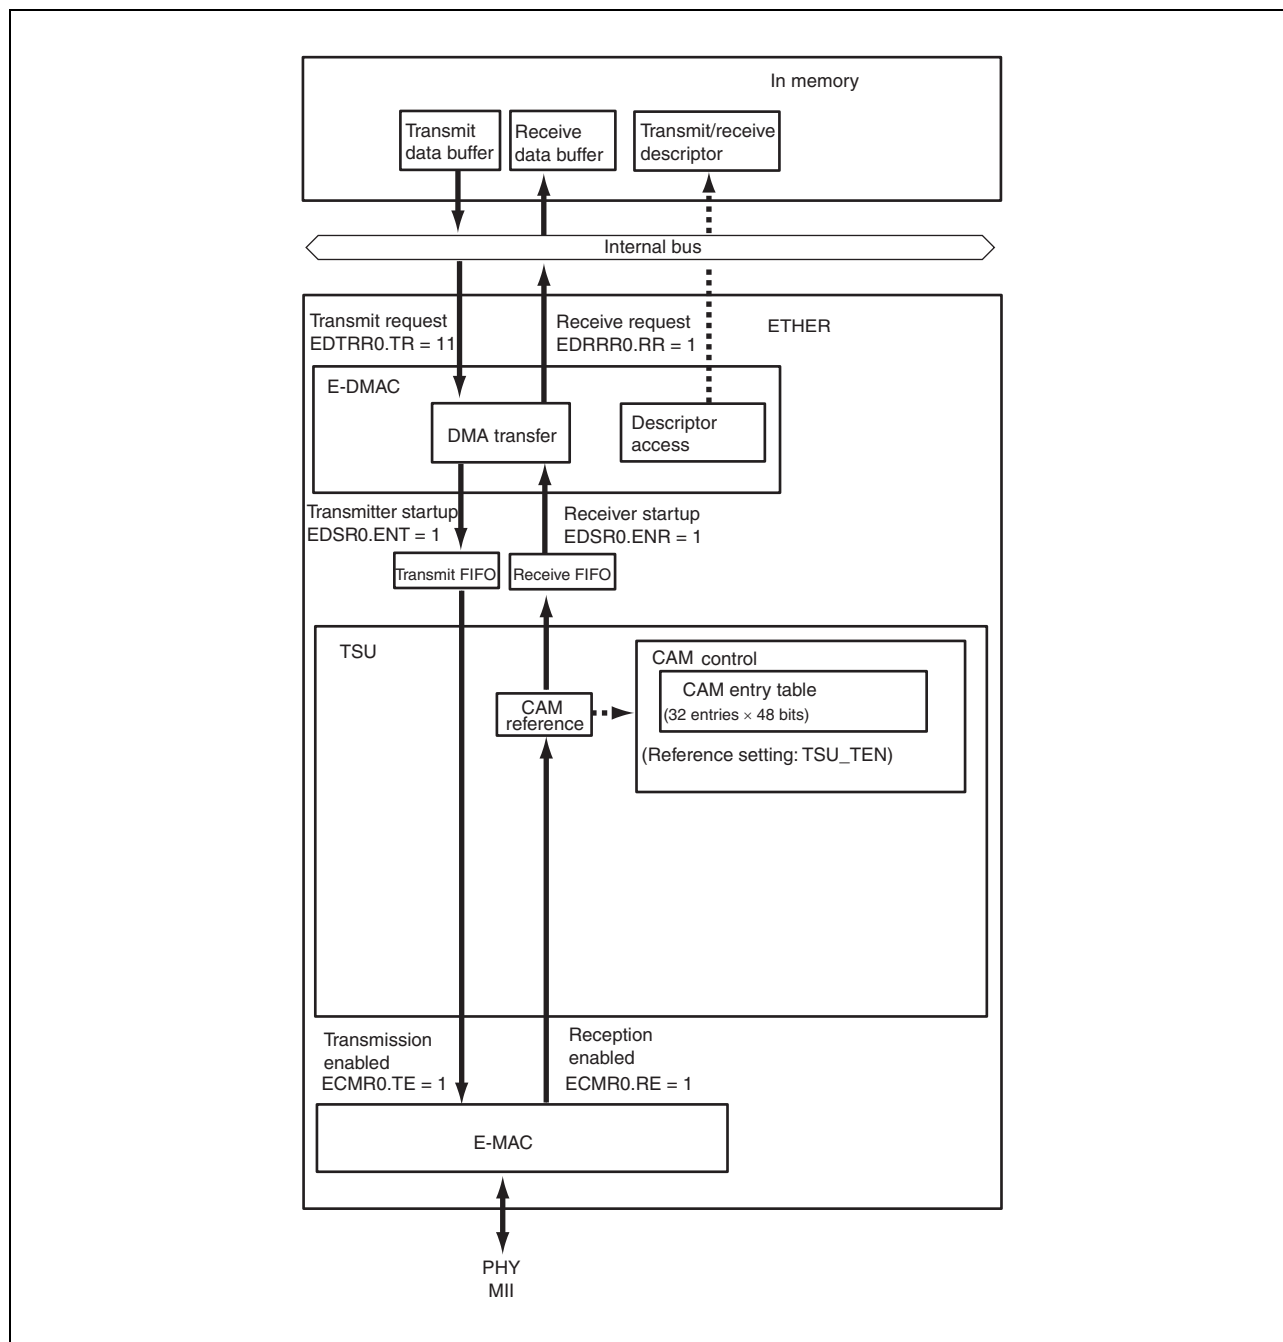

Figure 26.2 ETHER Data Path and Various Settings

26.4.1 Descriptors and Descriptor List

The E-DMAC performs DMA transfer according to the information (data), referred to as a descriptor, written in memory space. There are two types of descriptors: transmit descriptors and receive descriptors. Before a DMA transfer, DMA transfer information including a transmit/receive frame data storage address must be set by software.

The E-DMAC automatically starts reading a transmit/receive descriptor when the TR bits in EDTRR are set to 11 or the RR bit in EDRRR is set to 1, and performs DMA transfer of frame data between the transmit/receive buffer and transmit/receive FIFO according to the information stored in the descriptor. After completion of Ethernet frame transmission/reception, the E-DMAC disables the descriptor valid/invalid bit and reflects the result of transmission/reception in the status bits.

Descriptors are placed in a readable/writable memory space. The address of the start descriptor (descriptor to be read first by the E-DMAC) is set in TDLAR/RDLAR. When multiple descriptors are prepared as a descriptor row (descriptor list), the descriptors are placed in continuous addresses (memory) according to the descriptor length set in the DL0 and DL1 bits in EDMR.

(1) Transmit Descriptor

Figure 26.3 shows the configuration of a transmit descriptor and the relationship with a transmit buffer.

The data of a transmit descriptor consists of TD0, TD1, TD2, and padding data in groups of 32 bits from top to end. The length of padding data is determined according to the descriptor length specified by the DL0 and DL1 bits in EDMR. TD0 indicates whether the transmit descriptor is valid or invalid, and information about the descriptor configuration and status. TD1 indicates the length of data in a transmit buffer to be transferred (TDL) as specified by the descriptor. TD2 indicates the start address of a transmit buffer that holds data to be transferred (TBA).

Depending on the descriptor specification, one transmit descriptor can specify all transmit data of one frame (single-frame/single-buffer) or multiple descriptors can specify the transmit data of one frame (single-frame/multi-buffer). As an example of single-frame/multi-buffer operation, the data portion that is used in a fixed manner in each Ethernet frame transmission can be referenced by multiple descriptors. For example, multiple descriptors can share the destination address and transmit source address in an Ethernet frame, and the remaining data can be stored in each separate buffer.

Figure 26.3 Relationship between Transmit Descriptor and Transmit Buffer

(a) Transmit Descriptor 0 (TD0)

Before the TR bits in EDTRR are set to 11, the user sets whether the bits of the descriptor are valid or invalid bit and sets other descriptor configuration. After Ethernet frame transmission, the E-DMAC disables the valid/invalid bits of the descriptor and writes status information. This operation is referred to as write-back.

When using TD0, the user should write desired values to bits 31 to 28 and 26 according to the descriptor configuration. Bits 27 and 25 to 0 should be cleared to 0.

Bit	Bit Name	Initial Value	R/W	Description
31	TACT	0	R/W	<p>Transmit Descriptor Valid/Invalid Indicates whether the corresponding descriptor is valid or invalid. To make this bit valid, store transmit data in a transmit buffer (user-specified transmit data storage destination) beforehand, then write 1 to this bit. The E-DMAC clears this bit to 0 after data transfer.</p> <p>0: Indicates that this transmit descriptor is invalid Indicates the initial setting state, the state after 0 is written, or (in case the user writes 1 to this bit) that this bit is cleared to 0 because the E-DMAC data transfer processing is completed. If this state is recognized when the E-DMAC reads a descriptor, the E-DMAC clears the TR bit in EDTRR to 0, and halts transfer operation related to transmission by the E-DMAC.</p> <p>1: Indicates that this transmit descriptor is valid After the user writes 1 to this bit, this bit indicates that data is not transferred yet or data is being transferred. When there is a descriptor row (descriptor list) consisting of multiple continuous descriptors, the E-DMAC can continue operation when this bit of the next descriptor is valid.</p>
30	TDLE	0	R/W	<p>Transmit Descriptor List End Indicates whether the corresponding descriptor is the last descriptor of the descriptor row (descriptor list).</p> <p>0: Not last descriptor After transfer of the corresponding descriptor, the E-DMAC reads the next one in the list of continuous descriptors.</p> <p>1: Last descriptor After transfer of the corresponding descriptor, the E-DMAC reads the descriptor placed at the address indicated by TDLAR.</p>
29, 28	TFP[1:0]	00	R/W	<p>Transmit Frame Position These bits indicate whether information of this descriptor represents information about the start, middle, or end of the transmit frame.</p> <p>00: The information of the descriptor represents information about the middle of the frame.</p> <p>01: The information of the descriptor represents information about the end of the frame.</p> <p>10: The information of the descriptor represents information about the start of the frame.</p> <p>11: The information of the descriptor represents all information about the frame (single-frame/single-descriptor (single-buffer)).</p> <p>Reference When one frame is divided for use, the method of specifying this bit for a descriptor row according to the number of divisions is described below.</p> <ul style="list-style-type: none"> For single-frame/single-descriptor operation First descriptor: TFP[1:0] = 11 For single-frame/two-descriptor operation First descriptor: TFP[1:0] = 10 Second descriptor: TFP[1:0] = 01 For single-frame/three-descriptor operation First descriptor: TFP[1:0] = 10 Second descriptor: TFP[1:0] = 00 Third descriptor: TFP[1:0] = 01 <p>When the number of divisions is large, a descriptor row is configured by adding intermediate descriptors with TFP[1:0] = 00.</p>

Bit	Bit Name	Initial Value	R/W	Description
27	TFE	0	R/W	Transmit Frame Error Occurrence Indicates that an error occurred in the transmit frame. 0: The TFS11 to TFS0 bits are all 0 1: One of the TFS11 to TFS0 bits is 1 The TFS8 to TFS0 bits can be masked for each factor by using TRSCER. The TFS11 to TFS9 bits cannot be masked. This bit is set by the E-DMAC write-back operation.
26	TWBI	0	R/W	Write-Back Completion Interrupt Notification 0: Does not notify of a write-back completion interrupt 1: After a write-back operation to this descriptor is complete, this bit sets the TWB1 and TWB0 bits in EESR to 11 and notifies the CPU of a write-back completion interrupt. This bit is valid only for the descriptor including the end of transmit frame (TFP = 01 or 11). This bit is cleared to 0 by the E-DMAC write-back operation.
25 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	TFS [11:0]	All 0	R/W	Transmit Frame Status These bits indicate the status of the corresponding frame. A bit below, which is set by the E-DMAC write-back operation, indicates the occurrence of the corresponding event when set to 1. <ul style="list-style-type: none"> • TFS[11:10]: Reserved (The write value should always be 0.) • TFS[9]: Transmit FIFO underflow (Corresponding to the TUC bit in EESR) • TFS[8]: Detection of transmission abort (Corresponding to the TABT bit in EESR) • TFS[7:0]: Reserved (The write value should always be 0.)

(b) Transmit Descriptor 1 (TD1)

TD1 indicates the data length of the transmit buffer used by the corresponding descriptor.

The user should set TD1 before the start of a read by the E-DMAC.

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	TDL [15:0]	All 0	R/W	Transmit Buffer Data Length (in bytes) These bits indicate the data length of the corresponding transmit buffer in bytes. The specifiable data lengths are from a minimum of 1 (H'0001) byte to a maximum of 64 K - 32 (H'FFE0) bytes.
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

(c) Transmit Descriptor 2 (TD2)

TD2 indicates the start address of the corresponding 32-bit width transmit buffer. An address value should be specified in a 16-byte boundary.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TBA [31:0]	All 0	R/W	Transmit Buffer Start Address These bits set the start address of the corresponding transmit buffer in a 16-byte boundary.

If descriptors are set below, the E-DMAC does not return to normal operation until a system reset is performed.

- TFP (transmit frame position) is not logically correct
Example: The TFP bits are set to 11 in a descriptor (descriptor A) and the TFP bits are set to 01 in the next descriptor (descriptor B). This specification means that there is no descriptor indicating the start of the transmit frame specified by descriptor B.
- TBL (transmit buffer length) is set to 0

When one transmit frame is divided into three parts or more with transmit descriptors, the E-DMAC performs the following write-back operation:

- A write-back operation is performed for a transmit descriptor including information for the start of the transmit frame (TFP = 10 or 11) and for a transmit descriptor including information for the end of the frame (TFP = 01 or 11).
- A write-back operation is not performed for a transmit descriptor for the middle of the frame (TFP = 00).

However, TFE (transmit frame error occurrence) or TFS (transmit frame status) is written only to a transmit descriptor including information for the end of the frame (TFP = 01 or 11) by a write-back operation.

Before changing a transmit descriptor with the software, make sure that a write-back operation has been performed (TACT = 0) for the transmit descriptor including information for the end of the frame (TFP = 01 or 11) to avoid overwriting (re-setting) an unprocessed transmit descriptor.

(2) Receive Descriptor

Figure 26.4 shows the relationship between a receive descriptor and receive buffer.

The data of a receive descriptor consists of RD0, RD1, RD2, and padding data in groups of 32 bits from top to end. The length of padding data is determined according to the descriptor length specified by the DL0 and DL1 bits in EDMR.

RD0 indicates whether the receive descriptor is valid or invalid, and information about descriptor configuration and status. RD1 indicates the length of data that can be received in the receive buffer specified by the descriptor (RBL) and the length of the received frame data (RDL). RD2 indicates the start address of the receive buffer for storing receive data (RBA).

Depending on the descriptor specification, one receive descriptor can specify the storing of all receive data of one frame in a receive buffer (single-frame/single-buffer). All receive frames can be stored in a single buffer if RBL of each descriptor is set to more than 1514 bytes (maximum Ethernet frame length).

Figure 26.4 Relationship between Receive Descriptor and Receive Buffer

(a) Receive Descriptor 0 (RD0)

The user sets whether the bits of the descriptor are valid or invalid and whether the descriptor represents the end of the descriptor list in RD0 before the RR bit in EDRRR is set to 1 and the start of a read by the E-DMAC. After receive DMA transfer of an Ethernet frame by the E-DMAC, the E-DMAC disables the valid/invalid bits of the descriptor and writes status information. This operation is referred to as write-back.

When using RD0, the user should write desired values to bits 31 and 30 according to the descriptor configuration. Bits 29 to 0 should be cleared to 0.

Bit	Bit Name	Initial Value	R/W	Description
31	RACT	0	R/W	<p>Receive Descriptor Valid/Invalid</p> <p>Indicates whether this descriptor is valid or invalid. To make this bit valid, prepare a receive buffer (user-specified receive data storage destination) beforehand, then write 1 to this bit. The E-DMAC clears this bit to 0 after data transfer.</p> <p>0: Indicates that this receive descriptor is invalid</p> <p>Indicates the initial setting state, the state after 0 is written to, or (in case the user writes 1 to this bit) that this bit is cleared to 0 because the E-DMAC data transfer processing is completed</p> <p>If this state is recognized when the E-DMAC reads a descriptor, the E-DMAC clears the RR bit in EDRRR to 0, and halts transfer operation related to reception by the E-DMAC</p> <p>1: Indicates that this receive descriptor is valid</p> <p>Indicates that data is not transferred yet after the user writes 1 to this bit, or that data is being transferred</p> <p>When there is a descriptor row (descriptor list) consisting of multiple continuous descriptors, the E-DMAC can continue operation when this bit of the next descriptor is valid</p>
30	RDLE	0	R/W	<p>Receive Descriptor List End</p> <p>Indicates whether this descriptor is the last descriptor of the descriptor row (descriptor list).</p> <p>0: Not last descriptor</p> <p>After transfer of this descriptor, the E-DMAC reads the next one in the list of continuous descriptors</p> <p>1: Last descriptor</p> <p>After transfer of this descriptor, the E-DMAC reads the descriptor placed at the address indicated by RDLAR</p>
29, 28	RFP[1:0]	00	R/W	<p>Receive Frame Position 1, 0</p> <p>The E-DMAC indicates by write-back operation whether information of the corresponding descriptor represents information about the start, middle, or end of the receive frame.</p> <p>00: The information of the descriptor represents information about the middle of the frame</p> <p>01: The information of the descriptor represents information about the end of the frame</p> <p>10: The information of the descriptor represents information about the start of the frame</p> <p>11: The information of the descriptor represents all information about the frame (single-frame/single-descriptor (single-buffer))</p> <p>Note:</p> <p>The relationship between a frame after reception of one frame and a descriptor is described below.</p> <p>When the receive buffer data length is less than the receive frame length, these bits are set to a value other than 11 after reception. When they are set so, reception processing should be started after a software reset.</p>
27	RFE	0	R/W	<p>Receive Frame Error Occurrence</p> <p>Indicates that an error occurred in the receive frame.</p> <p>0: RFS9 to RFS0 are all 0</p> <p>1: One of RFS9 to RFS0 is 1</p> <p>Each of RFS8 to RFS0 can be masked by using TRSCER. RFS9 cannot be masked.</p> <p>This bit is set by the E-DMAC write-back operation.</p>

Bit	Bit Name	Initial Value	R/W	Description
26	RCSE	0	R/W	Receive Packet Checksum Value Evaluation by Intelligent Checksum When CSEBL = 1 and CSMD = 1, the value of this bit is set as shown in Table 26.3, according to the receive packet and receive data. The information of this bit is invalid when operation is performed with a setting other than above.
25 to 16	RFS[9:0]	All 0	R/W	Receive Frame Status These bits indicate the error status during frame reception. RFS9: Receive FIFO overflow (corresponding to the RFOF bit in EESR) RFS8: Reserved (write value should be 0) RFS7: Multicast address frame received (corresponding to the RMAF bit in EESR) RFS[6:5]: Reserved (write value should be 0) RFS4: Residual-bit frame receive error (corresponding to the RRF bit in EESR) RFS3: Long frame receive error (corresponding to the RTLf bit in EESR) RFS2: Short frame receive error (corresponding to the RTSF bit in EESR) RFS1: PHY-LSI receive error (corresponding to the PRE bit in EESR) RFS0: CRC error on receive frame (corresponding to the CERF bit in EESR)
15 to 0	RCS[15:0]	All 0	R/W	Receive Packet Checksum Value in Intelligent Checksum

Other than IPv4 or IPv6		H'0000	0	H'0000	0

(b) Receive Descriptor 1 (RD1)

In RD1, the user specifies the data length of a receive buffer usable by the corresponding descriptor. After reception of a frame, RD1 indicates the length of a frame received by the E-DMAC.

The user should set RD1 before the start of a read by the E-DMAC.

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	RBL [15:0]	All 0	R/W	<p>Receive Buffer Data Length (in bytes, to be specified with a 32-byte boundary) These bits set the length of data that can be received by the corresponding receive buffer with an integral multiple of 32 bytes. The specifiable data lengths are from a minimum of 32 (H'0020) bytes to a maximum of 64 K - 32 (H'FFE0) bytes. Set the data length so that a receive frame can be stored in a single buffer. When the checksum function is disabled, any received frame can be stored in a single buffer if the setting is for 1514 bytes (the maximum length of an Ethernet frame) or more. When the checksum function is enabled, any received frame can be stored in a single buffer if the setting is for 1516 bytes (the maximum length of an Ethernet frame + checksum data) or more.</p>
15 to 0	RDL [15:0]	All 0	R	<p>Receive Data Length These bits indicate the data length of a receive frame stored in the receive buffer. Receive data transferred to the receive buffer does not include CRC data (4 bytes) placed at the end of a frame. Accordingly, these bits indicate the number of bytes (valid data bytes), excluding the CRC code, as the data length of the received frame. When the checksum function is enabled, they indicate the number of bytes including the checksum value (2 bytes) as the data length. In single-frame/multi-buffer (descriptor) operation, only the receive data length of the last descriptor is valid. The receive data length of an intermediate descriptor has no meaning. The maximum frame length that can be received is: When padding function is invalid: 64 Kbytes between 1 byte (H'FFFF) When padding function is valid: 64 Kbytes between 32 bytes (H'FFE0)</p>

(c) Receive Descriptor 2 (RD2)

RD2 indicates the start address of the corresponding receive buffer. Set the start address of a receive buffer with a 32-byte boundary.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	RBA [31:0]	All 0	R/W	Receive Buffer Start Address These bits set the start address of the corresponding receive buffer with a 32-byte boundary.

The E-DMAC performs DMA transfer for a receive frame from the address specified by RBA (receive buffer address) to the receive buffer in 32-byte units. RBL (receive buffer length) must be set to be an integral multiple of 32 bytes.

If data to be transferred is less than 32 bytes, invalid data will be written to.

[Example]

When the receive frame length is 170 bytes and the required receive buffer capacity is 192 bytes (32 bytes × 6), the sixth DMA-transfer causes invalid data to be written to the receive buffer (In the 32-byte DMA data, the former 10 bytes are valid and the latter 22 bytes are invalid).

Padding of the value 0 can be inserted into only one position in the receive frame by setting RPADIR. The padding size can be selected from 1 byte to 31 bytes in byte units. When padding is inserted into a receive frame, a receive buffer area equal to the total of "receive frame length and padding size" is required. RPADIR setting is valid for all receive frames. RFE (receive frame error occurrence), PV (padding insertion), RFS (receive frame status) and RFS (receive frame status) are only set in the receive descriptor including information for the end of the frame (TFP = 01 or 11) by a write-back operation.

Before re-setting a receive descriptor with the software, completion of a write-back operation for the receive descriptor (RACT = 0) must be confirmed to avoid rewriting to (and re-setting) an unprocessed receive descriptor.

(3) Descriptor and Transmit/Receive Buffer

(a) Transmission

Each transmit descriptor specifies one transmit buffer. The E-DMAC transfers a transmit frame stored in a transmit buffer specified by a transmit descriptor to the transmit FIFO. Multiple transmit frames stored in transmit buffers specified by multiple descriptors can be connected into one transmit frame and transferred to the transmit FIFO.

Figure 26.5 shows the relationship between the transmit descriptors and transmit buffers.

Figure 26.5 Relationship between Transmit Descriptor and Transmit Buffer

(b) Reception

Each receive descriptor specifies one receive buffer. The E-DMAC receives a receive frame from the receive FIFO and stores it in a receive buffer specified by a receive descriptor.

Figure 26.6 shows the relationship between the receive descriptors and receive buffers.

Figure 26.6 Relationship between Receive Descriptor and Receive Buffer

(4) Descriptor Pointer

The E-DMAC controls the transmit and receive descriptor addresses in memory and the processing priority by using the following registers.

1. Registers related to a transmit descriptor
 - TDLAR: Address of the start descriptor in a list of transmit descriptors.
 - TDFAR: Address of the transmit descriptor to be processed
 - TDFXR: Address of the transmit descriptor that finished processing (set by a write-back operation) last
 - TDFFR (DL bit): Indicates whether the TDLE value of the transmit descriptor specified by TDFXR is 1 or not.
2. Registers related to receive descriptor:
 - RDLAR: Address of the start descriptor in a list of receive descriptors.
 - RDFAR: Address of the receive descriptor to be processed
 - RDFXR: Address of the receive descriptor that finished processing (set by a write-back operation) last
 - RDFFR (DL bit): Indicates whether the RDLE value of the receive descriptor specified by RDFXR is 1 or not.

Transmit descriptors and receive descriptors have a ring structure. When the TDLE (RDLE) value of the processed transmit (receive) descriptor is 0, the next descriptor will be processed. The next descriptor is the transmit (receive) descriptor at the address obtained by adding the processed transmit (receive) descriptor address to the descriptor length specified by the DL bits in EDMR. When the TDLE (RDLE) value of the processed transmit (receive) descriptor is 1, the transmit descriptor indicated by TDLAR (RDLAR) will be processed next. Figure 26.7 shows the relationship between the transmit/receive descriptor ring and read pointer.

The transmit descriptor list must be large enough to point to five or more transmit frames. If four or less transmit frames are pointed to in a list, E-DMAC operation is not guaranteed. Accordingly, do not set that all the transmit descriptors in a ring are used by four or less descriptors. The receive descriptor list does not have this restriction. For example, one receive frame can use all receive descriptors in a list.

In the initial setting, the start address of a descriptor list must be set to TDLAR (RDLAR) and TDFAR (RDFAR), and the end descriptor address of the descriptor list to TDFXR (RDFXR) by the software.

The E-DMAC updates TDFAR (RDFAR), TDFXR (RDFXR), and the DL bit in TDFFR (DL bit in RDFFR) each time a descriptor is processed.

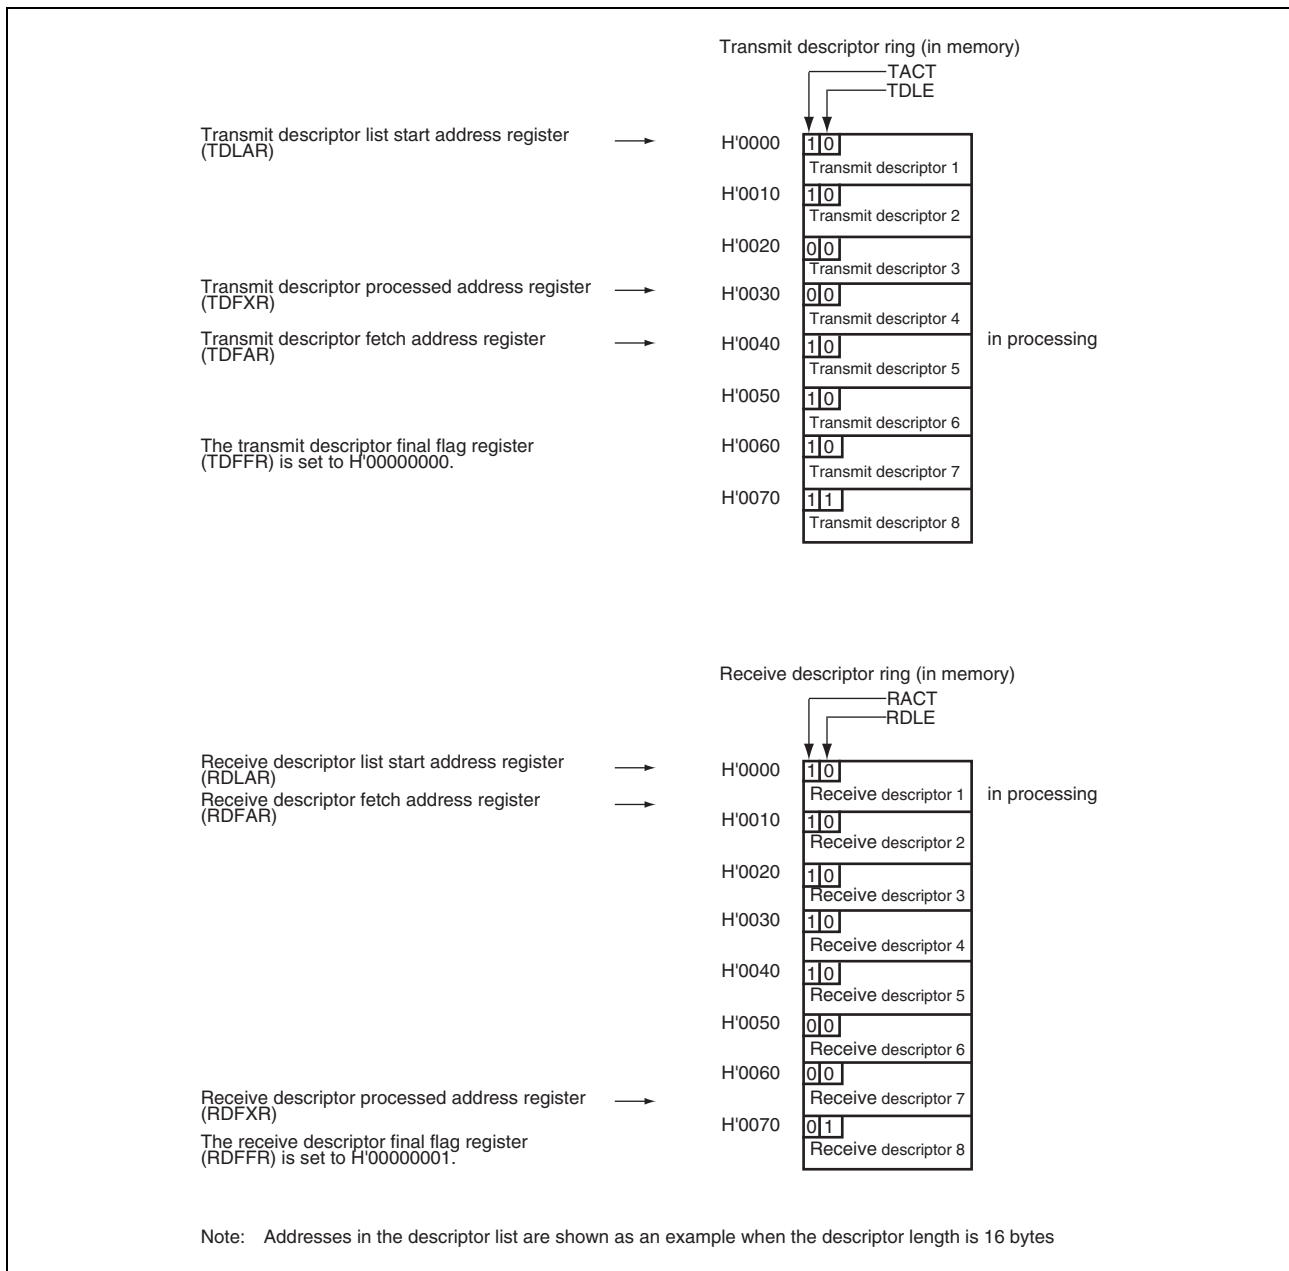

Figure 26.7 Relationship between Transmit/Receive Descriptor and Descriptor Pointing Registers

26.4.2 Transmission

(1) Transmission Procedure and Processing Flow

When 11 is written to the TR bits in EDTRR with the TE bit in ECMR set to 1 and there is empty space of 32 bytes or more in the transmit FIFO, the E-DMAC reads the descriptor following the previously used descriptor from the transmit descriptor list (or the descriptor indicated by TDLAR at the initial startup).

If the TACT bit of the read descriptor is set to 1 (valid), the E-DMAC sequentially reads transmit frame data from the transmit buffer start address specified by TD2 and transfers the data to the transmit FIFO. The E-DMAC configures a transmit frame and starts transmission to the MII. After DMA transfer of data equivalent to the buffer length specified in the descriptor, the following processing is carried out according to the TFP value.

- TFP = 10 (start of a frame)
Descriptor write-back (writing 0 to the TACT bit) is performed after completion of DMA transfer.
- TFP = 01 or 11 (end of a frame)
Descriptor write-back (writing 0 to the TACT bit and writing status) is performed after completion of frame transmission.
- TFP = 00 (frame continued)
Descriptor write-back is not performed. The TACT bit retains the value 1.

As long as the TACT bit of a read descriptor is set to 1 (valid), the reading of E-DMAC descriptors and the transmission of frames continue.

When a descriptor with the TACT bit cleared to 0 (invalid) is read, the E-DMAC performs the following processing and completes transmit processing.

- Clears the TR bits in EDTRR to 00.
- Writes the TC bits in EESR to 11 and generates an interrupt to the CPU.

The E-DMAC can store up to four frames of data in the transmit FIFO.

When the following conditions are satisfied, the E-MAC transmit processing section reads transmit data from the transmit FIFO to configure a frame and transmits the frame to the MII.

- The amount of data in the transmit FIFO exceeds the number of bytes specified by TFTR.
- One or more frame of data is stored in the transmit FIFO.
- The transmit FIFO has no space (full of transmit wait data for the MII).

Figure 26.8 shows an example of transmission flow.

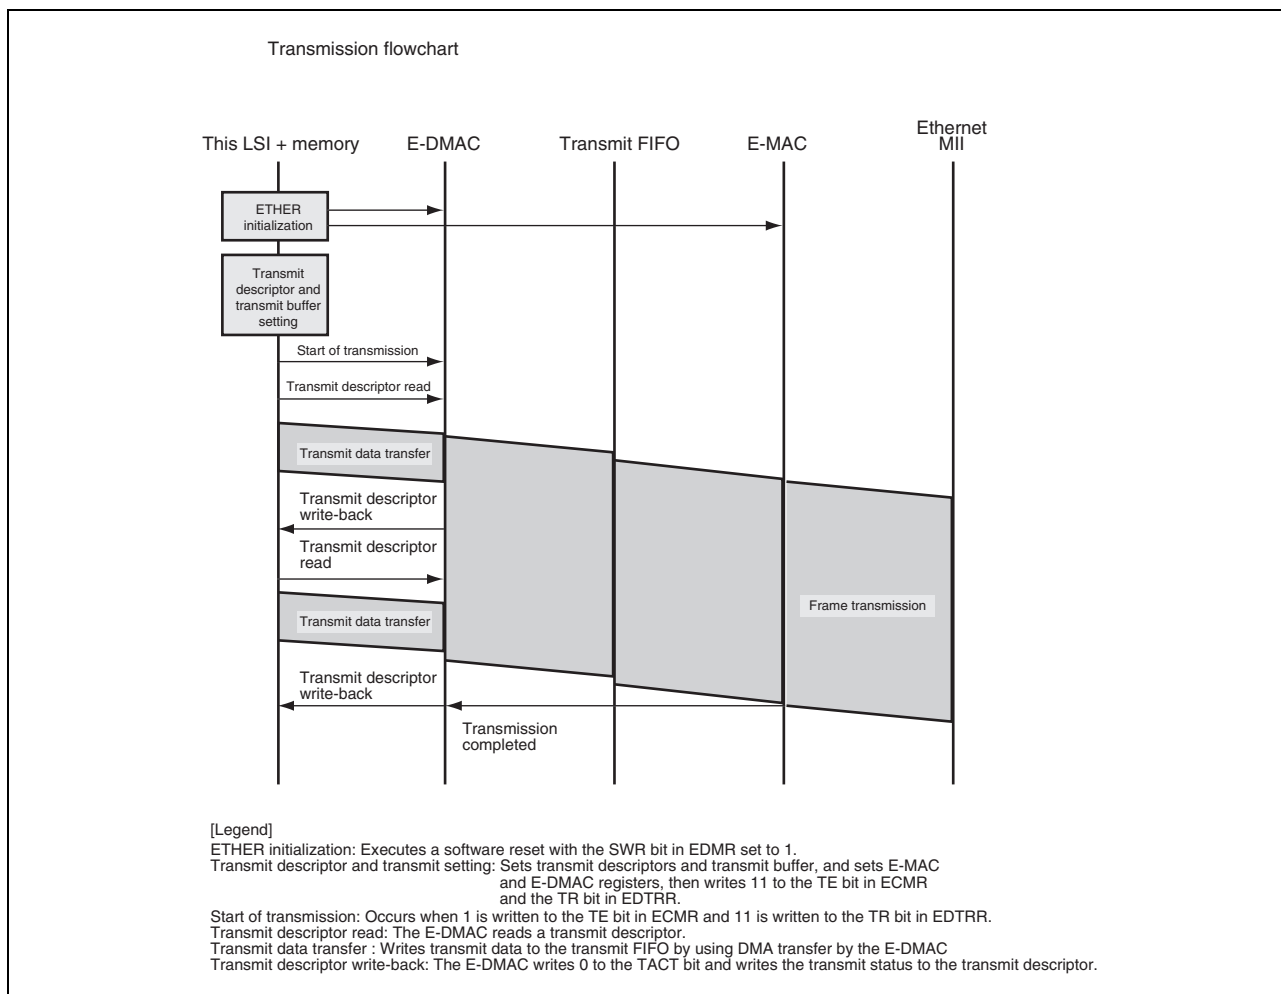

Figure 26.8 Sample Transmission Flowchart (Single-Frame/Two-Description)

Figure 26.9 shows the status change of the E-MAC transmitter.

1. When the TE bit in EDCMR is set, the transmitter enters the transmit idle state.
2. The preamble is sent as soon as a transmit request is issued by the E-DMAC.
3. The transmitter sends the SFD, data, and CRC sequentially. At the end of transmission, the transmit E-DMAC generates a transmission complete interrupt (TC).
4. After waiting for the frame interval time, the transmitter enters the idle state, and if there is more transmit data, continues transmitting.

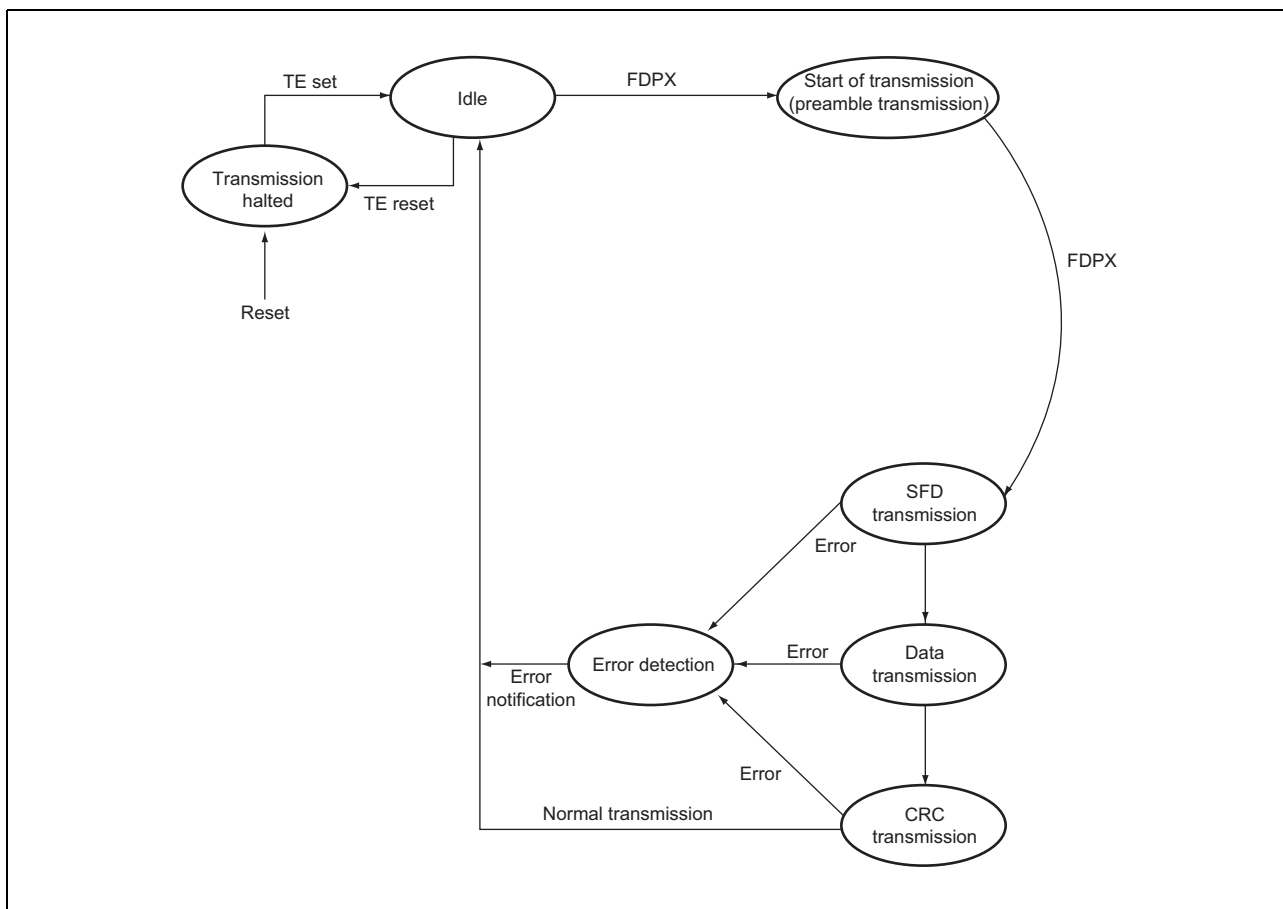

Figure 26.9 E-MAC Transmitter State Transitions

(2) Transmission Error Processing

(a) Transmission Abort

If a transmission error is detected during frame transmission from the transmit FIFO to the MII, transmission of the frame data is aborted. At this time, if DMA transfer of the appropriate frame from the transmit buffer to the transmit FIFO has not been completed, the DMA transfer is also aborted.

Following a write-back operation to the transmit descriptor related to the transmit frame aborted by a transmission error, 1 is written to the TABT bit in EESR and an interrupt is issued to the CPU. The subsequent transmit descriptors will be processed normally.

(b) Transmit FIFO Underflow

If the transmit FIFO is empty (transmit FIFO underflow) during frame transmission from the transmit FIFO to the MII, the E-MAC forcibly aborts transmission of the frame to the MII. At this time, the frame that the E-MAC receives from the E-DMAC is cut off halfway. Then, the E-MAC performs the following operation:

- Writes the TFUF bit in EESR to 1 and generates an interrupt to the CPU.
- Performs a write-back operation to the transmit descriptor corresponding to the transmit frame.
- Following the write-back operation, writes the TUC bit in EESR and generates an interrupt to the CPU.

The subsequent transmit descriptors operate normally.

The E-MAC waits to start frame transmission from the transmit FIFO to the MII until the data that was stored in the transmit FIFO exceeds the number of the bytes specified by TFTR. Through the effective use of TFTR, the transmit FIFO underflow counts can be controlled.

(c) Transmit Descriptor Empty

When the TFP bits of the descriptor previously processed are set to 00 or 10 and the TACT bit of the read transmit descriptor is set to 0 (invalid), a transmit descriptor empty state is determined and 1 is written to the TDE bit in EESR, and then an interrupt is issued to the CPU.

When a transmit descriptor state is empty, start transmission processing after a software reset.

26.4.3 Reception

(1) Reception Procedure and Processing Flow

The E-MAC receiver separates the frame from the MII into preamble, SFD, data and CRC, and transfers the fields from DA (destination address) to the data to the receive FIFO. Up to 24 frames can be written in the receive FIFO. Figure 26.10 shows the status change of the E-MAC receiver.

1. When the RE bit in ECMR is set to 1, the receiver enters the receive idle state.
2. When an SFD (start frame delimiter) is detected after a receive packet preamble, the receiver starts receive processing. A frame with an invalid pattern is discarded.
3. In normal mode, if the destination of the frame address is this LSI, the receiver starts data reception when broadcast or multicast transmission is specified. In promiscuous mode, data reception starts regardless of the frame type.
4. Following data reception from the MII, the receiver carries out a CRC check. The result is indicated as a status bit in the descriptor after the frame data has been written to the receive FIFO. Reports an error status in the case of an abnormality.

After one frame has been received, if the RE bit in ECMR is set to 1, the receiver prepares to receive the next frame.

Figure 26.10 E-MAC Receiver State Transitions

CAM evaluation can be referenced during frame processing in reception (for details on the CAM function, refer to section 26.4.4, CAM Function).

When 1 is written to the RR bit in EDRRR while the RE bit in ECMR is set to 1, the E-DMAC reads the descriptor following the previously used descriptor from the receive descriptor list (or the descriptor indicated by RDLAR at the initial startup) then enters the receive wait state. If 32 bytes or more of data or the last byte of the receive frame is stored in the receive FIFO, the E-DMAC transfers receive FIFO data to the receive buffer specified by RD2 according to the receive descriptor with the RACT bit set to 1 (valid).

If the data length of a received frame is longer than the buffer length specified by RD1, the E-DMAC performs a write-back operation to the descriptor (set RFP to 10 or 00) when the buffer is full, then reads the next descriptor. The E-DMAC then continues to transfer data to the receive buffer specified by the new RD2.

When the following conditions are satisfied, a write-back operation is performed for the descriptor (RFP = 11 or 01), 11 is written to the FR bits in EESR, and an interrupt is issued to the CPU.

- The receive buffer has been full during DMA transfer.
- DMA transfer to the receive buffer of the last byte of the receive frame has been completed.

After the reception processing of the frame, the next descriptor reading standby state begins. At this time, if 32 bytes or more of data or the last byte of the receive frame is stored in the receive FIFO, the next receive descriptor process is performed continuously.

When the TACT bit of the read receive descriptor is 0 (invalid), the receive descriptor empty state is determined and the RDE bit in EESR is written to 1, and then an interrupt is issued to the CPU.

To receive frames continuously, set the RNC bit in RMCR to 1. The initial value is 0.

Figure 26.11 shows an example of reception flow.

Figure 26.11 Sample Reception Flowchart (Single-Frame/Single-Descriptor)

(2) Reception Error Processing

(a) Reception Error

When a reception error occurs, the FR and RABT bits in EESR are set to 1 and an interrupt is issued to the CPU after a write-back operation for the receive descriptor related to the reception error frame.

If a reception error occurs when the length of the frame received from the MII is less than 32 bytes, DMA transfer to the receive buffer for the frame is not performed. At this time, the receive frame is discarded in the E-DMAC (flush function). However, if padding is inserted in the receive frame by RPADIR, the flush function is performed when the frame length including the padding bytes is less than 32 bytes.

(b) Receive FIFO Overflow

In any of the following cases, the E-MAC cannot receive frames from the MII because it has no space to store receive frames, and all the receive frames that have been transferred to the E-MAC will be discarded in the E-MAC (receive FIFO overflow).

- Receive FIFO is full of data waiting for DMA transfer (the receive FIFO has no space).
- The number of receive frames waiting for DMA transfer is 24 in total (the receive frame information managing area has no empty space; up to 24 frames can be managed).

If an overflow occurs due to the former case, the RFOF bit in EESR is set to 1 and an interrupt is generated to the CPU. If an overflow occurs due to the latter case, the RFCOF bit in EESR is set to 1 and an interrupt is generated to the CPU. Each time a receive frame is discarded due to an overflow, RMFCR is incremented. However, RMFCR is not incremented for a receive frame that is cut off due to insufficient receive FIFO space. If a receive frame is cut off due to insufficient receive FIFO space (the frame is partially stored in the receive FIFO), the E-DMAC performs the following operation:

- Performs DMA transfers for the cut-off frame stored in the receive FIFO to the receive buffer.
- After the DMA transfer, performs a write-back operation on the receive descriptor.
- After the write-back operation, sets the ROC bit in EESR to 1 and generates an interrupt to the CPU.

When the receive FIFO is full of data waiting for DMA transfer, frame reception from the MII can be resumed if DMA transfer is performed from the receive FIFO to the receive buffer and 32 bytes or more of empty space is generated in the receive FIFO. When the number of receive frames waiting for DMA transfer is 24 in total, frame reception from the MII can be resumed if one or more frame has been DMA transferred from the receive FIFO to the receive buffer. For restarting frame reception from the MII, when the E-DMAC resumes frame reception from the MII, it only accepts from the start of the frame.

(c) Flow Control

When the amount of receive data or the number of receive frames in the receive FIFO leads to one of the following conditions, the E-DMAC notifies the E-MAC to control E-MAC writing to the receive FIFO.

- When the space used in the receive FIFO exceeds the data amount specified by FCFTR
- When the number of receive frames in the receive FIFO exceeds the value specified by FCFTR

The threshold of the receive data amount can be set in a range from 256 to 65536 bytes in 256-byte units.

The threshold of receive frames can be set in a range from 1 to 24 frames (by the frame) in frame units.

(d) Receive Descriptor Empty

When the RACT bit of the read descriptor is 0 (invalid), the receive descriptor empty state is determined and DMA transfer is stopped. Then the following operation is performed.

- Writes the RR bit in EDRRR to 0
- Sets the RDE bit in EESR to 1 and generates an interrupt to the CPU.

To resume the DMA transfer to the receive buffer, the interrupt source needs to be cleared by software, the receive descriptor needs to be re-set and the RR bit in EDRRR should be set to 1.

Even if receive descriptor is empty, frame reception from the MII to the receive FIFO is continued if there is empty space left in the receive FIFO and receive frame information management area. Therefore, even if a receive descriptor empty state is determined, the DMA transfer can be performed without discarding the frames received from the MII if DMA transfer to the receive buffer can be resumed before an overflow occurs.

26.4.4 CAM Function

Frames input to the E-MAC are grouped into the following four types; unicast for this LSI, broadcast, multicast, and unicast to other destinations. The MAC addresses of unicast for this LSI and broadcast are fixed, and determined only by register settings. Consequently, only multicast and unicast to other destinations determine whether to receive or not by using the CAM (unicast frames whose destination MAC addresses match this LSI are called unicast frames to this LSI, and those that do not are called unicast frames to other destinations).

Furthermore, the evaluation of reception of unicast to other destinations and multicast frames by using CAM are performed by referencing the registered MAC addresses of the CAM entry table in the TSU. By using this function, receive FIFO overflow can be prevented caused by accumulation of frame data not required for reception, and CPU processing for determining reception can be reduced.

The on-chip CAM has entry tables which can register the MAC address of 32 entries, the details of which can be set by TSU_ADRH0 to TSU_ADRH31 and TSU_ADRL0 to TSU_ADRL31. The setting to enable/disable referencing of the on-chip CAM entry table is performed by the CAM entry table enable setting register which sets whether to perform CAM evaluation or not. When on-chip CAM entry table referencing is enabled, the destination address in the frame and MAC address registered in the CAM entry table are compared, and it is determined whether to transfer the frames input to the E-MAC to E-DMAC (have E-DMAC receive the frames) or discard the frames. Table 26.4 shows the processing method of frames (receive or discard) in reception from E-MAC to E-DMAC.

Table 26.4 Receive Frame Processing

CAM Entry Table Referencing Results	Types of Frame	Normal Mode		Promiscuous Mode	
		MCT = 0	MCT = 1	MCT = 0	MCT = 1
CAM hit (when addresses match)	Frame to this LSI	Discarded		Discarded	
	Broadcast frame	Discarded		Discarded	
	Multicast frame	Discarded	Received	Discarded	Received
	Frames having destinations other than this LSI	Received		Discarded	
CAM mishit (when addresses do not match)	Frames to this LSI	Received		Received	
	Broadcast frame	Received		Received	
	Multicast frame	Received	Discarded	Received	Discarded
	Frames having destinations other than this LSI	Discarded		Received	

[Legend]

MCT (Bit 13 in ECMR): Multicast receive mode (0: Receive when CAM mishit/1: Receive when CAM hit)

26.4.5 Transmit Processing of Multi-Buffer Frame (Single-Frame/Multi-Descriptor)

(1) Multi-Buffer Frame Transmit Processing

If an error occurs during multi-buffer frame transmission, the processing shown in Figure 26.12 is carried out by the E-DMAC.

In the figure where the transmit descriptor is shown as inactive (TACT bit = 0), buffer data has already been transmitted successfully, and where the transmit descriptor is shown as active (TACT bit = 1), buffer data has not been transmitted. If a frame transmit error occurs in the first descriptor part where the transmit descriptor is active (TACT bit = 1), transmission is halted, and the TACT bit is cleared to 0, immediately. The next descriptor is then read, and the position within the transmit frame is determined on the basis of bits TFP1 and TFP0 (continuing [B'00] or end [B'01]). In the case of a continuing descriptor, the TACT bit is cleared to 0, and the next descriptor is read immediately. If the descriptor is the final descriptor, not only is the TACT bit cleared to 0, but write-back is also performed to the TFE and TFS bits at the same time. Data in the buffer is not transmitted between the occurrence of an error and write-back to the final descriptor. If error interrupts are enabled in EESIPR, an interrupt is generated immediately after the final descriptor write-back.

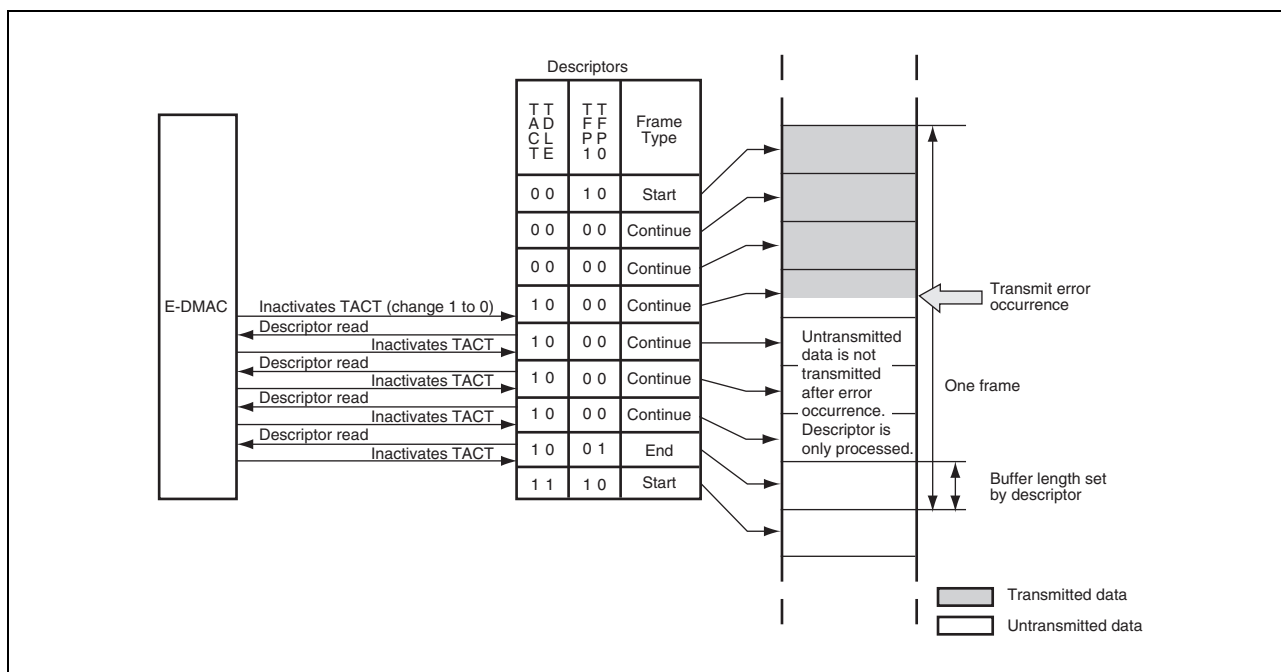

Figure 26.12 E-DMAC Operation after Transmit Error

26.4.6 Padding Insertion in Receive Data

In the E-DMAC, one to three bytes of padding can be inserted in any byte position of receive data to improve software handling capability. By using this function, for instance, inserting 2-byte padding after the MAC header (14 bytes) of Ethernet frame enables data following the MAC header to set in 4-byte boundary.

Figure 26.13 Padding Insertion in Receive Data

26.4.7 Interrupt Processing

(1) Interrupt Sources

The ETHER issues one type of interrupt to the CPU: receive/transmit interrupts (ETHERI).

ETHERI interrupts are generated in correspondence with the transmit/receive operation. When an interrupt source is generated, it is set in EESR0 and an interrupt is issued to the CPU. For some interrupt sources, the EESR0 setting and an interrupt to the CPU are performed after a write-back operation to a descriptor is completed, not immediately after the interrupt source is detected. Interrupt sources other than the E-MAC status register source (ECI bit) are cleared by writing a 1 to the corresponding source bit. The E-MAC status register source (ECI bit) is cleared by writing a 1 to the corresponding source bit in ECSR. Interrupt source bits retain the values until they are cleared. ETHERI interrupt source is allowed to issue interrupts by setting the corresponding bit in EESIPR0. Each E-MAC state register source (ECI bit) is allowed to issue an interrupt by setting the corresponding bit in ECSIPR. In the initial value, interrupts are disabled. Table 26.5 shows these three interrupts, interrupt sources, interrupt status registers and bits set at interrupt occurrence and interrupt generation timing.

Table 26.5 List of ETHER Interrupts

Interrupt	Interrupt Source	Register and Bit	Interrupt Generation Timing
Transmit/ receive interrupt (ETHERI)	Write-back completed	EESR0.TWB	After write-back
	Transmit underflow frame write-back completed	EESR0.TUC	After write-back
	Receive underflow frame write-back completed	EESR0.ROC	After write-back
	Transmission abort detection	EESR0.TABT	After write-back
	Reception abort detection	EESR0.RABT	After write-back
	Receive frame counter overflow	EESR0.RFCOF	When the interrupt source is detected
	E-MAC status register source	EESR0.ECI	When the interrupt source is detected
	Frame transmission completed	EESR0.TC	After write-back
	Transmit descriptor empty	EESR0.TDE	When the interrupt source is detected
	Transmit FIFO underflow	EESR0.TFUF	When the interrupt source is detected
	Frame reception	EESR0.FR	After write-back
	Receive descriptor empty	EESR0.RDE	When the interrupt source is detected
	Receive FIFO overflow	EESR0.RFOF	When the interrupt source is detected
	Receive Multicast Address Frame	EESR0.RMAF	After write-back
	Receive Residual-Bit Frame	EESR0.RRF	After write-back
	Receive Too-Long Frame	EESR0.RTLF	After write-back
	Receive Too-Short Frame	EESR0.RTSF	After write-back
	PHY-LSI Receive Error	EESR0.PRE	After write-back
	CRC Error on Received Frame	EESR0.CERF	After write-back

26.4.8 Activation Procedure

The ETHER should be activated by the following procedure:

(1) Reset

1. Perform a power-on reset.
2. Set the ET_TXCLK and ET_RXCLK pins and supply the clock signal (for details on pin function settings, see section 41, Ports).
3. Start the E-DMAC transmitter and receiver (activation of descriptor engine).
 - Set ENT to 1 and ENR to 1 in EDSR.
4. Perform a software reset.
 - Set SWRR to 1 and SWRT to 1 in EDMR simultaneously.
5. Initialize the descriptor entry table.
6. Confirm cancellation of the software reset.
 - Check that the SWRR and SWRT bits in EDMR are cleared to 0.

(2) Pin Settings

See section 41, Ports.

(3) Registration of Descriptor Ring

The address of a descriptor ring configured in memory is registered in the descriptor entry table.

1. Transmit descriptor setting
 - Set TDLAR.
 - Set TDFAR.
 - Set TDFXR.
 - Set TDFFR. When the descriptor indicated by TDFXR is the last descriptor in the descriptor list, set H'00000001.
2. Receive descriptor setting
 - Set RDLAR.
 - Set RDFAR.
 - Set RDFXR.
 - Set RDFFR. When the descriptor indicated by RDFXR is the last descriptor in the descriptor list, set H'00000001.

(4) Register Settings

The following registers should be set as necessary.

1. E-DMAC related registers
 - Set EDMR: Operating mode, etc.
 - Set EESIPR: Interrupt masks
 - Set TRSCER: Error masks
 - Set TFTR: Transmit FIFO threshold
 - Set FDR: External FIFO size
 - Set RMCR: Reset method for reception activation
 - Set RPADIR: Padding insertion into receive data
 - Set FCFTR: Receive BSY output threshold
2. E-MAC related registers
 - Set ECMR setting: Transmission/reception specifications
 - Set ECSIPR setting: Interrupt masks
 - Set MAHR: MAC address
 - Set MALR: MAC address

- Set RFLR: Maximum receive frame length
- Set APR: TIME parameter value of an automatic pause frame
- Set MPR: TIME parameter value of a manual PAUSE frame
- Set TPAUSER: Upper limit of automatic PAUSE frame retransmission

(5) Activation

1. Start the E-DMAC transmission/reception function
 - Set the TR bits in EDTRR to 11.
 - Set the RR bit in EDRRR to 1.
2. Start the E-MAC transmission/reception function
 - Set the TE and RE bits in ECMR to 1.

26.4.9 Flow Control

The ETHER supports flow control functions conforming to IEEE802.3x for full-duplex operation. The flow control can be applied to both receive and transmit operations. When transmitting PAUSE frames, flow control can be performed by the following two procedures:

(1) Automatic PAUSE Frame Transmission

For receive frames, PAUSE frames are automatically transmitted when the number of data written to the receive FIFO reaches the value set in FCFTR. The TIME parameter included in the PAUSE frame is set by APR. The automatic PAUSE frame transmission is repeated until the number of data in the receive FIFO becomes less than the value set in FCFTR as the receive data is read from the FIFO. Using TPAUSER, the upper limit of retransmission counts of the PAUSE frames can also be set in the range from 1 to 65535. In this case, PAUSE frame transmission is repeated until the number of receive FIFO data becomes less than the FCFTR value, or the number of transmits reaches the value set by TPAUSER. The transmission counter is cleared to 0 when the next PAUSE frame is transmitted after the number of data in the receive FIFO becomes less than the FCFTR value.

The automatic PAUSE frame transmission is enabled when the TXF bit in ECMR is 1.

(2) Manual PAUSE Frame Transmission

PAUSE frames are transmitted by directives from the software. When writing the Timer value to MPR, manual PAUSE frame transmission is started. With this method, PAUSE frame transmission is carried out only once.

(3) PAUSE Frame Reception

The next frame is not transmitted until the time indicated by the Timer value elapses after receiving a PAUSE frame. However, the transmission of the current frame is continued. A received PAUSE frame is valid only when the RXF bit in ECMR is set to 1. The number of times of PAUSE frame receptions is counted.

(4) 0-Time PAUSE Frame Control

Flow control is performed using a PAUSE frame with the TIME parameter value set to 0. The PAUSE frame with the TIME parameter set to 0 can be enabled or disabled by the ZPF bit in ECMR.

- When PAUSE frame control with the TIME parameter value set to 0 is enabled
A PAUSE frame with the TIME parameter value set to 0 is transmitted when the number of data in the receive FIFO is less than the FCFTR value before the time indicated by the TIME parameter value has not elapsed. When a PAUSE frame with the time indicated by the TIME parameter value set to 0 is received, the transmit standby state is canceled.
- When PAUSE frame control with the TIME parameter value set to 0 is disabled
A PAUSE frame with the TIME parameter value set to 0 is not transmitted. When a PAUSE frame with the TIME parameter value set to 0 is received, the PAUSE frame is discarded.

26.4.10 Intelligent Checksum Calculation Function

This function accelerates checksum calculation on received packets, and provides the following two modes.

- MAC/IP packet analyzing intelligent checksum calculation mode
- All-data intelligent checksum calculation mode with bytes to be skipped specified

(1) MAC/IP Packet Analyzing Intelligent Checksum Calculation Mode (CSEBL = 1 and CSMD = 1 in CSMR)

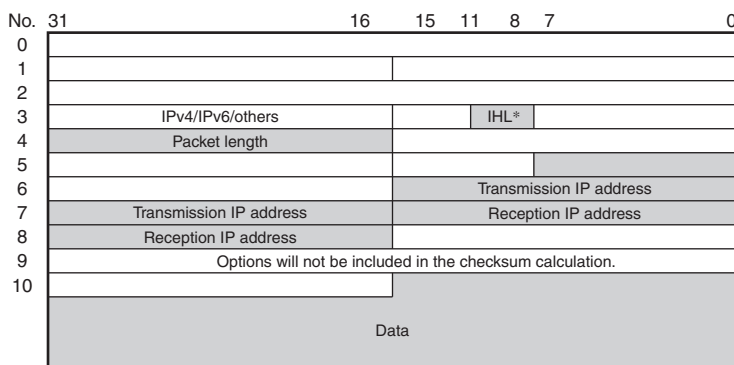

In this mode, the checksum of received packets indicated in the table is calculated. However, if a MAC packet payload includes padding data in fields other than those for the IP packet itself because there is too little data for a full packet, it is not included in the checksum.

IPver	Items
IPv4	Option present
	Option not present
	Fragment*1
IPv6	Extension header not present
	Hop-by-hop options extension header length
	Routing extension header length
	Fragment extension header length*1
	Destination options header length
	AH extension header length
	ESP extension header length*2
Extension header length for mobile IPv6*2	

Note 1. This packet is to be checksummed, however, the RCS[15:0] bits and RCSE bit in RD0 are to be undefined even if the data is successfully received.

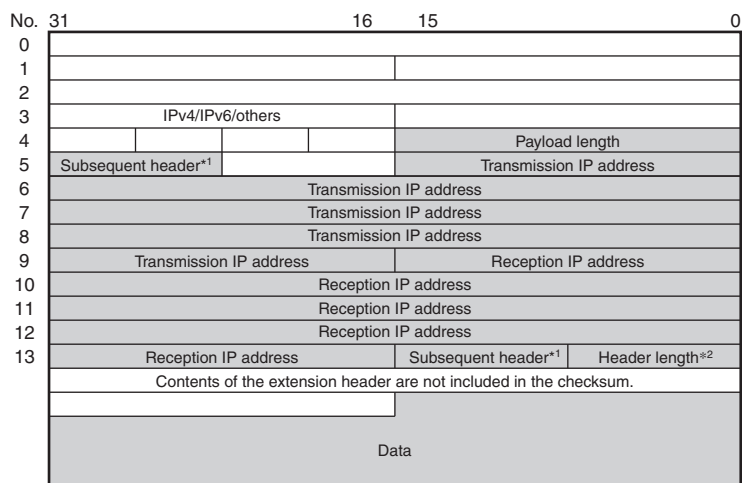

Note 2. The RD0.RCSE bit is set to 1 without calculating the value of the RD0.RCS[15:0] bits.

The shaded regions of the following figure indicate the parts of an IPv4 packet which are used to obtain the checksum.

Note: * After conversion to octet units, this is subtracted in the checksum calculation. In the calculation: {8'h00, protocol no.[7:0]}

The shaded regions of the following figure indicate the parts of an IPv6 packet which are used to obtain the checksum.

Notes: *1 Only included in the checksum when the header is for the TCP or UDP. Calculation coverage is extended to {8'h00, protocol No.[7:0]} when the checksum is taken.
 *2 After conversion to octet units, this is subtracted in the checksum calculation.

(2) All-Data Intelligent Checksum Calculation Mode with Bytes to be Skipped Specified (CSELB = 1 and CSMD = 0 in CSMR)

After having skipped the number of bytes specified in the SB[5:0] bits in CSMR, counting from the beginning of the packet, the checksum is calculated for all subsequent data (e.g. 14 bytes may be skipped).

26.5 Connection to PHY-LSI

26.5.1 MII Frame Transmission/Reception Timing

Each MII frame transmission/reception timing is shown in Figure 26.14 to Figure 26.17.

Figure 26.14 MII Frame Transmit Timing (Normal Transmission)

Figure 26.15 MII Frame Receive Timing (Normal Reception)

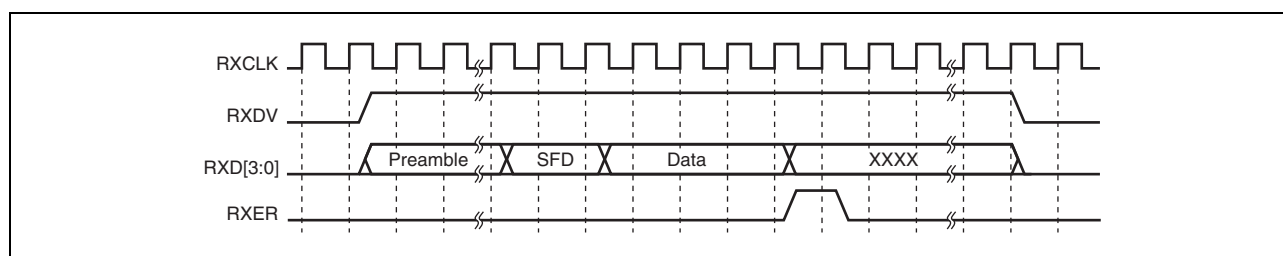

Figure 26.16 MII Frame Receive Timing (Reception Error (1))

Figure 26.17 MII Frame Receive Timing (Reception Error (2))

26.5.2 Accessing MII Registers

MII registers in the PHY-LSI are accessed via PIR in this LSI. PIR is used as a serial interface conforming to the MII frame format specified in IEEE802.3u.

(1) MII Management Frame Format

Figure 26.18 shows the format of an MII management frame. To access an MII register, a management frame is implemented by the program in accordance with the procedures shown in MII Register Access Procedure.

Access Type	MII Management Frame							
Item	PRE	ST	OP	PHYAD	REGAD	TA	DATA	IDLE
Number of bits	32	2	2	5	5	2	16	
Read	1..1	01	10	00001	RRRRR	Z0	D..D	
Write	1..1	01	01	00001	RRRRR	10	D..D	X

[Legend]

PRE: 32 consecutive 1s
 ST: Write of 01 indicating start of frame
 OP: Write of code indicating access type
 PHYAD: Write of 0001 if the PHY-LSI address is 1 (sequential write starting with the MSB). This bit changes depending on the PHY-LSI address.
 REGAD: Write of 000q if the register address is 1 (sequential write starting with the MSB). This bit changes depending on the PHY-LSI register address.
 TA: Time for switching data transmission source on MII interface
 (a) Write: 10 written
 (b) Read: Bus release (notation: Z0) performed
 DATA: 16-bit data. Sequential write or read from MSB
 (a) Write: 16-bit data write
 (b) Read: 16-bit data read
 IDLE: Wait time until next MII management format input
 (a) Write: Independent bus release (notation: X) performed
 (d) Read: Bus already released in TA: control unnecessary

Figure 26.18 MII Management Frame Format

(2) MII Register Access Procedure

The program accesses MII registers via PIR. Access is implemented by a combination of 1-bit-unit data write, 1-bit-unit data read, bus release, and independent bus release. Figure 26.19 (1) to Figure 26.22 (4) show the MII register access timing. The timing will differ depending on the PHY-LSI type.

Figure 26.19 1-Bit Data Write Flowchart

Figure 26.21 1-Bit Data Read Flowchart

Figure 26.22 Independent Bus Release Flowchart (IDLE in Write in Figure 26.18)

26.6 Usage Notes

26.6.1 Checksum Calculation of Ethernet Frames

This LSI is capable of calculating the checksum data of the received frames. Only the data fields of the Ethernet frames are subject to checksum calculation. Specifically, a data field follows the length/type field and is followed by the CRC field. Figure 26.23 shows schematics indicating which parts of the Ethernet frames are calculated. Calculation involves 16-bit addition only; it does not involve bit inversion. Note that when the checksum data is valid, the CRC data (4 bytes) is not transferred as a receive frame, and the checksum data (sum data) is added automatically. Figure 26.24 shows schematics of Ethernet frames to which the checksum data has been added.

Note: • Also for the frames with VLANtag inserted, the 15th byte from the top and the following bytes before the CRC field are subject to calculation.

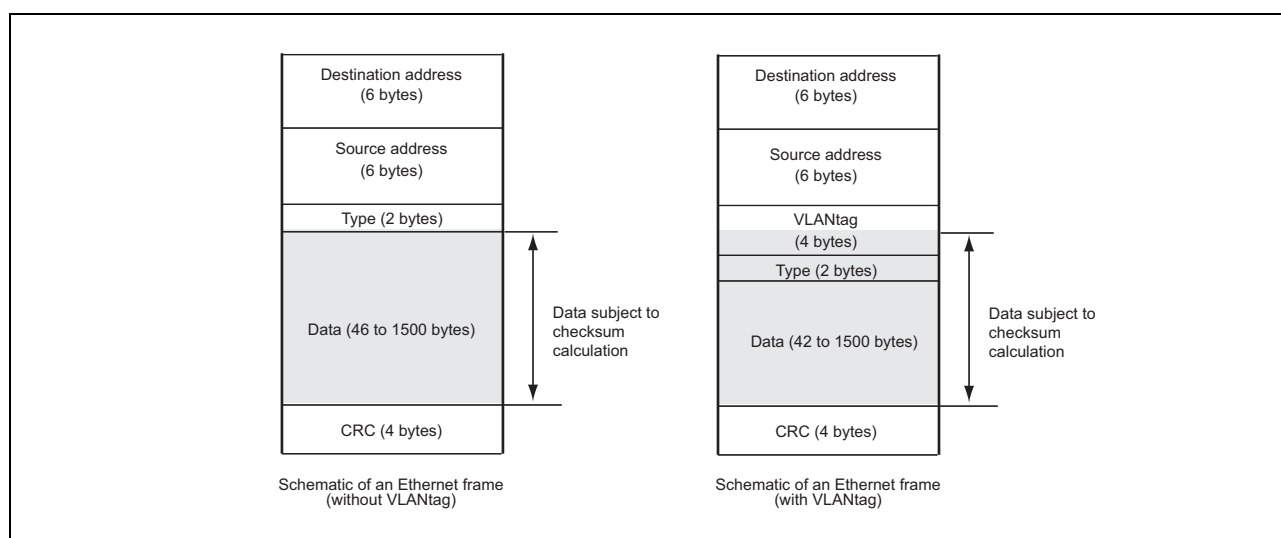

Figure 26.23 Data Subject to Checksum Calculation

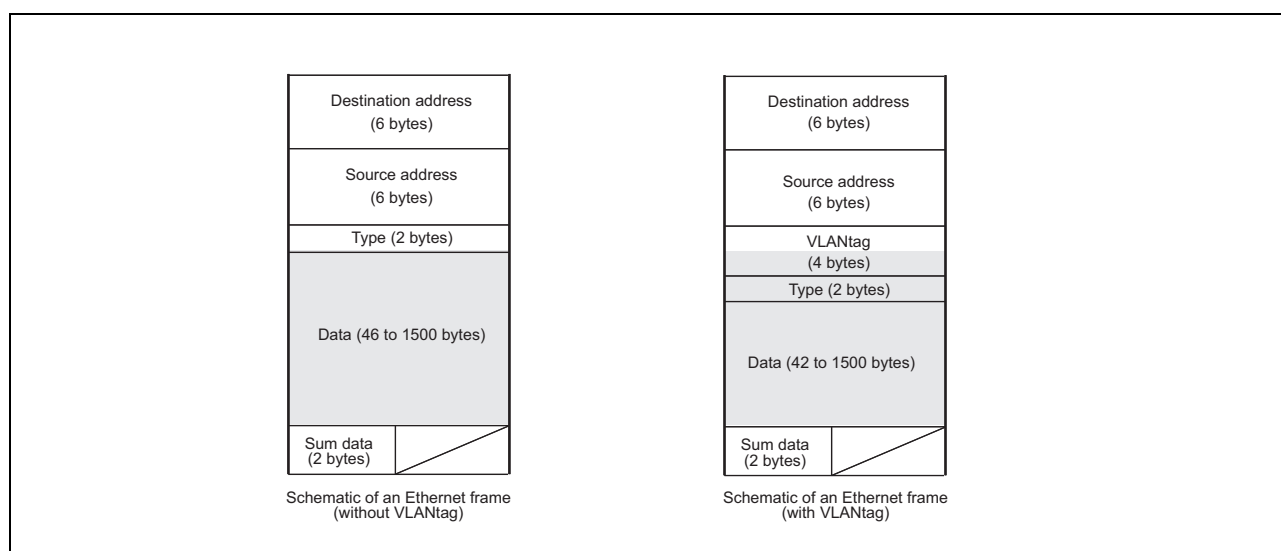

Figure 26.24 Data after Checksum Data Addition

26.6.2 Notes on Using the Intelligent Checksum Function

Checksum calculation using the intelligent checksum function is not affected by padding insertion specified by the receive data padding insert register (RPADIR). This is because checksum calculation is performed when transferring receive data from E-MAC to E-DMAC, while padding of receive data is performed when transferring receive data from E-DMAC to the receive buffer in memory.

26.6.3 Software Reset

For transitions to the software reset state by the ARST bit in the software reset register (ARSTR) or SWRT and SWRR bits in the E-DMAC mode register (EDMR0), see [section 42.3.6, Software Reset](#). However, where the procedure refers to the SRST bit, read this as the ARST bit or SWRT and SWRR bits.

27. A/D Converter

This LSI includes a 12-bit successive-approximation A/D converter allowing selection of up to eight analog input channels.

27.1 Features

- Resolution: 12 bits
- Input channels: Eight channels
- Minimum conversion time: 5.0 μ s per channel
- Absolute accuracy: ± 11 LSB
- Operating modes: Three
 - Single mode: A/D conversion on one channel
 - Multi mode: A/D conversion on one to four channels or on one to eight channels
 - Scan mode: Continuous A/D conversion on one to four channels or on one to eight channels
- Data registers: Eight
Conversion results are held in a 16-bit data register for each channel
- Sample-and-hold function
- A/D conversion start methods: Three methods
 - Software
 - Conversion start trigger from the multi-function timer pulse unit 2
 - External trigger signal
- Interrupt source: Two sources
An A/D conversion end interrupt (ADI) request can be generated on completion of A/D conversion.
An over-limit interrupt (LMTI) request can be generated when a result of conversion exceeds the upper or lower limit for each channel.*

Note: * This is only available when 10-bit precision is in use.

- Module standby mode can be set

Figure 27.1 shows a block diagram of the A/D converter.

Figure 27.1 Block Diagram of A/D Converter

27.2 Input/Output Pins

Table 27.1 shows the A/D converter pins.

Table 27.1 Pin Configuration

Pin Name	Symbol	I/O	Function
Analog power supply pin	AVcc	Input	Analog power supply pin
Analog ground pin	AVss	Input	Analog ground pin and A/D conversion reference ground
Analog reference voltage pin	AVref	Input	A/D converter reference voltage pin
Analog input pin 0	AN0	Input	Analog input
Analog input pin 1	AN1	Input	
Analog input pin 2	AN2	Input	
Analog input pin 3	AN3	Input	
Analog input pin 4	AN4	Input	
Analog input pin 5	AN5	Input	
Analog input pin 6	AN6	Input	
Analog input pin 7	AN7	Input	
A/D external trigger input pin	$\overline{\text{ADTRG}}$	Input	External trigger input to start A/D conversion

27.3 Register Descriptions

The A/D converter has the following registers.

Table 27.2 Register Configuration

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
A/D data register A	ADDRA	R	H'0000	H'E8005800	16
A/D data register B	ADDRB	R	H'0000	H'E8005802	16
A/D data register C	ADDRC	R	H'0000	H'E8005804	16
A/D data register D	ADDRD	R	H'0000	H'E8005806	16
A/D data register E	ADDRE	R	H'0000	H'E8005808	16
A/D data register F	ADDRF	R	H'0000	H'E800580A	16
A/D data register G	ADDRG	R	H'0000	H'E800580C	16
A/D data register H	ADDRH	R	H'0000	H'E800580E	16
A/D comparison upper limit value register A	ADCMPHA	R/W	H'0000	H'E8005820	16
A/D comparison lower limit value register A	ADCMPLA	R/W	H'0000	H'E8005822	16
A/D comparison upper limit value register B	ADCMPHB	R/W	H'0000	H'E8005824	16

27.3.1 A/D Data Registers A to H (ADDRA to ADDRH)

The eight A/D data registers, ADDRA to ADDRH, are 16-bit read-only registers that store the results of A/D conversion. An A/D conversion produces 12-bit data, which is transferred for storage into bits 15 to 4 of the ADDR corresponding to the selected channel. Bits 3 to 0 of ADDR are reserved bits that are always read as 0.

Access to ADDR in 8-bit units is prohibited. ADDR must always be accessed in 16-bit units.

Table 27.3 indicates the correspondence between analog input channels and ADDR.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 4		All 0	R	Bit Data (12bits)
3 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Table 27.3 Correspondence between Analog Input Channels and ADDR

Analog Input Channel	A/D Data Register where Conversion Result is Stored
AN0	ADDRA
AN1	ADDRB
AN2	ADDRC
AN3	ADDRD
AN4	ADDRE
AN5	ADDRF
AN6	ADDRG
AN7	ADDRH

27.3.2 A/D Comparison Upper Limit Value Registers A to H (ADCMPHA to ADCMPHH)

ADCMPH is a 16-bit readable/writable register that holds the upper limit value to be compared with an A/D conversion result. Eight registers, ADCMPHA to ADCMPHH, are provided.

On completion of A/D conversion on each channel, the A/D conversion result is compared with the data stored in the corresponding upper limit value register. When the result is greater than the upper limit value, the corresponding bit in the A/D comparison status register (ADCMPSTR) is set. Comparison with the upper limit value is performed only when the corresponding bit in the A/D comparison interrupt enable register (ADCMPER) is set.

Access to ADCMPH in 8-bit units is prohibited. ADCMPH must always be accessed in 16-bit units.

Table 27.4 indicates the correspondence between the ADDR registers and the ADCMPH/ADCMPL registers.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 6		All 0	R/W	Comparison Upper Limit Value (10 bits)
5 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

27.3.3 A/D Comparison Lower Limit Value Registers A to H (ADCMPLA to ADCMPLH)

ADCMPL is a 16-bit readable/writable register that holds the lower limit value to be compared with an A/D conversion result. Eight registers, ADCMPLA to ADCMPLH, are provided.

On completion of A/D conversion on each channel, the A/D conversion result is compared with the data stored in the corresponding lower limit value register. When the result is smaller than the lower limit value, the corresponding bit in the A/D comparison status register (ADCMPSR) is set. Comparison with the lower limit value is performed only when the corresponding bit in the A/D comparison interrupt enable register (ADCMPIER) is set.

Access to ADCMPL in 8-bit units is prohibited. ADCMPL must always be accessed in 16-bit units.

Table 27.4 indicates the correspondence between the ADDR registers and the ADCMPH/ADCMPL registers.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
											-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 6		All 0	R/W	Comparison Lower Limit Value (10 bits)
5 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Table 27.4 Correspondence between ADDR and ADCMPH/ADCMPL Registers

ADDR where Conversion Result is Stored	ADCMPH/ADCMPL (Target for Comparison)
ADDRA	ADCMPHA/ADCMPLA
ADDRB	ADCMPHB/ADCMPLB
ADDRC	ADCMPHC/ADCMPLC
ADDRD	ADCMPHD/ADCMPLD
ADDRE	ADCMPHE/ADCMPLE
ADDRF	ADCMPHF/ADCMPLF
ADDRG	ADCMPHG/ADCMPLG
ADDRH	ADCMPHH/ADCMPLH

27.3.4 A/D Control/Status Register (ADCSR)

ADCSR is a 16-bit readable/writable register that selects the operating mode, controls the A/D converter, and enables or disables starting of A/D conversion by external trigger input.

Bit: 15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ADF		ADIE	ADST	TRGS[3:0]			CKS[2:0]			MDS[2:0]			CH[2:0]		
Initial value: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0															
R/W:R(W)*1		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: *1 Only 0 can be written to clear the flag after 1 is read.

Bit	Bit Name	Initial Value	R/W	Description
15	ADF	0	R(W)*1	A/D End Flag Status flag indicating the end of A/D conversion. [Clearing conditions] <ul style="list-style-type: none"> Cleared by reading ADF while ADF = 1, then writing 0 to ADF Cleared when the direct memory access controller is activated by ADI interrupt and ADDR is read [Setting conditions] <ul style="list-style-type: none"> A/D conversion ends in single mode A/D conversion ends for all the selected channels in multi mode A/D conversion ends for all the selected channels in scan mode

[Legend]

x: Don't care

Note 1. Only 0 can be written to clear the flag after 1 is read.

Note 2. Clear the ADST to stop A/D conversion before transition to software standby mode or module standby mode.

Note 3. Set the A/D conversion time to at least the minimum value to obtain the absolute accuracy specified for the A/D converter.

Note 4. t_{cyc} indicates a cycle time of the peripheral clock 1 ($P1\phi$).

27.3.5 A/D Comparison Interrupt Enable Register (ADCMPER)

ADCMPER is a 16-bit readable/writable register that enables or disables comparison between the A/D data register (ADDR) that holds the A/D conversion result on each channel and the A/D comparison upper/lower limit value register (ADCMPL/ADCMPL), and enables or disables interrupt request.

27.3.6 A/D Comparison Status Register (ADCMPSR)

ADCMPSR is a 16-bit read-only register that indicates the results of comparison between the A/D data register (ADDR) that holds an A/D conversion result on each channel and the A/D comparison upper/lower limit value register (ADCMPL/ADCMPL).

The bits in this register are valid only when the comparison and an LMTI interrupt are enabled in the A/D comparison interrupt enable register (ADCMPIER). When they are disabled, the bits are always in the cleared state.

When an A/D conversion result exceeds the upper or lower limit value, the corresponding bit is set to 1.

27.4 Operation

The A/D converter uses the successive-approximation method, and the resolution is 12 bits. It has three operating modes: single mode, multi mode, and scan mode. Switching the operating mode or analog input channels must be done while the ADST bit in ADCSR is 0 to prevent incorrect operation. The ADST bit can be set at the same time as the operating mode or analog input channels are changed.

27.4.1 Single Mode

Single mode should be selected when only A/D conversion on one channel is required.

In single mode, A/D conversion is performed once for the specified one analog input channel, as follows:

1. A/D conversion for the selected channel starts when the ADST bit in ADCSR is set to 1 by software, the multi-function timer pulse unit 2, or external trigger input.
2. When A/D conversion is completed, the A/D conversion result is transferred to the A/D data register corresponding to the channel.
3. After A/D conversion has completed, the ADF bit in ADCSR is set to 1. If the ADIE bit is set to 1 at this time, an ADI interrupt request is generated.
4. The ADST bit that remains 1 during A/D conversion is automatically cleared to 0 when A/D conversion is completed, and the A/D converter becomes idle.

When the operating mode or analog input channel selection must be changed during A/D conversion, to prevent incorrect operation, first clear the ADST bit to 0 to halt A/D conversion. After making the necessary changes, set the ADST bit to 1 to start A/D conversion again. The ADST bit can be set at the same time as the mode or channel selection is switched.

Typical operations when a single channel (AN1) is selected in single mode (MDS[2] = 0) are described next. Figure 27.2 shows a timing diagram for this example (the bits which are set in this example belong to ADCSR).

1. Single mode is selected, input channel AN1 is selected (CH[2:0] = 001), the A/D interrupt is enabled (ADIE = 1), and A/D conversion is started (ADST = 1).
2. When A/D conversion is completed, the A/D conversion result is transferred into ADDR0. At the same time the ADF flag is set to 1, the ADST bit is cleared to 0, and the A/D converter becomes idle.
3. Since ADF = 1 and ADIE = 1, an ADI interrupt is requested.
4. The A/D interrupt handling routine starts.
5. The routine reads ADF = 1, and then writes 0 to the ADF flag.
6. The routine reads and processes the A/D conversion result (ADDR0).
7. Execution of the A/D interrupts handling routine ends. Then, when the ADST bit is set to 1, A/D conversion starts and steps 2 to 7 are executed.

Figure 27.2 Example of A/D Converter Operation (Single Mode, One Channel (AN1) Selected)

27.4.2 Multi Mode

Multi mode should be selected when performing A/D conversion once on one or more channels.

In multi mode, A/D conversion is performed once for a maximum of eight specified analog input channels, as follows:

1. A/D conversion starts from the analog input channel with the lowest number (e.g. AN0, AN1, ..., AN3) when the ADST bit in ADCSR is set to 1 by software, the multi-function timer pulse unit 2, or external trigger input.
2. When A/D conversion is completed on each channel, the A/D conversion result is sequentially transferred to the A/D data register corresponding to that channel.
3. After A/D conversion on all selected channels has completed, the ADF bit in ADCSR is set to 1. If the ADIE bit is set to 1 at this time, an ADI interrupt request is generated.
4. The ADST bit that remains 1 during A/D conversion is automatically cleared to 0 when A/D conversion is completed, and the A/D converter becomes idle. If the ADST bit is cleared to 0 during A/D conversion, A/D conversion is halted and the A/D converter becomes idle. The ADF bit is cleared by reading ADF while ADF = 1, then writing 0 to the ADF bit.

A/D conversion is to be performed once on all the specified channels. The conversion results are transferred for storage into the A/D data registers (ADDR) corresponding to the channels.

When the operating mode or analog input channel selection must be changed during A/D conversion, to prevent incorrect operation, first clear the ADST bit to 0 to halt A/D conversion. After making the necessary changes, set the ADST bit to 1.

1. A/D conversion will start again from the first channel in the group. The ADST bit can be set at the same time as the mode or channel selection is changed.

Typical operations when three channels (AN0 to AN2) are selected in multi mode are described next. Figure 27.3 shows a timing diagram for this example.

1. Multi mode is selected (MDS[2] = 1, MDS[1] = 0), analog input channels AN0 to AN2 are selected (CH[2:0] = 010), and A/D conversion is started (ADST = 1).
2. A/D conversion of the first channel (AN0) starts. When A/D conversion is completed, the A/D conversion result is transferred into ADDR0.
3. Next, the second channel (AN1) is selected automatically and A/D conversion starts.
4. Conversion proceeds in the same way through the third channel (AN2).
5. When conversion of all selected channels (AN0 to AN2) is completed, the ADF flag is set to 1 and the ADST bit is cleared to 0.
6. If the ADIE bit is set to 1 at this time, an ADI interrupt is requested.

Figure 27.3 Example of A/D Converter Operation (Multi Mode, Three Channels (AN0 to AN2) Selected)

27.4.3 Scan Mode

Scan mode is useful for monitoring analog inputs in a group of one or more channels at all times. In scan mode, A/D conversion is performed sequentially for a maximum of eight specified analog input channels, as follows:

1. A/D conversion starts from the analog input channel with the lowest number (e.g. AN0, AN1, ..., AN3) when the ADST bit in ADCSR is set to 1 by software, the multi-function timer pulse unit 2, or external trigger input.
2. When A/D conversion is completed on each channel, the A/D conversion result is sequentially transferred to the A/D data register corresponding to that channel.
3. After A/D conversion on all selected channels has completed, the ADF bit in ADCSR is set to 1. If the ADIE bit is set to 1 at this time, an ADI interrupt request is generated. The A/D converter starts A/D conversion again from the channel with the lowest number.
4. The ADST bit is not cleared automatically, so steps 2. and 3. are repeated as long as the ADST bit remains set to 1. When the ADST bit is cleared to 0, A/D conversion halts and the A/D converter becomes idle. The ADF bit is cleared by reading ADF while ADF = 1, then writing 0 to the ADF bit.

When the operating mode or analog input channel selection must be changed during A/D conversion, to prevent incorrect operation, first clear the ADST bit to 0 to halt A/D conversion. After making the necessary changes, set the ADST bit to 1. A/D conversion will start again from the first channel in the group. The ADST bit can be set at the same time as the mode or channel selection is changed.

Typical operations when three channels (AN0 to AN2) are selected in scan mode are described as follows. Figure 27.4 shows a timing diagram for this example.

1. Scan mode is selected (MDS[2] = 1, MDS[1] = 1), analog input channels AN0 to AN2 are selected (CH[2:0] = 010), and A/D conversion is started (ADST = 1).
2. A/D conversion of the first channel (AN0) starts. When A/D conversion is completed, the A/D conversion result is transferred into ADDRA.
3. Next, the second channel (AN1) is selected automatically and A/D conversion starts.
4. Conversion proceeds in the same way through the third channel (AN2).
5. When conversion of all the selected channels (AN0 to AN2) is completed, the ADF flag is set to 1 and conversion of the first channel (AN0) starts again. If the ADIE bit is set to 1 at this time, an ADI interrupt is requested after A/D conversion of the third channel.
6. The ADST bit is not cleared automatically, so steps 2. to 4. are repeated as long as the ADST bit remains set to 1. When steps 2. to 4. are repeated, the ADF flag is kept to 1. When the ADST bit is cleared to 0, A/D conversion stops. The ADF bit is cleared by reading ADF while ADF = 1, then writing 0 to the ADF bit.

If both the ADF flag and ADIE bit are set to 1 while steps 2. to 4. are repeated, an ADI interrupt is requested at all times. To generate an interrupt on completing conversion of the third channel, clear the ADF bit to 0 after an interrupt is requested.

Figure 27.4 Example of A/D Converter Operation (Scan Mode, Three Channels (AN0 to AN2) Selected)

27.4.4 A/D Converter Activation by External Trigger or Multi-Function Timer Pulse Unit 2

The A/D converter can be independently activated by an external trigger or an A/D conversion request from the multi-function timer pulse unit 2. To activate the A/D converter by an external trigger or the multi-function timer pulse unit 2, set the A/D trigger enable bits (TRGS[3:0]). When an external trigger or an A/D conversion request from the multi-function timer pulse unit 2 is generated with this bit setting, the ADST bit is set to 1 to start A/D conversion. The channel combination is determined by bits CH2 to CH0 in ADCSR. The timing from setting of the ADST bit until the start of A/D conversion is the same as when 1 is written to the ADST bit by software.

27.4.5 Input Sampling and A/D Conversion Time

The A/D converter has a built-in sample-and-hold circuit. The A/D converter samples the analog input at the A/D conversion start delay time (t_D) after the ADST bit in ADCSR is set to 1, then starts conversion. Figure 27.5 shows the A/D conversion timing. Table 27.5 indicates the A/D conversion time.

As indicated in Figure 27.5, the A/D conversion time (t_{CONV}) includes t_D and the input sampling time (t_{SPL}). The length of t_D varies depending on the timing of the write access to ADCSR. The total conversion time therefore varies within the ranges indicated in Table 27.5.

In multi mode and scan mode, the values given in Table 27.5 apply to the first conversion. In the second and subsequent conversions, time is the values given in Table 27.6.

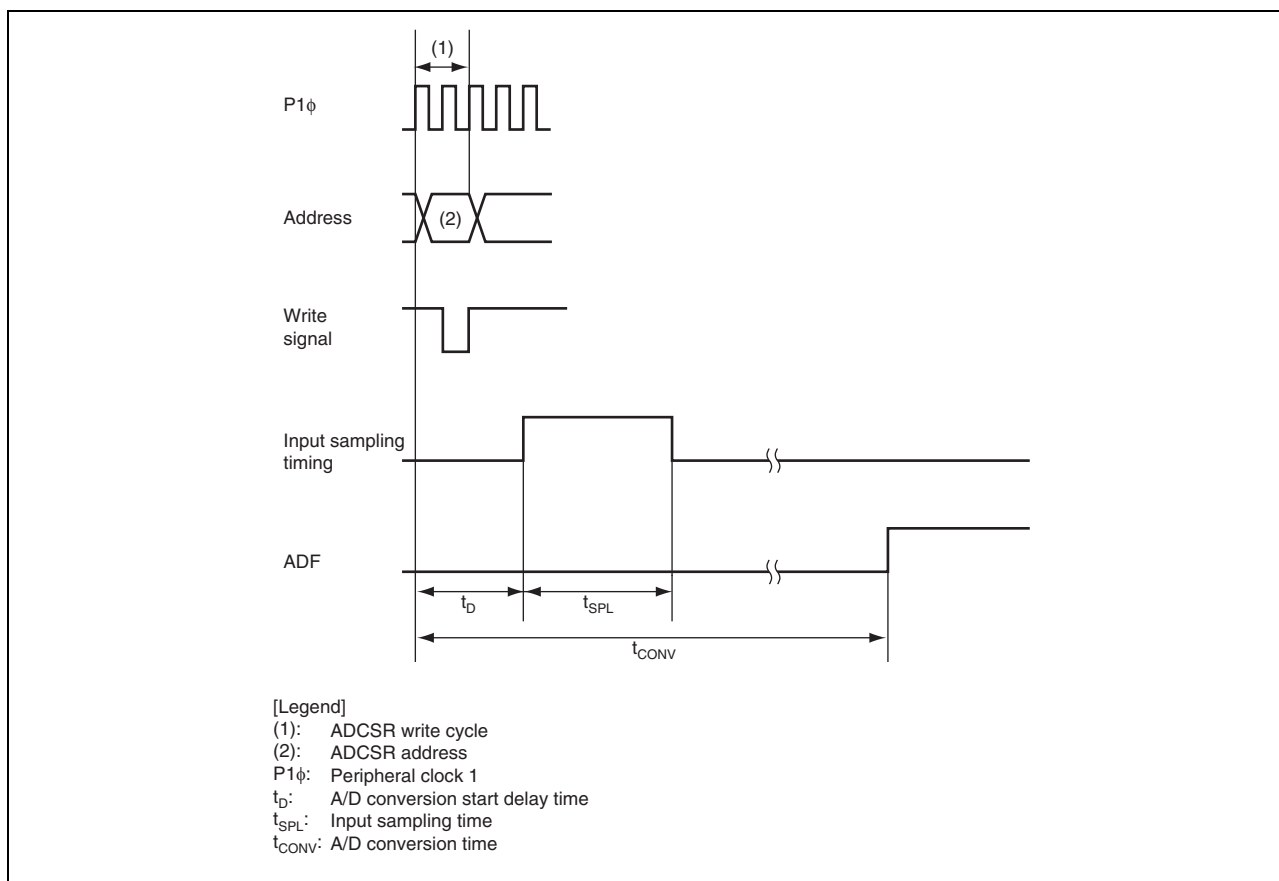

Figure 27.5 A/D Conversion Timing

Table 27.5 A/D Conversion Time (Single Mode)

Item	Symbol	CKS1 = 0						CKS1 = 1					
		CKS0 = 0			CKS0 = 1			CKS0 = 0			CKS0 = 1		
		Min.	Typ.	Max.	Min.	Typ.	Max.	Min.	Typ.	Max.	Min.	Typ.	Max.
A/D conversion start delay time	t_D	9	—	14	10	—	16	11	—	18	12	—	20
Input sampling time	t_{SPL}	—	78	—	—	91	—	—	104	—	—	117	—
A/D conversion time	t_{CONV}	251	—	256	292	—	298	333	—	340	374	—	382

Note: Values in the table are represented in terms of t_{cyc} . t_{cyc} indicates a cycle time of the peripheral clock 1 (P1 ϕ).

Table 27.6 A/D Conversion Time (Multi Mode and Scan Mode)

CKS1	CKS0	Conversion Time (t_{cyc})
0	0	240 (constant)
	1	280 (constant)
1	0	320 (constant)
	1	360 (constant)

Note: Values in the table are represented in terms of t_{cyc} . t_{cyc} indicates a cycle time of the peripheral clock 1 (P1 ϕ).

27.4.6 External Trigger Input Timing

A/D conversion can also be externally triggered. When the TRGS[3:0] bits in ADCSR are set to B'1001, an external trigger is input to the $\overline{\text{ADTRG}}$ pin. The ADST bit in ADCSR is set to 1 at the falling edge of the $\overline{\text{ADTRG}}$ pin, thus starting A/D conversion. Other operations, regardless of the operating mode, are the same as when the ADST bit has been set to 1 by software. Figure 27.6 shows the timing.

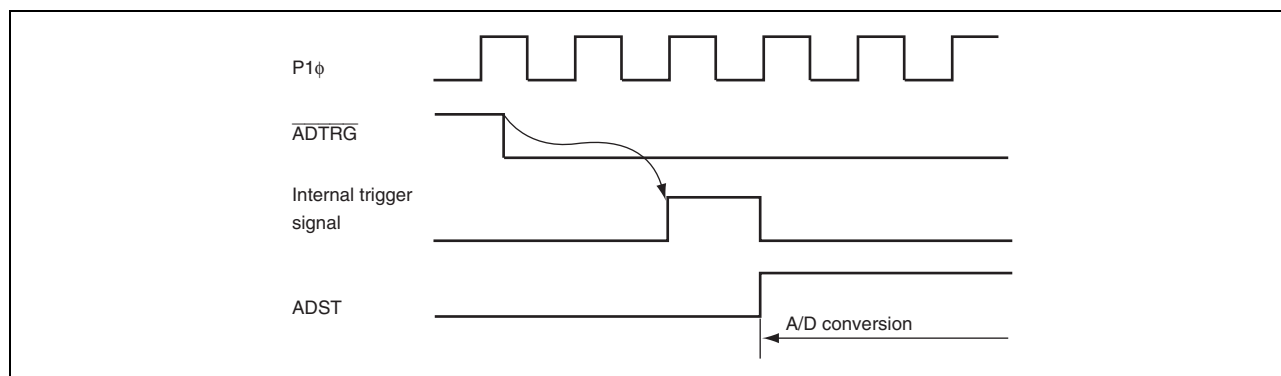

Figure 27.6 External Trigger Input Timing

27.5 Interrupt Sources and DMA Transfer Request

The A/D converter generates an A/D conversion end interrupt (ADI) and an over-limit interrupt (LMTI). The direct memory access controller can be activated by an ADI interrupt request depending on the setting of the direct memory access controller.

Table 27.7 shows the relationship between interrupt sources and the DMA transfer request.

Table 27.7 Relation between Interrupt Sources and DMA Transfer Request

Name	Interrupt Source	Interrupt Flag	Direct Memory Access Controller Activation
ADI	A/D conversion end	ADF in ADCSR	Possible
LMTI	Conversion result exceeding the limit value	HOVRA to HOVRH and LUDRA to LUDRH in ADCMPSR	Impossible

(a) ADI Interrupt

The A/D converter generates an A/D conversion end interrupt (ADI) at the end of A/D conversion. An ADI interrupt request is generated if the ADIE bit is set to 1 when the ADF bit in ADCSR is set to 1 on completion of A/D conversion. Note that the direct memory access controller can be activated by an ADI interrupt depending on the setting of the direct memory access controller. In this case, an interrupt is not issued to the CPU. If the setting to activate the direct memory access controller has not been made, an interrupt request is sent to the CPU. Having the converted data read by the direct memory access controller in response to an ADI interrupt enables continuous conversion to be achieved without imposing a load on software.

In single mode, set the direct memory access controller so that DMA transfer initiated by an ADI interrupt only proceeds once (single transfer mode). In the case of A/D conversion on multiple channels in scan mode or multi mode, setting the number of DMA transfers to one causes DMA transfer to finish after transferring only one channel of data. To make the direct memory access controller transfer all conversion data, set the ADDR where A/D conversion data is stored as the transfer source address, and the number of converted channels as the number of transfers (the number of DMA transactions in block transfer mode).

For details, see section 9, Direct Memory Access Controller.

When the direct memory access controller is activated by ADI, the ADF bit in ADCSR is automatically cleared to 0 when data is transferred by the direct memory access controller.

(b) LMTI Interrupt

An A/D conversion result is compared with the upper or lower limit value on each channel, and if the result exceeds the limit, the over-limit interrupt (LMTI) is generated. While the HLMEN bit in ADCMPER is 1, a conversion result is compared with the upper limit in ADCMPH the instant the conversion value is determined. When the value exceeds the upper limit, the corresponding bit in ADCMPSR is set to 1, which causes an LMTI interrupt to be generated. In the same way, while the LLMEN bit in ADCMPER is 1, a conversion result is compared with the lower limit. If it exceeds the limit, an LMTI interrupt request is generated.

The ADCMPSR register can be referenced in the LMTI interrupt handling to identify the channel causing over-limit value and to know whether the result has exceeded the upper limit value or the lower one.

27.6 Definitions of A/D Conversion Accuracy

The A/D converter compares an analog value input from an analog input channel with its analog reference value and converts it to 12-bit digital data. The absolute accuracy of this A/D conversion is the deviation between the input analog value and the output digital value. It includes the following errors:

- Offset error
- Full-scale error
- Quantization error
- Nonlinearity error

These four error quantities are explained below with reference to Figure 27.7. In the figure, the 12-bit A/D converter is illustrated as the 3-bit A/D converter for explanation. Offset error is the deviation between actual and ideal A/D conversion characteristics when the digital output value changes from the minimum (zero voltage) B'000000000000 (000 in the figure) to B'000000000001 (001 in the figure) (Figure 27.7, item (1)). Full-scale error is the deviation between actual and ideal A/D conversion characteristics when the digital output value changes from B'111111111110 (110 in the figure) to the maximum B'111111111111 (111 in the figure) (Figure 27.7, item (2)). Quantization error is the intrinsic error of the A/D converter and is expressed as 1/2 LSB (Figure 27.7, item (3)). Nonlinearity error is the deviation between actual and ideal A/D conversion characteristics between zero voltage and full-scale voltage (Figure 27.7, item (4)). Note that it does not include offset, full-scale, or quantization error.

Figure 27.7 Definitions of A/D Conversion Accuracy

27.7 Usage Notes

When using the A/D converter, note the following points.

27.7.1 Module Standby Mode Setting

Operation of the A/D converter can be disabled or enabled using the standby control register. The initial setting is for operation of the A/D converter to be halted. Register access is enabled by clearing module standby mode. For details, see section 42, Power-Down Modes. The wait time (20 μ s) is required after release from the module standby state. After the wait time has elapsed, perform conversion by the A/D converter.

27.7.2 Setting Analog Input Voltage

Using the LSI outside the following voltage ranges may impair the LSI reliability.

1. Analog input range

During A/D conversion, voltages on the analog input pins ANn should not go beyond the following range: $AV_{ss} \leq AN_n \leq AV_{cc}$ ($n = 0$ to 7).

2. AVcc and AVss input voltages

Input voltages AVcc and AVss should be $PV_{cc} - 0.3 \text{ V} \leq AV_{cc} \leq PV_{cc}$ and $AV_{ss} = V_{ss}$. Do not leave the AVcc and AVss pins open even when the A/D converter is not in use and in software standby mode. When not in use, connect AVcc to the power supply (PVcc) and AVss to the ground (Vss).

3. Setting range of AVref input voltage

Set the reference voltage range of the AVref pin as $3.0 \text{ V} \leq AV_{ref} \leq AV_{cc}$.

27.7.3 Notes on Board Design

In board design, digital circuitry and analog circuitry should be as mutually isolated as possible, and layout in which digital circuit signal lines and analog circuit signal lines cross or are in close proximity should be avoided as far as possible. Failure to do so may result in incorrect operation of the analog circuitry due to inductance, adversely affecting A/D conversion values.

Digital circuitry must be isolated from the analog input signals (AN0 to AN7), analog reference voltage (AVref), and analog power supply (AVcc) by the analog ground (AVss). Also, the analog ground (AVss) should be connected at one point to a stable digital ground (Vss) on the board.

27.7.4 Processing of Analog Input Pins

To prevent damage from voltage surges at the analog input pins (AN0 to AN7), connect an input protection circuit like the one shown in Figure 27.8. The circuit shown also includes a CR filter to suppress noise. This circuit is shown as an example; the circuit constants should be selected according to actual application conditions.

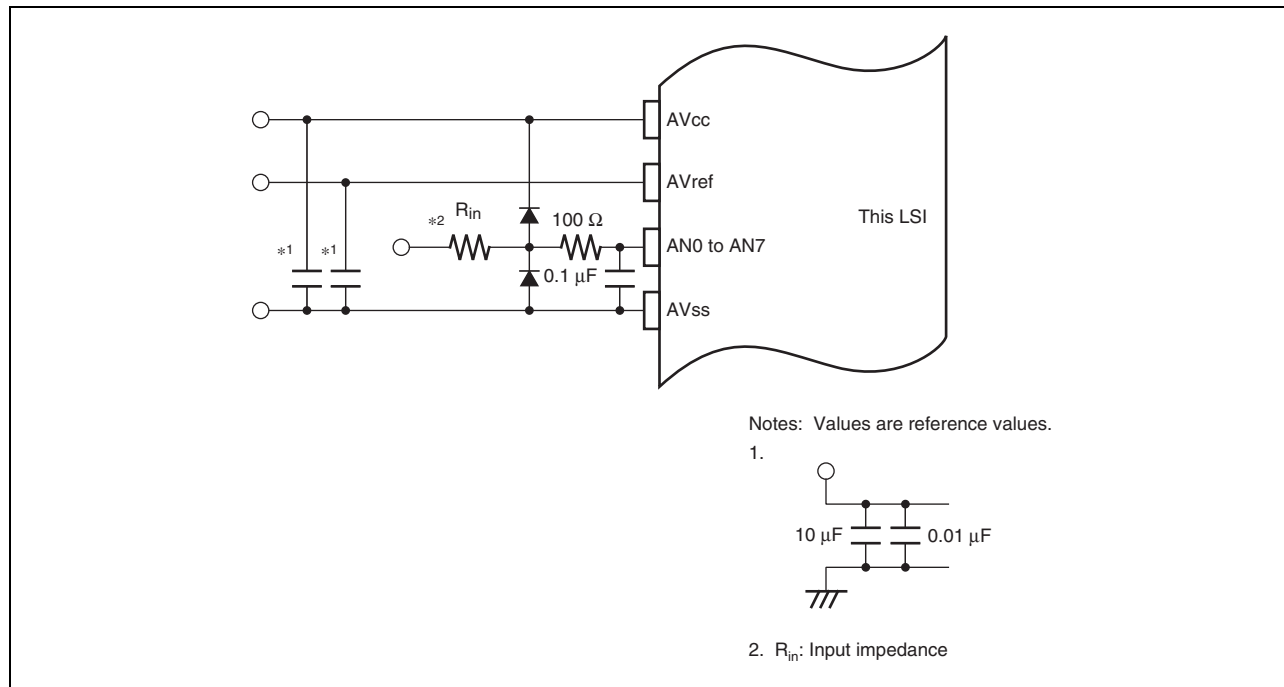

Figure 27.8 Example of Analog Input Protection Circuit

27.7.5 Permissible Signal Source Impedance

This LSI's analog input is designed such that conversion precision is guaranteed for an input signal for which the signal source impedance is 3 k Ω or less. This specification is provided to enable the A/D converter's sample-and-hold circuit input capacitance to be charged within the sampling time; if the sensor output impedance exceeds 3 k Ω , charging may be insufficient and it may not be possible to guarantee A/D conversion precision. However, for A/D conversion in single mode with a large capacitance provided externally for A/D conversion in single mode, the input load will essentially comprise only the internal input resistance of 1 k Ω , and the signal source impedance is ignored. However, as a low-pass filter effect is obtained in this case, it may not be possible to follow an analog signal with a large differential coefficient (e.g., 5 mV/ μ s or greater) (see Figure 27.9). When converting a high-speed analog signal or performing A/D conversion in scan mode, a low-impedance buffer should be inserted.

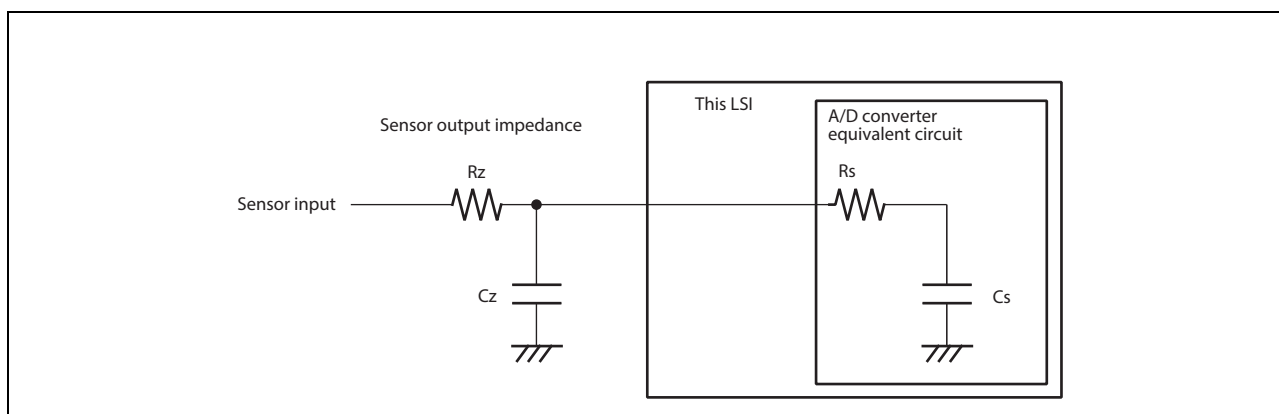

Figure 27.9 Example of Analog Input Circuit

Table 27.8 Analog Input Pin Ratings

Item	Symbol	Min.	Max.	Unit
Permissible Signal Source Impedance	Rz	—	3	k Ω
Low-Pass Filter	Cz	—	0.1	μ F
Equivalent Circuit of A/D Converter	Rs	—	1	k Ω
	Cs	—	20	pF

Note: Values are reference values.

27.7.6 Influences on Absolute Precision

Adding capacitance results in coupling with GND, and therefore noise in GND may adversely affect absolute precision. Be sure to connect AVss, etc. to an electrically stable GND.

Care is also required to insure that filter circuits do not communicate with digital signals on the mounting board (i.e., acting as antennas).

27.7.7 Usage Note on Port Pins

The analog input pins (AN0 to AN7) are multiplexed with general-purpose I/O port pin functions (pins P1_8 to P1_15) and the latter can be used as digital inputs. Do not use these general-purpose I/O port pins as digital inputs while the A/D converter is in use with 12-bit precision.

28. USB2.0 Host/Function Module

This LSI includes a two-channel USB 2.0 host/function module. This module is a USB controller which provides capabilities as a USB host controller and USB function controller.

This module supports high-speed transfer, full-speed transfer, and low-speed transfer defined by USB (Universal Serial Bus) Specification 2.0, when used as the host controller, and supports high-speed transfer and full-speed transfer defined by USB (Universal Serial Bus) Specification 2.0, when used as the function controller.

This module supports all of the transfer types defined by the USB Specification. This module has an 8-Kbyte buffer memory for data transfer, providing a maximum of 16 pipes. Any endpoint numbers can be assigned to PIPE1 to PIPE15, based on the peripheral devices or user system for communication.

28.1 Features

(1) Host Controller and Function Controller Supporting USB High-Speed Operation

- The USB host controller and USB function controller are incorporated.
- The USB host controller and USB function controller can be switched by register settings.
- On-chip USB transceiver

(2) All Types of USB Transfers Supported

All types of USB transfers including isochronous transfer are supported.

- Control transfer
- Bulk transfer
- Interrupt transfer (high bandwidth transfers not supported)
- Isochronous transfer (high bandwidth transfers not supported)

(3) Internal Bus Interfaces

- Two DMA interfaces available for each channel

(4) Pipe Configuration

- Up to 8 Kbytes of buffer memory for USB communications are supported for each channel
- Up to sixteen pipes can be selected for each channel (including the default control pipe)
- Programmable pipe configuration
- Endpoint numbers can be assigned flexibly to PIPE1 to PIPE15.
- Transfer conditions that can be set for each pipe:
 - PIPE0: Control transfer, 256-byte fixed single buffer
 - PIPE1 and PIPE2: Bulk transfer or isochronous transfer can be selected, continuous transfer mode, programmable buffer size (up to 2 Kbytes: double buffer can be specified)
 - PIPE3 to PIPE5: Bulk transfer, continuous transfer mode, programmable buffer size (up to 2 Kbytes: double buffer can be specified)
 - PIPE6 to PIPE8: Interrupt transfer, 64-byte fixed single buffer
 - PIPE9: Bulk transfer (only when the function controller mode is selected)
Interrupt transfer (only when the host controller mode is selected), programmable buffer size (up to 2 Kbytes: double buffer can be specified only when bulk transfer has been selected)
 - PIPE10: Bulk transfer or interrupt transfer can be selected (only when the function controller mode is selected), programmable buffer size (up to 2 Kbytes: double buffer can be specified only when bulk transfer has been selected)

PIPE11 to PIPE15: Bulk transfer (only when the function controller mode is selected), programmable buffer size (up to 2 Kbytes: double buffer can be specified)

(5) Features of the USB Host Controller

- High-speed transfer (480 Mbps), full-speed transfer (12 Mbps), and low-speed transfer (1.5 Mbps) are supported.
- Communications with multiple peripheral devices connected via a single HUB
- Automatic response to the reset handshake
- Automatic scheduling for SOF and packet transmissions
- Programmable intervals for isochronous and interrupt transfers

(6) Features of the USB Function Controller

- High-speed transfer (480 Mbps) and full-speed transfer (12 Mbps) are supported.
- Automatic recognition of high-speed operation or full-speed operation based on automatic response to the reset handshake
- Control transfer stage monitoring function
- Device state monitoring function
- Auto response function for SET_ADDRESS request
- NAK response interrupt function (NRDY)
- SOF interpolation function

(7) Other Features

- Transfer ending function using transaction count
- BRDY interrupt event notification timing change function (BFRE)
- Function that automatically clears the buffer memory after the data for the pipe specified at the DnFIFO port has been read (DCLRM)
- NAK setting function for response PID generated by end of transfer (SHTNAK)

28.2 Input/Output Pins

Table 28.1 shows the pin configuration.

Table 28.1 Pin Configuration

Channel	Name	Pin Name	I/O	Function
0	USB D+ data	DP0	Input/ Output	The D+ input/output pin of the on-chip USB transceiver Connect this pin to the D+ pin of the USB bus.
	USB D- data	DM0	Input/ Output	The D- input/output pin of the on-chip USB transceiver Connect this pin to the D- pin of the USB bus.
	VBUS input	VBUS0	Input	A pin for monitoring connection of the USB cable Connect this pin to the Vbus pin of the USB bus so that it can detect connection and disconnection of the Vbus pin. When it is not connected to the Vbus pin of the USB, It should be fixed to 5 V. Also supply 5 V to this pin when the host controller mode is selected. Note: This module is not capable of supplying Vbus power to connected peripheral devices.
1	USB D+ data	DP1	Input/ Output	The D+ input/output pin of the on-chip USB transceiver Connect this pin to the D+ pin of the USB bus.
	USB D- data	DM1	Input/ Output	The D- input/output pin of the on-chip USB transceiver Connect this pin to the D- pin of the USB bus.
	VBUS input	VBUS1	Input	A pin for monitoring connection of the USB cable Connect this pin to the Vbus pin of the USB bus so that it can detect connection and disconnection of the Vbus pin. When it is not connected to the Vbus pin of the USB, It should be fixed to 5 V. Also supply 5 V to this pin when the host controller mode is selected. Note: This module is not capable of supplying Vbus power to connected peripheral devices.
Common	Reference input	REFRIN	Input	A pin for connecting the reference resistor Connect this pin to the USBAPVss pin through a resistor with a value of 5.6 kΩ ± 1%. (QFP package) Connect this pin to the Vss pin through a resistor with a value of 5.6 kΩ ± 1%. (BGA package)
	USB crystal oscillator/external clock	USB_X1	Input	Connect this pin to the crystal oscillator for USB. An external clock can also be input to the USB_X1 pin.
		USB_X2	Output	
	Transceiver digital core power*	USBDVcc	Input	Power supply for the module's digital core
	Transceiver digital core ground*	USBDVss	Input	Ground for the module's digital core
	Transceiver digital pin power source*	USBDPVcc	Input	Power supply for pins
	Transceiver digital pin ground*	USBDPVss	Input	Ground for pins
	Transceiver analog pin power source	USBAPVcc	Input	Power supply for pins
	Transceiver analog pin ground*	USBAPVss	Input	Ground for pins
	Transceiver analog core power	USBAVcc	Input	Power supply for the module's digital core
	Transceiver analog core ground*	USBAVss	Input	Ground for the module's digital core
	Power source for the UTMI module*	USBUVcc	Input	Power supply for operation at 480 MHz
	Ground for the UTMI module*	USBUVss	Input	Power supply for operation at 480 MHz

Note: *These pins are not present on products in the BGA package.

28.3 Register Descriptions

Table 28.2 shows the register configuration of this module.

Table 28.2 Register Configuration

Channel	Register Name	Abbreviation	R/W	Address	Access Size
0	System configuration control register_0	SYSCFG0_0	R/W	H'E801 0000	16

28.3.1 System Configuration Control Register (SYSCFG0)

SYSCFG is a register that enables high-speed operation, selects the host controller mode or function controller mode, controls the DP and DM pins, and enables operation of this module.

This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	HSE	DCFM	DRPD	DPRPU	—	UCK SEL	UPLLE	USBE
Initial value:	—	—	—	—	—	—	—	0	0	0	1	0	—	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 9	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
8	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
7	HSE	0	R/W	High-Speed Operation Enable 0: High-speed operation is disabled When the function controller mode is selected: Only full-speed operation is enabled. When the host controller mode is selected: Full-speed or low-speed operation is enabled. 1: High-speed operation is enabled (communication speed is detected by this module) (1) When the host controller mode is selected When HSE = 0, the USB port performs low-speed or full-speed operation. Set HSE to 0 when connection of a low-speed peripheral device to the USB port has been detected. When HSE = 1, this module executes the reset handshake protocol, and automatically allows the USB port to perform high-speed or full-speed operation according to the protocol execution result. This bit should be modified after detecting device connection (after detecting the ATTCH interrupt) and before executing a USB bus reset (before setting USBRST to 1). (2) When the function controller mode is selected When HSE = 0, this module performs full-speed operation. When HSE = 1, this module executes the reset handshake protocol, and automatically performs high-speed or full-speed operation according to the protocol execution result. This bit should be modified while DPRPU is 0.
6	DCFM	0	R/W	Controller Mode Select Selects the host controller mode or function controller mode. 0: Function controller mode is selected. 1: Host controller mode is selected. This bit should be modified while DPRPU and DRPD are 0.
5	DRPD	1	R/W	D+/D- Line Resistor Control Enables or disables pulling down D+ and D- lines when the host controller mode is selected. 0: Pulling down the lines is disabled. 1: Pulling down the lines is enabled. This bit should be set to 1 if the host controller mode is selected, and should be set to 0 if the function controller mode is selected.

Bit	Bit Name	Initial Value	R/W	Description
4	DPRPU	0	R/W	<p>D+ Line Resistor Control</p> <p>Enables or disables pulling up D+ line when the function controller mode is selected.</p> <p>0: Pulling up the line is disabled.</p> <p>1: Pulling up the line is enabled.</p> <p>Setting this bit to 1 when the function controller mode is selected allows this module to pull up the D+ line, thus notifying the USB host of connection. Modifying this bit from 1 to 0 allows this module to cancel pulling up the D+ line, thus notifying the USB host of disconnection. This bit should be set to 1 if the function controller mode is selected, and should be set to 0 if the host controller mode is selected.</p>
3	—	Undefined	R	<p>Reserved</p> <p>The read value is undefined. The write value should always be 0.</p>
2	UCKSEL*1	0	R/W	<p>Input Clock Selection</p> <p>Selects the clock to be supplied to this module from 48-MHz USB_X1 or 12-MHz EXTAL.</p> <p>0: The 48-MHz USB_X1 clock is selected.</p> <p>1: The 12-MHz EXTAL clock is selected.</p> <p>This bit should be modified while SUSPMODE.SUSPM for channel 0 and channel 1 is 0. Note that this bit is available only in channel 0 (SYSCFG0_0). Make the required setting for SYSCFG0_0 to use channel 1.</p>
1	UPLLE*1	0	R/W	<p>USB Internal PLL Operation Enable</p> <p>Enables or disables operation of the internal PLL of the USB block.</p> <p>0: Disables operation of the internal PLL.</p> <p>1: Enables operation of the internal PLL.</p> <p>This bit should be modified while SUSPMODE.SUSPM for channel 0 and channel 1 is 0. Set this bit to 0 when this module is to enter software standby or USB standby mode. Note that this bit is available only in channel 0 (SYSCFG0_0). Make the required setting for SYSCFG0_0 to use channel 1.</p>
0	USBE	0	R/W	<p>USB Module Operation Enable</p> <p>Enables or disables operation of this module.</p> <p>0: USB module operation is disabled.</p> <p>1: USB module operation is enabled.</p> <p>Modifying this bit from 1 to 0 initializes some register bits as listed in Table 28.3 and Table 28.4.</p> <p>This bit should be modified while SUSPMODE.SUSPM is 1.</p> <p>When the host controller mode is selected, this bit should be set to 1 after setting DPRD to 1, eliminating LNST bit chattering, and checking that the USB bus has been settled.</p>

Note: • Writing to this register is possible even while the clock supply to this module is stopped (SUSPM = 0).

Note 1. UCKSEL and UPLLE are available only in channel 0 (SYSCFG0_0).

Table 28.3 Register Bits Initialized by Writing USBE = 0 (when Function Controller Mode is Selected)

Register Name	Bit Name	Remarks
SYSSTS0	LNST	The value is retained when the host controller mode is selected.
DVSTCTR0	RHST	
INTSTS0	DVSQ	The value is retained when the host controller mode is selected.
USBADDR	USBADDR	The value is retained when the host controller mode is selected.
USEREQ	BRequest, bmRequestType	The values are retained when the host controller mode is selected.
USBVAL	wValue	The value is retained when the host controller mode is selected.
USBINDX	wIndex	The value is retained when the host controller mode is selected.
USBLENG	wLength	The value is retained when the host controller mode is selected.

Table 28.4 Register Bits Initialized by Writing USBE = 0 (when Host Controller Mode is Selected)

Register Name	Bit Name	Remarks
DVSTCTR	RHST	
FRMNUM	FRNM	The value is retained when the function controller mode is selected.
UFRMNUM	UFRNM	The value is retained when the function controller mode is selected.

28.3.2 CPU Bus Wait Setting Register (BUSWAIT)

BUSWAIT is a register that specifies the number of wait cycles to be inserted during an access from the CPU to this module.

This register can be modified even when the SUSPM bit in SUSPMODE is 0.

This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	BWAIT[5:0]					
Initial value:	—	—	0	0	1	1	1	1	—	—	0	0	1	1	1	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15, 14	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
13, 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 8	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 0.
7, 6	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
5 to 0	BWAIT[5:0]	001111	R/W	<p>CPU Bus Wait</p> <p>Specifies the number of wait cycles to be inserted during an access to this module.</p> <p>000000: 0 wait cycles (2 access cycles)</p> <p>:</p> <p>000010: 2 wait cycles (4 access cycles)</p> <p>:</p> <p>000100: 4 wait cycles (6 access cycles)</p> <p>:</p> <p>001111: 15 wait cycles (17 access cycles) (initial value)</p> <p>:</p> <p>111111: 63 wait cycles (65 access cycles)</p> <p>There is the following constraint imposed on the cycle period required to access SYSSTS0 and the subsequent registers of this module:</p> <p>Wait constraint: The cycle period required to consecutively access registers of this controller must be at least 67 ns.</p> <p>To satisfy this constraint, it is necessary to exercise wait control according to the frequency of peripheral clock 1 (P1ϕ). The initial value is 17 clock cycles. Select an appropriate value.</p> <p>This setting is also applied to the accesses to the FIFO port registers. The maximum access speeds for the FIFO ports are as follows:</p> <p>MBW = 10 (32-bit width): up to 60 MBytes/sec</p> <p>MBW = 01 (16-bit width): up to 30 MBytes/sec</p> <p>MBW = 00 (8-bit width): up to 15 MBytes/sec</p>

28.3.3 System Configuration Status Register (SYSSTS0)

SYSSTS is a register that monitors the line status (D+ and D- lines) of the USB data bus.

This register is initialized by a power-on reset or a USB bus reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	HTACT	SOFEA	—	—	—	—	LNST[1:0]
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 7	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
6	HTACT	Undefined	R	USB Host Sequencer Status Monitor Indicates the status of the host sequencer. 0: Stopped 1: Running This bit is set to 0 when the host sequencer in this controller is completely stopped. Make sure that the HTACT bit is set to 0 to put this controller in the USB suspended state by setting the UACT bit to 0 and stop the clock by setting the SUSPM bit to 0 in the host-mode communication state.
5	SOFEA	Undefined	R	SOF Active Monitor when the Host Controller Mode Is Selected Indicates the SOF output status. 0: SOF output stopped 1: SOF output in progress This bit allows checking if the last SOF has been output after setting the UACT bit to 0 when putting this controller in the USB suspended state with the host controller mode selected. To set the SUSPM bit to 0 (to stop the clock) after stopping this controller by setting the USBE bit to 0 in the host-mode communication state, make sure that both the HTACT bit and the SOFEA bit are set to 0.
4 to 2	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
1, 0	LNST[1:0]	Undefined	R	USB Data Line Status Monitor Indicates the status of the USB data bus lines (D+ and D-) as shown in Table 28.5. These bits should be read after setting DPRPU to 1 to notify connection when the function controller mode is selected; whereas after setting DRPD to 1 to enable pulling down the lines when the host controller mode is selected.

Table 28.5 USB Data Bus Line States

LNST[1]	LNST[0]	During Low-Speed Operation (Only when Host Controller Mode is Selected)	During Full-Speed Operation	During High-Speed Operation	During Chirp Operation
0	0	SE0	SE0	Squelch	Squelch
0	1	K state	J state	UnSquelch	Chirp J
1	0	J state	K state	Invalid	Chirp K
1	1	SE1	SE1	Invalid	Invalid

[Legend]

Chirp: The reset handshake protocol (RHSP) is being executed in high-speed operation enabled state (the HSE bit in SYSCFG is set to 1).

Squelch: SE0 or idle state

UnSquelch: High-speed J state or high-speed K state

Chirp J: Chirp J state

Chirp K: Chirp K state

28.3.4 Device State Control Register 0 (DVSTCTR0)

DVSTCTR is a register that controls and confirms the state of the USB data bus.

This register is initialized by a power-on reset. After a USB bus reset, only the WKUP bit is initialized.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	WKUP	RWUP E	USBRST	RESU ME	UACT	—	RHST[2:0]		
Initial value:	—	—	—	—	0	0	0	0	0	0	0	0	—	0	0	0
R/W:	R	R	R	R	R	R	R	R/W*1	R/W	R/W	R/W	R/W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	WKUP	0	R/W*1	Wakeup Output Enables or disables outputting the remote wakeup signal (resume signal) to the USB bus when the function controller mode is selected. 0: Remote wakeup signal is not output. 1: Remote wakeup signal is output. This module controls the output time of a remote wakeup signal. When this bit is set to 1, this module clears this bit to 0 after outputting the 10-ms K state. According to the USB Specification, the USB bus idle state must be kept for 5 ms or longer before a remote wakeup signal is output. If this module writes 1 to this bit right after detection of suspended state, the K state will be output after 2 ms. Do not write 1 to this bit unless the device state is in the suspended state (the DVSQ bits in the INTSTS0 register are set to 1xx) and the USB host enables the remote wakeup signal. When this bit is set to 1, the internal clock must not be stopped even in the suspended state (write 1 to this bit while SUSPMODE.SUSPM is 1). This bit should be set to 0 if the host controller mode is selected.
7	RWUPE	0	R/W	Remote Wakeup Detection Enable Enables or disables the downstream port peripheral device to use the remote wakeup function (resume signal output) when the host controller mode is selected. 0: Downstream port remote wakeup is disabled. 1: Downstream port remote wakeup is enabled. With this bit set to 1, on detecting the resume signal (K-state for 2.5 μs) to the downstream port when the remote wakeup signal has been detected, this module performs the resume process (drives the port to the K-state). With this bit set to 0, this module ignores the detected remote wakeup signal (K-state) from the peripheral device connected to the downstream port. While this bit is 1, the internal clock should not be stopped even in the suspended state (SUSPMODE.SUSPM should be set to 1). Also note that the USB bus should not be reset from the suspended state (USBRST should not be set to 1); it is prohibited by USB Specification 2.0. This bit should be set to 0 if the function controller mode is selected.

Bit	Bit Name	Initial Value	R/W	Description
6	USBRST	0	R/W	<p>Bus Reset Output Controls the USB bus reset signal output when the host controller mode is selected.</p> <p>0: USB bus reset signal is not output. 1: USB bus reset signal is output.</p> <p>When the host controller mode is selected, setting this bit to 1 allows this module to drive the USB port to SE0 to reset the USB bus. Here, this module performs the reset handshake protocol if the HSE bit is 1. This module continues outputting SE0 while USBRST is 1 (until 0 is written to USBRST). Ensure the period over which USBRST being set to 1 (= USB bus reset period) conforms to the USB Specification 2.0. Even if 1 is written to this bit during communication (UACT = 1) or during the resume process (RESUME = 1), this module does not start the USB bus reset process until both UACT and RESUME become 0. Write 1 to the UACT bit simultaneously with the end of the USB bus reset process (writing 0 to USBRST). This bit should be set to 0 if the function controller mode is selected.</p>
5	RESUME	0	R/W	<p>Resume Output Controls the resume signal output when the host controller mode is selected.</p> <p>0: Resume signal is not output. 1: Resume signal is output.</p> <p>Setting this bit to 1 allows this module to drive the port to the K-state and output the resume signal. The controller sets this bit to 1 when detecting a remote wakeup signal while the RWUPE bit is set to 1 and the controller is in the USB suspended state. This module continues outputting K-state while RESUME is 1 (until 0 is written to RESUME). Ensure the period over which RESUME being set to 1 (= resume period) conforms to the USB Specification 2.0. This bit should only be set to 1 in the suspended state. Write 1 to the UACT bit simultaneously with the end of the resume process (writing 0 to RESUME). This bit should be set to 0 if the function controller mode is selected.</p>
4	UACT	0	R/W	<p>USB Bus Enable Enables operation of the USB bus (controls the SOF or μSOF packet transmission to the USB bus) when the host controller mode is selected.</p> <p>0: Downstream port is disabled (SOF/μSOF transmission is disabled). 1: Downstream port is enabled (SOF/μSOF transmission is enabled).</p> <p>With this bit set to 1, this module puts the USB port to the USB-bus enabled state and performs SOF output and data transmission and reception. This module starts outputting SOF/μSOF within 1 (μ) frame after 1 is written to UACT. With this bit set to 0, this module enters the idle state after outputting SOF/μSOF. This module sets this bit to 0 on any of the following conditions.</p> <ul style="list-style-type: none"> • A DTCH interrupt is detected during communication (while UACT = 1). • An EOFERR interrupt is detected during communication (while UACT = 1). <p>Writing 1 to this bit should be done at the end of the USB bus reset process (writing 0 to USBRST) or at the end of the resume process from the suspended state (writing 0 to RESUME). This bit should be set to 0 if the function controller mode is selected.</p>
3	—	Undefined	R	<p>Reserved The read value is undefined. The write value should always be 0.</p>

Bit	Bit Name	Initial Value	R/W	Description

Then, these bits indicate 011 as soon as this module outputs Chirp-K and detects Chirp-JK from the USB host three times. If the connection speed is not fixed to high speed within 2.5 ms after Chirp-K output, these bits indicate 010.</p> <p>If HSE has been set to 0, these bits indicate 010 as soon as this module detects the USB bus reset.</p> <p>A DVST interrupt is generated as soon as this module detects the USB bus reset and then the value of the RHST bits is fixed to 010 or 011.</p>

Note 1. Only 1 can be written.

28.3.5 Test Mode Register (TESTMODE)

TESTMODE is a register that controls the USB test signal output during high-speed operation.

This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

28.3.6 DMA_n-FIFO Bus Configuration Registers (D0FBCFG, D1FBCFG)

D0FBCFG is a register that controls bus access to the DMA0-FIFO and D1FBCFG is a register that controls bus access to the DMA1-FIFO. Note that the setting of this register is invalid when the DMA0-FIFO bus or DMA1-FIFO bus is connected to the local bus.

These registers are initialized by a power-on reset.

The MBW bit in DnFIFOSEL can be set to 10 (32-bit width) only.</p> <p>Be sure to follow the procedure below when setting the DFACC bits for 16- or 32-byte continuous access.</p> <p>(1) Set the DREQE bit in the DnFIFOSEL register to 0. (2) Set the DFACC bits to 01 (16 bytes) or 10 (32 bytes). (3) In the DnFIFOSEL register, set the CURPIPE bits to 0000 (specifying no pipe) and the MBW bits to 10 (32-bit width) at the same time. After that, read the CURPIPE bits to confirm that they have been updated to the written value (0000). (4) Use the CPU to dummy-read the DnFIFO port register (DnFIFO) with 32-bit width (the value read data can be discarded). After that, specify the target pipe by using the CURPIPE bits in the DnFIFOSEL register and read the CURPIPE bits to confirm that they have been updated to written value. (5) Set the DREQE bit in the DnFIFOSEL to 1.</p> <p>Note that the above procedure is not required if these bits are to be set for the cycle-stealing mode (not following the procedure has no effect).</p>

Bit	Bit Name	Initial Value	R/W	Description
11 to 5	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
4	TENDE	0	R/W	DMA Transfer End Sampling Enable Controls acceptance of DMA transfer end signal. 0: DMA transfer end signal is not sampled. 1: DMA transfer end signal is sampled. Controls acceptance of DMA transfer end signal output from the direct memory access controller on completion of a DMA transfer. This module can control input of the DMA transfer end signal to end the DMA transfer of data to the FIFO. Set this bit to 0 when the DFACC bits are set to 01 or 10.
3 to 0	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.

28.3.7 FIFO Port Registers (CFIFO, D0FIFO, D1FIFO)

CFIFO, D0FIFO, and D1FIFO are port registers that are used to read data from the FIFO buffer memory and write data to the FIFO buffer memory.

There are three FIFO ports: the CFIFO, D0FIFO and D1FIFO ports. There are also DnFIFO continuous transfer ports for continuous transfer. Each FIFO port is configured of a port register (CFIFO, D0FIFO, or D1FIFO) that handles reading of data from the FIFO buffer memory and writing of data to the FIFO buffer memory, a select register (CFIFOSEL, D0FIFOSEL, or D1FIFOSEL) that is used to select the pipe assigned to the FIFO port, and a control register (CFIFOCTR, D0FIFOCTR, or D1FIFOCTR).

Each FIFO port has the following characteristics.

- Access to the FIFO buffer for the DCP should be performed through the CFIFO port.
- Access to the FIFO buffer by DMA transfer should be performed through the D0FIFO or D1FIFO port when the DFACC bits are set to 00 (cycle steal mode).
- Access to the FIFO buffer by DMA transfer should be performed through D0FIFO or D1FIFO continuous transfer ports when the DFACC bits are set to 01 (16-byte continuous access mode) or 10 (32-byte continuous access mode).
- The D1FIFO or D0FIFO port can be accessed by the CPU.
- When using functions specific to the FIFO port, the pipe number (selected pipe) specified by the CURPIPE bits cannot be changed (when the DMA transfer function is used, etc.).
- Registers configuring a FIFO port do not affect other FIFO ports.
- The same pipe should not be assigned to two or more FIFO ports.
- There are two FIFO buffer states: the access right is on the CPU side and it is on the SIE side. When the FIFO buffer access right is on the SIE side, the FIFO buffer cannot be accessed from the CPU.

These registers are initialized by a power-on reset.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	FIFOPORT [31:0]	All 0	R/W	FIFO Port Accessing these bits allow reading the received data from the FIFO buffer or writing the transmit data to the FIFO buffer. These bits can be accessed only while the FRDY bit in each FIFO port control register (CFIFOCTR, D0FIFOCTR, or D1FIFOCTR) is 1 (or this module is issuing a DMA transfer request). The valid bits in this register depend on the settings of the MBW bits (access bit width setting) and BIGEND bit (endian setting) as shown in Table 28.7 to Table 28.9.

Table 28.7 Endian Operation in 32-Bit Access

BIGEND Bit	Bits 31 to 24	Bits 23 to 16	Bits 15 to 8	Bits 7 to 0
0	N+3 address	N+2 address	N+1 address	N+0 address
1	N+0 address	N+1 address	N+2 address	N+3 address

Table 28.8 Endian Operation in 16-Bit Access

BIGEND Bit	Bits 31 to 24	Bits 23 to 16	Bits 15 to 8	Bits 7 to 0
0	N+1 address	N+0 address	Writing: invalid, reading: prohibited* ¹	
1	Writing: invalid, reading: prohibited* ¹		N+0 address	N+1 address

Note 1. Reading data from the invalid bits in a word or byte unit is prohibited.

Table 28.9 Endian Operation in 8-Bit Access

BIGEND Bit	Bits 31 to 24	Bits 23 to 16	Bits 15 to 8	Bits 7 to 0
0	N+0 address	Writing: invalid, reading: prohibited* ¹		
1	Writing: invalid, reading: prohibited* ¹			N+0 address

Note 1. Reading data from the invalid bits in a word or byte unit is prohibited.

28.3.8 FIFO Port Select Registers (CFIFOSEL, D0FIFOSEL, D1FIFOSEL)

CFIFOSEL, D0FIFOSEL and D1FIFOSEL are registers that assign the pipe to the FIFO port, and control access to the corresponding port.

The same pipe should not be specified by the CURPIPE bits in CFIFOSEL, D0FIFOSEL and D1FIFOSEL. When the CURPIPE bits in D0FIFOSEL and D1FIFOSEL are cleared to B'0000, no pipe is selected.

The pipe number should not be changed while the DMA transfer is enabled.

These registers are initialized by a power-on reset.

28.3.9 FIFO Port Control Registers (CFIFOCTR, D0FIFOCTR, D1FIFOCTR)

CFIFOCTR, D0FIFOCTR and D1FIFOCTR are registers that determine whether or not writing to the buffer memory has been finished, the buffer accessed from the CPU has been cleared, and the FIFO port is accessible. CFIFOCTR, D0FIFOCTR, and D1FIFOCTR are used for the corresponding FIFO ports. These registers are initialized by a power-on reset.

When clearing the buffer on the SIE side, set the PID bits for the DCP to NAK before setting BCLR to 1.</p> <p>When the selected pipe is not the DCP, writing 1 to this bit should be done while FRDY indicates 1. When checking the FRDY bit after setting this bit, allow an interval of at least 80 ns before referencing FRDY.</p>

Bit	Bit Name	Initial Value	R/W	Description
13	FRDY	0	R	<p>FIFO Port Ready</p> <p>Indicates whether the FIFO port can be accessed.</p> <p>0: FIFO port access is disabled.</p> <p>1: FIFO port access is enabled.</p> <p>In the following cases, this module sets FRDY to 1 but data cannot be read via the FIFO port because there is no data to be read. In these cases, set BCLR to 1 to clear the FIFO buffer, and enable transmission and reception of the next data.</p> <ul style="list-style-type: none"> • A zero-length packet is received when the FIFO buffer assigned to the selected pipe is empty. • A short packet is received and the data is completely read while BFRE is 1.
12	—	Undefined	R	<p>Reserved</p> <p>The read value is undefined. The write value should always be 0.</p>
11 to 0	DTLN[11:0]	H'000	R	<p>Receive Data Length</p> <p>Indicates the length of the receive data.</p> <p>While the FIFO buffer is being read, these bits indicate the different values depending on the RCNT bit value as described below.</p> <ul style="list-style-type: none"> • When RCNT = 0: <ul style="list-style-type: none"> The length of received data is set in these bits, and the value is retained until all received data has been read from a single FIFO buffer plane. While BFRE is 1, these bits retain the length of the receive data until BCLR is set to 1 even after all the data has been read. • When RCNT = 1: <ul style="list-style-type: none"> This module decrements the value indicated by these bits each time data is read from the FIFO buffer. (The value is decremented by one when MBW is 00, by two when MBW is 01, and by four when MBW is 10.) <p>This module sets these bits to 0 when all the data has been read from one FIFO buffer plane. However, in double buffer mode, if data has been received in one FIFO buffer plane before all the data has been read from the other plane, this module sets these bits to indicate the length of the receive data in the latter plane when all the data has been read from the former plane.</p> <p>Note: When reading these bits during FIFO buffer reading while RCNT = 1, note that these bits are updated within ten bus cycles after a read cycle for the FIFO port.</p>

Note 1. Only 0 can be read and 1 can be written to.

Note 2. Only 1 can be written to.

28.3.10 Interrupt Enable Register 0 (INTENB0)

INTENB0 is a register that enables various interrupts. On detecting the interrupt corresponding to the bit in this register which has been set to 1, this module generates the USB interrupt.

This module sets 1 to each status bit in INTSTS0 when a detection condition of the corresponding interrupt source has been satisfied regardless of the set value in INTENB0 (regardless of whether the interrupt output is enabled or disabled). While the status bit in INTSTS0 corresponding to the interrupt source indicates 1, this module generates the USB interrupt when the corresponding interrupt enable bit in INTENB0 is changed from 0 to 1.

This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	VBSE	0	R/W	VBUS Interrupt Enable Enables or disables the USB interrupt request when the VBINT interrupt is detected. 0: Interrupt output disabled 1: Interrupt output enabled
14	RSME	0	R/W	Resume Interrupt Enable*1 Enables or disables the USB interrupt request when the RESM interrupt is detected. 0: Interrupt output disabled 1: Interrupt output enabled
13	SOFE	0	R/W	Frame Number Update Interrupt Enable Enables or disables the USB interrupt request when the SOFR interrupt is detected. 0: Interrupt output disabled 1: Interrupt output enabled
12	DVSE	0	R/W	Device State Transition Interrupt Enable*1 Enables or disables the USB interrupt request when the DVST interrupt is detected. 0: Interrupt output disabled 1: Interrupt output enabled
11	CTRE	0	R/W	Control Transfer Stage Transition Interrupt Enable*1 Enables or disables the USB interrupt request when the CTRT interrupt is detected. 0: Interrupt output disabled 1: Interrupt output enabled
10	BEMPE	0	R/W	Buffer Empty Interrupt Enable Enables or disables the USB interrupt request when the BEMP interrupt is detected. 0: Interrupt output disabled 1: Interrupt output enabled
9	NRDYE	0	R/W	Buffer Not Ready Response Interrupt Enable Enables or disables the USB interrupt request when the NRDY interrupt is detected. 0: Interrupt output disabled 1: Interrupt output enabled
8	BRDYE	0	R/W	Buffer Ready Interrupt Enable Enables or disables the USB interrupt request when the BRDY interrupt is detected. 0: Interrupt output disabled 1: Interrupt output enabled

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.

Note 1. The RSME, DVSE, and CTRE bits can be set to 1 only when the function controller mode is selected; do not set these bits to 1 to enable the corresponding interrupt output when the host controller mode is selected.

28.3.11 Interrupt Enable Register 1 (INTENB1)

INTENB1 is a register that enables various interrupts when the host controller mode is selected.

On detecting the interrupt corresponding to the bit in this register which has been set to 1, this module generates the USB interrupt.

This module sets 1 to each status bit in INTSTS1 when a detection condition of the corresponding interrupt source has been satisfied regardless of the set value in INTENB1 (regardless of whether the interrupt output is enabled or disabled).

While the status bit in INTSTS1 corresponding to the interrupt source indicates 1, this module generates the USB interrupt when the corresponding interrupt enable bit in INTENB1 is changed from 0 to 1.

When the function controller mode is selected, the interrupts should not be enabled.

This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bit	Bit Name	Initial Value	R/W	Description
6	EOFERRE	0	R/W	EOF Error Detection Interrupt Enable Enables or disables the USB interrupt request when the EOFERR interrupt is detected. 0: Interrupt output disabled 1: Interrupt output enabled
5	SIGNE	0	R/W	Setup Transaction Error Interrupt Enable Enables or disables the USB interrupt request when the SIGN interrupt is detected. 0: Interrupt output disabled 1: Interrupt output enabled
4	SACKE	0	R/W	Setup Transaction Normal Response Interrupt Enable Enables or disables the USB interrupt request when the SACK interrupt is detected. 0: Interrupt output disabled 1: Interrupt output enabled
3 to 1	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
0	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Note 1. The INTENB1 register bits can be set to 1 only when the host controller mode is selected; do not set these bits to 1 to enable the corresponding interrupt output when the function controller mode is selected.

28.3.12 BRDY Interrupt Enable Register (BRDYENB)

BRDYENB is a register that enables or disables the BRDY bit in INTSTS0 to be set to 1 when the BRDY interrupt is detected for each pipe.

On detecting the BRDY interrupt for the pipe corresponding to the bit in this register which has been set to 1, this module sets 1 to the corresponding PIPEBRDY bit in BRDYSTS and the BRDY bit in INTSTS0, and generates the BRDY interrupt.

While at least one PIPEBRDY bit in BRDYSTS indicates 1, this module generates the BRDY interrupt when the corresponding interrupt enable bit in BRDYENB is changed from 0 to 1.

This register is initialized by a power-on reset.

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	PIPEBRDYE	H'0000	R/W	BRDY Interrupt Enable for each Pipe 0: Interrupt output disabled 1: Interrupt output enabled

Note 1. The bit number corresponds to the pipe number.

28.3.13 NRDY Interrupt Enable Register (NRDYENB)

NRDYENB is a register that enables or disables the NRDY bit in INTSTS0 to be set to 1 when the NRDY interrupt is detected for each pipe.

On detecting the NRDY interrupt for the pipe corresponding to the bit in this register which has been set to 1, this module sets 1 to the corresponding PIPENRDY bit in NRDYSTS and the NRDY bit in INTSTS0, and generates the NRDY interrupt.

While at least one PIPENRDY bit in NRDYSTS indicates 1, this module generates the NRDY interrupt when the corresponding interrupt enable bit in NRDYENB is changed from 0 to 1.

This register is initialized by a power-on reset.

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	PIPENRDYE	H'0000	R/W	NRDY Interrupt Enable for each Pipe 0: Interrupt output disabled 1: Interrupt output enabled

Note 1. The bit number corresponds to the pipe number.

28.3.14 BEMP Interrupt Enable Register (BEMPENB)

BEMPENB is a register that enables or disables the BEMP bit in INTSTS0 to be set to 1 when the BEMP interrupt is detected for each pipe.

On detecting the BEMP interrupt for the pipe corresponding to the bit in this register which has been set to 1, this module sets 1 to the corresponding PIPEBEMP bit in BEMPSTS and the BEMP bit in INTSTS0, and generates the BEMP interrupt.

While at least one PIPEBEMP bit in BEMPSTS indicates 1, this module generates the BEMP interrupt when the corresponding interrupt enable bit in BEMPENB is changed from 0 to 1.

This register is initialized by a power-on reset.

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	PIPEBEMPE	H'0000	R/W	BEMP Interrupt Enable for each Pipe 0: Interrupt output disabled 1: Interrupt output enabled

Note 1. The bit number corresponds to the pipe number.

28.3.15 SOF Output Configuration Register (SOFCFG)

SOFCFG is a register that specifies the transaction-enabled time and BRDY interrupt status clear timing. This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TRNEN SEL	—	BRDY M	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	0	—	0	0	0	0	0	—	—
R/W:	R	R	R	R	R	R	R	R/W	R	R/W	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 9	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
8	TRNENSEL	0	R/W	Transaction-Enabled Time Select Selects the transaction-enabled time either for full-speed or low-speed communication, where is the time in which this module issues tokens in a frame. 0: For non-low-speed communication 1: For low-speed communication This bit is valid only when the host controller mode is selected. Even when the host controller mode is selected, the setting of this bit has no effect on the transaction-enabled time during high-speed communication. This bit should be set to 0 when the function controller mode is selected.
7	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
6	BRDYM	0	R/W	BRDY Interrupt Status Clear Timing for Each Pipe Specifies the timing for clearing the BRDY interrupt status for each pipe. 0: Clears the status by writing 0 to this bit. 1: This module automatically clears the status when data has been read from the FIFO buffer or data has been written to the FIFO buffer.
5 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.

28.3.16 Interrupt Status Register 0 (INTSTS0)

INTSTS0 is a register that indicates the status of the various interrupts detected.

This register is initialized by a power-on reset. By a USB bus reset, the DVST and DVSQ[2:0] bits are initialized.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VBINT	RESM	SOFR	DVST	CTRT	BEMP	NRDY	BRDY	VBSTS	DVSQ[2:0]			VALID	CTSQ[2:0]		
Initial value:	0	0	0	0/1 ^{*1}	0	0	0	0	0/1 ^{*3}	0 ^{*2}	0 ^{*2}	0/1 ^{*2}	0	0	0	0
R/W:	R/W ^{*7}	R/W ^{*7}	R/W ^{*7}	R/W ^{*7}	R/W ^{*7}	R	R	R	R	R	R	R	R/W ^{*7}	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	VBINT	0	R/W ^{*7}	VBUS Interrupt Status ^{*4*5} 0: VBUS interrupts not generated 1: VBUS interrupts generated This module sets this bit to 1 when a change in the value input to the VBUS pin (high to low or low to high) is detected. The module indicates the VBUS pin input value in the VBSTS bit. When a VBINT interrupt is generated, the VBSTS bit is read several times to remove the chattering effect until the same value is read repeatedly from the bit.
14	RESM	0	R/W ^{*7}	Resume Interrupt Status ^{*4*5*6} 0: Resume interrupts not generated 1: Resume interrupts generated When the function controller mode is selected, this module sets this bit to 1 on detecting the falling edge of the signal on the DP pin in the suspended state (DVSQ = 1XX). When the host controller mode is selected, the read value is invalid.
13	SOFR	0	R/W ^{*7}	Frame Number Refresh Interrupt Status ^{*4} 0: SOF interrupts not generated 1: SOF interrupts generated (1) When the host controller mode is selected This module sets this bit to 1 on updating the frame number when the UACT bit is set to 1. (This interrupt is detected every 1 ms.) (2) When the function controller mode is selected This module sets this bit to 1 on updating the frame number. (This interrupt is detected every 1 ms.) This module can detect an SOFR interrupt through the internal interpolation function even when a damaged SOF packet is received from the USB host.
12	DVST	0/1 ^{*1}	R/W ^{*7}	Device State Transition Interrupt Status ^{*4*6} 0: Device state transition interrupts not generated 1: Device state transition interrupts generated When the function controller mode is selected, this module updates the DVSQ value and sets this bit to 1 on detecting a change in the device state. When this interrupt is generated, clear the status before this module detects the next device state transition. When the host controller mode is selected, the read value is invalid.
11	CTRT	0	R/W ^{*7}	Control Transfer Stage Transition Interrupt Status ^{*4*6} 0: Control transfer stage transition interrupts not generated 1: Control transfer stage transition interrupts generated When the function controller mode is selected, this module updates the CTSQ value and sets this bit to 1 on detecting a change in the control transfer stage. When this interrupt is generated, clear the status before this module detects the next control transfer stage transition. When the host controller mode is selected, the read value is invalid.

Bit	Bit Name	Initial Value	R/W	Description
10	BEMP	0	R	<p>Buffer Empty Interrupt Status</p> <p>0: BEMP interrupts not generated 1: BEMP interrupts generated</p> <p>This module sets this bit to 1 when at least one PIPEBEMP bit in BEMPSTS is set to 1 among the PIPEBEMP bits corresponding to the PIPEBEMPE bits in BEMPENB to which 1 has been set (when this module detects the BEMP interrupt status in at least one pipe among the pipes for which the BEMP interrupt notification is enabled). For the conditions for PIPEBEMP status assertion, refer to section 28.4.2 (4) BEMP Interrupt.</p> <p>This module clears this bit to 0 when 0 is written to all the PIPEBEMP bits corresponding to the PIPEBEMPE bits to which 1 has been set. This bit cannot be cleared to 0 even if 0 is written to this bit.</p>
9	NRDY	0	R	<p>Buffer Not Ready Interrupt Status</p> <p>0: NRDY interrupts not generated 1: NRDY interrupts generated</p> <p>This module sets this bit to 1 when at least one PIPENRDY bit in NRDYSTS is set to 1 among the PIPENRDY bits corresponding to the PIPENRDYE bits in NRDYENB to which 1 has been set (when this module detects the NRDY interrupt status in at least one pipe among the pipes for which the NRDY interrupt notification is enabled). For the conditions for PIPENRDY status assertion, refer to section 28.4.2 (3) NRDY Interrupt.</p> <p>This module clears this bit to 0 when 0 is written to all the PIPENRDY bits corresponding to the PIPENRDYE bits to which 1 has been set. For the conditions for PIPEBRDY status assertion, refer to section 28.4.2 (2) BRDY Interrupt.</p> <p>This module clears this bit to 0 when 0 is written to all the PIPEBRDY bits corresponding to the PIPEBRDYE bits to which 1 has been set. This bit cannot be cleared to 0 even if 0 is written to this bit.</p>
7	VBSTS	0/1 ³	R	<p>VBUS Input Status</p> <p>0: The VBUS pin is low level. 1: The VBUS pin is high level.</p>
6 to 4	DVSQ[2:0]	000/001 ²	R	<p>Device State</p> <p>000: Powered state 001: Default state 010: Address state 011: Configured state 1xx: Suspended state</p> <p>When the host controller mode is selected, the read value is invalid.</p>
3	VALID	0	R/W ⁷	<p>USB Request Reception</p> <p>0: Not detected 1: Setup packet reception</p> <p>When the host controller mode is selected, the read value is invalid.</p>
2 to 0	CTSQ[2:0]	000	R	<p>Control Transfer Stage</p> <p>000: Idle or setup stage 001: Control read data stage 010: Control read status stage 011: Control write data stage 100: Control write status stage 101: Control write (no data) status stage 110: Control transfer sequence error 111: Setting prohibited</p> <p>When the host controller mode is selected, the read value is invalid.</p>

- Note 1. This bit is initialized to B'0 by a power-on reset and B'1 by a USB bus reset.
- Note 2. These bits are initialized to B'000 by a power-on reset and B'001 by a USB bus reset.
- Note 3. This bit is 1 when the level of the VBUS pin input is high and 0 when low.
- Note 4. To clear the VBINT, RESM, SOFR, DVST, or CTRT bit, write 0 only to the bits to be cleared; write 1 to the other bits. Do not write 0 to the status bits indicating 0.
- Note 5. A change in the status indicated by the VBINT and RESM bits can be detected by this module even while the clock supply is stopped, and the interrupts are output when the corresponding interrupt enable bits are enabled. Clearing the status should be done after enabling the clock supply.
- Note 6. A change in the status of the RESM, DVST, and CTRT bits occurs only when the function controller mode is selected; disable the corresponding interrupt enable bits (set to 0) when the host controller mode is selected.
- Note 7. Only 0 can be written to.

28.3.17 Interrupt Status Register 1 (INTSTS1)

INTSTS1 is a register that is used to confirm interrupt status.

The various interrupts indicated by the bits in this register should be enabled only when the host controller mode is selected.

This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	BCHG	—	DTCH	ATTCH	—	—	—	—	EOFER R	SIGN	SACK	—	—	—	—
Initial value:	0	0	—	0	0	—	0	0	—	0	0	0	—	—	—	0
R/W:	R	R/W*	R	R/W*	R/W*	R	R	R	R	R/W*	R/W*	R/W*	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14	BCHG	0	R/W*	USB Bus Change Interrupt Status Indicates the status of the USB bus change interrupt. 0: BCHG interrupts not generated 1: BCHG interrupts generated This module detects the BCHG interrupt when a change in the full-speed or low-speed signal level occurs on the USB port (a change from J-state, K-state, or SE0 to J-state, K-state, or SE0), and sets this bit to 1. Here, if the corresponding interrupt enable bit is set to 1, this module generates the interrupt. This module sets the LNST bits in SYSSTS to indicate the current input state of the USB port. When the BCHG interrupt is generated, the LNST bits are read several times to remove the chattering effect until the same value is read repeatedly from the bits. A change in the USB bus state can be detected even while the internal clock supply is stopped. When the function controller mode is selected, the read value is invalid.
13	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
12	DTCH	0	R/W*	USB Disconnection Detection Interrupt Status Indicates the status of the USB disconnection detection interrupt when the host controller mode is selected. 0: DTCH interrupts not generated 1: DTCH interrupts generated This module detects the DTCH interrupt on detecting USB bus disconnection, and sets this bit to 1. Here, if the corresponding interrupt enable bit is set to 1, this module generates the interrupt. This module detects bus disconnection based on USB Specification 2.0. After detecting the DTCH interrupt, this module controls hardware as described below (irrespective of the set value of the corresponding interrupt enable bit). Software should terminate all the pipes in which communications are currently carried out for the USB port and make a transition to the wait state for bus connection to the USB port (wait state for ATTCH interrupt generation). (1) Modifies the UACT bit to 0. (2) Puts the port into the idle state. When the function controller mode is selected, the read value is invalid.

Bit	Bit Name	Initial Value	R/W	Description
11	ATTCH	0	R/W*	<p>ATTCH Interrupt Status Indicates the status of the ATTCH interrupt when the host controller mode is selected.</p> <p>0: ATTCH interrupts not generated 1: ATTCH interrupts generated</p> <p>This module detects the ATTCH interrupt on detecting J-state or K-state of the full-speed or low-speed level signal for 2.5 μs, and sets this bit to 1. Here, if the corresponding interrupt enable bit is set to 1, this module generates the interrupt.</p> <p>Specifically, this module detects the ATTCH interrupt on any of the following conditions.</p> <ul style="list-style-type: none"> • K-state, SE0, or SE1 changes to J-state, and J-state continues 2.5 μs. • J-state, SE0, or SE1 changes to K-state, and K-state continues 2.5 μs. <p>When the function controller mode is selected, the read value is invalid.</p>
10	—	Undefined	R	<p>Reserved The read value is undefined. The write value should always be 0.</p>
9, 8	—	All 0	R	<p>Reserved These bits are always read as 0. The write value should always be 0.</p>
7	—	Undefined	R	<p>Reserved The read value is undefined. The write value should always be 0.</p>
6	EOFERR	0	R/W*	<p>EOF Error Detection Interrupt Status Indicates the status of the EOFERR interrupt when the host controller mode is selected.</p> <p>0: EOFERR interrupt not generated 1: EOFERR interrupt generated</p> <p>This module detects the EOFERR interrupt on detecting that communication is not completed at the EOF2 timing prescribed by USB Specification 2.0, and sets this bit to 1. Here, if the corresponding interrupt enable bit is set to 1, this module generates the EOFERR interrupt.</p> <p>After detecting the EOFERR interrupt, this module controls hardware as described below (irrespective of the set value of the corresponding interrupt enable bit). Software should terminate all the pipes in which communications are currently carried for the USB port and perform re-enumeration of the USB port.</p> <p>(1) Modifies the UACT bit to 0. (2) Puts the port into the idle state.</p> <p>When the function controller mode is selected, the read value is invalid.</p>
5	SIGN	0	R/W*	<p>Setup Transaction Error Interrupt Status Indicates the status of the setup transaction error interrupt when the host controller mode is selected.</p> <p>0: SIGN interrupts not generated 1: SIGN interrupts generated</p> <p>This module detects the SIGN interrupt when ACK response is not returned from the peripheral device three consecutive times during the setup transactions issued by this module, and sets this bit to 1. Here, if the corresponding interrupt enable bit is set to 1, this module generates the SIGN interrupt.</p> <p>Specifically, this module detects the SIGN interrupt when any of the following response conditions occur for three consecutive setup transactions.</p> <ul style="list-style-type: none"> • Timeout is detected when the peripheral device has returned no response. • A damaged ACK packet is received. • A handshake other than ACK (NAK, NYET, or STALL) is received. <p>When the function controller mode is selected, the read value is invalid.</p>

Bit	Bit Name	Initial Value	R/W	Description
4	SACK	0	R/W*	Setup Transaction Normal Response Interrupt Status Indicates the status of the setup transaction normal response interrupt when the host controller mode is selected. 0: SACK interrupts not generated 1: SACK interrupts generated This module detects the SACK interrupt when ACK response is returned from the peripheral device during the setup transactions issued by this module, and sets this bit to 1. Here, if the corresponding interrupt enable bit is set to 1, this module generates the SACK interrupt. When the function controller mode is selected, the read value is invalid.
3 to 1	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
0	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Note 1. To clear the status indicated by the bits in this register, write 0 only to the bits to be cleared; write 1 to the other bits. Do not write 0 to the status bits indicating 0.

Note 2. A change in the status indicated by the BCHG bit can be detected by this module even while the clock supply is stopped, and the interrupt is output when the corresponding interrupt enable bit is enabled. Clearing the status should be done after enabling the clock supply.

No interrupts other than BCHG can be detected while the clock supply is stopped.

* Only 0 can be written to.

28.3.18 BRDY Interrupt Status Register (BRDYSTS)

BRDYSTS is a register that indicates the BRDY interrupt status for each pipe.

This register is initialized by a power-on reset.

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	PIPEBRDY	H'0000	R/W*1	BRDY Interrupt Status for each Pipe*2 0: Interrupts not generated 1: Interrupts generated

Note 1. The bit number corresponds to the pipe number.

Note 2. To clear the status indicated by the bits in this register when BRDYM is 0, write 0 only to the bits to be cleared; write 1 to the other bits. Do not write 0 to the status bits indicating 0.

* 1. Only 0 can be written to.

* 2. When BRDYM is 0, clearing this bit should be done before accessing the FIFO.

28.3.19 NRDY Interrupt Status Register (NRDYSTS)

NRDYSTS is a register that indicates the NRDY interrupt status for each pipe.

This register is initialized by a power-on reset.

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	PIPENRDY	H'0000	R/W*	NRDY Interrupt Status for each Pipe 0: Interrupts not generated 1: Interrupts generated

Note 1. The bit number corresponds to the pipe number.

Note 2. To clear the status indicated by the bits in this register, write 0 only to the bits to be cleared; write 1 to the other bits. Do not write 0 to the status bits indicating 0.

* Only 0 can be written to.

28.3.20 BEMP Interrupt Status Register (BEMPSTS)

BEMPSTS is a register that indicates the BEMP interrupt status for each pipe.

This register is initialized by a power-on reset.

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	PIPEBEMP	H'0000	R/W*	BEMP Interrupt Status for each Pipe 0: Interrupts not generated 1: Interrupts generated

Note 1. The bit number corresponds to the pipe number.

Note 2. To clear the status indicated by the bits in this register, write 0 only to the bits to be cleared; write 1 to the other bits. Do not write 0 to the status bits indicating 0.

* Only 0 can be written to.

28.3.21 Frame Number Register (FRMNUM)

FRMNUM is a register that determines the source of isochronous error notification and indicates the frame number. This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OVRN	CRCE	—	—	—											
Initial value:	0	0	—	—	—	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W*1	R/W*1	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	OVRN	0	R/W*1	<p>Overrun/Underrun Detection Status</p> <p>Indicates whether an overrun/underrun error has been detected in the pipe during isochronous transfer. On detecting either error, this module simultaneously generates the internal NRDY interrupt request. For details, refer to section 28.4.2, Interrupt Functions.</p> <p>0: No error 1: An error occurred</p> <p>This bit can be cleared to 0 by writing 0 to the bit. Here, 1 should be written to the other bits in this register.</p> <p>(1) When the host controller mode is selected This module sets this bit to 1 on any of the following conditions.</p> <ul style="list-style-type: none"> For the isochronous transfer pipe in the transmitting direction, the time to issue an OUT token comes before all the transmit data has been written to the FIFO buffer. For the isochronous transfer pipe in the receiving direction, the time to issue an IN token comes when no FIFO buffer planes are empty. <p>(2) When the function controller mode is selected This module sets this bit to 1 on any of the following conditions.</p> <ul style="list-style-type: none"> For the isochronous transfer pipe in the transmitting direction, the IN token is received before all the transmit data has been written to the FIFO buffer. For the isochronous transfer pipe in the receiving direction, the OUT token is received when no FIFO buffer planes are empty. <p>Note: This bit should be used for debugging. When designing a system, control the timing so that neither overrun nor underrun occurs.</p>
14	CRCE	0	R/W*1	<p>Receive Data Error</p> <p>Indicates whether a CRC error or bit stuffing error has been detected in the pipe during isochronous transfer. On detecting either error, this module simultaneously generates the internal NRDY interrupt request. For details, refer to section 28.4.2, Interrupt Functions.</p> <p>0: No error 1: An error occurred</p> <p>This bit can be cleared to 0 by writing 0 to the bit. Here, 1 should be written to the other bits in this register.</p>
13 to 11	—	Undefined	R	<p>Reserved</p> <p>The read value is undefined. The write value should always be 0.</p>
10 to 0	FRNM[10:0]	H'000	R	<p>Frame Number</p> <p>This module sets these bits to indicate the latest frame number, which is updated every time an SOF packet is issued or received (every 1 ms). When reading these bits, repeat reading until the same value is read twice.</p>

Note 1. Only 0 can be written to.

28.3.22 μ Frame Number Register (UFRMNUM)

UFRMNUM is a register that indicates the μ frame number.

This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	UFRNM[2:0]		
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 3	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
2 to 0	UFRNM[2:0]	000	R	μ Frame The μ frame number can be confirmed. This module sets these bits to indicate the μ frame number during high-speed operation. During operation other than high-speed operation, this module sets these bits to B'000. When reading these bits, repeat reading until the same value is read twice.

28.3.23 USB Address Register (USBADDR)

USBADDR is a register that indicates the USB address. This register is valid only when the function controller mode is selected. When the host controller mode is selected, peripheral device addresses should be set using the DEVSEL bits in PIPEMAXP.

This register is initialized by a power-on reset or a USB bus reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	USBADDR[6:0]						
Initial value:	—	—	—	—	—	—	—	—	—	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 7	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
6 to 0	USBADDR[6:0]	H'00	R	USB Address When the function controller mode is selected, these bits indicate the USB address assigned by the host when the SET_ADDRESS request is successfully processed. When the function controller mode is selected, these bits indicate H'00 upon detection of a USB bus reset signal. When the host controller mode is selected, the read value is invalid.

28.3.24 USB Request Type Register (USBREQ)

USBREQ is a register that stores setup requests for control transfers.

When the function controller mode is selected, the values of bRequest and bmRequestType that have been received are stored. When the host controller mode is selected, the values of bRequest and bmRequestType to be transmitted are set. This register is initialized by a power-on reset or a USB bus reset.

Bit	Bit Name	Initial Value	R/W	Description
15 to 8	BREQUEST[7:0]	H'00	R/W*1	Request These bits store the USB request bRequest value. (1) When the host controller mode is selected The USB request data value for the setup transaction to be transmitted should be set in these bits. After SUREQ has been set to 1, do not modify these bits until SUREQ is read as 0. (2) When the function controller mode is selected Indicates the USB request data value received during the setup transaction. Writing to these bits is invalid.
7 to 0	BMREQUEST TYPE[7:0]	H'00	R/W*1	Request Type These bits store the USB request bmRequestType value. (1) When the host controller mode is selected The USB request type value for the setup transaction to be transmitted should be set in these bits. After SUREQ has been set to 1, do not modify these bits until SUREQ is read as 0. (2) When the function controller mode is selected Indicates the USB request type value received during the setup transaction. Writing to these bits is invalid.

Note 1. When the function controller mode is selected, these bits can only be read, and writing to these bits is invalid. When the host controller mode is selected, these bits can be read and written to.

28.3.25 USB Request Value Register (USBVAL)

USBVAL is a register that stores setup requests for control transfers. When the function controller mode is selected, the value of wValue that has been received is stored. When the host controller mode is selected, the value of wValue to be transmitted is set.

This register is initialized by a power-on reset or a USB bus reset.

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	WVALUE[15:0]	H'0000	R/W*1	Value These bits store the USB request wValue value. (1) When the host controller mode is selected The USB request wValue value for the setup transaction to be transmitted should be set in these bits. After SUREQ has been set to 1, do not modify these bits until SUREQ is read as 0. (2) When the function controller mode is selected Indicates the USB request wValue value received during the setup transaction. Writing to these bits is invalid.

Note 1. When the function controller mode is selected, these bits can only be read, and writing to these bits is invalid. When the host controller mode is selected, these bits can be read and written to.

28.3.26 USB Request Index Register (USBINDEX)

USBINDEX is a register that stores setup requests for control transfers. When the function controller mode is selected, the value of wIndex that has been received is stored. When the host controller mode is selected, the value of wIndex to be transmitted is set.

This register is initialized by a power-on reset or a USB bus reset.

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	WINDEX[15:0]	H'0000	R/W*1	Index These bits store the USB request wIndex value. (1) When the host controller mode is selected The USB request wIndex value for the setup transaction to be transmitted should be set in these bits. After SUREQ has been set to 1, do not modify these bits until SUREQ is read as 0. (2) When the function controller mode is selected Indicates the USB request wIndex value received during the setup transaction. Writing to these bits is invalid.

Note 1. When the function controller mode is selected, these bits can only be read, and writing to these bits is invalid. When the host controller mode is selected, these bits can be read and written to.

28.3.27 USB Request Length Register (USBLENG)

USBLENG is a register that stores setup requests for control transfers. When the function controller mode is selected, the value of wLength that has been received is stored. When the host controller mode is selected, the value of wLength to be transmitted is set.

This register is initialized by a power-on reset or a USB bus reset.

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	WLENGTH[15:0]	H'0000	R/W*1	Length These bits store the USB request wLength value. (1) When the host controller mode is selected The USB request wLength value for the setup transaction to be transmitted should be set in these bits. After SUREQ has been set to 1, do not modify these bits until SUREQ is read as 0. (2) When the function controller mode is selected Indicates the USB request wLength value received during the setup transaction. Writing to these bits is invalid.

Note 1. When the function controller mode is selected, these bits can only be read, and writing to these bits is invalid. When the host controller mode is selected, these bits can be read and written to.

28.3.28 DCP Configuration Register (DCPCFG)

DCPCFG is a register that specifies the data transfer direction for the default control pipe (DCP).

This register is initialized by a power-on reset.

Bit	Bit Name	Initial Value	R/W	Description
15 to 9	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
8	CNTMD	0	R/W	<p>Continuous Transfer Mode</p> <p>Specifies whether to use the default control pipe in continuous transfer mode.</p> <p>0: Non-continuous transfer mode 1: Continuous transfer mode</p> <p>This module determines whether transmitting to/receiving from the FIFO buffer allocated for the DCP has completed or not using this bit setting, as shown in Table 28.10.</p> <p>Modify this bit while CSSTS is 0, PID is NAK, and the pipe is not selected by the CURPIPE bits.</p> <p>To modify this bit after completing USB communication using the DCP, write 1 to BCLR to clear the FIFO buffer assigned to the DCP while the CSSTS, PID, and CURPIPE bits are in the above-described state.</p> <p>Before modifying these bits after modifying the PID bits for the DCP from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.</p>
7	SHTNAK	0	R/W	<p>Pipe Disabled at End of Transfer</p> <p>Specifies whether to modify PID to NAK upon the end of transfer when the default control pipe is in the receiving direction.</p> <p>0: Pipe continued at the end of transfer 1: Pipe disabled at the end of transfer</p> <p>When this bit is set to 1, this module modifies the PID bits corresponding to the DCP to NAK on determining the end of the transfer. This module determines that the transfer has ended when a short packet (including a zero-length packet) is successfully received.</p> <p>Modify this bit while CSSTS is 0 and PID is NAK.</p> <p>Before modifying this bit after modifying the PID bits for the DCP from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.</p> <p>This bit should be cleared to 0 for the DCP in the transmitting direction.</p>
6, 5	—	Undefined	R	<p>Reserved</p> <p>The read value is undefined. The write value should always be 0.</p>
4	DIR	0	R/W	<p>Transfer Direction</p> <p>When the host controller mode is selected, this bit sets the transfer direction of data stage and status stage for control transfers.</p> <p>0: Data receiving direction 1: Data transmitting direction</p> <p>When the function controller mode is selected, this bit should be cleared to 0.</p>
3 to 0	—	Undefined	R	<p>Reserved</p> <p>The read value is undefined. The write value should always be 0.</p>

Table 28.10 Relationship between Transfer Mode Settings by CNTMD Bit and Timings at which Reading Data or Transmitting Data from FIFO Buffer is Enabled

Continuous or Non-Continuous Transfer Mode	When Reading Data or Transmitting Data is Enabled
Non-continuous transfer (CNTMD = 0)	<p>In the receiving direction (DIR = 0), reading data from the FIFO buffer is enabled in the following case.</p> <p>This module receives a single packet.</p> <hr/> <p>In the transmitting direction (DIR = 1), transmitting data from the FIFO buffer is enabled in either of the following cases.</p> <p>(1) Data of the maximum packet size is written to the FIFO buffer.</p> <p>(2) Data of the short packet size (including 0-byte data) is written to the FIFO buffer and then 1 is written to the BVAL bit</p>
Continuous transfer (CNTMD = 1)	<p>In the receiving direction (DIR = 0), reading data from the FIFO buffer is enabled in any of the following cases.</p> <p>(1) The number of the data bytes received in the FIFO buffer assigned to the DCP becomes the same as the number of assigned data bytes (fixed to 256 bytes)</p> <p>(2) This module receives a short packet other than a zero-length packet</p> <p>(3) This module receives a zero-length packet when data is already stored in the FIFO buffer assigned to the DCP.</p> <hr/> <p>In the transmitting direction (DIR = 1), transmitting data from the FIFO buffer is enabled in either of the following cases.</p> <p>(1) The number of the data bytes written to the FIFO buffer becomes the same as the number of data bytes in a single FIFO buffer plane assigned to the DCP.</p> <p>(2) A number of data bytes less than the size of a single FIFO buffer (including 0-byte data) assigned to the DCP being written to the FIFO buffer and then 1 being written to BVAL.</p>

28.3.29 DCP Maximum Packet Size Register (DCPMAXP)

DCPMAXP is a register that specifies the maximum packet size for the DCP.

This register is initialized by a power-on reset.

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	DEVSEL[3:0]	0000	R/W	<p>Device Select When the host controller mode is selected, these bits specify the communication target peripheral device address for control transfers. 0000: Address 0000 0001: Address 0001 : : 1001: Address 1001 1010: Address 1010 Others: Setting prohibited These bits should be set after setting the DEVADDn register corresponding to the value to be set in these bits. For example, before setting DEVSEL to 0010, the DEVADD2 register should be set first. These bits should be set while CSSTS is 0, PID is NAK, and SUREQ is 0. Before modifying these bits after modifying the PID bits for the DCP from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked. When the function controller mode is selected, these bits should be set to B'0000.</p>
11 to 7	—	Undefined	R	<p>Reserved The read value is undefined. The write value should always be 0.</p>
6 to 0	MXPS[6:0]	H'40	R/W	<p>Maximum Packet Size Specifies the maximum data payload (maximum packet size) for the DCP. These bits are initialized to H'40 (64 bytes). These bits should be set to the value based on the USB Specification. These bits should be set while CSSTS is 0, PID is NAK, and the pipe is not selected by the CURPIPE bits. Before modifying these bits after modifying the PID bits for the DCP from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked. While MXPS is 0, do not write to the FIFO buffer or do not set PID to BUF.</p>

28.3.30 DCP Control Register (DCPCTR)

DCPCTR is a register that is used to confirm the buffer memory status, change and confirm the data PID sequence bit, and set the response PID for the DCP.

This register is initialized by a power-on reset. The CCPL and PID[1:0] bits are initialized by a USB bus reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BSTS	SUREQ	CSCLR	CSSTS	SUREQCLR	—	—	SQCLR	SQSET	SQMON	PBUSY	PINGE	—	CCPL	PID[1:0]	
Initial value:	0	0	0	0	0	—	—	0	0	1	0	0	—	0	0	0
R/W:	R	R/W ²	R/W ^{*1}	R	R/W ^{*1}	R	R	R/W ^{*1}	R/W ^{*1}	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	BSTS	0	R	<p>Buffer Status Indicates whether DCP FIFO buffer access is enabled or disabled. 0: Buffer access is disabled. 1: Buffer access is enabled. The meaning of the BSTS bit depends on the ISEL bit setting as follows.</p> <ul style="list-style-type: none"> When ISEL = 0, BSTS indicates whether the received data can be read from the buffer. When ISEL = 1, BSTS indicates whether the data to be transmitted can be written to the buffer.
14	SUREQ	0	R/W ^{*2}	<p>Setup Token Transmission Transmits the setup packet by setting this bit to 1 when the host controller mode is selected. 0: Writing invalid 1: Transmits the setup packet. After completing the setup transaction process, this module generates either the SACK or SIGN interrupt and clears this bit to 0. This module also clears this bit to 0 when the SUREQCLR bit is set to 1. Before setting this bit to 1, set the DEVSEL bits, USBREQ register, USBVAL register, USBINDX register, and USBLENG register appropriately to transmit the desired USB request in the setup transaction. Before setting this bit to 1, check that the PID bits for the DCP are set to NAK. After setting this bit to 1, do not modify the DEVSEL bits, USBREQ register, USBVAL register, USBINDX register, or USBLENG register while the setup transaction is in progress (SUREQ = 1). Write 1 to this bit only when transmitting the setup token; for the other purposes, write 0. When the function controller mode is selected, be sure to write 0 to this bit.</p>
13	CSCLR	0	R/W ^{*1}	<p>C-SPLIT Status Clear for Split Transaction When the host controller mode is selected, setting this bit to 1 clears the CSSTS bit to 0 for the transfer using the split transaction. In this case, the next DCP transfer restarts with the S-SPLIT. 0: Writing invalid 1: Clears the CSSTS bit to 0. When this bit is set to 1, this module clears the CSSTS bit to 0. For the transfer using the split transaction, to restart the next transfer with the S-SPLIT forcibly, set this bit to 1. However, for the normal split transaction, this module automatically clears the CSSTS bit to 0 upon completion of the C-SPLIT; therefore, clearing the CSSTS bit is not necessary. Controlling the CSSTS bit through this bit must be done while UACT is 0 and thus communication is halted or while no transfer is being performed with bus disconnection detected. Setting this bit to 1 while CSSTS is 0 has no effect. When the function controller mode is selected, be sure to write 0 to this bit.</p>

Bit	Bit Name	Initial Value	R/W	Description
12	CSSTS	0	R	<p>COMPLETE SPLIT (C-SPLIT) Status of Split Transaction</p> <p>Indicates the C-SPLIT status of the split transaction when the host controller mode is selected.</p> <p>0: START-SPLIT (S-SPLIT) transaction being processed or the device not using the split transaction being processed</p> <p>1: C-SPLIT transaction being processed</p> <p>This module sets this bit to 1 upon start of the C-SPLIT and clears this bit to 0 upon detection of C-SPLIT completion.</p> <p>When the function controller mode is selected, the read value is invalid.</p>
11	SUREQCLR	0	R/W*1	<p>SUREQ Bit Clear</p> <p>When the host controller mode is selected, setting this bit to 1 clears the SUREQ bit to 0.</p> <p>0: Writing invalid</p> <p>1: Clears the SUREQ bit to 0.</p> <p>This bit always indicates 0.</p> <p>Set this bit to 1 when communication has stopped with SUREQ being 1 during the setup transaction. However, for normal setup transactions, this module automatically clears the SUREQ bit to 0 upon completion of the transaction; therefore, clearing the SUREQ bit is not necessary.</p> <p>Controlling the SUREQ bit through this bit must be done while UACT is 0 and thus communication is halted or while no transfer is being performed with bus disconnection detected.</p> <p>When the function controller mode is selected, be sure to write 0 to this bit.</p>
10, 9	—	Undefined	R	<p>Reserved</p> <p>The read value is undefined. The write value should always be 0.</p>
8	SQCLR	0	R/W*1	<p>Toggle Bit Clear</p> <p>Specifies DATA0 as the expected value of the sequence toggle bit for the next transaction during the DCP transfer.</p> <p>0: Writing invalid</p> <p>1: Specifies DATA0.</p> <p>This bit always indicates 0.</p> <p>Do not set the SQCLR and SQSET bits to 1 simultaneously.</p> <p>Set this bit to 1 while CSSTS is 0, PID is NAK, and the pipe is not selected by the CURPIPE bits.</p> <p>Before setting this bit to 1 after modifying the PID bits for the DCP from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.</p>
7	SQSET	0	R/W*1	<p>Toggle Bit Set</p> <p>Specifies DATA1 as the expected value of the sequence toggle bit for the next transaction during the DCP transfer.</p> <p>0: Writing invalid</p> <p>1: Specifies DATA1.</p> <p>Do not set the SQCLR and SQSET bits to 1 simultaneously.</p> <p>Set this bit to 1 while CSSTS is 0 and PID is NAK.</p> <p>Before setting this bit to 1 after modifying the PID bits for the DCP from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.</p>
6	SQMON	1	R	<p>Sequence Toggle Bit Monitor</p> <p>Indicates the expected value of the sequence toggle bit for the next transaction during the DCP transfer.</p> <p>0: DATA0</p> <p>1: DATA1</p> <p>This module allows this bit to toggle upon normal completion of the transaction. However, this bit is not allowed to toggle when a DATA-PID disagreement occurs during the transfer in the receiving direction.</p> <p>When the function controller mode is selected, this module sets this bit to 1 (specifies DATA1 as the expected value) upon normal reception of the setup packet.</p> <p>When the function controller mode is selected, this module does not reference to this bit during the IN/OUT transaction of the status stage, and does not allow this bit to toggle upon normal completion.</p>

Bit	Bit Name	Initial Value	R/W	Description
5	PBUSY	0	R	<p>Pipe Busy</p> <p>Indicates whether or not the actual communication state of the DCP has entered the NAK state when the PID bits for the DCP are changed from BUF to NAK.</p> <p>0: Has not finished the transition to NAK 1: Has finished the transition to NAK</p> <p>This module modifies this bit from 0 to 1 upon start of the USB transaction for the DCP, and modifies the bit from 1 to 0 upon completion of one transaction.</p> <p>Reading this bit after PID has been set to NAK allows checking whether modification of the pipe settings is possible.</p> <p>For details, refer to section 28.4.3 (1) Pipe Control Register Switching Procedures.</p>
4	PINGE	0	R/W	<p>PING Token Issue Enable</p> <p>When the host controller mode is selected, setting this bit to 1 allows this module to issue the PING token during transfers in the transmitting direction and start a transfer in the transmitting direction with the PING transaction.</p> <p>0: Disables issuing PING token. 1: Enables normal PING operation.</p> <p>When having detected the ACK handshake during PING transactions, this module performs the OUT transaction as the next transaction.</p> <p>When having detected the NAK handshake or NYET handshake during OUT transactions, this module performs the PING transaction as the next transaction.</p> <p>When the host controller mode is selected, setting this bit to 0 prevents this module from issuing the PING token during transfers in the transmitting direction and only allows this module to perform OUT transactions for the transfers in the transmitting direction.</p> <p>This bit should be modified while CSSTS is 0 and PID is NAK.</p> <p>Before setting this bit to 1 after modifying the PID bits for the DCP from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.</p> <p>When the function controller mode is selected, be sure to write 0 to this bit.</p>
3	—	Undefined	R	<p>Reserved</p> <p>The read value is undefined. The write value should always be 0.</p>
2	CCPL	0	R/W	<p>Control Transfer End Enable</p> <p>When the function controller mode is selected, setting this bit to 1 enables the status stage of the control transfer to be completed.</p> <p>0: Completion of control transfer is disabled. 1: Completion of control transfer is enabled.</p> <p>In function controller mode, when this bit is set to 1 while the corresponding PID bits are set to BUF, this module completes the control transfer status stage.</p> <p>Specifically, during control read transfer, this module transmits the ACK handshake in response to the OUT transaction from the USB host, and outputs the zero-length packet in response to the IN transaction from the USB host during control write or no-data control transfer. However, on detecting the SET_ADDRESS request, this module operates in auto response mode from the setup stage up to the status stage completion irrespective of the setting of this bit.</p> <p>This module modifies this bit from 1 to 0 on receiving the new setup packet.</p> <p>1 cannot be written to this bit while VALID is 1.</p> <p>When the host controller mode is selected, be sure to write 0 to this bit.</p>

Bit	Bit Name	Initial Value	R/W	Description
1, 0	PID[1:0]	00	R/W	<p>Response PID Controls the response type of this module during control transfer.</p> <p>00: NAK response 01: BUF response (depending on the buffer state) 10: STALL response 11: STALL response</p> <p>(1) When the host controller mode is selected Modify the setting of these bits from NAK to BUF using the following procedure.</p> <ul style="list-style-type: none"> When the transmitting direction is set Write all the transmit data to the FIFO buffer while UACT is 1 and PID is NAK, and then set PID to BUF. After PID has been set to BUF, this module executes the OUT transaction (or PING transaction). When the receiving direction is set Check that the FIFO buffer is empty (or empty the buffer) while UACT is 1 and PID is NAK, and then set PID to BUF. After PID has been set to BUF, this module executes the IN transaction. <p>This module modifies the setting of these bits as follows.</p> <ul style="list-style-type: none"> This module sets PID to STALL (11) on receiving the data of the size exceeding the maximum packet size when PID has been set to BUF. This module sets PID to NAK on detecting a reception error such as a CRC error three consecutive times. This module also sets PID to STALL (11) on receiving the STALL handshake. <p>Even if the PID bits are modified to NAK after this module has issued S-SPLIT of the split transaction for the selected pipe (while CSSTS indicates 1), this module continues the transaction until C-SPLIT completes. This module sets PID to NAK upon completion of C-SPLIT.</p> <p>(2) When the function controller mode is selected This module modifies the setting of these bits as follows.</p> <ul style="list-style-type: none"> This module modifies PID to NAK on receiving the setup packet. Here, this module sets VALID to 1. The setting of PID cannot be modified until VALID is set to 0. This module sets PID to STALL (11) on receiving the data of the size exceeding the maximum packet size when PID has been set to BUF. This module sets PID to STALL (1x) on detecting the control transfer sequence error. This module sets PID to NAK on detecting the USB bus reset. <p>This module does not reference to the setting of the PID bits while the SET_ADDRESS request is processed (auto processing).</p>

Note 1. Only 0 can be read and 1 can be written to.

Note 2. Only 1 can be written to.

28.3.31 Pipe Window Select Register (PIPESEL)

PIPE1 to PIPE9 should be set using PIPESEL, PIPECFG, PIPEBUF, PIPEMAXP, PIPEPERI, PIPEnCTR, PIPEnTRE, and PIPEnTRN.

After selecting the pipe using PIPESEL, functions of the pipe should be set using PIPECFG, PIPEBUF, PIPEMAXP, and PIPEPERI. PIPEnCTR, PIPEnTRE, and PIPEnTRN can be set regardless of the pipe selection in PIPESEL.

This register is initialized by a power-on reset.

3 to 0	PIPESEL[3:0]	0000	R/W	Pipe Window Select When a value between 0001 and 1111 is set in these bits, the information and settings for the corresponding pipe can be read from the PIPECFG, PIPEBUF, PIPEMAXP, and PIPEPERI registers. 0000: No pipe selected 0001: PIPE1 0010: PIPE2 0011: PIPE3 0100: PIPE4 0101: PIPE5 0110: PIPE6 0111: PIPE7 1000: PIPE8 1001: PIPE9 1010: PIPE10 1011: PIPE11 1100: PIPE12 1101: PIPE13 1110: PIPE14 1111: PIPE15 Others: Setting prohibited When 0000 is set in these bits, 0 is read from all of the bits in the PIPECFG, PIPEBUF, PIPEMAXP, and PIPEPERI registers. Writing to the bits in these registers is invalid.

28.3.32 Pipe Configuration Register (PIPECFG)

PIPECFG is a register that specifies the transfer type, buffer memory access direction, and endpoint numbers for PIPE1 to PIPE15. It also selects continuous or non-continuous transfer mode, single or double buffer mode, and whether to continue or disable pipe operation at the end of transfer.

This register is initialized by a power-on reset.

Table 28.11 Relationship between Transfer Mode Settings by CNTMD Bit and Timings at which Reading Data or Transmitting Data from FIFO Buffer is Enabled

Continuous or Non-Continuous Transfer Mode	When Reading Data or Transmitting Data is Enabled
Non-continuous transfer (CNTMD = 0)	<p>In the receiving direction (DIR = 0), reading data from the FIFO buffer is enabled in the following case. This module receives a single packet.</p> <hr/> <p>In the transmitting direction (DIR = 1), transmitting data from the FIFO buffer is enabled in either of the following cases.</p> <ul style="list-style-type: none"> (1) Data of the maximum packet size is written to the FIFO buffer. (2) Data of the short packet size (including 0-byte data) is written to the FIFO buffer and then 1 is written to BVAL.
Continuous transfer (CNTMD = 1)	<p>In the receiving direction (DIR = 0), reading data from the FIFO buffer is enabled in any of the following cases.</p> <ul style="list-style-type: none"> (1) The number of the data bytes received in the FIFO buffer assigned to the selected pipe becomes the same as the number of assigned data bytes ((BUFSIZE + 1) × 64). (2) This module receives a short packet other than a zero-length packet. (3) This module receives a zero-length packet when data is already stored in the FIFO buffer assigned to the selected pipe. (4) This module receives the number of packets equal to the transaction counter value specified for the selected pipe. <hr/> <p>In the transmitting direction (DIR = 1), transmitting data from the FIFO buffer is enabled in any of the following cases.</p> <ul style="list-style-type: none"> (1) The number of the data bytes written to the FIFO buffer becomes the same as the number of data bytes in a single FIFO buffer plane assigned to the selected pipe. (2) A number of data bytes less than the size of a single FIFO buffer (including 0 bytes of data) assigned to the selected pipe being written to the FIFO buffer and then 1 being written to BVAL (3) After setting the DMA transfer end sampling enable bit (TENDE) to 1, a number of data bytes less than the size of a single FIFO buffer (including 0 bytes of data) assigned to the selected pipe being written to the FIFO buffer by DMA transfer and the DMA transfer end signal is received when the last byte is written.

28.3.33 Pipe Buffer Setting Register (PIPEBUF)

PIPEBUF is a register that specifies the buffer size and buffer number for PIPE1 to PIPE9.

This register is initialized by a power-on reset.

Bit	Bit Name	Initial Value	R/W	Description
15	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
14 to 10	BUFSIZE[4:0]	H'00	R/W	<p>Buffer Size</p> <p>Specifies the size of the buffer for the pipe selected by the PIPESEL bits (selected pipe) in terms of blocks, where one block comprises 64 bytes.</p> <p>00000 (H'00): 64 bytes 00001 (H'01): 128 bytes : : 11111 (H'1F): 2 Kbytes</p> <p>When the DBLB bit is set to 1, this module assigns two planes of the FIFO buffer size specified by the BUFSIZE bits to the selected pipe. Specifically, the following expression determines the FIFO buffer size assigned to the selected pipe by this module.</p> $(BUFSIZE + 1) \times 64 \times (DBLB + 1) \text{ [bytes]}$ <p>The valid value for these bits depends on the selected pipe.</p> <ul style="list-style-type: none"> • PIPE1 to PIPE5 and PIPE9 to PIPE15: Any value from H'00 to H'1F is valid. • PIPE6 to PIPE8: H'00 should be set. <p>When used with CNTMD = 1, set an integral multiple of the maximum packet size to the BUFSIZE bits.</p> <p>Modify these bits while CSSTS is 0, PID is NAK, and the pipe is not selected by the CURPIPE bits.</p> <p>Before modifying these bits after modifying the PID bits for the selected pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.</p>
9, 8	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	BUFNMB[7:0]	H'00	R/W	<p>Buffer Number</p> <p>The first block number in the FIFO buffer to be allocated for the selected pipe should be set in these bits. The FIFO buffer blocks allocated for the selected pipe by this module are determined as follows: Block number: BUFNMB to block number of $(BUFNMB + (BUFSIZE + 1) \times (DBLB + 1) - 1)$</p> <p>These bits should be set to a value from H'04 to H'7F. BUFNMB = H'00 is used exclusively for DCP. BUFNMB = H'04 is used exclusively for PIPE6. When PIPE6 is not used, H'04 can be used for other pipes. When PIPE6 is selected, writing to these bits is invalid and H'04 is automatically assigned by this module. BUFNMB = H'05 is used exclusively for PIPE7. When PIPE7 is not used, H'05 can be used for other pipes. When PIPE7 is selected, writing to these bits is invalid and H'05 is automatically assigned by this module. BUFNMB = H'06 is used exclusively for PIPE8. When PIPE8 is not used, H'06 can be used for other pipes. When PIPE8 is selected, writing to these bits is invalid and H'06 is automatically assigned by this module. BUFNMB = H'07 is used exclusively for PIPE9. When PIPE9 is not used, H'07 can be used for other pipes. When PIPE9 is selected, writing to these bits is valid and H'07 is assigned as the initial value by this module.</p> <p>Modify these bits while CSSTS is 0, PID is NAK, and the pipe is not selected by the CURPIPE bits. Before modifying these bits after modifying the PID bits for the selected pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.</p>

28.3.34 Pipe Maximum Packet Size Register (PIPEMAXP)

PIPEMAXP is a register that specifies the maximum packet size for PIPE1 to PIPE15.

This register is initialized by a power-on reset.

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	DEVSEL[3:0]	0000	R/W	<p>Device Select</p> <p>When the host controller mode is selected, these bits specify the USB address of the communication target peripheral device.</p> <p>0000: Address 0000 0001: Address 0001 0010: Address 0010 : : 1010: Address 1010 Others: Setting prohibited</p> <p>These bits should be set after setting the address to the DEVADDn (n = 0 to 9, and A) register corresponding to the value to be set in these bits. For example, before setting DEVSEL to 0010, the DEVADD2 address should be set first.</p> <p>Before modifying these bits after modifying the PID bits for the selected pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.</p> <p>When the function controller mode is selected, these bits should be set to B'0000.</p>
11	—	Undefined	R	<p>Reserved</p> <p>The read value is undefined. The write value should always be 0.</p>
10 to 0	MXPS[10:0]	*1	R/W	<p>Maximum Packet Size</p> <p>Specifies the maximum data payload (maximum packet size) for the selected pipe. The valid value for these bits depends on the pipe as follows.</p> <p>PIPE1, PIPE2: 1 byte (H'001) to 1,024 bytes (H'400) PIPE3 to PIPE5: 8 bytes (H'008), 16 bytes (H'010), 32 bytes (H'020), 64 bytes (H'040), and 512 bytes (H'200) (Bits [2:0] are not available.) PIPE6 to PIPE8: 1 byte (H'001) to 64 bytes (H'040) PIPE9 (when in host controller mode): 1 byte (H'001) to 64 bytes (H'040) PIPE9 (when in function controller mode): 8 bytes (H'008), 16 bytes (H'010), 32 bytes (H'020), 64 bytes (H'040), 512 bytes (H'200) (Bits [2:0] are not available.) PIPE10 to PIPE15: 8 bytes (H'008), 16 bytes (H'010), 32 bytes (H'020), 64 bytes (H'040), 512 bytes (H'200) (Bits [2:0] are not available.)</p> <p>These bits should be set to the appropriate value for each transfer type based on the USB Specification.</p> <p>For split transactions using the isochronous pipe, these bits should be set to 188 bytes or less.</p> <p>Modify these bits while CSSTS is 0, PID is NAK, and the pipe is not selected by the CURPIPE bits.</p> <p>Before modifying these bits after modifying the PID bits for the selected pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.</p> <p>While MXPS is 0, do not write to the FIFO buffer or set PID to BUF.</p>

Note 1. The initial value of MXPS is H'000 when no pipe is selected with the PIPESEL bits in PIPESEL and H'040 when a pipe is selected with the PIPESEL bits in PIPESEL.

28.3.35 Pipe Timing Control Register (PIPEPERI)

PIPEPERI is a register that selects whether the buffer is flushed or not when an interval error occurred during isochronous IN transfer, and sets the interval error detection interval for PIPE1 to PIPE15.

This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	IFIS	—	—	—	—	—	—	—	—	—	IITV[2:0]		
Initial value:	—	—	—	0	—	—	—	—	—	—	—	—	—	0	0	0
R/W:	R	R	R	R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 13	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
12	IFIS	0	R/W	<p>Isochronous IN Buffer Flush Specifies whether to flush the buffer when the pipe selected by the PIPESEL bits is used for isochronous IN transfers. 0: The buffer is not flushed. 1: The buffer is flushed.</p> <p>When the function controller mode is selected and the selected pipe is for isochronous IN transfers, this module automatically clears the FIFO buffer when this module fails to receive the IN token from the USB host within the interval set by the IITV bits in terms of (μ) frames. In double buffer mode (DBLB = 1), this module only clears the data in the plane used earlier. This module clears the FIFO buffer on receiving the SOF packet immediately after the (μ) frame in which this module has expected to receive the IN token. Even if the SOF packet is corrupted, this module also clears the FIFO buffer at the right timing to receive the SOF packet by using the internal interpolation. When the host controller mode is selected, set this bit to 0. When the selected pipe is not for the isochronous transfer, set this bit to 0.</p>
11 to 3	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
2 to 0	IITV[2:0]	000	R/W	<p>Interval Error Detection Interval Specifies the interval error detection timing for the selected pipe in terms of frames, which is expressed as n-th power of 2 (n is the value to be set). As described later, the detailed functions are different in host controller mode and in function controller mode. Modify these bits while CSSTS is 0, PID is NAK, and the pipe is not selected by the CURPIPE bits. Before modifying these bits after modifying the PID bits for the selected pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked. Before modifying these bits after USB communication has been completed with these bits set to a certain value, set PID to NAK and then set ACLRM to 1 to initialize the interval timer. The IITV bits are invalid for PIPE3 to PIPE5 and PIPE10 to PIPE15; set these bits to 000 for these pipes.</p>

28.3.36 PIPEn Control Registers (PIPEnCTR) (n = 1 to F)

PIPEnCTR is a register that is used to confirm the buffer memory status for the corresponding pipe, change and confirm the data PID sequence bit, determine whether auto response mode is set, determine whether auto buffer clear mode is set, and set a response PID for PIPE1 to PIPE15. This register can be set regardless of the pipe selection in PIPESEL. These registers are initialized by a power-on reset. The PID[1:0] bits are initialized by a USB bus reset.

(1) PIPEnCTR (n = 1 to 5, 9, A to F)

Bit	Bit Name	Initial Value	R/W	Description
1, 0	PID[1:0]	00	R/W	<p>Response PID</p> <p>Specifies the response type for the next transaction of the pertinent pipe.</p> <p>00: NAK response 01: BUF response (depending on the buffer state) 10: STALL response 11: STALL response</p> <p>The default setting of these bits is NAK. Modify the setting to BUF to use the pertinent pipe for USB transfer. Table 28.14 and Table 28.15 show the basic operation (operation when there are no errors in the transmitted and received packets) of this module depending on the PID bit setting. Some registers require these bits to be set to NAK before their settings can be changed by software. Set these bits to NAK by software when changing such kind of registers. To confirm which registers apply to this, reference the descriptions of bits. After modifying the setting of these bits from BUF to NAK during USB communication using the pertinent pipe, check that PBUSY is 0 to see if USB communication using the pertinent pipe has actually entered the NAK state. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.</p> <p>Even if the PID bits are modified to NAK after S-SPLIT of the split transaction has been issued for the pertinent pipe (while CSSTS indicates 1), this module continues the transaction until C-SPLIT completes.</p> <ul style="list-style-type: none"> This module modifies the setting of these bits as follows. <ul style="list-style-type: none"> This module sets PID to NAK on recognizing the completion of the transfer when the pertinent pipe is in the receiving direction and the SHTNAK bit for the selected pipe has been set to 1. This module sets PID to STALL (11) on receiving the data packet with the payload exceeding the maximum packet size of the pertinent pipe. This module sets PID to NAK on detecting a USB bus reset when the function controller mode is selected. This module sets PID to NAK on detecting a reception error such as a CRC error three consecutive times when the host controller mode is selected. This module sets PID to STALL (11) on receiving the STALL handshake when the host controller mode is selected. <p>To specify each response type, set these bits as follows.</p> <ul style="list-style-type: none"> To make a transition from NAK (00) to STALL, set 10. To make a transition from BUF (01) to STALL, set 11. To make a transition from STALL (11) to NAK, set 10 and then 00. To make a transition from STALL to BUF, set 00 (NAK) and then 01 (BUF).

Note 1. Only 0 can be read and 1 can be written to.

Note 2. Only 1 can be written to.

Table 28.12 Meaning of BSTS Bit

DIR Bit	BFRE Bit	DCLRM Bit	Meaning of BSTS Bit
0	0	0	1: The received data can be read from the FIFO buffer. 0: The received data has been completely read from the FIFO buffer.
		1	Setting prohibited
	1	0	1: The received data can be read from the FIFO buffer. 0: The BCLR bit has been set to 1 after the received data has been completely read from the FIFO buffer.
		1	1: The received data can be read from the FIFO buffer. 0: The received data has been completely read from the FIFO buffer.
1	0	0	1: The transmit data can be written to the FIFO buffer. 0: The transmit data has been completely written to the FIFO buffer.
		1	Setting prohibited
	1	0	Setting prohibited
		1	Setting prohibited

Table 28.13 Contents Cleared by This Module by Setting ACLRM = 1

No.	Contents Cleared by ACLRM Bit Manipulation	Cases in which Clearing the Contents is Necessary
1	All the contents in the FIFO buffer assigned to the pertinent pipe (all the information in two FIFO buffer planes in double buffer mode)	
2	The interval count value when the pertinent pipe is for isochronous transfer	When the interval count value is to be reset
3	Values of the internal flags related to the BFRE bit	When the BFRE setting is modified
4	FIFO buffer toggle control	When the DBLB setting is modified
5	Values of the internal flags related to the transaction count	When the transaction count function is forcibly terminated

Table 28.14 Operation of This Module Depending on PID Setting (when Host Controller Mode is Selected)

PID	Transfer Type (TYPE Bits)	Transfer Direction (DIR Bit)	Operation of This Module
00 (NAK)	Operation does not depend on the setting.	Operation does not depend on the setting.	Does not issue tokens.
01 (BUF)	Bulk (TYPE = 01) or interrupt (TYPE = 10)	Operation does not depend on the setting.	Issues tokens while UACT is 1 and the FIFO buffer corresponding to the pertinent pipe is ready for transmission and reception. Does not issue tokens while UACT is 0 or the FIFO buffer corresponding to the pertinent pipe is not ready for transmission or reception.
	Isochronous (TYPE = 11)	Operation does not depend on the setting.	Issues tokens irrespective of the status of the FIFO buffer corresponding to the pertinent pipe when the UACT bit is set to 1. Does not issue tokens when the UACT bit is set to 0.
10 (STALL) or 11 (STALL)	Operation does not depend on the setting.	Operation does not depend on the setting.	Does not issue tokens.

Table 28.15 Operation of This Module Depending on PID Setting (when Function Controller Mode is Selected)

PID	Transfer Type (TYPE Bits)	Transfer Direction (DIR Bit)	Operation of This Module
00 (NAK)	Bulk (TYPE = 01) or interrupt (TYPE = 10)	Operation does not depend on the setting.	Returns NAK in response to the token from the USB host.
	Isochronous (TYPE = 11)	Operation does not depend on the setting.	Returns nothing in response to the token from the USB host.
01 (BUF)	Bulk (TYPE = 01)	Receiving direction (DIR = 0)	Receives data and returns ACK or NYET in response to the OUT token from the USB host if the FIFO buffer corresponding to the pertinent pipe is ready for reception. Returns NAK if not ready. Returns ACK in response to the PING token from the USB host if the FIFO buffer corresponding to the pertinent pipe is ready for reception. Returns NAK if not ready.
		Interrupt (TYPE = 10)	Receiving direction (DIR = 0)
	Bulk (TYPE = 01) or interrupt (TYPE = 10)	Transmitting direction (DIR = 1)	Transmits data in response to the token from the USB host if the corresponding FIFO buffer is ready for transmission. Returns NAK if not ready.
	Isochronous (TYPE = 11)	Receiving direction (DIR = 0)	Receives data in response to the OUT token from the USB host if the FIFO buffer corresponding to the pertinent pipe is ready for reception. Discards data if not ready.
		Transmitting direction (DIR = 1)	Transmits data in response to the token from the USB host if the corresponding FIFO buffer is ready for transmission. Transmits the zero-length packet if not ready.
10 (STALL) or 11 (STALL)	Bulk (TYPE = 01) or interrupt (TYPE = 10)	Operation does not depend on the setting.	Returns STALL in response to the token from the USB host.
	Isochronous (TYPE = 11)	Operation does not depend on the setting.	Returns nothing in response to the token from the USB host.

Note 1. Only 0 can be read and 1 can be written to.

Table 28.16 Contents Cleared by This Module by Setting ACLRM = 1

No.	Contents Cleared by ACLRM Bit Manipulation	Cases in which Clearing the Contents is Necessary
1	All the contents in the FIFO buffer assigned to the selected pipe	
2	When the host controller mode is selected, the interval count value when the selected pipe is for interrupt transfer	When the interval count value is to be reset
3	Values of the internal flags related to the BFRE bit	When the BFRE setting is modified
4	Values of the internal flags related to the transaction count	When the transaction count function is forcibly terminated

28.3.37 PIPE_n Transaction Counter Enable Registers (PIPE_nTRE) (n = 1 to 5, 9, and A to F)

PIPE_nTRE is a register that enables or disables the transaction counter corresponding to PIPE1 to PIPE5, and clears the transaction counter.

These registers are initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TRENB	TRCLR	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	0	0	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R/W	R/W*	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
9	TRENB	0	R/W	Transaction Counter Enable Enables or disables the transaction counter. 0: The transaction counter is disabled. 1: The transaction counter is enabled. For the pipe in the receiving direction, setting this bit to 1 after setting the total number of the packets to be received in the TRNCNT bits allows this module to control hardware as described below on having received the number of packets equal to the set value in the TRNCNT bits. <ul style="list-style-type: none"> In continuous transmission/reception mode (CNTMD = 1), this module switches the FIFO buffer to the CPU side even if the FIFO buffer is not full on completion of reception. While SHTNAK is 1, this module modifies the PID bits to NAK for the corresponding pipe on having received the number of packets equal to the set value in the TRNCNT bits. While BFRE is 1, this module asserts the BRDY interrupt on having received the number of packets equal to the set value in the TRNCNT bits and then reading out the last received data. For the pipe in the transmitting direction, set this bit to 0. When the transaction counter is not used, set this bit to 0. When the transaction counter is used, set the TRNCNT bits before setting this bit to 1. Set this bit to 1 before receiving the first packet to be counted by the transaction counter.
8	TRCLR	0	R/W*	Transaction Counter Clear When this bit is set to 1, this module clears the current counter value of the transaction counter corresponding to the pertinent pipe and then sets this bit to 0. 0: Invalid 1: The current counter value is cleared.
7 to 0	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.

Note 1. Modify each bit in this register while CSSTS is 0 and PID is NAK. Before modifying each bit after modifying the PID bits for the corresponding pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.

* Only 0 can be read and 1 can be written to.

28.3.38 PIPE_n Transaction Counter Registers (PIPE_nTRN) (n = 1 to 5, 9, and A to F)

PIPE_nTRN is a transaction counter corresponding to PIPE1 to PIPE5, 9, and A to F.

These registers are initialized by a power-on reset, but retain the set value by a USB bus reset.

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	TRNCNT[15:0]	H'0000	R/W	<p>Transaction Counter</p> <p>When written to: Specifies the total number of packets to be received by the pertinent pipe (number of transactions).</p> <p>When read from: Indicates the specified number of transactions if TREN_B is 0. Indicates the number of currently counted transaction if TREN_B is 1.</p> <p>This module increments the value of these bits by one when all of the following conditions are satisfied on receiving the packet.</p> <ul style="list-style-type: none"> • TREN_B is 1. • (TRNCNT setting ≠ current counter value + 1) on receiving the packet. • The payload of the received packet agrees with the set value in the MXPS bits. <p>This module clears the value of these bits to 0 when any of the following conditions are satisfied.</p> <ul style="list-style-type: none"> • All the following conditions are satisfied. TREN_B is 1. (TRNCNT setting = current counter value + 1) on receiving the packet. The payload of the received packet agrees with the set value in the MXPS bits. • All the following conditions are satisfied. TREN_B is 1. This module has received a short packet. • The following condition is satisfied. TRCLR is 1. <p>For the pipe in the transmitting direction, set these bits to 0. When the transaction counter is not used, set these bits to 0. Modify these bits while CSSTS is 0, PID is NAK, and TREN_B is 0. Before modifying these bits after modifying the PID bits for the corresponding pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked. To modify the value of these bits, set TRCLR to 1 before setting TREN_B to 1.</p>

28.3.39 Device Address n Configuration Registers (DEVADDn) (n = 0 to 9, and A)

DEVADDn is a register that specifies the USB address and port number of the hub to which the communication target peripheral device is connected and also specifies the USB transfer speed of the communication target peripheral device. These registers are initialized by a power-on reset.

Bit	Bit Name	Initial Value	R/W	Description
15	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
14 to 11	UPPHUB[3:0]	0000	R/W	Address of Hub to which Communication Target is Connected Specifies the USB address of the hub to which the communication target peripheral device is connected. 0000: The peripheral device is directly connected to the port of this module. 0001 to 1010: USB address of the hub 1011 to 1111: Setting prohibited
10 to 8	HUBPORT[2:0]	000	R/W	Port Number of Hub to which Communication Target is Connected Specifies the port number of the hub to which the communication target peripheral device is connected. 000: The peripheral device is directly connected to the port of this module. 001 to 111: Port number of the hub
7, 6	USBSPD[1:0]	00	R/W	Transfer Speed of the Communication Target Device Specifies the USB transfer speed of the communication target peripheral device. 00: DEVADDn register is not used. 01: Low speed 10: Full speed 11: High speed
5 to 0	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.

Note 1. When the host controller mode is selected, the bits in this register should be set before starting communication using each pipe.

(1) When the host controller mode is selected, this module refers to the settings of the UPPHUB bits and HUBPORT bits to generate packets for split transactions.

(2) When the host controller mode is selected, this module refers to the setting of the USBSPD bits to generate packets.

Note 2. The bits in this register should be modified while no valid pipes are using the settings of this register. Valid pipes refer to the ones satisfying both of conditions (1) and (2) below.

(1) This register is selected by the DEVSEL bits as the communication target.

(2) The PID bits are set to BUF for the pertinent pipe or the pertinent pipe is the DCP with SUREQ being 1.

Note 3. When the function controller mode is selected, set all the bits in this register to 0.

28.3.40 UTMI Suspend Mode Register (SUSPMODE)

SUSPMODE is a register that specifies the SuspendM signal to be sent to the UTMI.

This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	SUSP M	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	0	—	0	—	—	—	0	—	—	—	—	0	—	0	0
R/W:	R	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
14	SUSPM	0	R/W	SuspendM Control Enables or disables the clock to be supplied to this module. 0: The clock supplied to this module is disabled. 1: The clock supplied to this module is enabled. This module controls clock output by using the SuspendM signal. The clock to the LINK is stopped, when the SuspendM signal is low. Writing to the registers of this module is impossible when the SUSPM bit is set to 0 (the clock to this module is stopped). Reading the registers is possible. Note that writing to the following registers is possible even when the SUSPM bit is set to 0. - SYSCFG0 - BUSWAIT - INTENB1* - SUSPMODE Note: * Writing to bit 0 in INTENB1 is only possible when the SUSPM bit is set to 0. When setting this bit to 1, wait for at least 1 ms after setting the UPLLE bit to 1. Set this bit to 0 when this module is to enter software standby or USB standby mode.
13	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
12	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
11 to 9	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
8	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
7 to 4	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
1, 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

28.3.41 D0FIFO Continuous Transfer Port Register n (D0FIFOBn)
 D1FIFO Continuous Transfer Port Register n (D1FIFOBn) (n = 0 to 7)

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	FIFOPORT [31:0]	H'0000 0000	R/W	FIFO Port Accessing these bits allows reading the received data from the FIFO buffer or writing the transmit data to the FIFO buffer. When the DFACC bits are set to 01 (16-byte continuous access mode) or 10 (32-byte continuous access mode), use the DnFIFO continuous transfer port registers to access the DnFIFO buffer.

28.4 Operation

28.4.1 System Control and Oscillation Control

This section describes the register operations that are necessary to the initial settings of this module, and the registers necessary for power consumption control.

(1) Resets

Table 28.17 lists the types of resets for this module. For the initialized states of the registers following the reset operations, see section 28.3, Register Descriptions.

Table 28.17 Types of Reset

Name	Operation
Power-on reset	Low level input from the $\overline{\text{RES}}$ pin
USB bus reset	Automatically detected by this module from the D+ and D- lines when the function controller mode is selected

(2) Controller Mode Selection

This module can select the host controller mode or function controller mode using the DCFM bit in SYSCFG0. Changing the DCFM bit should be done in the initial settings immediately after a power-on reset or in the D+ pull-up disabled (DPRPU = 0) and D+ /D- pull-down disabled (DRPD = 0) state.

(3) USB Data Bus Resistor Control

This module controls switching between a pull-up resistor for the D+ signal and a pull-down resistor for the D+ and D- signals for the Renesas USB 2.0 PHY port. The DPRPU and DRPD bits of the SYSCFG0 register are used to make the pull-up and pull-down resistor settings.

When the function controller mode is selected, set the DPRPU bit of the SYSCFG0 register to 1, which pulls up the D+ signal, after connection to a USB host is recognized.

When disconnection from the USB host is recognized, set the DPRPU and DCFM bits according to the procedure below.

1. Set the DPRPU bit to 0.
2. Wait for at least 1 μs (1000 ns).
3. Set the DCFM bit to 1.
4. Wait for at least 200 ns.
5. Set the DCFM bit to 0.

This module incorporates the terminating resistor for the D+ and D- signals during high-speed operation and the output resistor for the signals during full-speed operation. This module automatically switches the resistor after connection with the host controller or peripheral device upon the detection of a reset handshake, suspend, and resume event.

When the function controller mode is selected and the DPRPU bit in SYSCFG0 is cleared to 0 during communication with the host controller, the pull-up resistor (or the terminating resistor) of the USB data line is disabled, making it possible to notify the USB host of the device disconnection.

(4) Selecting the Input Clock

This module can select the signal on USB_X1 or EXTAL as an input clock. The UCKSEL bit of the SYSCFG0 register for channel 0 is used to select the input clock. The UCKSEL bit should be set while supply of the clock signal to the USB module is stopped (SUSPM = 0 for channel 0 and channel 1).

(5) Setting the Clock Supply for the USB Module

Set the UCKSEL bit of the SYSCFG0 register to the target input clock and then set clock supply by following the appropriate procedure below.

Example 1: When the clock supply is enabled by the initial setting immediately after a power-on reset,

1. set the UPLLE bit to 1,
2. wait for 1 ms, and
3. set the SUSPM bit to 1.

Example 2: When the clock supply is stopped in the suspended state,

1. set the SUSPM bit to 0 and
2. set the UPLLE bit to 0.

Example 3: When the clock supply is enabled after recovery from the suspended state,

1. set the UPLLE bit to 1,
2. wait for 1 ms, and
3. set the SUSPM bit to 1.

Note: • During high-speed operation when the function controller mode is selected, set the SUSPM bit to 1 within 2.5 ms of this module resuming operation from the suspended state due to a USB reset.

28.4.2 Interrupt Functions

(1) Overview of Interrupt Functions

Table 28.18 lists the interrupt generation conditions for this module.

Table 28.18 Interrupt Generation Conditions

Bit	Interrupt Name	Cause of Interrupt	Mode That Generates the Interrupt	Related Status
VBINT	VBUS interrupt	<ul style="list-style-type: none"> When a change in the state of the VBUS input pin has been detected (low to high or high to low) 	Host, function	VBSTS
RESM	Resume interrupt	<ul style="list-style-type: none"> When a change in the state of the USB bus has been detected in the suspended state (J-state to K-state or J-state to SE0) 	Function	—
SOFR	Frame number update interrupt	When the host controller mode is selected: <ul style="list-style-type: none"> When an SOF packet with a different frame number has been transmitted When the function controller mode is selected: <ul style="list-style-type: none"> If SOFRM = 0, reception of an SOF packet with a different frame number If SOFRM = 1, reception of an SOF packet with the microframe number 0 was not possible because it was corrupted. 	Host, function	—
DVST	Device state transition interrupt	<ul style="list-style-type: none"> When a device state transition is detected A USB bus reset detected The suspended state detected SET_ADDRESS request received SET_CONFIGURATION request received 	Function	DVSQL
CTRT	Control transfer stage transition interrupt	<ul style="list-style-type: none"> When a stage transition is detected in control transfer Setup stage completed Control write transfer status stage transition Control read transfer status stage transition Control transfer completed A control transfer sequence error occurred 	Function	CTSQR
BEMP	Buffer empty interrupt	<ul style="list-style-type: none"> When transmission of all of the data in the buffer memory has been completed and the buffer has become empty When an excessive maximum packet size error has been detected 	Host, function	PIPEBEMP
NRDY	Buffer not ready interrupt	When the host controller mode is selected: <ul style="list-style-type: none"> When STALL is received from the peripheral side for the issued token When a response cannot be received correctly from the peripheral side for the issued token (No response is returned three consecutive times or a packet reception error occurred three consecutive times.) When an overrun/underrun occurred during isochronous transfer When the function controller mode is selected: <ul style="list-style-type: none"> Reception of a token while PID = BUF and the buffer memory is not ready for transmission or reception When a CRC error or a bit stuffing error occurred during data reception in isochronous transfer When an interval error occurred during data reception in isochronous transfer 	Host, function	PIPENRDY
BRDY	Buffer ready interrupt	<ul style="list-style-type: none"> When the buffer is ready (reading or writing is enabled) 	Host, function	PIPEBRDY
BCHG	Bus change interrupt	<ul style="list-style-type: none"> When a change of USB bus state is detected 	Host	—
DTCH	Device disconnection detection	<ul style="list-style-type: none"> When disconnection of a peripheral device connected to this LSI's USB port is detected. 	Host	—
ATTCH	Device connection detection	<ul style="list-style-type: none"> When J-state or K-state is detected on the USB port for 2.5 μs. Used for checking whether a peripheral device is connected. 	Host	—

Table 28.18 Interrupt Generation Conditions

Bit	Interrupt Name	Cause of Interrupt	Mode That Generates the Interrupt	Related Status
EOFERR	EOF error detection	<ul style="list-style-type: none">When EOF error of a peripheral device is detected	Host	—
SACK	Normal setup operation	<ul style="list-style-type: none">When the normal response (ACK) for the setup transaction is received	Host	—
SIGN	Setup error	<ul style="list-style-type: none">When a setup transaction error (no response or ACK packet corruption) is detected three consecutive times.	Host	—

Figure 28.1 shows a diagram relating to interrupts of this module.

Figure 28.1 Items Relating to Interrupts

(2) BRDY Interrupt

The BRDY interrupt is generated when either of the host controller mode or function controller mode is selected. When each pipe satisfies the following conditions, this module sets 1 to a corresponding bit in BRDYSTS. Under this condition, if the PIPEBRDYE bit in BRDYENB that corresponds to the pipe is set to 1 and the BRDYE bit in INTENB0 is set to 1, this module sets the BRDY bit in INTSTS0 to 1, allowing the BRDY interrupt to be generated.

The conditions for generating and clearing the BRDY interrupt depend on the settings of the BRDYM bit and BFRE bit for the pertinent pipe as described below.

(a) When BRDYM Bit is 0 and BFRE Bit is 0

With these settings, the BRDY interrupt indicates that the FIFO port is accessible.

On any of the following conditions, this module generates the internal BRDY interrupt request trigger and sets 1 to the PIPEBRDY bit corresponding to the pertinent pipe.

1. For the pipe in the transmitting direction

- When the DIR bit is changed from 0 to 1.

- When packet transmission is completed using the pertinent pipe when write-access from the CPU to the FIFO buffer for the pertinent pipe is disabled (when the BSTS bit is read as 0).

In continuous transmission/reception mode, the request trigger is generated on completion of transmitting data of one plane of the FIFO buffer.

- When one FIFO buffer is empty on completion of writing data to the other FIFO buffer in double buffer mode.

The request trigger is not generated until completion of writing data to the currently-written FIFO buffer plane even if transmission to the other FIFO buffer is completed.

- When the hardware flushes the buffer of the pipe for isochronous transfers.

- When 1 is written to the ACLRM bit, which causes the FIFO buffer to make transition from the write-disabled to write-enabled state.

The request trigger is not generated for the DCP (that is, during data transmission for control transfers).

2. For the pipe in the receiving direction

- When packet reception is completed successfully thus enabling the FIFO buffer to be read when read-access from the CPU to the FIFO buffer for the pertinent pipe is disabled (when the BSTS bit is read as 0).

The request trigger is not generated for the transaction in which DATA-PID disagreement occurs.

In continuous transmission/reception mode, the request trigger is not generated when the data is of the specified maximum packet size and the buffer has available space.

When a short packet is received, the request trigger is generated even if the FIFO buffer has available space.

- When the transaction counter is used, the request trigger is generated on receiving the specified number of packets.

In this case, the request trigger is generated even if the FIFO buffer has available space.

When one FIFO buffer is read-enabled on completion of reading data from the other FIFO buffer in double buffer mode.

The request trigger is not generated until completion of reading data from the currently-read FIFO buffer plane even if reception by the other FIFO buffer is completed.

When the function controller mode is selected, the BRDY interrupt is not generated in the status stage of control transfers.

The PIPEBRDY interrupt status of the pertinent pipe can be cleared to 0 by writing 0 to the corresponding PIPEBRDY interrupt status bit in the BRDYSTS register. In this case, 1s should be written to the PIPEBRDY interrupt status bits for the other pipes.

Be sure to clear the BRDY status before accessing the FIFO buffer.

(b) When BRDYM Bit is 0 and BFRE Bit is 1

With these settings, this module generates the BRDY interrupt on completion of reading all the data for a single transfer using the pipe in the receiving direction, and sets 1 to the PIPEBRDY bit corresponding to the pertinent pipe.

On any of the following conditions, this module determines that the last data for a single transfer has been received.

- When a short packet including a zero-length packet is received.
- When the transaction counter register (TRNCNT bits) is used and the number of packets specified by the TRNCNT bits is completely received.

When the pertinent data is completely read out after any of the above determination conditions has been satisfied, this module determines that all the data for a single transfer has been completely read out.

When a zero-length packet is received when the FIFO buffer is empty, this module determines that all the data for a single transfer has been completely read out upon the FRDY and DTLN bits of the FIFO port control register being set to 1 and 0, respectively. In this case, to start the next transfer, write 1 to the BCLR bit in the corresponding FIFOCTR register.

With these settings, this module does not detect the BRDY interrupt for the pipe in the transmitting direction.

The PIPEBRDY interrupt status of the pertinent pipe can be cleared to 0 by writing 0 to the corresponding PIPEBRDY interrupt status bit. In this case, 1s should be written to the PIPEBRDY interrupt status bits for the other pipes.

In this mode, the BFRE bit setting should not be modified until all the data for a single transfer has been processed.

When it is necessary to modify the BFRE bit before completion of processing, all the FIFO buffers for the pertinent pipe should be cleared using the ACLRM bit.

(c) When the BRDYM bit is 1 and the BFRE bit is 0

With these settings, the PIPEBRDY values are linked to the BSTS bit settings for each pipe. In other words, the BRDY interrupt status bits (PIPEBRDY) are set to 1 or 0 by this module depending on the FIFO buffer status.

1. For the pipe in the transmitting direction

The BRDY interrupt status bits are set to 1 when the FIFO buffer is write-enabled and are set to 0 when write-disabled.

However, the BRDY interrupt is not generated if the DCP in the transmitting direction is write-enabled.

2. For the pipe in the receiving direction

The BRDY interrupt status bits are set to 1 when the FIFO buffer is read-enabled and are set to 0 when all the data have been read (read-disabled).

When a zero-length packet is received when the FIFO buffer is empty, the pertinent bit is set to 1 and the BRDY interrupt continues to be effective until BCLR = 1 is written.

With this setting, the PIPEBRDY bit cannot be cleared to 0. When BRDYM is set to 1, all of the BFRE bits (for all pipes) should be cleared to 0.

(3) NRDY Interrupt

On generating the internal NRDY interrupt request for the pipe whose PID bits are set to BUF, this module sets the corresponding PIPENRDY bit in NRDYSTS to 1. If the corresponding bit in NRDYENB is set to 1, this module sets the NRDY bit in INTSTS0 to 1, allowing the NRDY interrupt to be generated.

The following describes the conditions on which this module generates the internal NRDY interrupt request for each pipe.

However, the internal NRDY interrupt request is not generated during setup transaction execution when the host controller mode is selected. During setup transactions when the host controller mode is selected, the SACK or SIGN interrupt is detected.

The internal NRDY interrupt request is not generated during status stage execution of the control transfer when the function controller mode is selected.

(a) If Host Controller Mode is Selected when Connection is Used in which No Split Transactions Occur

1. For the pipe in the transmitting direction

On any of the following conditions, this module detects the NRDY interrupt.

- For the pipe for isochronous transfers, when the time to issue an OUT token comes in a state in which there is no data to be transmitted in the FIFO buffer.

In this case, this module transmits a zero-length packet following the OUT token, setting the corresponding PIPENRDY bit and the OVRN bit to 1.

- During communications other than setup transactions using the pipe for the transfers other than isochronous transfers, when any combination of the following two cases occur three consecutive times: 1) no response is returned from the peripheral device (when timeout is detected before detection of the handshake packet from the peripheral device) and 2) an error is detected in the packet from the peripheral device.

In this case, this module sets the corresponding PIPENRDY bit to 1 and modifies the setting of the PID bits of the corresponding pipe to NAK.

- During communications other than setup transactions, when the STALL handshake is received from the peripheral device (including the STALL handshake in response to PING in addition to the STALL handshake in response to OUT).

In this case, this module sets the corresponding PIPENRDY bit to 1 and modifies the setting of the PID bits of the corresponding pipe to STALL (11).

2. For the pipe in the receiving direction

- For the pipe for isochronous transfers, when the time to issue an IN token comes in a state in which there is no space available in the FIFO buffer.

In this case, this module discards the received data for the IN token, setting the PIPENRDY bit of the corresponding pipe and the OVRN bit to 1.

When a packet error is detected in the received data for the IN token, this module also sets the CRCE bit to 1.

- For the pipe for the transfers other than isochronous transfers, when any combination of the following two cases occur three consecutive times: 1) no response is returned from the peripheral device for the IN token issued by this module (when timeout is detected before detection of the DATA packet from the peripheral device) and 2) an error is detected in the packet from the peripheral device.

In this case, this module sets the corresponding PIPENRDY bit to 1 and modifies the setting of the PID bits of the corresponding pipe to NAK.

- For the pipe for isochronous transfers, when no response is returned from the peripheral device for the IN token (when timeout is detected before detection of the DATA packet from the peripheral device) or an error is detected in the packet from the peripheral device.

In this case, this module sets the corresponding PIPENRDY bit to 1. (The setting of the PID bits of the corresponding pipe is not modified.)

- For the pipe for isochronous transfers, when a CRC error or a bit stuffing error is detected in the received data packet.

In this case, this module sets the corresponding PIPENRDY bit and CRCE bit to 1.

- When the STALL handshake is received.

In this case, this module sets the corresponding PIPENRDY bit to 1 and modifies the setting of the PID bits of the corresponding pipe to STALL.

(b) If Host Controller Mode is Selected when Connection is Used in which Split Transactions Occur

1. For the pipe in the transmitting direction

- For the pipe for isochronous transfers, when the time to issue an OUT token comes in a state in which there is no data to be transmitted in the FIFO buffer.

In this case, this module transmits a zero-length packet following the OUT token, setting the corresponding PIPENRDY bit and the OVRN bit to 1 at the issuance of the start-split transaction (S-SPLIT).

- For the pipe for the transfers other than isochronous transfers, when any combination of the following two cases occur three consecutive times: 1) no response is returned from the HUB for the S-SPLIT or complete-split transaction (C-SPLIT) (when timeout is detected before detection of the handshake packet from the HUB) and 2) an error is detected in the packet from the HUB.

In this case, this module sets the PIPENRDY bit of the corresponding pipe to 1 and modifies the setting of the PID bits of the corresponding pipe to NAK.

If the NRDY interrupt is detected when the C-SPLIT is issued, this module clears the CSSTS bit to 0.

- When the STALL handshake is received in response to the C-SPLIT.

In this case, this module sets the corresponding PIPENRDY bit to 1, modifies the setting of the PID bits of the corresponding pipe to STALL (11) and clears the CSSTS bit to 0.

This interrupt is not detected for setup transactions.

- For the pipe for interrupt transfers when the NYET is received in response to the C-SPLIT and the microframe number = 4.

In this case, this module sets the corresponding PIPENRDY bit to 1 and clears the CSSTS bit to 0 (does not modify the setting of the PID bits for the corresponding pipe).

2. For the pipe in the receiving direction

- For the pipe for isochronous transfers, when the time to issue an IN token comes in a state in which there is no space available in the FIFO buffer.

In this case, this module discards the received data for the IN token, setting the corresponding PIPENRDY bit and the OVRN bit to 1 at the issuance of the S-SPLIT.

- For the pipes for bulk transfers, or the transfers other than setup transactions with the DCP, when any combination of the following two cases occur three consecutive times: 1) no response is returned from the HUB for the IN token issued by this module at the issuance of S-SPLIT or C-SPLIT (when timeout is detected before detection of the DATA packet from the HUB) and 2) an error is detected in the packet from the HUB.

In this case, this module sets the corresponding PIPENRDY bit to 1 and modifies the setting of the PID bits of the corresponding pipe to NAK. When the condition is generated during the C-SPLIT transaction, this module clears the CSSTS bit to 0.

- During the C-SPLIT transaction for the pipe for isochronous transfers or interrupt transfers, when any combination of the following two cases occur three consecutive times: 1) no response is returned from the HUB for the IN token issued by this module (when timeout is detected before detection of the DATA packet from the HUB) and 2) an error is detected in the packet from the HUB.

On generating this condition for the pipe for interrupt transfers, this module sets the corresponding PIPENRDY bit to 1, modifies the setting of the PID bits of the corresponding pipe to NAK and clears the CSSTS bit to 0.

On generating this condition for the pipe for isochronous transfers, this module sets the corresponding PIPENRDY

bit to 1 and CRCE bit to 1, and clears the CSSTS bit to 0 (does not modify the setting of the PID bits for the corresponding pipe).

- During the C-SPLIT transaction, when the STALL handshake is received for the pipe for the transfers other than isochronous transfers.

In this case, this module sets the corresponding PIPENRDY bit to 1, modifies the setting of the PID bits of the corresponding pipe to STALL (11) and clears the CSSTS bit to 0.

- During the C-SPLIT transaction, when the NYET handshake is received for the pipe for the isochronous transfers or interrupt transfers and the microframe number = 4.

In this case, this module sets the corresponding PIPENRDY bit for the pipe to 1, sets the CRCE bit to 1, and clears the CSSTS bit to 0 (does not modify the setting of the PID bits for the corresponding pipe).

(c) When Function Controller Mode is Selected

1. For the pipe in the transmitting direction

- On receiving an IN token when the PID bits are set to 01 (BUF) for the pertinent pipe and there is no data to be transmitted in the FIFO buffer.

In this case, this module generates an NRDY interrupt request at the reception of the IN token, setting the PIPENRDY bit to 1. For the pipe for the isochronous transfers in which an interrupt is generated, this module transmits a zero-length packet, setting the OVRN bit to 1.

2. For the pipe in the receiving direction

- On receiving an OUT token when the PID bits are set to 01 (BUF) for the pertinent pipe and there is no space available in the FIFO buffer.

For the pipe for the isochronous transfers in which an interrupt is generated, this module generates an NRDY interrupt request at the reception of the OUT token, setting the PIPENRDY bit to 1 and OVRN bit to 1.

For the pipe for the transfers other than isochronous transfers in which an interrupt is generated, this module generates an NRDY interrupt request when an NAK handshake is transferred after the data following the OUT token was received, setting the PIPENRDY bit to 1.

However, during re-transmission (due to DATA-PID disagreement), the NRDY interrupt request is not generated.

In addition, if an error occurs in the DATA packet, the NRDY interrupt request is not generated.

- On receiving a PING token when the PID bits are set to 01 (BUF) for the pertinent pipe and there is no space available in the FIFO buffer.

In this case, this module generates an NRDY interrupt request at the reception of the PING token, setting the PIPENRDY bit to 1.

- For the pipe for isochronous transfers, when the PID bits are set to 01 (BUF) for the pertinent pipe and a token is not received normally within an interval frame.

In this case, this module generates an NRDY interrupt request at the reception of an SOF, and sets the PIPENRDY bit to 1.

(4) BEMP Interrupt

On detecting the BEMP interrupt for the pipe whose PID bits are set to BUF, this module sets the corresponding PIPEBEMP bit in BEMPSTS to 1. If the corresponding bit in BEMPENB is set to 1, this module sets the BEMP bit in INTSTS0 to 1, allowing the USB interrupt to be generated.

The following describes the conditions on which this module generates the internal BEMP interrupt request.

1. For the pipe in the transmitting direction, when the FIFO buffer of the corresponding pipe is empty on completion of transmission (including zero-length packet transmission). In single buffer mode, the internal BEMP interrupt request is generated simultaneously with the BRDY interrupt for the pipe other than DCP. However, the internal BEMP interrupt request is not generated on any of the following conditions.

- When writing data to the FIFO buffer on the CPU side is started on completion of transmitting data of one plane in double buffer mode.
- When the buffer is cleared (emptied) by setting the ACLRM or BCLR bit to 1.
- When IN transfer (zero-length packet transmission) is performed during the control transfer status stage in function controller mode.

2. For the pipe in the receiving direction

When the successfully-received data packet size exceeds the specified maximum packet size. In this case, this module generates the BEMP interrupt request, setting the corresponding PIPEBEMP bit to 1, and discards the received data and modifies the setting of the PID bits of the corresponding pipe to STALL (11).

Here, this module returns no response when used as the host controller, and returns STALL response when used as the function controller.

However, the internal BEMP interrupt request is not generated on any of the following conditions.

- When a CRC error or bit stuffing error is detected in the received data.
- When a setup transaction is being performed.

Writing 0 to the PIPEBEMP bit clears the status; writing 1 to the PIPEBEMP bit has no effect.

(5) Device State Transition Interrupt (Function Controller Mode)

Figure 28.2 shows a diagram of how this module handles the device state transitions. This module monitors device states and generates device state transition interrupts. However, recovery from the suspended state (resume signal detection) is detected by means of the resume interrupt. The device state transition interrupts can be enabled or disabled individually by using INTENB0. The device state after a transition can be confirmed by using the DVSQ bits in INTSTS0.

When making a transition to the default state, the device state transition interrupt is generated after the reset handshake protocol has been completed.

Device state can be monitored only when the function controller mode is selected. Also, the device state transition interrupts can be generated only when the function controller mode is selected.

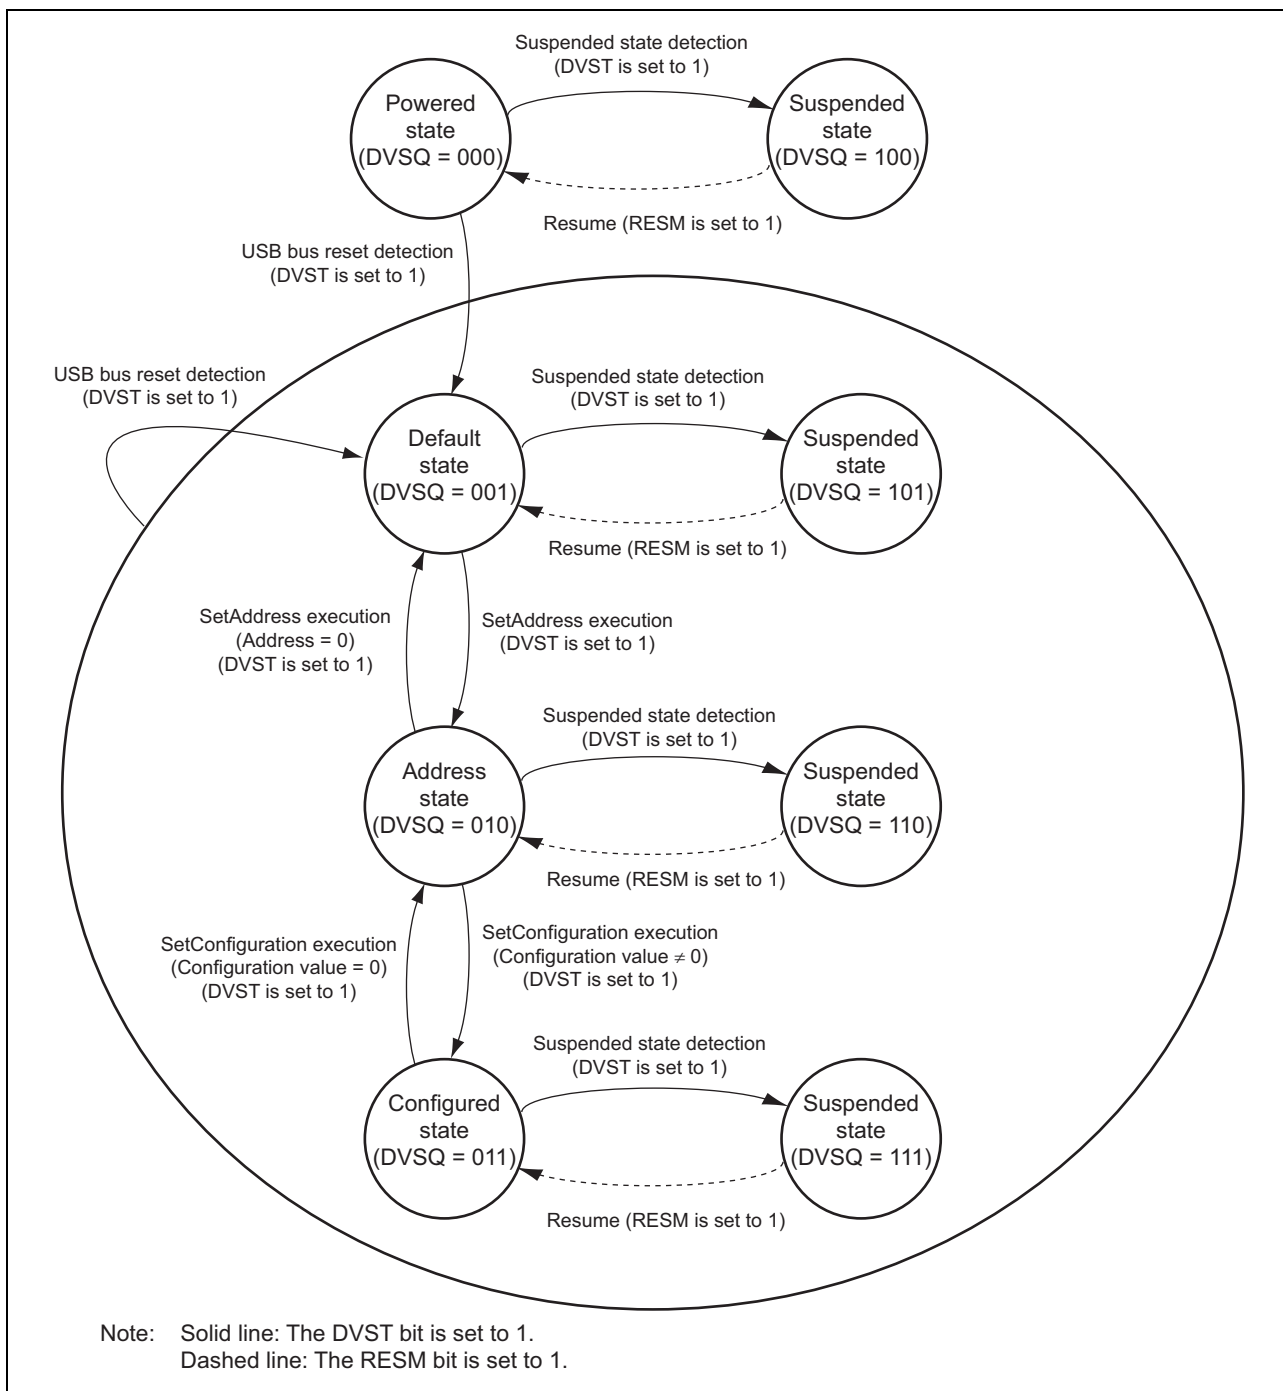

Figure 28.2 Device State Transitions

(6) Control Transfer Stage Transition Interrupt (Function Controller Mode)

Figure 28.3 shows a diagram of how this module handles the control transfer stage transition. This module monitors the control transfer sequence and generates control transfer stage transition interrupts. Control transfer stage transition interrupts can be enabled or disabled individually using INTENB0. The control transfer stage after a transition can be confirmed using the CTSQ bits in INTSTS0.

The control transfer stage transition interrupts are generated only when the function controller mode is selected.

The control transfer sequence errors are described below. If an error occurs, the PID bits in DCPCTR are set to B'1x (STALL).

1. During control read transfers
 - At the IN token of the data stage, an OUT or PING token is received when there have been no data transfers at all.
 - An IN token is received at the status stage
 - A packet is received at the status stage for which the data packet is DATAPID = DATA0
2. During control write transfers
 - At the OUT token of the data stage, an IN token is received when there have been no ACK response at all
 - A packet is received at the data stage for which the first data packet is DATAPID = DATA0
 - At the status stage, an OUT or PING token is received
3. During control write no-data transfers
 - At the status stage, an OUT or PING token is received

At the control write transfer data stage, if the number of receive data exceeds the wLength value of the USB request, it cannot be recognized as a control transfer sequence error. At the control read transfer status stage, packets other than zero-length packets are received by an ACK response and the transfer ends normally.

When a CTRT interrupt occurs in response to a sequence error (SERR = 1), the CTSQ = 110 value is retained until CTRT = 0 is written from the system (the interrupt status is cleared). Therefore, while CTSQ = 110 is being retained, the CTRT interrupt that indicates completion of the setup stage will not be generated even if a further USB request is received (this module retains the indication of completion of the setup stage, and after the interrupt status flag has been cleared, a CTRT interrupt is generated).

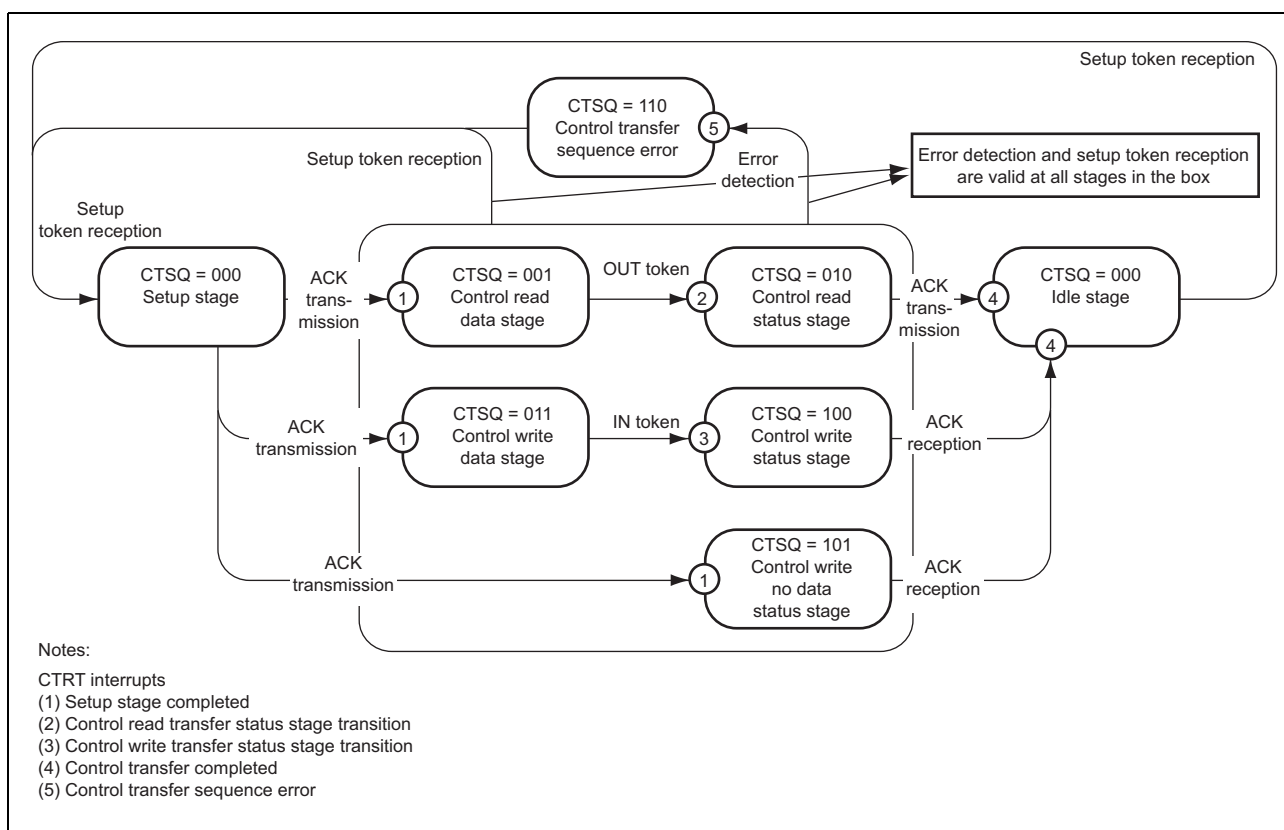

Figure 28.3 Control Transfer Stage Transitions

28.4.3 Pipe Control

Table 28.19 lists the pipe setting items of this module. With USB data transfer, data transmission has to be carried out using the logic pipe called the endpoint. This module has 16 pipes that are used for data transfer. Settings should be entered for each of the pipes in conjunction with the specifications of the system.

Table 28.19 Pipe Setting Items

Register Name	Bit Name	Setting Contents	Remarks
DCPCFG PIPECFG	TYPE	Specifies the transfer type	PIPE1 to PIPE15: Can be set
	BFRE	Selects the BRDY interrupt mode	PIPE1 to PIPE5, PIPE11 to PIPE15: Can be set
	DBLB	Selects a double buffer	PIPE1 to PIPE5, PIPE11 to PIPE15: Can be set PIPE9 and PIPE10: Can be set (only when bulk transfer has been selected).
	CNTMD	Selects continuous transfer or non-continuous transfer	DCP: Can be set. PIPE1 and PIPE2, PIPE9 and PIPE10: Can be set (only when bulk transfer has been selected). PIPE3 to PIPE5, PIPE11 to PIPE15: Can be set
	DIR	Selects transfer direction	IN or OUT can be set
	EPNUM	Endpoint number	PIPE1 to PIPE15: Can be set A value other than 0000 should be set when the pipe is used.
	SHTNAK	Selects disabled state for pipe when transfer ends	DCP: Can be set. PIPE1 and PIPE2, PIPE9 and PIPE10: Can be set (only when bulk transfer has been selected) PIPE3 to PIPE5, PIPE11 to PIPE15: Can be set
PIPEBUF	BUFSIZE	Buffer memory size	DCP: Cannot be set (fixed at 256 bytes) PIPE1 to PIPE5, PIPE9 to PIPE15: Can be set (a maximum of 2 Kbytes can be specified) PIPE6 to PIPE8: Cannot be set (fixed at 64 bytes)
	BUFNMB	Buffer memory number	DCP: Cannot be set (areas fixed at H'0 to H'3) PIPE1 to PIPE5, PIPE9 to PIPE15: Can be set (can be specified in areas H'7 to H'7F) PIPE6 to PIPE8: Cannot be set (areas fixed at H'4 to H'6)
DCPMAXP PIPEMAXP	DEVSEL	Selects a device	Referenced only when the host controller mode is selected.
	MXPS	Maximum packet size	Compliant with the USB standard.
PIPEPERI	IFIS	Buffer flush	PIPE1 and PIPE2: Can be set (only when isochronous transfer has been selected) PIPE3 to PIPE15: Cannot be set
	IITV	Interval counter	PIPE1 and PIPE2: Can be set (only when isochronous transfer has been selected) PIPE3 to PIPE5: Cannot be set PIPE6 to PIPE9: Can be set (only when the host controller mode has been selected) PIPE10 to PIPE15: Can be set

Table 28.19 Pipe Setting Items

Register Name	Bit Name	Setting Contents	Remarks
DCPCTR PIPEnCTR	BSTS	Buffer status	For the DCP, receive buffer status and transmit buffer status are switched with the ISEL bit.
	INBUFM	IN buffer monitor	Mounted for only PIPE3 to PIPE5 and PIPE9 to PIPE15.
	SUREQ	Setup request	Can be set only for the DCP. Can be controlled only when the host controller mode has been selected.
	SUREQCLR	SUREQ clear	Can be set only for the DCP. Can be controlled only when the host controller mode has been selected.
	CSCLR	CSSTS clear	Can be controlled only when the host controller mode has been selected.
	CSSTS	SPLIT status indication	Can be referenced only when the host controller mode has been selected.
	ATREPM	Auto response mode	PIPE1 to PIPE5, PIPE9 to PIPE15: Can be set Can be set only when the function controller mode has been selected.
	ACLRM	Auto buffer clear	PIPE1 to PIPE15: Can be set
	SQCLR	Sequence clear	Clears the data toggle bit
	SQSET	Sequence set	Sets the data toggle bit
	SQMON	Sequence monitor	Monitors the data toggle bit
	PBUSY	Pipe busy confirmation	
	PID	Response PID	
PIPEnTRE	TRENB	Transaction counter enable	PIPE1 to PIPE5, PIPE9 to PIPE15: Can be set
	TRCLR	Current transaction counter clear	PIPE1 to PIPE5, PIPE9 to PIPE15: Can be set
PIPEnTRN	TRNCNT	Transaction counter	PIPE1 to PIPE5, PIPE9 to PIPE15: Can be set

(1) Pipe Control Register Switching Procedures

The following bits in the pipe control registers are only modifiable when USB communication is disabled (PID = NAK): Figure 28.4 shows the procedure for modifying the pipe control registers from the USB communication enabled (PID = BUF) state.

[Bits that should not be set in the USB communication enabled (PID = BUF) state]

- All bits in DCPCFG and DCPMAXP
- The SQCLR and SQSET bits in DCPCTR
- All bits in PIPECFG, PIPEBUF, PIPEMAXP, and PIPEPERI
- The ATREPM, ACLRM, SQCLR, and SQSET bits in PIPEnCTR
- All bits in PIPEnTRE and PIPEnTRN
- All bits in DEVADDn

In addition to the settings described for the CSCLR bit and all bits in DEVADDn, the settings for each bit described in section 28.3, Register Descriptions must also be complied with.

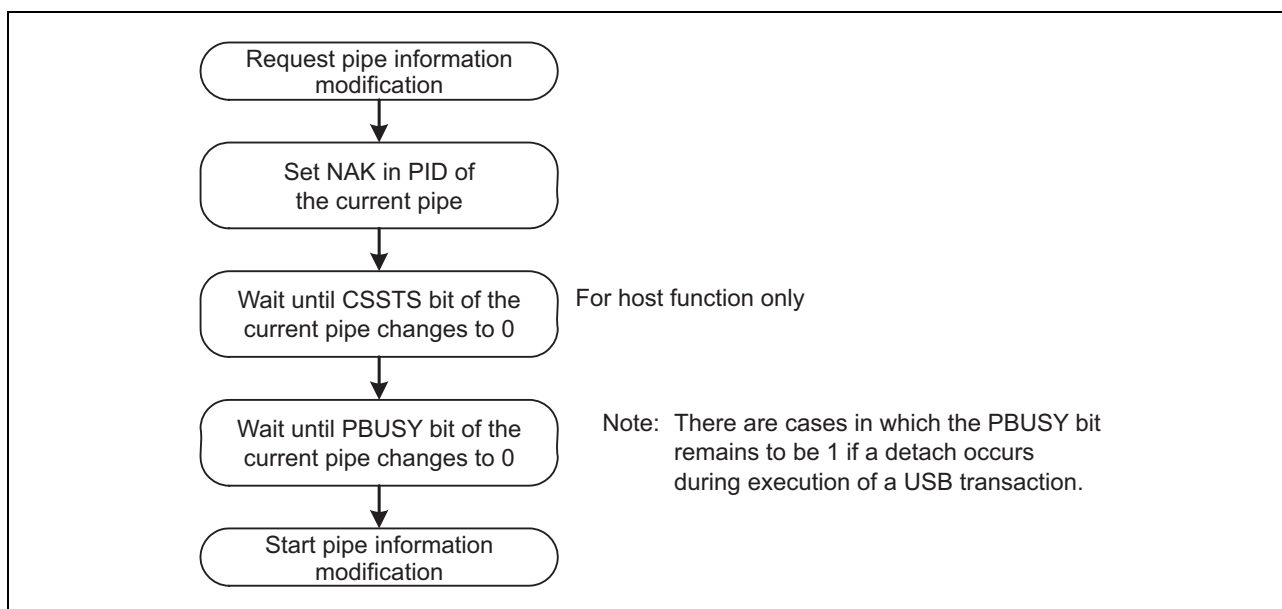

Figure 28.4 Procedure for Modifying Pipe Information from USB Communication Enabled (PID = BUF) State

The following bits in the pipe control registers are only modifiable when the pertinent pipe has not been specified by the CURPIPE bits in CFIFOSEL, D0FIFOSEL, and D1FIFOSEL.

[Bits that should not be set when the pertinent pipe is specified by the CURPIPE bits in FIFO port select registers]

- All bits in DCPCFG and DCPMAXP
- All bits in PIPECFG, PIPEBUF, PIPEMAXP, and PIPEPERI
- The ACLRM bit in PIPEnCTR

In order to modify pipe information, the CURPIPE bits should be set to the pipes other than the pipe to be modified. For the DCP, the buffer should be cleared using BCLR after the pipe information is modified.

(2) Maximum Packet Size Setting

The MXPS bits in DCPMAXP and PIPEMAXP are used to specify the maximum packet size for each pipe. DCP, PIPE1 to PIPE5, and PIPE11 to PIPE15 can be set to any of the maximum packet sizes defined by the USB Specification. For PIPE6 to PIPE10, 64 bytes are the upper limit of the maximum packet size. The maximum packet size should be set before beginning the transfer (PID = BUF).

- DCP: 64 should be set when using high-speed operation.
- DCP: Select and set 8, 16, 32, or 64 when using full-speed operation.
- PIPE1 to PIPE5: 512 should be set when using high-speed bulk transfer.
- PIPE1 to PIPE5: Select and set 8, 16, 32, or 64 when using full-speed bulk transfer.
- PIPE1 and PIPE2: Set a value between 1 and 1024 when using high-speed isochronous transfer.
- PIPE1 and PIPE2: Set a value between 1 and 1023 when using full-speed isochronous transfer.

For details, see section 28.4.9, Isochronous Transfers (PIPE1 and PIPE2).

- PIPE6 to PIPE8: Set a value between 1 and 64.
- PIPE9: 64 should be set when using interrupt transfer (only when the host controller mode has been selected).
512 should be set when using high-speed bulk transfer (only when the function controller mode has been selected).
Select and set 8, 16, 32, or 64 when using full-speed bulk transfer (only when the function controller mode has been selected).
- PIPE10 to PIPE15: 512 should be set when using high-speed bulk transfer (only when the function controller mode has been selected).
- PIPE10 to PIPE15: Select and set 8, 16, 32, or 64 when using full-speed bulk transfer (only when the function controller mode has been selected).

The high bandwidth transfers used with interrupt transfers and isochronous transfers are not supported.

(3) Response PID

The PID bits in DCPCTR and PIPEnCTR are used to set the response PID for each pipe.

The following shows this module operation with various response PID settings:

1. Response PID settings when the host controller mode is selected

The response PID is used to specify the execution of transactions.

- NAK setting: Using pipes is disabled. No transaction is executed.

- BUF setting: Transactions are executed based on the status of the buffer memory.

For OUT direction: If there are transmit data in the buffer memory, an OUT token is issued.

For IN direction: If there is an area to receive data in the buffer memory, an IN token is issued.

- STALL setting: Using pipes is disabled. No transaction is executed.

Note: • Setup transactions for the DCP are set with the SUREQ bit.

2. Response PID settings when the function controller mode is selected

The response PID is used to specify the response to transactions from the host.

- NAK setting: The NAK response is always returned in response to the generated transaction.

- BUF setting: Responses are made to transactions based on the status of the buffer memory.

- STALL setting: The STALL response is always returned in response to the generated transaction.

Note: • For setup transactions, an ACK response is always returned, regardless of the PID setting, and the USB request is stored in registers USBREQ, USBVAL, USBINDX, and USBLENG.

This module may carry out writing to the PID bits, depending on the results of the transaction. Writing to the PID bits by this module is carried out in the following cases.

1. When the host controller mode has been selected and the response PID is set by this module

- NAK setting: In the following cases, PID = NAK is set and issuing of tokens is automatically stopped:

- For transfer that is not isochronous, any combination of the following two items occurring three consecutive times in response to transmitted tokens

1) no response being returned or 2) a reception error such as a CRC error or a bit stuffing error

- For isochronous transfer, a reception error such as a CRC error or a bit stuffing error occurring three consecutive times in response to transmitted tokens

- Reception of a short packet at the stage of control read transfer data when the setting of the SHTNAK bit in PIPECFG is 1

- If a short packet is received when the SHTNAK bit in PIPECFG has been set to 1 for bulk transfer.

- If counting by the transaction counter ends while the SHTNAK bit in PIPECFG is set to 1 during bulk transfer.

- BUF setting: There is no BUF writing by this module.

- STALL setting: In the following cases, PID = STALL is set and issuing of tokens is automatically stopped:

When STALL is received in response to the transmitted token.

When the size of the receive data packet exceeds the maximum packet size.

2. When the function controller mode has been selected and the response PID is set by this module

- NAK setting: When the setup token is received normally (DCP only).

If counting by the transaction counter ends or a short packet is received while the SHTNAK bit in PIPECFG is set to 1 during bulk transfer.

- BUF setting: There is no BUF writing by this module.

- STALL setting: When a maximum packet size exceeded error has been detected in the receive data packet.

When a control transfer sequence error has been detected.

(4) Data PID Sequence Bit

This module automatically toggles the sequence bit in the data PID when data is transferred normally in the control transfer data stage, bulk transfer and interrupt transfer. The sequence bit of the data PID that is to be transmitted for the next transaction can be confirmed with the SQMON bit in DCPCTR or PIPEnCTR. When data is transmitted, the sequence bit switches at the timing at which the ACK handshake is received. When data is received, the sequence bit switches at the timing at which the ACK handshake is transmitted. The SQCLR and SQSET bits in DCPCTR or PIPEnCTR can be used to change the data PID sequence bit.

When the function controller mode has been selected and control transfer is used, this module automatically sets the sequence bit when a stage transition is made. The data PID sequence bit becomes DATA1 when the setup stage ends and this module does not reference the sequence bit and responds with PID = DATA1 in the status stage. Therefore, settings are not required. However, when the host controller mode has been selected and control transfer is used, the sequence bit should be set at the stage transition.

For the ClearFeature request transmission or reception, the data PID sequence bit should be set, regardless of whether the host controller mode or function controller mode is selected.

With pipes for which isochronous transfer has been set, sequence bit operation cannot be carried out using the SQSET bit.

28.4.4 FIFO Buffer Memory

This section describes the operation of the FIFO buffers incorporated in this module. Unless specifically specified, the buffer operation is the same regardless of whether the host controller mode or function controller mode is selected.

(1) FIFO Buffer Memory Allocation

Figure 28.5 shows an example of a FIFO buffer memory map for this module. The FIFO buffer memory is an area shared by the CPU and this module. In the FIFO buffer memory status, there are times when the access right to the buffer memory is allocated to the user system (CPU side), and times when it is allocated to this module (SIE side). Independent FIFO buffer memory areas should be set for each pipe. Each memory area can be set using the first block number and the number of blocks (specified using the BUFNMB and BUFSIZE bits in PIPEBUF), where one block comprises 64 bytes.

When continuous transfer mode has been selected using the CNTMD bit in PIPECFG, the BUFSIZE bits should be set so that the buffer memory size should be an integral multiple of the maximum packet size. When double buffer mode has been selected using the DBLB bit in PIPECFG, two planes of the memory area specified using the BUFSIZE bits in PIPEBUF can be assigned to a single pipe.

Moreover, three FIFO ports are used for access to the FIFO buffer memory (reading and writing data). A pipe is assigned to the FIFO port by specifying the pipe number using the CURPIPE bits in CFIFOSEL/DnFIFOSEL.

The FIFO buffer status of each pipe can be confirmed using the BSTS bit in DCPCTR or the BSTS and INBUFM bits in PIPEnCTR. Also, the access right of the FIFO port can be confirmed using the FRDY bit in CFIFOCTR or DnFIFOCTR.

Figure 28.5 Example of a FIFO Buffer Memory Map

(a) FIFO Buffer Clearing

Table 28.20 shows the clearing of the FIFO buffer memory by this module. The FIFO buffer memory can be cleared using the BCLR, DCLRM, and ACLRM bits.

Table 28.20 List of FIFO Buffer Clearing Methods

Bit Name	BCLR	DCLRM	ACLRM
Register	CFIFOCTR DnFIFOCTR	DnFIFOSEL	PIPEnCTR
Function	Clears the FIFO buffer memory on the CPU side	In this mode, after the data of the specified pipe has been read, the FIFO buffer memory is cleared automatically.	This is the auto buffer clear mode, in which all of the received packets are discarded.
Clearing method	Cleared by writing 1	1: Mode valid 0: Mode invalid	1: Mode valid 0: Mode invalid

28.4.5 FIFO Port Functions

This section describes the FIFO port functions. Table 28.21 shows the settings for the FIFO port functions of this module. In write access, writing data until the buffer is full (or the maximum packet size for non-continuous transfers) automatically enables sending of the data to the USB bus. To enable sending of data before the buffer is full (or before the maximum packet size for non-continuous transfers), the BVAL bit in CFIFOCTR/DnFIFOCTR must be set to end the writing (TEND signal for DMA transfers). Also, to send a zero-length packet, the BCLR bit in the same register must be used to clear the buffer and then the BVAL bit is set in order to end the writing.

In read access, reception of new packets is automatically enabled if all of the data has been read. Data cannot be read when a zero-length packet has been received (DTLN = 0), so the BCLR bit in the same register must be used to clear the buffer. The length of the data being received can be confirmed using the DTLN bit in CFIFOCTR/DnFIFOCTR.

Table 28.21 FIFO Port Function Settings

Register Name	Bit Name	Function	Note
CFIFOSEL/ DnFIFOSEL	RCNT	Selects DTLN read mode	
	REW	Buffer memory rewind (re-read, rewrite)	
	DCLRM	Automatically clears data received for a specified pipe after the data has been read	For DnFIFO only
	DREQE	Enables a DMA transfer request	For DnFIFO only
	MBW	FIFO port access bit width	
	BIGEND	Selects FIFO port endian	
	ISEL	FIFO port access direction	For DCP only
CFIFOCTR/ DnFIFOCTR	CURPIPE	Selects the current pipe	
	BVAL	Ends writing to the buffer memory	
	BCLR	Clears the buffer memory on the CPU side	
	FRDY	Monitors whether the FIFO port is ready for access	
	DTLN	Checks the length of received data	

(a) FIFO Port Selection

Table 28.22 shows the pipes that can be selected with each FIFO port. The pipe to be accessed is selected using the CURPIPE bits in CFIFOSEL/DnFIFOSEL. After the pipe is selected, whether the CURPIPE value for the pipe which was written last can be correctly read should be checked. (If the previous pipe number is read, it indicates that the pipe switching is being executed by this module.) Then, the FIFO port can be accessed after FRDY = 1 is checked. Figure 28.6 shows the procedure for pipe switching during access to the FIFO port.

Also, the bus width to be accessed should be selected using the MBW bit. The buffer memory access direction conforms to the DIR bit in PIPECFG. The ISEL bit determines this only for the DCP.

Table 28.22 FIFO Port Access Categorized by Pipe

Pipe	Access Method	Port that can be Used
DCP	CPU access	CFIFO port register
PIPE1 to PIPE15	CPU access	CFIFO port register
	DMA access	D0FIFO/D1FIFO port register

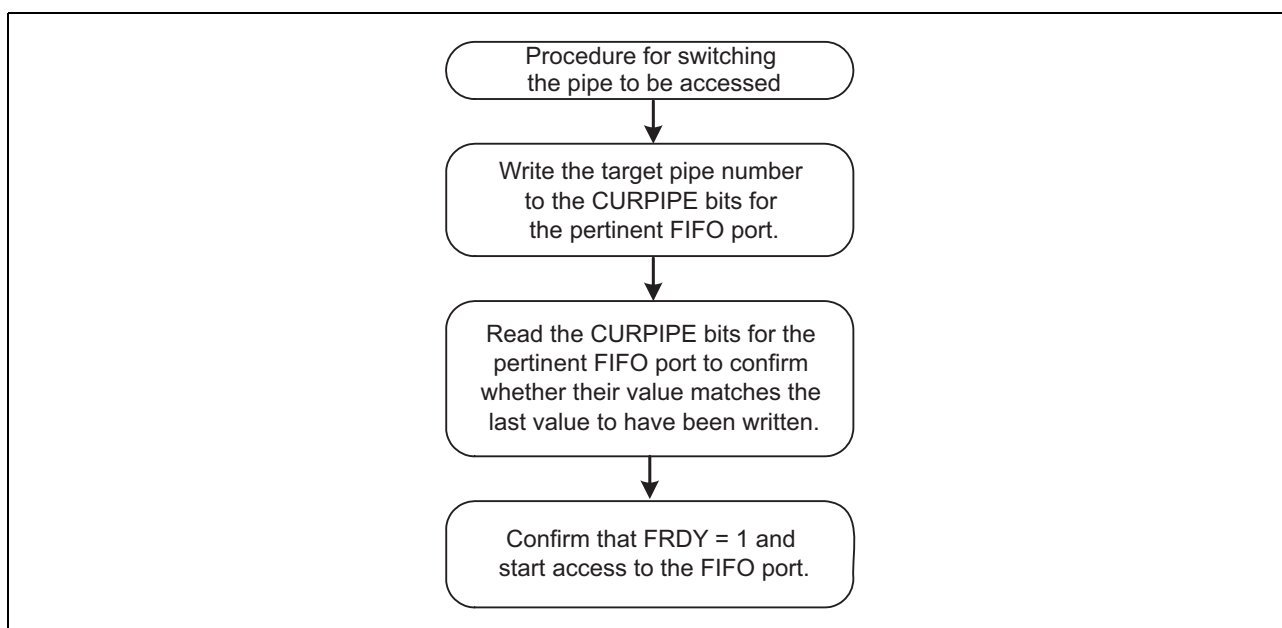

Figure 28.6 Procedure for Pipe Switching during Access to the FIFO Port

(b) DnFIFO Auto Clear Mode (D0FIFO/D1FIFO Port Reading Direction)

If 1 is set for the DCLRM bit in DnFIFOSEL, the module automatically clears the buffer memory of the selected pipe when reading of the data from the buffer memory has been completed.

Table 28.23 shows the packet reception and buffer memory clearing processing for each of the various settings. As shown in Table 28.23, the buffer clear conditions depend on the value set to the BFRE bit. Using the DCLRM bit eliminates the need for the buffer to be cleared even if a situation occurs that necessitates clearing of the buffer. This makes it possible to carry out DMA transfers without involving software.

This function can be set only in the buffer memory reading direction.

Table 28.23 Packet Reception and Buffer Memory Clearing Processing

Buffer Status when Packet is Received	Register Setting			
	DCLRM = 0		DCLRM = 1	
	BFRE = 0	BFRE = 1	BFRE = 0	BFRE = 1
Buffer full	Doesn't need to be cleared	Doesn't need to be cleared	Doesn't need to be cleared	Doesn't need to be cleared
Zero-length packet reception	Needs to be cleared	Needs to be cleared	Doesn't need to be cleared	Doesn't need to be cleared
Normal short packet reception	Doesn't need to be cleared	Needs to be cleared	Doesn't need to be cleared	Doesn't need to be cleared
Transaction count ended	Doesn't need to be cleared	Needs to be cleared	Doesn't need to be cleared	Doesn't need to be cleared

(c) Timing Selection Function for BRDY Interrupts

The BFRE bit of the PIPECFG register can be used to select non-generation of the BRDY interrupt when a data packet with the maximum packet size has been received.

For DMA transfer, this function enables the generation of an interrupt only when the last of the data have been received. Reception of the last of the data indicates either that a short packet was received or completion of counting by the transaction counter. If BFRE = 1, a BRDY interrupt is generated after the received data have been read. The length of the data packet that was last to have been received before the BRDY interrupt was generated can be confirmed by reading the DTLN bits of the DnFIFOCTR register.

Table 28.24 shows the times at which a BRDY interrupt is generated by this module.

Table 28.24 Times BRDY Interrupts are Generated

Buffer Status when Packet is Received	Register Setting	
	BFRE = 0	BFRE = 1
Buffer full (normal packet reception)	When a packet is received	No interrupt is generated.
Zero-length packet reception	When a packet is received	When a packet is received
Normal short packet reception	When a packet is received	When received data have been read from buffer memory
Transaction count ended	When a packet is received	When received data have been read from buffer memory

The BFRE bit function is only valid for the reading of buffer memory. In the case of writing, the value of the BFRE bit should always be 0.

28.4.6 Control Transfers (DCP)

Data transfers of the data stage of control transfers are done using the default control pipe (DCP). The DCP buffer memory is a 64-byte single buffer, and is a fixed area that is shared for both control reading and control writing. The buffer memory can be accessed through the CFIFO port.

(1) Control Transfers when the Host Controller Mode is Selected

(a) Setup Stage

USBREQ, USBVAL, USBINDX, and USBLENG are the registers that are used to transmit a USB request for setup transactions. Writing setup packet data to the registers and writing 1 to the SUREQ bit in DCPCTR transmits the specified data for setup transactions. Upon completion of transactions, the SUREQ bit is cleared to 0 by this module. The above USB request registers should not be modified while SUREQ = 1. The device address for setup transactions is specified using the DEVSEL bits in DCPMAXP.

When the data for setup transactions has been sent, a SIGN or SACK interrupt request is generated according to the response received from the peripheral device (SIGN or SACK bit in INTSTS1), by means of which the result of the setup transactions can be confirmed.

A data packet of DATA0 (USB request) is transmitted as the data packet for the setup transactions regardless of the setting of the SQMON bit in DCPCTR.

(b) Data Stage

Data transfers are done using the DCP buffer memory.

The access direction of the DCP buffer memory should be specified using the ISEL bit in CFIFOSEL. The transfer direction should be specified using the DIR bit in DCPCFG.

For the first data packet of the data stage, the data PID must be transferred as DATA1. Accordingly, transaction should be done by setting the data PID to DATA1 by using the SQSET bit in DCPCTR, and setting the response PID to BUF by using the PID bits in DCPCTR. Completion of data transfer is detected using the BRDY and BEMP interrupts.

The data in multiple packets can be transferred in continuous transfer mode. For continuous transfer in the receiving direction, however, note that a BRDY interrupt is only generated when the buffer memory is full or a short packet is received (when the number of bytes of data is an integer multiple of the maximum packet size and no greater than 256 bytes).

For control write transfers, when the number of data bytes to be sent is the integral multiple of the maximum packet size, a zero-length packet must be sent at the end.

(c) Status Stage

Zero-length packet data transfers are done in the direction opposite to that in the data stage. As with the data stage, data transfers are done using the DCP buffer memory. Transactions are done in the same manner as the data stage.

For the data packets of the status stage, the data PID must be transferred as DATA1. The data PID should be set to DATA1 using the SQSET bit in DCPCTR.

For reception of a zero-length packet, the received data length must be confirmed using the DTLN bits in CFIFOCTR after the BRDY interrupt is generated, and the buffer memory must then be cleared using the BCLR bit.

(2) Control Transfers when the Function Controller Mode is Selected

(a) Setup Stage

This module always sends an ACK response in response to a setup packet that is normal with respect to this module. The operation of this module in the setup stage is noted below.

(i) When a new setup packet is received, this module sets the following registers:

- Set the VALID bit in INTSTS0 to 1.
- Set the PID bits in DCPCTR to NAK.
- Set the CCPL bit in DCPCTR to 0.

(ii) When a data packet is received right after the setup packet, the USB request parameters are stored in USBREQ, USBVAL, USBINDX, and USBLENG.

Response processing with respect to the control transfer should always be carried out after first setting VALID = 0. In the VALID = 1 state, PID = BUF cannot be set, and the data stage cannot be terminated.

Using the function of the VALID bit, this module is able to interrupt the processing of a request currently being processed if a new USB request is received during a control transfer, and can send a response in response to the newest request.

Also, this module automatically judges the direction bit (bit 8 of the bmRequestType) and the request data length (wLength) of the USB request that was received, and then distinguishes between control read transfers, control write transfers, and control write no-data transfers, and monitors the stage transition. For a wrong sequence, the sequence error of the control transfer stage transition interrupt is generated. For information on the stage control of this module, see Figure 28.3.

(b) Data Stage

Data transfers corresponding to USB requests that have been received should be done using the DCP. Before accessing the DCP buffer memory, the access direction should be specified using the ISEL bit in CFIFOSEL.

Transaction should be done by setting the response PID to BUF by using the PID bits in DCPCTR.

Completion of data transfer is detected using the BRDY interrupt for control write transfers and BEMP interrupt for control read transfers, respectively.

With control write transfers during high-speed operation, the NYET handshake response is carried out based on the state of the buffer memory.

(c) Status Stage

Control transfers are terminated by setting the CCPL bit to 1 with the PID bits in DCPCTR set to BUF.

After the above settings have been entered, this module automatically executes the status stage in accordance with the data transfer direction determined at the setup stage. The specific procedure is as follows.

- For control read transfers
This module receives a zero-length packet from the USB host controller and transmits an ACK response.
- For control write transfers and no-data control transfers
This module transmits a zero-length packet and receives an ACK response from the USB host controller.

(d) Control Transfer Auto Response Function

This module automatically responds to a normal SET_ADDRESS request. If any of the following errors occur in the SET_ADDRESS request, a response is necessary.

- bmRequestType ≠ H'00
- wIndex ≠ H'00
- wLength ≠ H'00
- wValue > H'7F
- DVSQ = B'011 (Configured)

For all requests other than the SET_ADDRESS request, corresponding responses are required.

28.4.7 Bulk Transfers (PIPE1 to PIPE5, PIPE9 to PIPE15)

The buffer memory specifications for bulk transfers (single/double buffer setting, or continuous/non-continuous transfer mode setting) can be selected. The maximum size that can be set for the buffer memory is 2 Kbytes. The buffer memory state is controlled by this module, with a response sent automatically for a PING packet/NYET handshake.

(1) PING Packet Control when the Host Controller Mode is Selected

This module automatically sends a PING packet in the OUT direction at a specific timing.

On receiving an ACK handshake in the initial state in which PING packet sending mode is set, this module sends an OUT packet as noted below. Reception of an NAK or NYET handshake returns this module to PING packet sending mode. This control also applies to the control transfers in the data stage and status stage.

<Starts sending an OUT data>

1. Sets OUT data sending mode.
2. Sends a PING packet.
3. Receives an ACK handshake.
4. Sends an OUT data packet.
5. Receives an ACK handshake.
(Repeats steps 4 and 5.)
6. Sends an OUT data packet.
7. Receives an NAK/NYET handshake.
8. Sends a PING packet.

This module is returned to PING packet sending mode by a power-on reset, receiving an NYET/NAK handshake, clearing the sequence toggle bit (SQCLR), and setting the buffer clear bit (ACLRM) in PIPEnCTR.

(2) NYET Handshake Control when the Function Controller Mode is Selected

Table 28.25 lists responses to tokens received in bulk or control transfer. The NYET response of this module is made when there is only enough space in the buffer memory for one packet when an OUT token for such transfer is received. When a short packet is received, an ACK response will be produced instead of an NYET response even if the above condition holds.

Table 28.25 NYET Handshake Responses

Value Set for PID Bits in DCPCTR	Buffer Memory State	Received Token	Response	Note
NAK/STALL	—	SETUP	ACK	—
	—	IN/OUT/PING	NAK/STALL	—
BUF	—	SETUP	ACK	—
	RCV-BRDY	OUT/PING	ACK	If an OUT token is received, a data packet is received.*1
	RCV-BRDY	OUT	NYET	A data packet is received.*2
	RCV-BRDY	OUT (Short)	ACK	A data packet is received.*2
	RCV-BRDY	PING	ACK	*2
	RCV-NRDY	OUT/PING	NAK	
	TRN-BRDY	IN	DATA0/DATA1	A data packet is transmitted.
	TRN-NRDY	IN	NAK	

[Legend]

RCV-BRDY*1:When an OUT/PING token is received, there is space in the buffer memory for two or more packets.

RCV-BRDY*2:When an OUT token is received, there is only enough space in the buffer memory for one packet.

RCV-NRDY:When a PING token is received, there is no space in the buffer memory.

TRN-BRDY:When an IN token is received, there is data to be transmitted in the buffer memory.

TRN-NRDY:When an IN token is received, there is no data to be transmitted in the buffer memory.

28.4.8 Interrupt Transfers (PIPE6 to PIPE9, PIPE10)

When the function controller mode is selected, this module carries out interrupt transfers in accordance with the timing controlled by the host controller. For interrupt transfers, PING packets are ignored (no responses are sent), and the ACK, NAK, and STALL responses are carried out without an NYET handshake response being made.

When the host controller mode is selected, this module can set the timing of issuing a token using the interval counter. At this time, this module issues an OUT token even in the OUT direction, without issuing a PING token.

This module does not support high bandwidth transfers of interrupt transfers.

(1) Interval Counter during Interrupt Transfers when the Host Controller Mode is Selected

(a) Operation Outline

For interrupt transfers, intervals between transactions are set in the IITV bits in PIPEPERI. This module issues an interrupt transfer token based on the specified intervals.

(b) Counter Initialization

This module initializes the interval counter under the following conditions.

- Power-on reset:
The IITV bits are initialized.
- Buffer memory initialization using the ACLRM bit:
The IITV bits are not initialized but the count value is. Setting the ACLRM bit to 0 starts counting from the value set in the IITV bits.

Note that the interval counter is not initialized in the following case.

- USB bus reset, USB suspended:
The IITV bits are not initialized. Setting 1 to the UACT bit starts counting from the value before entering the USB bus reset state or USB suspended state.

(c) Operation when Transmission/Reception is Impossible at Token Issuance Timing

This module cannot issue tokens even at token issuance timing in the following cases. In such a case, this module attempts transactions at the subsequent interval.

- When the PID is set to NAK or STALL.
- When the buffer memory is full at the token sending timing in the receiving (IN) direction.
- When there is no data to be sent in the buffer memory at the token sending timing in the sending (OUT) direction.

28.4.9 Isochronous Transfers (PIPE1 and PIPE2)

This module has the following functions pertaining to isochronous transfers.

- Notification of isochronous transfer error information
- Interval counter (specified by the IITV bits)
- Isochronous IN transfer data setup control (IDLX function)
- Isochronous IN transfer buffer flush function (specified by the IFIS bit)
- SOF pulse output function

This module does not support the high bandwidth transfers of isochronous transfers.

(1) Error Detection with Isochronous Transfers

This module has a function for detecting the error information in isochronous transfers noted below. Table 28.26 and Table 28.27 show the priority in which errors are confirmed and the interrupts that are generated.

1. PID errors
 - If the PID of the packet being received is illegal
2. CRC errors and bit stuffing errors
 - If an error occurs in the CRC of the packet being received, or the bit stuffing is illegal
3. Exceeded maximum packet size
 - The data size of the received packet exceeded the specified maximum packet size.
4. Overrun and underrun errors
 - When host controller mode is selected
 - When using isochronous IN transfers (reception), the IN token was transmitted but there was not enough space in the buffer memory.
 - When using isochronous OUT transfers (transmission), the OUT token was transmitted, but the data was not in the buffer memory.
 - When function controller mode is selected
 - When using isochronous IN transfers (transmission), the IN token was received but the data was not in the buffer memory.
 - When using isochronous OUT transfers (reception), the OUT token was received, but there was not enough space in the buffer memory.
5. Interval errors

When function controller mode is selected, interval errors occur in following cases.

- During an isochronous IN transfer, the IN token could not be received during the interval frame.
- During an isochronous OUT transfer, the OUT token could not be received during the interval frame.

Table 28.26 Error Detection when a Token is Received

Detection Priority Order	Error	Generated Interrupt and Status
1	PID errors	No interrupts are generated in both cases when the host controller mode is selected and the function controller mode is selected (ignored as a corrupted packet).
2	CRC error and bit stuffing errors	No interrupts are generated in both cases when the host controller mode is selected and the function controller mode is selected (ignored as a corrupted packet).
3	Overflow and underrun errors	An NRDY interrupt is generated and the OVRN bit is set in both host controller mode and function controller mode. When the function controller mode is selected, a zero-length packet is transmitted in response to IN token. However, no data packet is received in response to OUT token.
4	Interval errors	An NRDY interrupt is generated when the function controller mode is selected. It is not generated in the host controller mode.

Table 28.27 Error Detection when a Data Packet is Received

Detection Priority Order	Error	Generated Interrupt and Status
1	PID errors	No interrupts are generated (ignored as a corrupted packet)
2	CRC error and bit stuffing errors	An NRDY interrupt is generated and the CRCE bit is set in both host controller mode and function controller mode.
3	Maximum packet size exceeded error	A BEMP interrupt is generated to set the PID bits to STALL in both cases when the host controller mode is selected and the function controller mode is selected.

(2) DATA-PID

This module does not support high bandwidth transfers. When the function controller mode is selected, this module operates as follows in response to the received PID.

1. IN direction
 - DATA0: Sent as data packet PID
 - DATA1: Not sent
 - DATA2: Not sent
 - mData: Not sent
2. OUT direction (when using full-speed operation)
 - DATA0: Received normally as data packet PID
 - DATA1: Received normally as data packet PID
 - DATA2: Packets are ignored
 - mData: Packets are ignored
3. OUT direction (when using high-speed operation)
 - DATA0: Received normally as data packet PID
 - DATA1: Received normally as data packet PID
 - DATA2: Received normally as data packet PID
 - mData: Received normally as data packet PID

(3) Interval Counter

(a) Operation Outline

The isochronous interval can be set using the IITV bits in PIPEPERI. The interval counter enables the functions shown in Table 28.28 when the function controller mode is selected. When the host controller mode is selected, this module generates the token issuance timing. When the host controller mode is selected, the interval counter operation is the same as the interrupt transfer operation. Refer to section 28.4.8 (1) Interval Counter during Interrupt Transfers when the Host Controller Mode is Selected.

Table 28.28 Functions of the Interval Counter when the Function Controller Mode is Selected

Transfer Direction	Function	Conditions for Detection
IN	Transmission buffer flush function	When an IN token cannot be normally received in the interval frame during an isochronous IN transfer
OUT	Notifies that a token not being received	When an OUT token cannot be normally received in the interval frame during an isochronous OUT transfer

The interval count is carried out when an SOF is received or for interpolated SOFs, so the isochronism can be maintained even if an SOF is damaged. The frame interval that can be set is the 2^{IITV} frames or 2^{IITV} μ frames.

(b) Interval Counter Initialization when the Function Controller Mode is Selected

This module initializes the interval counter under the following conditions.

- Power-on reset
The IITV bits are initialized.
- Buffer memory clearing using the ACLRM bit
The IITV bits are not initialized but the count value is.
- USB bus reset

After the interval counter has been initialized, the counter is started under the following condition 1 or 2 when a packet has been transferred normally.

1. An SOF is received following transmission of data in response to an IN token, in the PID = BUF state.
2. An SOF is received after data following an OUT token is received in the PID = BUF state.

The interval counter is not initialized under the conditions below.

1. When the PID bits are set to NAK or STALL
The interval timer does not stop. This module attempts the transactions at the subsequent interval.
2. The USB bus is reset or USB operations are suspended
The IITV bits are not initialized. When the SOF has been received, the counter is restarted from the value prior to the reception of the SOF.

(c) Interval Counting and Transfer Control when the Host Controller Mode is Selected

The IITV bits can be set when the selected pipe is for isochronous or interrupt transfers. This module controls the interval between token issuance operations based on the IITV bit setting. Specifically, this module issues a token for the selected pipe once every 2^{IITV} (μ) frames.

This module counts the interval every 1-ms frame for the pipes used for communications with the full-speed or low-speed peripheral devices connected to a high-speed HUB.

This module starts counting the token issuance interval at the (μ) frame following the (μ) frame in which the PID bits are

set to BUF.

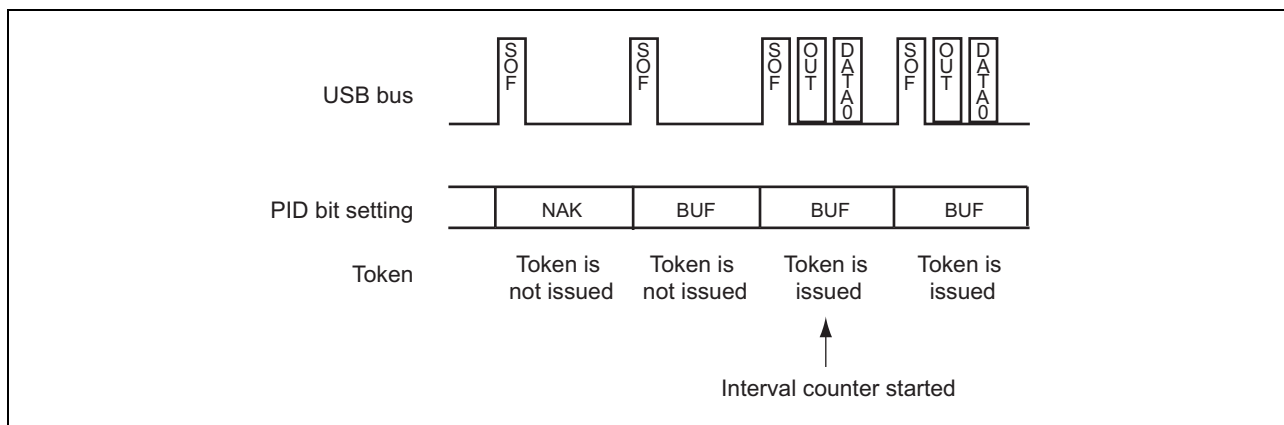

Figure 28.7 Token Issuance when IITV = 0

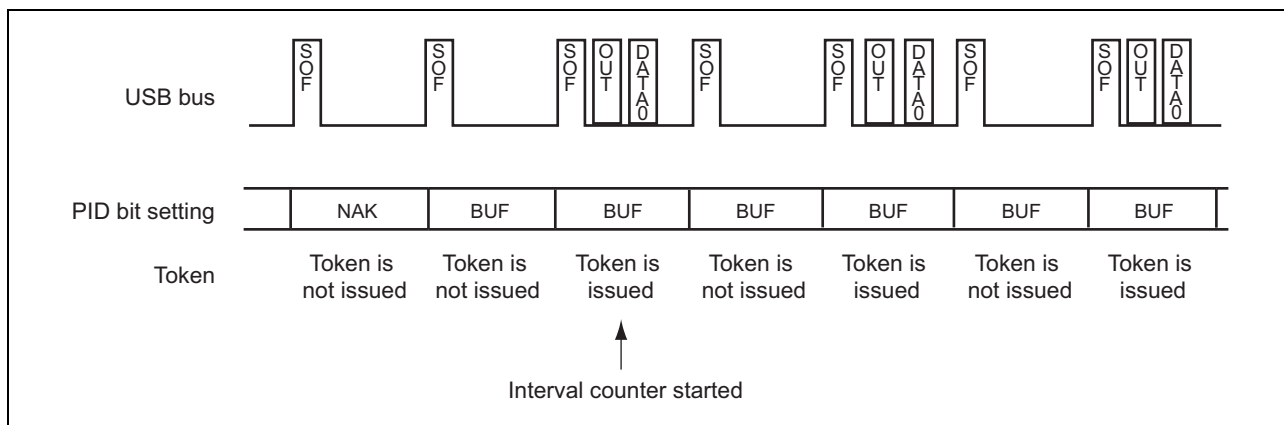

Figure 28.8 Token Issuance when IITV = 1

When the selected pipe is for isochronous transfers, this module carries out the operation below in addition to controlling token issuance interval. This module issues a token even when the NRDY interrupt generation condition is satisfied.

1. When the selected pipe is for isochronous IN transfers

This module generates the NRDY interrupt when this module issues the IN token but does not receive a packet successfully from a peripheral device (no response or packet error).

This module sets the OVRN bit to 1 generating the NRDY interrupt when the time to issue an IN token comes in a state in which this module cannot receive data because the FIFO buffer is full (because reading data from the FIFO buffer is slow).
2. When the selected pipe is for isochronous OUT transfers

This module sets the OVRN bit to 1 generating the NRDY interrupt and transmitting a zero-length packet when the time to issue an OUT token comes in a state in which there is no data to be transmitted in the FIFO buffer (because writing data to the FIFO buffer is slow).

The token issuance interval is reset by a power-on reset or when the ACLRM bit is set to 1.

(d) Interval Counting and Transfer Control when the Function Controller Mode is Selected

The IITV bits can be set when the selected pipe is for isochronous transfers.

1. When the selected pipe is for isochronous OUT transfers

This module generates the NRDY interrupt when it fails to receive a data packet within the interval set for (μ) frames by the IITV bits.

This module generates the NRDY interrupt when this module fails to receive a data packet because of a CRC error or other errors contained in the packet, or because of the FIFO buffer being full (because reading data from the FIFO buffer is slow).

This module generates the NRDY interrupt on receiving an SOF packet. Even if the SOF packet is corrupted, the internal interpolation is used and allows the interrupt to be generated at the timing to receive the SOF packet. However, when the IITV bits are set to the value other than 0, this module generates the NRDY interrupt on receiving an SOF packet for every interval after starting interval counting operation. When the PID bits are set to NAK after starting the interval timer, this module does not generate the NRDY interrupt on receiving an SOF packet.

The interval counting starts at the different timing depending on the IITV bit setting as follows.

- When IITV = 0: The interval counting starts at the (μ) frame following the (μ) frame in which the PID bits for the selected pipe are set to BUF.

Figure 28.9 Relationship between (μ) Frames and Expected Token Reception when IITV = 0

- When IITV ≠ 0: The interval counting starts on completion of successful reception of the first data packet after the PID bits for the selected pipe have been modified to BUF.

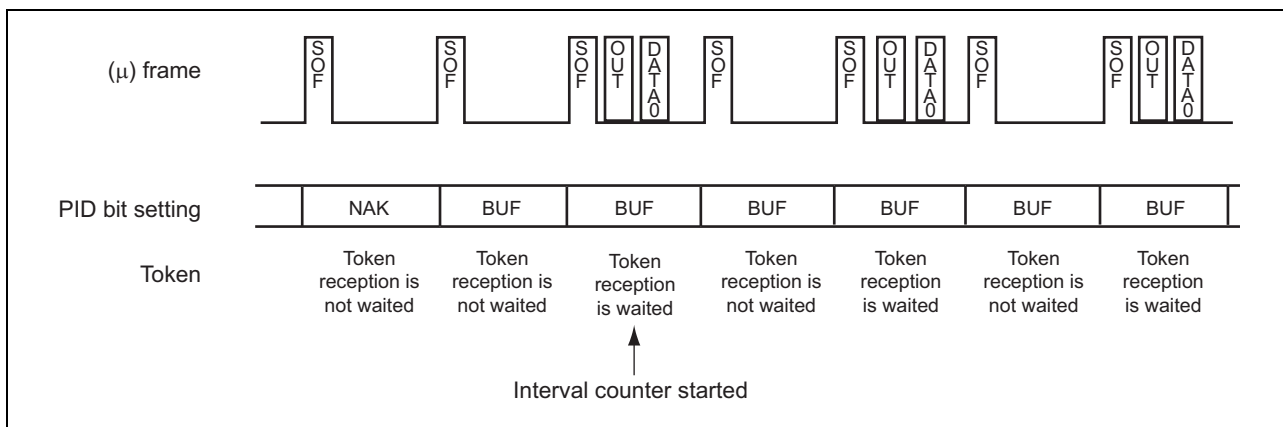

Figure 28.10 Relationship between (μ) Frames and Expected Token Reception when IITV = 1

2. When the selected pipe is for isochronous IN transfers

The IFIS bit should be 1 for this use. When IFIS = 0, this module transmits a data packet in response to the received IN token irrespective of the IITV bit setting.

When IFIS = 1, this module clears the FIFO buffer when this module fails to receive an IN token within the interval set for (μ) frames by the IITV bits in a state in which there is data to be transmitted in the FIFO buffer.

This module also clears the FIFO buffer when this module fails to receive an IN token successfully because of a bus error such as a CRC error contained in the token.

This module clears the FIFO buffer on receiving an SOF packet. Even if the SOF packet is corrupted, the internal interpolation is used and allows the FIFO buffer to be cleared at the timing to receive the SOF packet.

The interval counting starts at the different timing depending on the IITV bit setting (similar to the timing during OUT transfers).

The clearing conditions for the interval counter are any of the following in function controller mode.

- When a power-on-reset is applied to this module (the value set in the IITV bits is also cleared to 0).
- When the ACLRM bit is set to 1.
- When this module detects a USB bus reset.

(4) Setup of Data to be Transmitted using Isochronous Transfer when the Function Controller Mode is Selected

With isochronous data transmission using this module in function controller mode, after data has been written to the buffer memory, a data packet can be sent with the next frame in which an SOF packet is detected. This function is called the isochronous transfer transmission data setup function. This function enables identification of the frame that has started being transmitted.

When a double buffer is in use as the buffer memory, transmission from only one of the two buffers will be possible even after the writing of data to both buffers has been completed; the given buffer memory will be that to which the writing of data was completed first. For this reason, even if multiple IN tokens are received in a single frame, the only buffer memory that can be sent is one packet's worth of data.

When an IN token is received, if the buffer memory is in the transmission enabled state, this module transmits the data as a normal response. If the buffer memory is not in the transmission enabled state, however, a zero-length packet is sent and an underrun error occurs.

Figure 28.11 shows an example of transmission using the isochronous transfer transmission data setup function with this module, when IITV = 0 (every frame) has been set.

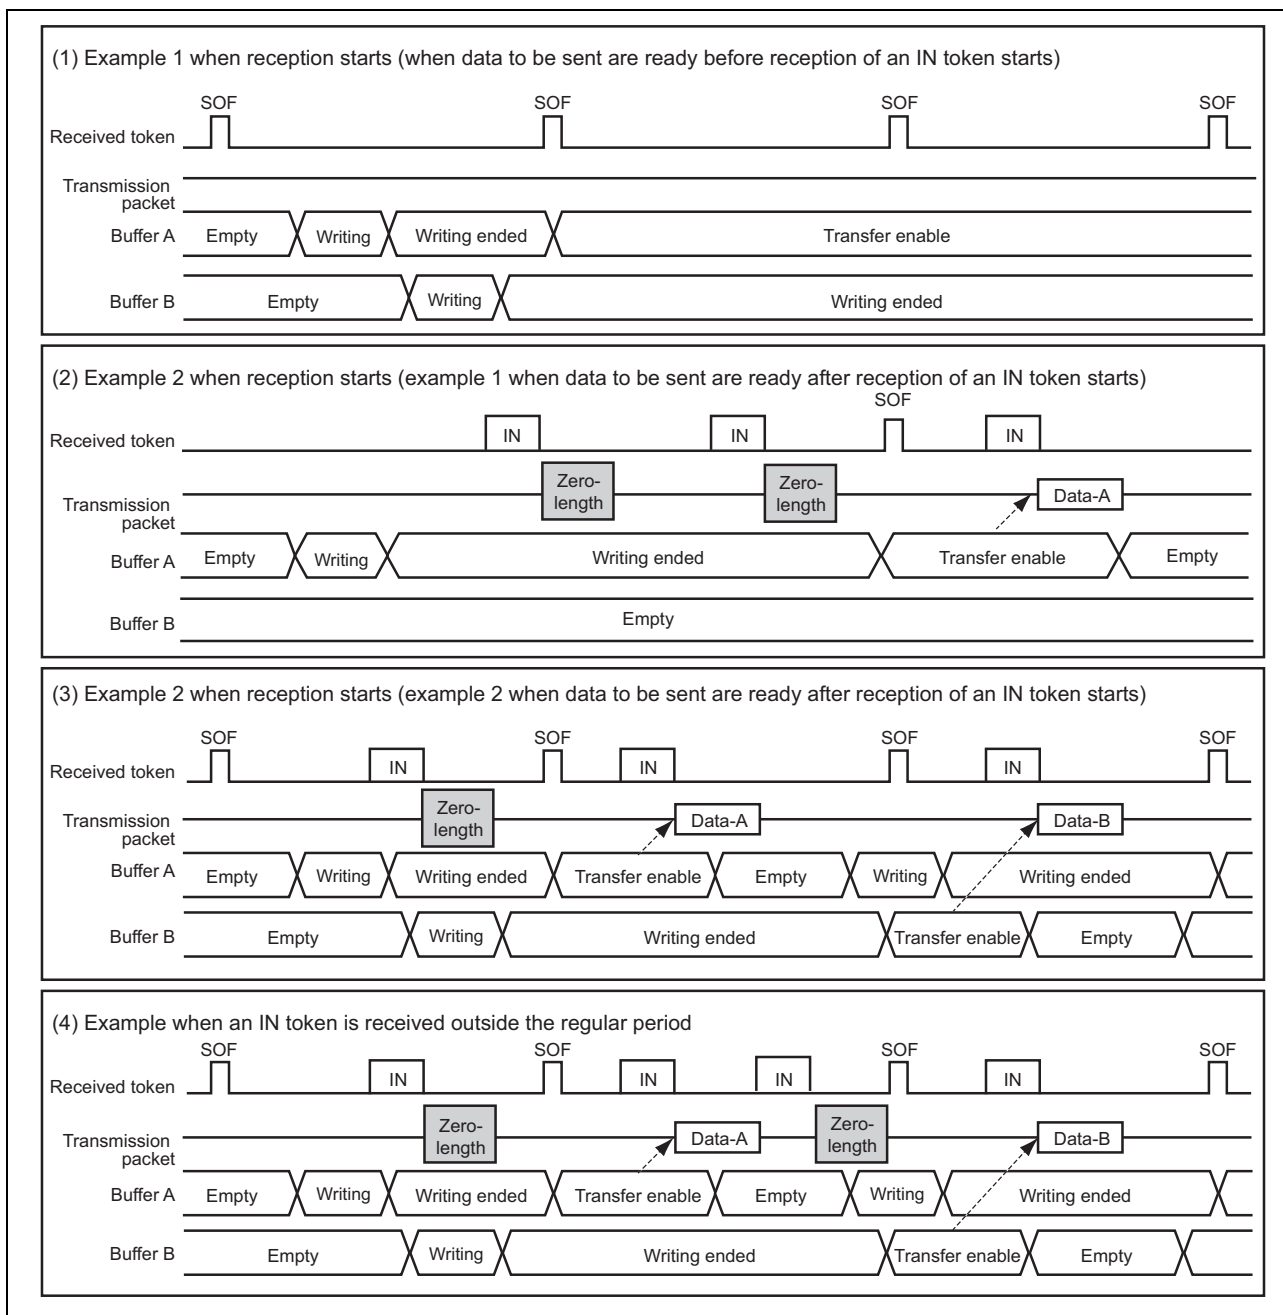

Figure 28.11 Example of Data Setup Function Operation

(5) Isochronous Transfer Transmission Buffer Flush when the Function Controller Mode is Selected

When the function controller mode is selected and an SOF packet or a μ SOF packet of the next frame is received without receiving an IN token in the interval frame during isochronous data transmission, this module operates as if a corrupted IN token was received, and clears the buffer for which transmission is enabled, putting that buffer in the writing enabled state.

If a double buffer is being used and writing to both buffers has been completed, data are considered to have been sent from the buffer memory that was cleared in the same interval frame, and transmission is enabled for the buffer memory that is not discarded with SOF or μ SOF packets reception.

The timing at which the buffer flush function is activated varies depending on the value set for the IITV bits.

- If IITV = 0
The buffer flush operation starts from the next frame after the pipe becomes valid.
- In any cases other than IITV = 0
The buffer flush operation is carried out subsequent to the first normal transaction.

Figure 28.12 shows an example of the buffer flush function of this module. When an unanticipated token is received prior to the interval frame, this module sends the written data or a zero-length packet as an underrun error according to the data setup state.

Figure 28.12 Example of Buffer Flush Function Operation

Figure 28.13 shows an example of this module generating an interval error. There are five types of interval errors, as shown below. The interval error is generated at the timing indicated by (1) in the figure, and the buffer flush function is activated.

If an interval error occurs during an IN transfer, the buffer flush function is activated; and if it occurs during an OUT transfer, an NRDY interrupt is generated.

The OVRN bit should be used to distinguish between NRDY interrupts such as received packet errors and overrun errors.

In response to tokens that are shaded in the figure, responses occur based on the buffer memory status.

1. IN direction
 - If the buffer is in the transmission enabled state, the data is transferred as a normal response.
 - If the buffer is in the transmission disabled state, a zero-length packet is sent and an underrun error occurs.
2. OUT direction
 - If the buffer is in the reception enabled state, the data is received as a normal response.
 - If the buffer is in the reception disabled state, the data is discarded and an overrun error occurs.

Figure 28.13 Example of an Interval Error being Generated when IITV = 1

28.4.10 SOF Interpolation Function

When the function controller mode is selected and if an SOF packet could not be received at intervals of 1 ms (when using full-speed operation) or 125 μ s (when using high-speed operation) because of corruption or missing, this module interpolates the SOF. The SOF interpolation operation begins when both the USBE bit in SYSCFG and the SUSPM bit in SUSPMODE have been set to 1 and an SOF packet is received. The interpolation function is initialized under the following conditions.

- Power-on reset
- USB bus reset
- Suspended state detected

Also, the SOF interpolation operates under the following specifications.

- Frame interval (125 μ s or 1 ms) conforms to the results of the reset handshake protocol.
- The interpolation function is not activated until an SOF packet is received.
- After the first SOF packet is received, either 125 μ s or 1 ms is counted with an internal clock of 48 MHz, and interpolation is carried out.
- After the second and subsequent SOF packets are received, interpolation is carried out at the previous reception interval.
- Interpolation is not carried out in the suspended state or while a USB bus reset is being received. (With suspended transitions in high-speed operation, interpolation continues for 3 ms after the last packet is received.)

This module supports the following functions based on the SOF reception. These functions also operate normally with SOF interpolation, if the SOF packet was missing.

- Refreshing of the frame number and micro-frame number
- SOFR interrupt and μ SOF lock
- SOF pulse output
- Isochronous transfer interval count

If an SOF packet is missing when full-speed operation is being used, the FRNM bits in FRMNUM are not refreshed. If a μ SOF packet is missing during high-speed operation, the UFRNM bits in UFRMNUM are refreshed. However, if a μ SOF packet for UFRNM = 000 is missing, the FRNM bits are not refreshed. In this case, the FRNM bits are not refreshed even if successive μ SOF packets other than UFRNM = 000 are received normally.

29. Video Display Controller 5 (1): Overview

29.1 Features

The video display controller 5 consists of the following six blocks. For the image synthesis, one plane of video image + two graphics planes, or three graphics planes can be selected.

1. Input controller: Input video image selection, sync signal adjustment, horizontal noise reduction, and brightness adjustment, gain adjustment, and YCbCr ↔ GBR conversion using a color matrix
2. Scaler: Scale up, scale down, and rotation of input video images using the frame buffer, and repeated recording of the specified number of fields in the frame buffer
3. Image quality improver: Black stretch, LTI/sharpness, and YCbCr ↔ GBR conversion using a color matrix
4. Image synthesizer: Synthesis of one plane of video image + two graphics planes, or three graphics planes
5. Output controller: Brightness/contrast adjustment, gamma correction, dither processing, output format conversion, control signal output for TFT-LCD panel
6. System controller: Interrupt control, panel clock control, CLUT table select signal status flag output

The functions of video display controller 5 are listed in Table 29.1.

Table 29.1 Features of Video Display Controller 5

Item	Function
Operating frequency	Video input clock: 87 MHz or less (for RGB/YCbCr video image) Panel clock: 87 MHz or less (depends on the panel specifications)
Input video image specification	<ul style="list-style-type: none"> • 8-bit input conforming to ITU-R BT.656 standard (27 MHz, interlace signal) • 8-bit input conforming to ITU-R BT.656 extended standard (54 MHz, progressive signal) *1 • 8-bit input conforming to ITU-R BT.601 extended standard (27 MHz, interlace signal) *1 • 8-bit input conforming to ITU-R BT.601 extended standard (54 MHz, progressive signal) *1 • 16-bit input conforming to ITU-R BT.601 extended standard (13.5 MHz, interlace signal) *1 • Digital pin input: YCbCr422, YCbCr444, RGB888, RGB666, and RGB565 video image • Digital pin input size: Maximum input video image size to be set *2: 1440 pixels × 1024 lines (horizontal × vertical) <p>Notes:1. LCD0_CLK	Output	Panel clock 0	Panel output 0 clock pin
LCD0_DATA 23 to LCD0_DATA 0	Output	Video image data 0 for panel	Panel output 0 video image data pin
LCD0_TCON 6 to LCD0_TCON 0	Output	Control signal 0 for panel	Panel output 0 timing control pin
LCD0_EXTCLK	Input	Panel clock source 0	Panel clock source 0 input pin

29.4 Clocks

There are two clocks to be mainly used by the video display controller 5: the video image clock and pixel clock.

The video image clock is used while the video image is processed in the input controller, passed to the scale-down control block in the scaler, and then written to the buffer (internal bus write control). The DV_CLK clock is used as the video image clock.

The pixel clock is used in graphics read-out processing by the scaler (internal bus read controller) through output controller processing. When the parallel RGB output is selected in the output controller, the frequencies of the pixel clock and panel clock (LCD_CLK) are the same. The panel clock can be selected from the video clock, LCD_EXTCLK, and peripheral bus clock 1 (P1φ) with SYSCNT_PANEL_CLK.PANEL_ICKSEL[1:0] of the system controller. When the serial RGB output (3/4 speed mode) is selected in the output controller, the pixel clock frequency is 1/3 or 1/4 the panel clock (LCD_CLK) frequency.

29.5 Hsync and Vsync Signals

Hsync and Vsync signals to be used in the logic stage following the scale-up control block of the scaler are generated by the synchronization control block of the scaler. Since the Hsync and Vsync signals are used as the reference signals for the LCD TCON, which generates various panel driving timings, they are also the reference signals for the control signals (LCD_TCON6 to LCD_TCON0 pins) passed to the panel.

The output Hsync signal always operates at a free-running frequency, and the horizontal period is set with SC_SCL0_FRC4.SC_RES_FH[10:0]. On the other hand, the output Vsync signal is selected from the external input and free-running Vsync signals with SC_SCL0_FRC3.SC_RES_VS_SEL of the scaler.

29.5.1 External Input Vsync

(1) Operation Outline

In this mode, the output Vsync signal is generated according to an external input Vsync signal. When displaying video image input from a digital pin on the panel and the pointer buffer is not in use, always use this mode. However, the output Hsync signal is free running even in this mode. Figure 29.4 shows the timing of external input Vsync signal.

Figure 29.4 External Input Vsync Timing

(2) Notes

When Vsync is externally input, generation of the output Vsync signal is based on the external Vsync signal. That is, the output Vsync signal follows the input Vsync signal, so if an unstable Vsync signal is input, the output Vsync signal will also be unstable.

Since the output Hsync signal is generated according to the frequency generated by a free-running clock and the Vsync signal is generated from the video input as a base, the signals will not be in synchronization. This module adjusts the timing between these signals by adjusting the output Vsync signal so that it stays in time with the output Hsync signal. Therefore, even if the input Vsync signal is stable, the timing of the output Vsync signal may be increased or decreased by up to one line to stay in synchronization with the timing of the output Hsync signal.

Figure 29.5 Detailed Timing Chart for Generation of the Output Vsync Signal

29.5.2 Free-Running Vsync

(1) Operation Outline

In this mode, the Vsync signal is generated according to the pixel clock (free running). The vertical period is selected with SC_SCL0_FRC4.SC_RES_FV[10:0]. The output Hsync signal is also free running. Figure 29.6 shows the timing.

Figure 29.6 Free Running Vsync Timing

(2) Pointer Buffers

In free-running vertical synchronization mode, output of the input video image to a panel may lead to flicker in the output video image. This occurs when the input and output vertical sync signals are not in synchronization. To prevent this, use the pointer buffers to adjust the timing between the input and output video images in frame units. If the input Vsync signal is faster than the output Vsync signal, frames from the input video image are skipped in the output image for display. On the other hand, when the input Vsync signal is slower than the output Vsync signal, frames from the input video image are repeated. However, when the difference in timing between the input and output Vsync signals is too large, the pointer buffers cannot deal with the difference, so flicker may occur. As more buffers are used, the pointer buffers can deal with larger differences in frequency.

Figure 29.7 Timing when the Input Vsync Signal is Faster than the Output Vsync Signal

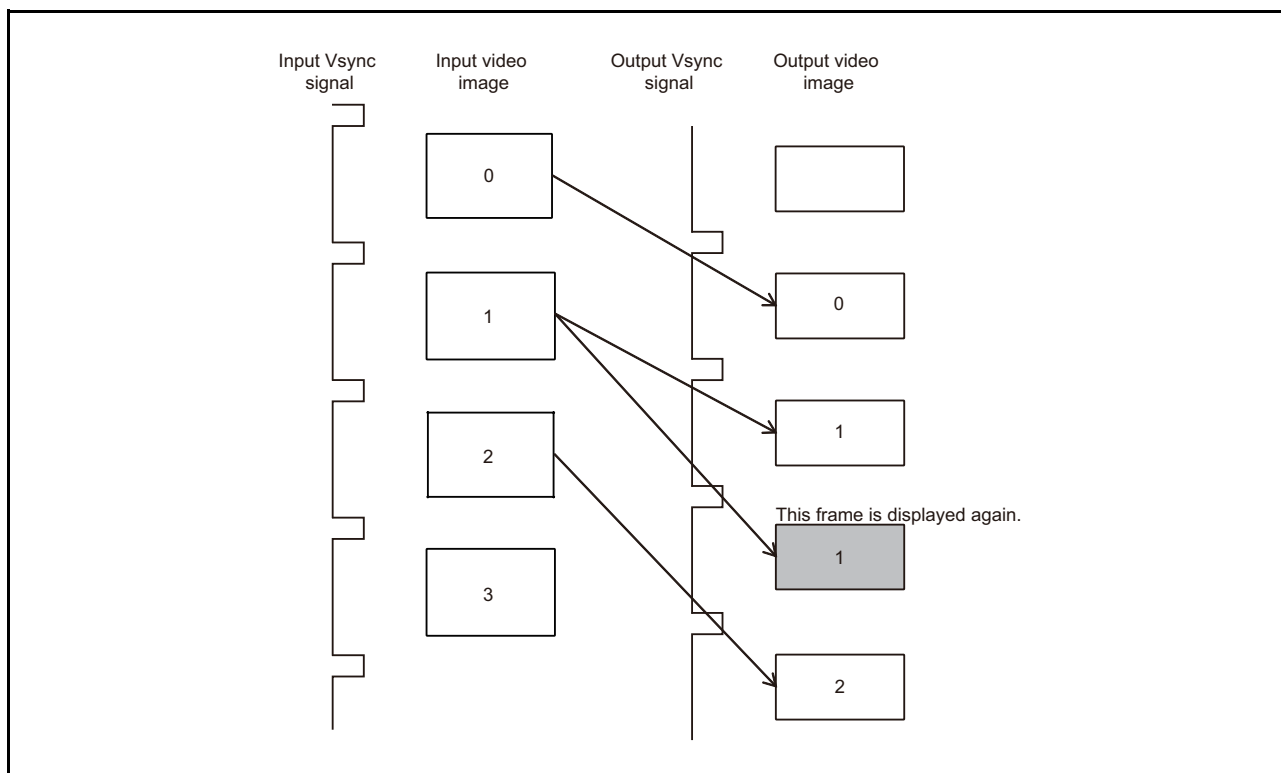

Figure 29.8 Timing when the Input Vsync Signal is Slower than the Output Vsync Signal

29.5.3 Usage Note on Changing Vsync Signal Selections

When the Vsync signal selection is changed, the output Vsync signal is discontinuous, resulting in disordered panel display. In this case, perform the mute processing according to the panel specification as necessary and change the Vsync signal selection.

30. Video Display Controller 5 (2): Input Controller

30.1 Input Controller Functions

30.1.1 Overview of Functions

The input controller performs the on/off control of input supplied via the external input pins, and subjects the signals to synchronization adjustment, horizontal noise reduction, and brightness adjustment, gain adjustment, and YCbCr ↔ GBR conversion using a color matrix.

The functional block diagram of the input controller is shown below.

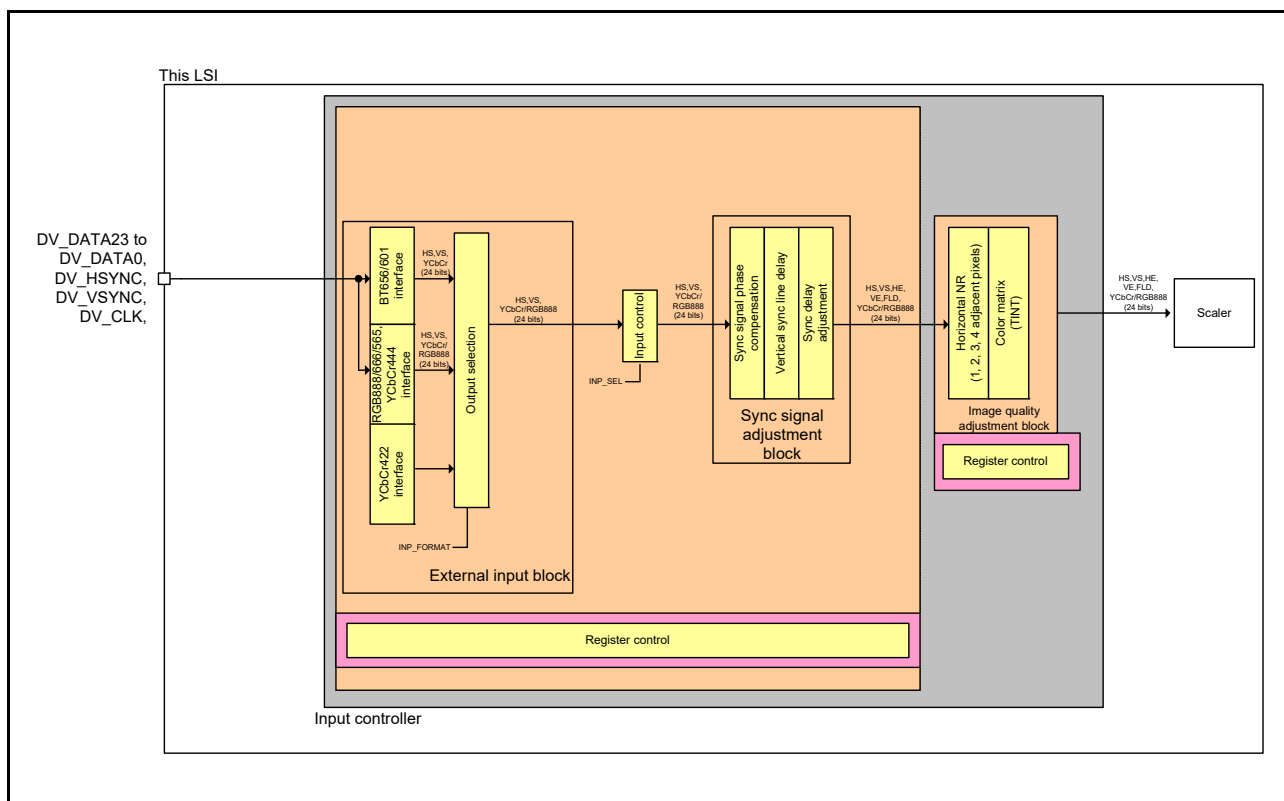

Figure 30.1 Functional Block Diagram of Input Controller

30.1.2 Updating Registers of External Signal Input Block and Sync Signal Adjustment Block

The control registers of the external input block and sync signal adjustment block are updated by setting the relevant update control bit to 1.

For the control registers other than the IMG_CNT_DRC_REG register of the image quality adjustment block, the update timing is controlled using the Vsync signal.

After 1 is set to the bits in the update control register, the contents of the relevant registers are actually modified at the rising edge of the Vsync signal, when the update control register is automatically cleared to 0.

Table 30.1 Register Update Control

Register Name	Bit Name	Initial Value	Description
INP_UPDATE	INP_EXT_UPDATE	0	External Input Block Register Update 0: Registers are not updated. 1: Registers are updated.
INP_UPDATE	INP_IMG_UPDATE	0	Sync Signal Adjustment Block Register Update 0: Registers are not updated. 1: Registers are updated.
IMG_CNT_UPDATE	IMG_CNT_VEN	0	Image Quality Adjustment Block Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync signal.

30.1.3 Controlling Input

The input controller performs the on/off control of input supplied via the external input pins.

Table 30.2 Input Control

Register Name	Bit Name	Initial Value	Description
INP_SEL_CNT	INP_SEL	0	On/Off Control of Input Supplied via External Input Pin 0: Input supplied via the external input pins is off. 1: Input supplied via the external input pins is on.

30.1.4 Controlling Externally Input Video Signals

The externally input video image signals in the YCbCr444, RGB888, RGB666, RGB565, BT656 (extended), BT601 (extended), YCbCr422 (the 16-bit data format of the BT601 standard) formats can be handled.

The BT656 signals can be used for the 525-line and 59.94-Hz (27.0-MHz) or the 625-line and 50.00-Hz (27.0-MHz) interlace signals and for the 525-line and 59.94-Hz (54.0-MHz) or the 625-line and 50.00-Hz (54.0-MHz) BT656-extended progressive signals.

The BT601 signals can be used for the 8-bit data line 525-line and 59.94 Hz (27.0-MHz) or the 625-line and 50.00-Hz (27.0-MHz) interlace signals and for the 525-line and 59.94 Hz (54.0-MHz) or the 625-line and 50.00-Hz (54.0-MHz) extended progressive signals.

The YCbCr422 signals can be used for the 16-bit data line 525-line and 59.94-Hz (13.5-MHz) or the 625-line and 50.00-Hz (13.5-MHz) BT601 interlace signals.

The above signals can be selected by the INP_FORMAT[2:0] bits. Bit endian change and B/R signal swap are controlled by setting the INP_ENDIAN_ON and INP_SWAP_ON bits.

Table 30.3 Externally Input Video Signal Control

Register Name	Bit Name	Initial Value	Description
INP_SEL_CNT	INP_FORMAT[2:0]	000	External Input Format Select 0: YCbCr444, RGB888 1: RGB666 2: RGB565 3: BT656 4: BT601 5: YCbCr422 6, 7: Setting prohibited
INP_EXT_SYNC_CNT	INP_ENDIAN_ON	0	External Input Bit Endian Change On/Off Control 0: Off 1: On
INP_EXT_SYNC_CNT	INP_SWAP_ON	0	External Input B/R Signal Swap On/Off Control 0: Off 1: On

30.1.5 Selecting Clock Edge for Externally Input Signals

The clock edge for receiving the video image signals, Vsync signals, and Hsync signals is individually selected with the INP_PXD_EDGE, INP_VS_EDGE, INP_HS_EDGE bits.

Table 30.4 Externally Input Clock Edge Selection

Register Name	Bit Name	Initial Value	Description
INP_SEL_CNT	INP_PXD_EDGE	0	Clock Edge Select for Capturing External Input Video Image Signals DV_DATA23 to DV_DATA0 0: Rising edge 1: Falling edge
INP_SEL_CNT	INP_VS_EDGE	0	Clock Edge Select for Capturing External Input Vsync Signal DV_VSYNC 0: Rising edge 1: Falling edge
INP_SEL_CNT	INP_HS_EDGE	0	Clock Edge Select for Capturing External Input Hsync Signal DV_HSYNC 0: Rising edge 1: Falling edge

Figure 30.2 shows the typical input timing of externally input signals.

The input signals can be received at the rising edge of the clock signal DV_CLK when the INP_PXD_EDGE, INP_VS_EDGE, and INP_ES_EDGE bits are 0.

Figure 30.2 Typical Input Timing of Externally Input Signals (Clock Phase)

30.1.6 Externally Input Sync Signal Inversion Control

Inversion of polarity of the Vsync and Hsync signals can be controlled by the INP_VS_INV and INP_HS_INV bits.

Table 30.5 Sync Signal Inversion Control

Register Name	Bit Name	Initial Value	Description
INP_EXT_SYNC_CNT	INP_VS_INV	0	External Input Vsync Signal DV_VSYNC Inversion Control 0: Not inverted (positive polarity) 1: Inverted (negative polarity)
INP_EXT_SYNC_CNT	INP_HS_INV	0	External Input Hsync Signal DV_HSYNC Inversion Control 0: Not inverted (positive polarity) 1: Inverted (negative polarity)

30.1.7 Bit Allocation of Externally Input Video Image Signals

Allocation of the externally input video image signal pins DV_DATA to the signals in each format is described below.

(1) YCbCr444/RGB888 Input

When the external input is of YCbCr444/RGB888 format, the video image signal pins DV_DATA are allocated to the internal signals Y/GOUT, Cb/BOUT, Cr/ROUT, as shown in Table 30.6.

Table 30.6 Bit Allocation of DV_DATA Pin Inputs when the External Input is of YCbCr444/RGB888

INP_FORMAT[2:0]	0	0	0	0
INP_ENDIAN_ON	0	0	1	1
INP_SWAP_ON	0	1	0	1
DV_DATA23	Cr/ROUT[7]	Cb/BOUT[7]	Cr/ROUT[0]	Cb/BOUT[0]
DV_DATA22	Cr/ROUT[6]	Cb/BOUT[6]	Cr/ROUT[1]	Cb/BOUT[1]
DV_DATA21	Cr/ROUT[5]	Cb/BOUT[5]	Cr/ROUT[2]	Cb/BOUT[2]
DV_DATA20	Cr/ROUT[4]	Cb/BOUT[4]	Cr/ROUT[3]	Cb/BOUT[3]
DV_DATA19	Cr/ROUT[3]	Cb/BOUT[3]	Cr/ROUT[4]	Cb/BOUT[4]
DV_DATA18	Cr/ROUT[2]	Cb/BOUT[2]	Cr/ROUT[5]	Cb/BOUT[5]
DV_DATA17	Cr/ROUT[1]	Cb/BOUT[1]	Cr/ROUT[6]	Cb/BOUT[6]
DV_DATA16	Cr/ROUT[0]	Cb/BOUT[0]	Cr/ROUT[7]	Cb/BOUT[7]
DV_DATA15	Y/GOUT[7]	Y/GOUT[7]	Y/GOUT[0]	Y/GOUT[0]
DV_DATA14	Y/GOUT[6]	Y/GOUT[6]	Y/GOUT[1]	Y/GOUT[1]
DV_DATA13	Y/GOUT[5]	Y/GOUT[5]	Y/GOUT[2]	Y/GOUT[2]
DV_DATA12	Y/GOUT[4]	Y/GOUT[4]	Y/GOUT[3]	Y/GOUT[3]
DV_DATA11	Y/GOUT[3]	Y/GOUT[3]	Y/GOUT[4]	Y/GOUT[4]
DV_DATA10	Y/GOUT[2]	Y/GOUT[2]	Y/GOUT[5]	Y/GOUT[5]
DV_DATA9	Y/GOUT[1]	Y/GOUT[1]	Y/GOUT[6]	Y/GOUT[6]
DV_DATA8	Y/GOUT[0]	Y/GOUT[0]	Y/GOUT[7]	Y/GOUT[7]
DV_DATA7	Cb/BOUT[7]	Cr/ROUT[7]	Cb/BOUT[0]	Cr/ROUT[0]
DV_DATA6	Cb/BOUT[6]	Cr/ROUT[6]	Cb/BOUT[1]	Cr/ROUT[1]
DV_DATA5	Cb/BOUT[5]	Cr/ROUT[5]	Cb/BOUT[2]	Cr/ROUT[2]
DV_DATA4	Cb/BOUT[4]	Cr/ROUT[4]	Cb/BOUT[3]	Cr/ROUT[3]
DV_DATA3	Cb/BOUT[3]	Cr/ROUT[3]	Cb/BOUT[4]	Cr/ROUT[4]
DV_DATA2	Cb/BOUT[2]	Cr/ROUT[2]	Cb/BOUT[5]	Cr/ROUT[5]
DV_DATA1	Cb/BOUT[1]	Cr/ROUT[1]	Cb/BOUT[6]	Cr/ROUT[6]
DV_DATA0	Cb/BOUT[0]	Cr/ROUT[0]	Cb/BOUT[7]	Cr/ROUT[7]

(2) RGB666 Input

When the external input is of RGB666 format, the video image signal pins DV_DATA are allocated to the internal signals GOUT, BOUT, ROUT as shown in Table 30.7.

The internal signals GOUT, BOUT, ROUT to which the video image signal pins DV_DATA are allocated are output as a 24-bit video image from the RGB666 interface with the following formulae.

$$G[7:0] = GOUT[7:2] \times 255 \div 63$$

$$B[7:0] = BOUT[7:2] \times 255 \div 63$$

$$R[7:0] = ROUT[7:2] \times 255 \div 63$$

Table 30.7 Bit Allocation of DV_DATA Pin Inputs When the External Input is of RGB666

INP_FORMAT[2:0]	1	1	1	1
INP_ENDIAN_ON	0	0	1	1
INP_SWAP_ON	0	1	0	1
DV_DATA17	ROUT[7]	BOUT[7]	ROUT[2]	BOUT[2]
DV_DATA16	ROUT[6]	BOUT[6]	ROUT[3]	BOUT[3]
DV_DATA15	ROUT[5]	BOUT[5]	ROUT[4]	BOUT[4]
DV_DATA14	ROUT[4]	BOUT[4]	ROUT[5]	BOUT[5]
DV_DATA13	ROUT[3]	BOUT[3]	ROUT[6]	BOUT[6]
DV_DATA12	ROUT[2]	BOUT[2]	ROUT[7]	BOUT[7]
DV_DATA11	GOUT[7]	GOUT[7]	GOUT[2]	GOUT[2]
DV_DATA10	GOUT[6]	GOUT[6]	GOUT[3]	GOUT[3]
DV_DATA9	GOUT[5]	GOUT[5]	GOUT[4]	GOUT[4]
DV_DATA8	GOUT[4]	GOUT[4]	GOUT[5]	GOUT[5]
DV_DATA7	GOUT[3]	GOUT[3]	GOUT[6]	GOUT[6]
DV_DATA6	GOUT[2]	GOUT[2]	GOUT[7]	GOUT[7]
DV_DATA5	BOUT[7]	ROUT[7]	BOUT[2]	ROUT[2]
DV_DATA4	BOUT[6]	ROUT[6]	BOUT[3]	ROUT[3]
DV_DATA3	BOUT[5]	ROUT[5]	BOUT[4]	ROUT[4]
DV_DATA2	BOUT[4]	ROUT[4]	BOUT[5]	ROUT[5]
DV_DATA1	BOUT[3]	ROUT[3]	BOUT[6]	ROUT[6]
DV_DATA0	BOUT[2]	ROUT[2]	BOUT[7]	ROUT[7]

(3) RGB565 Input

When the external input is of RGB565 format, the video image signal pins DV_DATA are allocated to the internal signals GOUT, BOUT, ROUT as shown in Table 30.8.

The internal signals GOUT, BOUT, ROUT to which the video image signal pins DV_DATA are allocated are output as a 24-bit video image from the RGB565 interface with the following formulae.

$$G[7:0] = GOUT[7:2] \times 255 \div 63$$

$$B[7:0] = BOUT[7:3] \times 255 \div 31$$

$$R[7:0] = ROUT[7:3] \times 255 \div 31$$

Table 30.8 Bit Allocation of DV_DATA Pin Inputs When the External Input is of RGB565

INP_FORMAT[2:0]	2	2	2	2
INP_ENDIAN_ON	0	0	1	1
INP_SWAP_ON	0	1	0	1
DV_DATA15	ROUT[7]	BOUT[7]	ROUT[3]	BOUT[3]
DV_DATA14	ROUT[6]	BOUT[6]	ROUT[4]	BOUT[4]
DV_DATA13	ROUT[5]	BOUT[5]	ROUT[5]	BOUT[5]
DV_DATA12	ROUT[4]	BOUT[4]	ROUT[6]	BOUT[6]
DV_DATA11	ROUT[3]	BOUT[3]	ROUT[7]	BOUT[7]
DV_DATA10	GOUT[7]	GOUT[7]	GOUT[2]	GOUT[2]
DV_DATA9	GOUT[6]	GOUT[6]	GOUT[3]	GOUT[3]
DV_DATA8	GOUT[5]	GOUT[5]	GOUT[4]	GOUT[4]
DV_DATA7	GOUT[4]	GOUT[4]	GOUT[5]	GOUT[5]
DV_DATA6	GOUT[3]	GOUT[3]	GOUT[6]	GOUT[6]
DV_DATA5	GOUT[2]	GOUT[2]	GOUT[7]	GOUT[7]
DV_DATA4	BOUT[7]	ROUT[7]	BOUT[3]	ROUT[3]
DV_DATA3	BOUT[6]	ROUT[6]	BOUT[4]	ROUT[4]
DV_DATA2	BOUT[5]	ROUT[5]	BOUT[5]	ROUT[5]
DV_DATA1	BOUT[4]	ROUT[4]	BOUT[6]	ROUT[6]
DV_DATA0	BOUT[3]	ROUT[3]	BOUT[7]	ROUT[7]

(4) BT656/BT601 Input

When the external input is of BT656 or BT601 format, the video image signal pins DV_DATA are allocated to the internal signal BTOUT, as shown in Table 30.9.

The internal signal BTOUT to which the video image signal pins DV_DATA are allocated is expanded to the YCbCr signal.

For expansion to the YCbCr signal, see section 30.1.12, BT656/BT601/YCbCr422 Format Setting.

Table 30.9 Bit Allocation of DV_DATA Pin Inputs When the External Input is of BT656 or BT601

INP_FORMAT[2:0]	3 to 4	3 to 4
INP_ENDIAN_ON	0	1
INP_SWAP_ON	0	0
DV_DATA7	BTOUT[7]	BTOUT[0]
DV_DATA6	BTOUT[6]	BTOUT[1]
DV_DATA5	BTOUT[5]	BTOUT[2]
DV_DATA4	BTOUT[4]	BTOUT[3]
DV_DATA3	BTOUT[3]	BTOUT[4]
DV_DATA2	BTOUT[2]	BTOUT[5]
DV_DATA1	BTOUT[1]	BTOUT[6]
DV_DATA0	BTOUT[0]	BTOUT[7]

(5) YCbCr422 Input

When the external input is of YCbCr422 format, the video image signal pins DV_DATA are allocated to the internal signals Y and Cb/Cr, as shown in Table 30.10.

Table 30.10 Bit Allocation of DV_DATA Pin Inputs When the External Input is of YCbCr422

INP_FORMAT[2:0]	5	5	5	5
INP_ENDIAN_ON	0	0	1	1
INP_SWAP_ON	0	1	0	1
DV_DATA15	Y[7]	Cb/Cr[7]	Y[0]	Cb/Cr[0]

Figure 30.10 SAV/EAV Code in BT656 Format (525 Lines/59.94 Hz)

30.1.11 BT656 Progressive Format

This product can be connected with devices which output data in the BT656 progressive format. Because the standard for the BT656 format does not include description of output in the progressive format, there is no guarantee that this product is connected with devices which output data in the progressive format. The following description shows how to generate a vertical/horizontal synchronization signal by decoding the SAV/EAV code input via the BT656 interface of this module. Confirm the connection with devices which output data in the BT656 progressive format in accordance with this section.

(1) SAV/EAV Code

The SAV/EAV code consists of four words. When the first word is set to FF and the second and third words are set to 00, timing signals are generated by decoding the value of the fourth word (XY).

For bit information, see Table 30.12 in section 30.1.10, SAV/EAV Code in BT656 Format. This product does not refer to the parity bits (P3 to P0).

(2) Vertical/Horizontal Synchronization Signal

Based on the SAV/EAV code, the vertical/horizontal synchronization signal is generated.

(a) Vertical Synchronization Signal

The vertical synchronization signal is output when the value of the V bit is changed from 0 to 1 in the BT656 format. The timing of the output varies with the setting of INP_EXT_SYNC_CNT.INP_F525_625 setting and the value of the F bit in the BT656 format.

Table 30.14 lists the timing.

Table 30.14 Timing of Delay for Output of Vertical Synchronization Signal

INP_EXT_SYNC_CNT. INP_F525_625	F Bit in BT656 Format	Output Timing	Remark
0: 525 lines	0 (Field 1)	2.5 lines after setting of V bit to 1 is detected	525 lines, vertical synchronization signal for field 2
	1 (Field 2)	3 lines after setting of V bit to 1 is detected	525 lines, vertical synchronization signal for field 1
1: 625 lines	0 (Field 1)	2.5 lines after setting of V bit	625 lines, vertical synchronization signal for field 2
	1 (Field 2)	2 lines after setting of V bit to 1 is detected	625 lines, vertical synchronization signal for field 1

(b) Horizontal Synchronization Signal

Based on the setting of the INP_EXT_SYNC_CNT.INP_H_EDGE_SEL bit, the horizontal synchronization signal is output.

(c) Timing Example of 525-Line Interface Input in BT656 Format

Figure 30.11 and Figure 30.12 show examples of the timing of vertical/horizontal synchronization signal extracted from 525-line interlaced input in the BT656 format.

Figure 30.11 Timing of Vertical/Horizontal Synchronization Signal from 525-Line Interlaced Input in BT656 Format (Top to Bottom)

Figure 30.12 Timing of Vertical/Horizontal Synchronization Signal from 525-Line Interlaced Input in BT656 Format (Bottom to Top)

(3) Example of Timing for Progressive Input in BT656 Format

Figure 30.13 shows an example of the SAV/EAV code in 525-line progressive input in the BT656 format.

Figure 30.14 shows the vertical/horizontal synchronization signal extracted from 525-line progressive input in the BT656 format. The field is detected as field 1 in this example, because the value of the F bit is set to 0 when that of the V bit is changed from 0 to 1. The field is regarded as the bottom field. The vertical synchronization signal is output 2.5 lines after the detection of the SAV code.

		One Horizontal Period																	
		EAV				H blank				SAV				Valid area

Figure 30.13 SAV/EAV Code in BT656 Progressive Format (525 Lines, 59.94 Hz)

Figure 30.14 Vertical/Horizontal Synchronization Signal in BT656 Format (525 Lines, Progressive)

30.1.12 BT656/BT601/YCbCr422 Format Setting

The BT656 format can be used for the 525-line and 59.94-Hz or the 625-line and 50.00-Hz interlace signal format and progressive signal format (extended).

The BT601 format can be used for the 525-line and 59.94-Hz or the 625-line and 50.00-Hz interlace signal format and progressive signal format (extended).

The YCbCr422 format can be used for the 525-line and 59.94-Hz or the 625-line and 50.00-Hz interlace signal format in the 16-bit data-bus format of the BT601 standard.

The Vsync signal timing for the 525-line BT656 format and 625-line BT656 format are different.

The operating mode is set by the INP_F525_625 bit.

Table 30.15 Operating Mode Setting for BT656 Format

Register Name	Bit Name	Initial Value	Description
INP_EXT_SYNC_CNT	INP_F525_625	0	Number of Lines for BT656 Input of External Input System 0: 525 lines 1: 625 lines

When the interlace signals are to be input in BT656/BT601/YCbCr422 format, half of 2fH phase timings of the Vsync signal and the Hsync signal are set with the INP_FH50[9:0] bits.

The INP_FH50[9:0] bits are also used for the vertical synchronous phase adjustment block. Therefore, for bit description, see Table 30.20.

When the external input is of BT656 format, the reference point of the Hsync signal is set with the INP_H_EDGE_SEL bit.

Table 30.16 Hsync Signal Reference Selection for BT656 Format

Register Name	Bit Name	Initial Value	Description
INP_EXT_SYNC_CNT	INP_H_EDGE_SEL	0	Hsync Signal Reference Select for BT656 Format of External Input System 0: EAV 1: SAV

When the external input is of BT656/BT601 format, the internal signal BTOUT[7:0], which is input from the DV_DATA pins and allocated, is expanded to the 24-bit YCbCr signal.

Expansion timing with respect to the Hsync signal reference is set with the INP_H_POS[1:0] bits.

Figure 30.15 YCbCr Data Expansion for BT656/BT601 Input

Table 30.17 Data String Start Timing Selection for BT656/BT601 Input

Register Name	Bit Name	Initial Value	Description
INP_EXT_SYNC_CNT	INP_H_POS[1:0]	0	Y/Cb/Y/Cr Data String Start Timing with respect to Hsync Reference 0: Cb/Y/Cr/Y 1: Y/Cr/Y/Cb 2: Cr/Y/Cb/Y 3: Y/Cb/Y/Cr

When the external input is in YCbCr422 format, the input from the DV_DATA pins is allocated to the internal Y[7:0] and CbCr[7:0] signals, and the CbCr[7:0] are expanded to a 16-bit signal.

Expansion timing with respect to the Hsync signal reference is set with the INP_H_POS[1:0] bits.

Figure 30.16 YCbCr Data Expansion for YCbCr422 Input

Table 30.18 Data String Start Timing Selection for YCbCr422 Input

Register Name	Bit Name	Initial Value	Description
INP_EXT_SYNC_CNT	INP_H_POS[1:0]	0	Cb/Cr Data String Start Timing with respect to Hsync Reference 0: Cb/Cr 3: Cr/Cb 1, 2: Setting prohibited

30.1.13 YCbCr444/RBG888/666/565 Input Timing

The YCbCr444/RGB888/666/565 format can be used for the progressive YCbCr/RGB signal.

The sync signal width (H_SYNC, V_SYNC), sync signal polarity (H_POL, V_POL), valid period start position (H_BP, V_BP), valid period end position (H_FP, V_FP), and valid period video width (H_ACTIVE, V_ACTIVE) are shown in Table 30.19.

Table 30.19 YCbCr/RGB Signal Reception Timing

Item	Description
External input clock	Maximum external input clock frequency: 87.00 MHz
Vsync signal width (V_SYNC)	Minimum Vsync signal width: 1 CLK
Vsync signal polarity (V_POL)	Positive or negative polarity is selected by the relevant registers.
Vertical valid period start position (V_BP)	From Vsync reference to the head of the video image: 5 lines or more
Vertical valid period video width (V_ACTIVE)	Maximum vertical valid period: 1024 lines
Vertical valid period end position (V_FP)	From the end of the video image to the Vsync reference: 4 lines or more ^{Note 1.}
Hsync signal width (H_SYNC)	Minimum Hsync signal width: 1 CLK
Hsync signal polarity (H_POL)	Positive or negative polarity is selected by the relevant registers.
Horizontal valid period start position (H_BP)	From Hsync reference to the head of the video image: 16 CLK or more
Horizontal valid period video width (H_ACTIVE)	Maximum horizontal valid period: 1440 pixels
Horizontal valid period end position (H_FP)	From the end of the video image to the Hsync reference: 16 CLK or more ^{Note 2.}
Number of vertical lines (V_BP+V_ACTIVE+V_FP)	Between vertical synchronization signals: 2047 lines or less
Number of horizontal pixels (H_BP+H_ACTIVE+H_FP)	Between horizontal synchronization signals: 2047 CLK or less

Note 1. When V_FP is below four lines, the setting of INP_DLY_ADJ.INP_VS_DLY_L[2:0] should be adjusted so that V_FP is at least four lines.

Note 2. When H_FP is below 16 cycles, the settings of INP_DLY_ADJ.INP_VS_DLY[7:0], INP_HS_DLY[7:0], and INP_FLD_DLY[7:0] should be adjusted so that H_FP is at least 16 cycles of the pixel clock.

Figure 30.17 YCbCr/RGB Signal Reception Timing

30.1.14 Field Differentiation and Vsync Signal Phase Adjustment

The phase of the input Vsync signal and Hsync signal is detected and the field of the interlace signal is determined. When the reference point of the Vsync signal is detected within ± 0.5 horizontal period with respect to the Hsync signal, it is determined as the interlace top field. When the reference point of the Vsync signal is detected outside ± 0.5 horizontal period with respect to the Hsync signal, it is determined as the interlace bottom field.

Figure 30.18 Vsync Signal Phase Adjustment

The timings of $1/2fH$ Vsync signal phase and $1/4fH$ Vsync signal phase are set with INP_FH50[9:0] and INP_FH25[9:0], respectively.

Table 30.20 Vsync Signal Phase Timing Setting

Register Name	Bit Name	Initial Value	Description
INP_VSYNC_PH_ADJ	INP_FH50[9:0]	858	Vsync Signal $1/2fH$ Phase Timing Should be $1/2$ the horizontal cycle.
INP_VSYNC_PH_ADJ	INP_FH25[9:0]	429	Vsync Signal $1/4fH$ Phase Timing Should be $1/4$ the horizontal cycle.

30.1.15 Vsync Signal Delay Adjustment in Line Units

The Vsync signal line delay adjust block can delay the Vsync signal and the field differentiation signal in line units.

When a video signal with a short vertical front porch is input, the vertical front porch is adjusted.

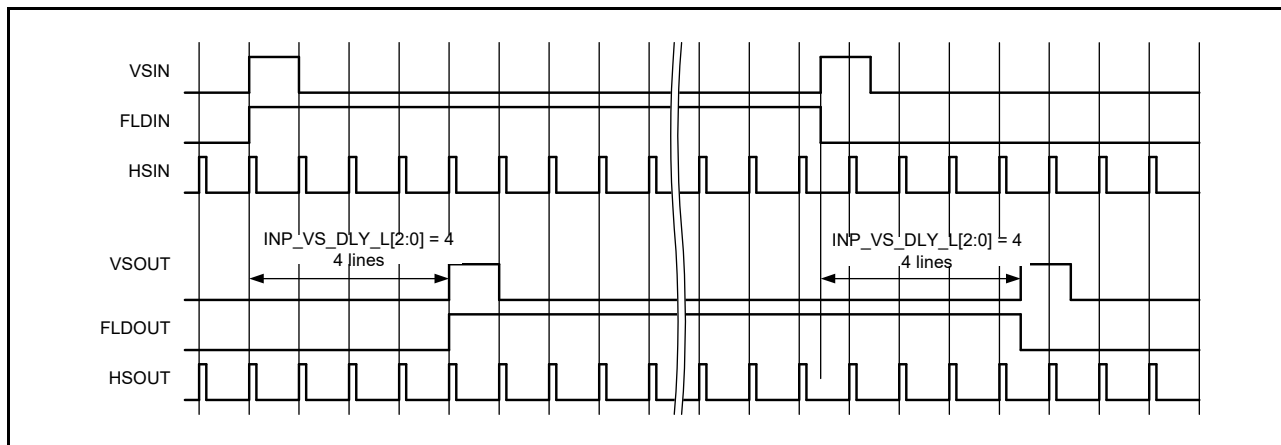

Figure 30.19 Timing of Vsync Signal Delay in Line Units

Table 30.21 Adjustment of Vsync Signal Delay in Line Units

Register Name	Bit Name	Initial Value	Description
INP_DLY_ADJ	INP_VS_DLY_L[2:0]	0	Number of Lines for Delaying Vsync Signal and Field Differentiation Signal Delay amount: 0 to 7 (lines)

30.1.16 Sync Signal Delay Adjustment

Delay can be adjusted independently for the Vsync signal, Hsync signal, and field differentiation signal in the units of clock.

Lacking margin of the horizontal front porch is adjusted according to the input synchronization disturbance.

Table 30.22 Sync Signal Delay Adjustment

Register Name	Bit Name	Initial Value	Description
INP_DLY_ADJ	INP_VS_DLY[7:0]	0	Vsync Signal Delay Amount Delay amount: 0 to 254 (clock cycles)
INP_DLY_ADJ	INP_HS_DLY[7:0]	0	Hsync Signal Delay Amount Delay amount: 0 to 254 (clock cycles)
INP_DLY_ADJ	INP_FLD_DLY[7:0]	0	Field Differentiation Signal Delay Amount Delay amount: 0 to 254 (clock cycles)

30.1.17 Horizontal Noise Reduction

Noise can be reduced according to horizontal pixel reference.

Noise reduction is controlled through noise component frequency band (TAP), noise level (threshold), and noise reduction intensity (gain).

(1) Frequency Band (TAP) Setting for Noise Component

The noise frequency band can be selected independently from the following four types by using the NR1D_Y_TAP[1:0], NR1D_CB_TAP[1:0], and NR1D_CR_TAP[1:0] bits.

When the number of adjacent pixels is one (noise reduction NR1D_Y/CB/CR_TAP is 0):

$$BPF_{(1)} = \frac{1}{4}(-1 \times Z_{(-1)}, 2 \times Z_{(0)}, -1 \times Z_{(+1)})$$

When the number of adjacent pixels is two (noise reduction NR1D_Y/CB/CR_TAP is 1):

$$BPF_{(2)} = \frac{1}{4}(-1 \times Z_{(-2)}, 2 \times Z_{(0)}, -1 \times Z_{(+2)})$$

When the number of adjacent pixels is three (noise reduction NR1D_Y/CB/CR_TAP is 2):

$$BPF_{(3)} = \frac{1}{4}(-1 \times Z_{(-3)}, 2 \times Z_{(0)}, -1 \times Z_{(+3)})$$

When the number of adjacent pixels is four (noise reduction NR1D_Y/CB/CR_TAP is 3):

$$BPF_{(4)} = \frac{1}{4}(-1 \times Z_{(-4)}, 2 \times Z_{(0)}, -1 \times Z_{(+4)})$$

Note: $Z_{(0)}$ indicates the target pixel for noise reduction and $Z_{(N)}$ indicates the pixel that is n pixels off from $Z_{(0)}$ in the horizontal direction.

(2) Setting Noise Level (Threshold)

The absolute value of the detected noise amount (BPF output value) is compared with the values of the NR1D_Y_TH[6:0], NR1D_CB_TH[6:0], and NR1D_CR_TH[6:0] bits. When the detected noise amount is greater than NR1D_Y/CB/CR_TH, the absolute value of the detected noise amount is considered as NR1D_Y/CB/CR_TH (fixed value).

$$\begin{aligned} \text{ABS}(BPF_{(n)}) \leq \text{absolute value of detected noise amount when } \text{ABS}(BPF_{(n)}) \leq \text{NR1D_Y/CB/CR_TH: NOISE_ABS} \\ = \text{ABS}(BPF_{(n)}) \end{aligned}$$

$$\begin{aligned} \text{ABS}(BPF_{(n)}) > \text{absolute value of detected noise amount when } \text{ABS}(BPF_{(n)}) > \text{NR1D_Y/CB/CR_TH: NOISE_ABS} \\ = \text{NR1D_Y/CB/CR_TH} \end{aligned}$$

(3) Setting Noise Reduction Intensity (Gain)

The absolute value of the detected noise amount is multiplied by the value of gain specified by the NR1D_Y_GAIN[1:0], NR1D_CB_GAIN[1:0], and NR1D_CR_GAIN[1:0] bits, and the feedback is calculated for the original signal.

$$\begin{aligned} \text{Computation when the amount of detected noise } (BPF_{(n)}) \text{ is negative } (-): \text{DOUT} = \text{DIN} + \text{NOISE_ABS} \div \\ 2^{(\text{NR1D_Y/CB/CR_GAIN}+1)} \end{aligned}$$

Computation when the amount of detected noise ($BPF_{(n)}$) is positive (+): $DOUT = DIN - NOISE_ABS \div 2^{(NR1D_Y/CB/CR_GAIN+1)}$

Table 30.23 Horizontal Noise Reduction

Register Name	Bit Name	Initial Value	Description
IMGCNT_NR_CNT0	NR1D_MD	1	Horizontal Noise Reduction Operating Mode 0: R/G/B mode 1: Y/Cb/Cr mode
IMGCNT_NR_CNT0	NR1D_ON	0	Noise Reduction On/Off Control 0: Noise Reduction Off 1: Noise Reduction On
IMGCNT_NR_CNT0	NR1D_Y_TAP[1:0]	0	Y/G Signal TAP Select 0: Adjacent pixel 1: 2 adjacent pixels 2: 3 adjacent pixels 3: 4 adjacent pixels
IMGCNT_NR_CNT0	NR1D_Y_TH[6:0]	8	Maximum Value (Absolute Value) of Y/G Signal Coring Coring is implemented when detected noise amount value \leq NR1D_Y_TH. Unsigned: 0 to 127 [LSB]
IMGCNT_NR_CNT0	NR1D_Y_GAIN[1:0]	3	Noise Reduction Gain Adjustment of Y/G Signal 0: 1/2 1: 1/4 2: 1/8 3: 1/16
IMGCNT_NR_CNT1	NR1D_CB_TAP[1:0]	0	Cb/B Signal TAP Select 0: Adjacent pixel 1: 2 adjacent pixels 2: 3 adjacent pixels 3: 4 adjacent pixels
IMGCNT_NR_CNT1	NR1D_CB_TH[6:0]	8	Maximum Value (Absolute Value) of Cb/B Signal Coring Coring is implemented when detected noise amount value \leq NR1D_C_TH. Unsigned: 0 to 127 [LSB]
IMGCNT_NR_CNT1	NR1D_CB_GAIN[1:0]	3	Noise Reduction Gain Adjustment of Cb/B Signal 0: 1/2 1: 1/4 2: 1/8 3: 1/16
IMGCNT_NR_CNT1	NR1D_CR_TAP[1:0]	0	Cr/R Signal TAP Select 0: Adjacent pixel 1: 2 adjacent pixels 2: 3 adjacent pixels 3: 4 adjacent pixels
IMGCNT_NR_CNT1	NR1D_CR_TH[6:0]	8	Maximum Value (Absolute Value) of Cr/R Signal Coring Coring is implemented when detected noise amount value \leq NR1D_C_TH. Unsigned: 0 to 127 [LSB]
IMGCNT_NR_CNT1	NR1D_CR_GAIN[1:0]	3	Noise Reduction Gain Adjustment of Cr/R Signal 0: 1/2 1: 1/4 2: 1/8 3: 1/16

30.1.18 Color Matrix

By using a color matrix, input signal offsets and nine-axis gain can be adjusted. This enables brightness adjustment, gain adjustment, and YCbCr and GBR mutual conversion.

(1) GBR to GBR Conversion

$$YGIN_A = YGIN + IMGCNT_MTX_YG - 128$$

$$CBBIN_A = CBBIN + IMGCNT_MTX_B - 128$$

$$CRRIN_A = CRRIN + IMGCNT_MTX_R - 128$$

$$YGOUT = (IMGCNT_MTX_GG \times YGIN_A + IMGCNT_MTX_GB \times CBBIN_A + IMGCNT_MTX_GR \times CRRIN_A) \div 256$$

$$CBBOUT = (IMGCNT_MTX_BG \times YGIN_A + IMGCNT_MTX_BB \times CBBIN_A + IMGCNT_MTX_BR \times CRRIN_A) \div 256$$

$$CRROUT = (IMGCNT_MTX_RG \times YGIN_A + IMGCNT_MTX_RB \times CBBIN_A + IMGCNT_MTX_RR \times CRRIN_A) \div 256$$

(2) GBR to YCbCr Conversion

$$YGIN_A = YGIN + IMGCNT_MTX_YG - 128$$

$$CBBIN_A = CBBIN + IMGCNT_MTX_B - 128$$

$$CRRIN_A = CRRIN + IMGCNT_MTX_R - 128$$

$$YGOUT = (IMGCNT_MTX_GG \times YGIN_A + IMGCNT_MTX_GB \times CBBIN_A + IMGCNT_MTX_GR \times CRRIN_A) \div 256$$

$$CBBOUT = (IMGCNT_MTX_BG \times YGIN_A + IMGCNT_MTX_BB \times CBBIN_A + IMGCNT_MTX_BR \times CRRIN_A) \div 256 + 128$$

$$CRROUT = (IMGCNT_MTX_RG \times YGIN_A + IMGCNT_MTX_RB \times CBBIN_A + IMGCNT_MTX_RR \times CRRIN_A) \div 256 + 128$$

Table 30.24 Matrix Coefficient (Typical Value) for SMPTE 293M

	YGIN		CBBIN		CRRIN	
	Coefficient	Set Value	Coefficient	Set Value	Coefficient	Set Value
YGOUT	0.587	IMGCNT_ MTX_GG = 150	0.114	IMGCNT_MTX_GB = 29	0.299	IMGCNT_MTX_GR = 77
CBBOUT	-0.331	IMGCNT_ MTX_BG = 1963	0.500	IMGCNT_MTX_BB = 128	-0.169	IMGCNT_MTX_BR = 2005
CRROUT	-0.419	IMGCNT_ MTX_RG = 1941	-0.081	IMGCNT_MTX_RB = 2027	0.500	IMGCNT_MTX_RR = 128

(3) YCbCr to GBR Conversion

$$YGIN_A = YGIN + IMGCNT_MTX_YG - 128$$

$$CBBIN_A = CBBIN - 128$$

$$CRRIN_A = CRRIN - 128$$

$$YGOUT = (IMGCNT_MTX_GG \times YGIN_A + IMGCNT_MTX_GB \times CBBIN_A + IMGCNT_MTX_GR \times CRRIN_A) \div 256$$

$$CBBOUT = (IMGCNT_MTX_BG \times YGIN_A + IMGCNT_MTX_BB \times CBBIN_A + IMGCNT_MTX_BR \times CRRIN_A) \div 256$$

$$CRROUT = (IMGCNT_MTX_RG \times YGIN_A + IMGCNT_MTX_RB \times CBBIN_A + IMGCNT_MTX_RR \times CRRIN_A) \div 256$$

Table 30.25 Matrix Coefficient (Typical Value) for SMPTE 293M

	YGIN		CBBIN		CRRIN	
	Coefficient	Set Value	Coefficient	Set Value	Coefficient	Set Value
YGOUT	1.000	IMGCNT_ MTX_GG = 256	-0.344	IMGCNT_MTX_GB = 1960	-0.714	IMGCNT_MTX_GR = 1865
CBBOUT	1.000	IMGCNT_ MTX_BG = 256	1.772	IMGCNT_MTX_BB = 454	0.000	IMGCNT_MTX_BR = 0
CRROUT	1.000	IMGCNT_ MTX_RG = 256	0.000	IMGCNT_MTX_RB = 0	1.402	IMGCNT_MTX_RR = 359

(4) YCbCr to YCbCr Conversion

$$YGIN_A = YGIN + IMGCNT_MTX_YG - 128$$

$$CBBIN_A = CBBIN - 128$$

$$CRRIN_A = CRRIN - 128$$

$$YGOUT = (IMGCNT_MTX_GG \times YGIN_A + IMGCNT_MTX_GB \times CBBIN_A + IMGCNT_MTX_GR \times CRRIN_A) \div 256$$

$$CBBOUT = (IMGCNT_MTX_BG \times YGIN_A + IMGCNT_MTX_BB \times CBBIN_A + IMGCNT_MTX_BR \times CRRIN_A) \div 256 + 128$$

$$CRROUT = (IMGCNT_MTX_RG \times YGIN_A + IMGCNT_MTX_RB \times CBBIN_A + IMGCNT_MTX_RR \times CRRIN_A) \div 256 + 128$$

Table 30.26 YCbCr to GBR Conversion

Register Name	Bit Name	Initial Value	Description
IMGCNT_MTX_MODE	IMGCNT_MTX_MD [1:0]	3	Operating Mode 0: GBR → GBR 1: GBR → YCbCr 2: YCbCr → GBR 3: YCbCr → YCbCr
IMGCNT_MTX_YG_ADJ0	IMGCNT_MTX_YG [7:0]	128	Offset (DC) Adjustment of Y/G Signal Unsigned (0 (-128) to 128 (0) to 255 (+127) [LSB], 512 [LSB])
IMGCNT_MTX_CBB_ADJ0	IMGCNT_MTX_B [7:0]	128	Offset (DC) Adjustment of B Signal Unsigned (0 (-128) to 128 (0) to 255 (+127) [LSB])
IMGCNT_MTX_CRR_ADJ0	IMGCNT_MTX_R [7:0]	128	Offset (DC) Adjustment of R Signal Unsigned (0 (-128) to 128 (0) to 255 (+127) [LSB])
IMGCNT_MTX_YG_ADJ0	IMGCNT_MTX_GG [10:0]	256	Y/G Signal Gain Adjustment for Y/G Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
IMGCNT_MTX_YG_ADJ1	IMGCNT_MTX_GB [10:0]	0	Cb/B Signal Gain Adjustment for Y/G Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

30.2 Register Descriptions

Table 30.27 and Table 30.28 show register Configuration.

- Symbols used in Register Description:

Initial value: Register value after a power-on reset

—: Undefined value

R/W: Readable/writable. The written value can be read.

R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.

R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.

R: Read-only. The write value should always be 0.

—/W: Write-only. The read value is undefined.

Table 30.27 Register Configuration of Input Controller

Name	Abbreviation	R/W	Initial Value	Address	Access Size
External input block register update control register	INP_UPDATE	R/WC1	H'0000 0000	H'FCFF 7400	32
Input select control register	INP_SEL_CNT	R/W	H'0000 0000	H'FCFF 7404	32
External input sync signal control register	INP_EXT_SYNC_CNT	R/W	H'0000 0000	H'FCFF 7408	32
Vsync signal phase adjustment register	INP_VSYNC_PH_ADJ	R/W	H'035A 01AD	H'FCFF 740C	32
Sync signal delay adjustment register	INP_DLY_ADJ	R/W	H'0000 0000	H'FCFF 7410	32

Table 30.28 Register Configuration of Image Quality Adjustment Block

Name	Abbreviation	R/W	Initial Value	Address	Access Size
Image quality adjustment block register update control register	IMGCNT_UPDATE	R/WC1	H'0000 0000	H'FCFF 7480	32
NR control register 0	IMGCNT_NR_CNT0	R/W	H'0010 0803	H'FCFF 7484	32
NR control register 1	IMGCNT_NR_CNT1	R/W	H'0803 0803	H'FCFF 7488	32
Image quality adjustment block matrix mode register	IMGCNT_MTX_MODE	R/W	H'0000 0003	H'FCFF 74A0	32
Image quality adjustment block matrix YG adjustment register 0	IMGCNT_MTX_YG_ADJ0	R/W	H'0080 0100	H'FCFF 74A4	32
Image quality adjustment block matrix YG adjustment register 1	IMGCNT_MTX_YG_ADJ1	R/W	H'0000 0000	H'FCFF 74A8	32
Image quality adjustment block matrix CBB adjustment register 0	IMGCNT_MTX_CBB_ADJ0	R/W	H'0080 0000	H'FCFF 74AC	32
Image quality adjustment block matrix CBB adjustment register 1	IMGCNT_MTX_CBB_ADJ1	R/W	H'0100 0000	H'FCFF 74B0	32
Image quality adjustment block matrix CRR adjustment register 0	IMGCNT_MTX_CRR_ADJ0	R/W	H'0080 0000	H'FCFF 74B4	32
Image quality adjustment block matrix CRR adjustment register 1	IMGCNT_MTX_CRR_ADJ1	R/W	H'0000 0100	H'FCFF 74B8	32

30.2.1 External Input Block Register Update Control Register (INP_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	INP_EXT_UPDATE	—	—	—	INP_IMG_UPDATE
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/WC1	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	INP_EXT_UPDATE	0	R/WC1	External Input Block Register Update 0: Registers are not updated. 1: Registers are updated.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INP_IMG_UPDATE	0	R/WC1	Sync Signal Adjustment Block Register Update 0: Registers are not updated. 1: Registers are updated.

30.2.2 Input Select Control Register (INP_SEL_CNT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	INP_SEL	—	—	—	—
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	INP_FORMAT[2:0]	—	—	—	—	INP_PXD_EDGE	—	—	—	INP_VS_EDGE	—	—	—	INP_HS_EDGE	—
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	INP_SEL	0	R/W	Input Select 0: Input supplied via the external input pins is off. 1: Input supplied via the external input pins is on.
19 to 15	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
14 to 12	INP_FORMAT[2:0]	0	R/W	External Input Format Select 0: YcbCr444, RGB888 1: RGB666 2: RGB565 3: BT656 4: BT601 5: YCbCr422 6, 7: Setting prohibited
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	INP_PXD_EDGE	0	R/W	Clock Edge Select for Capturing External Input Video Image Signals DV_DATA23 to DV_DATA0 0: Rising edge 1: Falling edge
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	INP_VS_EDGE	0	R/W	Clock Edge Select for Capturing External Input Vsync Signals DV_VSYNC 0: Rising edge 1: Falling edge
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INP_HS_EDGE	0	R/W	Clock Edge Select for Capturing External Input Hsync Signals DV_HSYNC 0: Rising edge 1: Falling edge

Note: INP_FORMAT, INP_PXD_EDGE, INP_VS_EDGE, and INP_HS_EDGE are updated when the INP_EXT_UPDATE bit in INP_UPDATE is 1. INP_SEL is updated when set.

30.2.3 External Input Sync Signal Control Register (INP_EXT_SYNC_CNT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	INP_ENDIAN_ON	—	—	—	INP_SWAP_ON	—	—	—	INP_VS_INV	—	—	—	INP_HS_INV
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	INP_H_EDGE_SEL	—	—	—	INP_F525_625	—	—	INP_H_POS[1:0]	
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	INP_ENDIAN_ON	0	R/W	External Input Bit Endian Change On/Off Control 0: Off 1: On
27 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	INP_SWAP_ON	0	R/W	External Input B/R Signal Swap On/Off Control 0: Off 1: On
23 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	INP_VS_INV	0	R/W	External Input Vsync Signal DV_VSYNC Inversion Control 0: Not inverted (positive polarity) 1: Inverted (negative polarity)
19 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	INP_HS_INV	0	R/W	External Input Hsync Signal DV_HSYNC Inversion Control 0: Not inverted (positive polarity) 1: Inverted (negative polarity)
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	INP_H_EDGE_SEL	0	R/W	Reference Select for External Input BT656 Hsync Signal 0: EAV 1: SAV
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	INP_F525_625	0	R/W	Number of Lines for BT656 External Input 0: 525 lines 1: 625 lines
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	INP_H_POS[1:0]	0	R/W	Y/Cb/Y/Cr Data String Start Timing to Hsync Reference for BT656/601 or YCbCr422 External Input 0: Cb/Y/Cr/Y(BT656/601), Cb/Cr (YCbCr422) 1: Y/Cr/Y/Cb(BT656/601), setting prohibited (YCbCr422) 2: Cr/Y/Cb/Y(BT656/601), setting prohibited (YCbCr422) 3: Y/Cb/Y/Cr(BT656/601), Cr/Cb (YCbCr422)

Note: This register is updated when the INP_EXT_UPDATE bit in INP_UPDATE is 1.

30.2.4 Vsync Signal Phase Adjustment Register (INP_VSYNC_PH_ADJ)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	INP_FH50[9:0]									
Initial Value:	0	0	0	0	0	0	1	1	0	1	0	1	1	0	1	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	INP_FH25[9:0]									
Initial Value:	0	0	0	0	0	0	0	1	1	0	1	0	1	1	0	1
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25 to 16	INP_FH50 [9:0]	858	R/W	Vsync Signal 1/2fH Phase Timing 1/2 clock cycle of the horizontal cycle should be set.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	INP_FH25 [9:0]	429	R/W	Vsync Signal 1/4fH Phase Timing 1/4 clock cycle of the horizontal cycle should be set.

Note: The INP_FH50[9:0] bits are updated when the INP_EXT_UPDATE and INP_IMG_UPDATE bits in INP_UPDATE are 1. The INP_FH25[9:0] bits are updated when the INP_IMG_UPDATE bit is 1.

30.2.5 Sync Signal Delay Adjustment Register (INP_DLY_ADJ)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	
	—	—	—	—	—	INP_VS_DLY_L[2:0]	INP_FLD_DLY[7:0]										
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
	INP_VS_DLY[7:0]							INP_HS_DLY[7:0]									
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 24	INP_VS_ DLY_L[2:0]	0	R/W	Number of lines for Delaying Vsync signal and Field Differentiation Signal Delay amount: 0 to 7 (lines)
23 to 16	INP_FLD_ DLY[7:0]	0	R/W	Field Differentiation Signal Delay Amount Delay amount: 0 to 254 (clock cycles)
15 to 8	INP_VS_ DLY[7:0]	0	R/W	Vsync Signal Delay Amount Delay amount: 0 to 254 (clock cycles)
7 to 0	INP_HS_ DLY[7:0]	0	R/W	Hsync Signal Delay Amount Delay amount: 0 to 254 (clock cycles)

Note: This register is updated when the INP_IMG_UPDATE bit in INP_UPDATE is 1.

30.2.6 Image Quality Adjustment Block Register Update Control Register (IMGCNT_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	IMGCNT_UPDATE
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	IMGCNT_UPDATE	0	R/WC1	Image Quality Adjustment Block Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync signal.

30.2.7 NR Control Register 0 (IMGCNT_NR_CNT0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	NR1D_MD	—	—	—	NR1D_ON
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	NR1D_Y_TH[6:0]						—	—	NR1D_Y_TAP[1:0]		—	—	NR1D_Y_GAIN[1:0]		
Initial Value:	0	0	0	0	1	0	0	0	0	0	0	0	0	0	1	1
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	NR1D_MD	1	R/W	Horizontal Noise Reduction Operating Mode 0: G/B/R mode 1: Y/Cb/Cr mode
19 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	NR1D_ON	0	R/W	Noise Reduction On/Off Control 0: Noise reduction Off 1: Noise reduction On
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14 to 8	NR1D_Y_TH[6:0]	8	R/W	Maximum Value (Absolute Value) of Y/G Signal Coring Coring is implemented when detected noise amount value ≤ NR1D_Y_TH. Unsigned: 0 to 127 [LSB]
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5, 4	NR1D_Y_TAP[1:0]	0	R/W	Y/G Signal TAP Select 0: Adjacent pixel 1: 2 adjacent pixels 2: 3 adjacent pixels 3: 4 adjacent pixels
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	NR1D_Y_GAIN[1:0]	3	R/W	Noise Reduction Gain Adjustment of Y/G Signal 0: 1/2 1: 1/4 2: 1/8 3: 1/16

Note: This register is updated when the IMGCNT_VEN bit in IMGCNT_UPDATE is 1.

30.2.8 NR Control Register 1 (IMGCNT_NR_CNT1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	NR1D_CB_TH[6:0]						—	—	NR1D_CB_TAP[1:0]		—	—	NR1D_CB_GAIN[1:0]		
Initial Value:	0	0	0	0	1	0	0	0	0	0	0	0	0	0	1	1
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R	R	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	NR1D_CR_TH[6:0]						—	—	NR1D_CR_TAP[1:0]		—	—	NR1D_CR_GAIN[1:0]		
Initial Value:	0	0	0	0	1	0	0	0	0	0	0	0	0	0	1	1
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 24	NR1D_CB_TH[6:0]	8	R/W	Maximum Value (Absolute Value) of Cb/B Signal Coring Coring is implemented when detected noise amount value ≤ NR1D_CB_TH. Unsigned: 0 to 127 [LSB]
23, 22	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
21, 20	NR1D_CB_TAP[1:0]	0	R/W	Cb/B Signal TAP Select 0: Adjacent pixel 1: 2 adjacent pixels 2: 3 adjacent pixels 3: 4 adjacent pixels
19, 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
17, 16	NR1D_CB_GAIN[1:0]	3	R/W	Noise Reduction Gain Adjustment of Cb/B Signal 0: 1/2 1: 1/4 2: 1/8 3: 1/16
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14 to 8	NR1D_CR_TH[6:0]	8	R/W	Maximum Value (Absolute Value) of Cr/R Signal Coring Coring is implemented when detected noise amount value ≤ NR1D_CR_TH. Unsigned: 0 to 127 [LSB]
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5, 4	NR1D_CR_TAP[1:0]	0	R/W	Cr/R Signal TAP Select 0: Adjacent pixel 1: 2 adjacent pixels 2: 3 adjacent pixels 3: 4 adjacent pixels
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	NR1D_CR_GAIN[1:0]	3	R/W	Noise Reduction Gain Adjustment of Cr/R Signal 0: 1/2 1: 1/4 2: 1/8 3: 1/16

Note: This register is updated when the IMGCNT_VEN bit in IMGCNT_UPDATE is 1.

30.2.9 Image Quality Adjustment Block Matrix Mode Register (IMGCNT_MTX_MODE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	IMGCNT_MTX_MD[1:0]
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	IMGCNT_MTX_MD [1:0]	3	R/W	Operating Mode 0: GBR → GBR 1: GBR → YCbCr 2: YCbCr → GBR 3: YCbCr → YCbCr

Note: This register is updated when the IMGCNT_VEN bit in IMGCNT_UPDATE is 1.

30.2.10 Image Quality Adjustment Block Matrix YG Adjustment Register 0 (IMGCNT_MTX_YG_ADJ0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	IMGCNT_MTX_YG[7:0]							
Initial Value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	IMGCNT_MTX_GG[10:0]										
Initial Value:	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	IMGCNT_MTX_YG[7:0]	128	R/W	Offset (DC) Adjustment of Y/G Signal Unsigned (0 (-128) to 128 (0) to 255 (+127) [LSB])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	IMGCNT_MTX_GG[10:0]	256	R/W	Y/G Signal Gain Adjustment for Y/G Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

Note: This register is updated when the IMGCNT_VEN bit in IMGCNT_UPDATE is 1.

30.2.11 Image Quality Adjustment Block Matrix YG Adjustment Register 1 (IMGCNT_MTX_YG_ADJ1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	IMGCNT_MTX_GB[10:0]										
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

26 to 16	IMGCNT_MTX_RB[10:0]	0	R/W	Cb/B Signal Gain Adjustment for Cr/R Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	IMGCNT_MTX_RR[10:0]	256	R/W	Cr/R Signal Gain Adjustment for Cr/R Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

Note: This register is updated when the IMGCNT_VEN bit in IMGCNT_UPDATE is 1.

30.3 Usage Methods

30.3.1 Input Format Adjustment Method

Setting examples of each input format are shown below.

Table 30.29 External Input (BT656, 525i) Setting Example

Register Name	Bit Name	Description	Setting Value
INP_SEL_CNT	INP_SEL	Performs the on/off control of input supplied via the external input pins.	1
INP_SEL_CNT	INP_FORMAT[2:0]	Selects the externally input format.	3
INP_SEL_CNT	INP_PXD_EDGE	Selects the clock edge for capturing the externally input video signals.	0
INP_SEL_CNT	INP_VS_EDGE	Selects the clock edge for capturing the externally input Vsync signals.	0
INP_SEL_CNT	INP_HS_EDGE	Selects the clock edge for capturing the externally input Hsync signals.	0
INP_EXT_SYNC_CNT	INP_ENDIAN_ON	Changes the bit endian of the external input.	0
INP_EXT_SYNC_CNT	INP_SWAP_ON	Enables or disables the B/R signal swap of the external input.	0
INP_EXT_SYNC_CNT	INP_HS_INV	Enables or disables the Hsync signal inversion of the external input.	1
INP_EXT_SYNC_CNT	INP_VS_INV	Enables or disables the Hsync signal inversion of the external input.	1
INP_EXT_SYNC_CNT	INP_H_EDGE_SEL	Selects the Hsync reference for BT656 input.	0
INP_EXT_SYNC_CNT	INP_F525_625	Sets the number of lines for BT656 input.	0
INP_EXT_SYNC_CNT	INP_H_POS[1:0]	Sets the data start timing with respect to the Hsync in the BT656/601 format.	0
INP_VSYNC_PH_ADJ	INP_FH50[9:0]	Sets the 1/2fH phase in clock cycle units.	858
INP_VSYNC_PH_ADJ	INP_FH25[9:0]	Sets the 1/4fH phase in clock cycle units.	429
INP_DLY_ADJ	INP_VS_DLY_L[2:0]	Sets the number of lines for delaying the Vsync signal and field differentiation signal.	0
INP_DLY_ADJ	INP_VS_DLY[7:0]	Sets the amount of delay of the Vsync signal in clock cycle units.	0
INP_DLY_ADJ	INP_HS_DLY[7:0]	Sets the amount of delay of the Hsync signal in clock cycle units.	0
INP_DLY_ADJ	INP_FLD_DLY[7:0]	Sets the amount of delay of the field differentiation signal in clock units.	0

Note: Some registers require, after they are set, that the INP_EXT_UPDATE and INP_IMG_UPDATE bits in INP_UPDATE should be set to 1.

Table 30.30 External Input (BT601, 525i) Setting Example

Register Name	Bit Name	Description	Setting Value
INP_SEL_CNT	INP_SEL	Performs the on/off control of input supplied via the external input pins.	1
INP_SEL_CNT	INP_FORMAT[2:0]	Selects the externally input format.	4
INP_SEL_CNT	INP_PXD_EDGE	Selects the clock edge for capturing the externally input video signals.	0
INP_SEL_CNT	INP_VS_EDGE	Selects the clock edge for capturing the externally input Vsync signals.	0
INP_SEL_CNT	INP_HS_EDGE	Selects the clock edge for capturing the externally input Hsync signals.	0
INP_EXT_SYNC_CNT	INP_ENDIAN_ON	Changes the bit endian of the external input.	0
INP_EXT_SYNC_CNT	INP_SWAP_ON	Enables or disables the B/R signal swap of the external input.	0
INP_EXT_SYNC_CNT	INP_HS_INV	Enables or disables the Hsync signal inversion of the external input.	1
INP_EXT_SYNC_CNT	INP_VS_INV	Enables or disables the Hsync signal inversion of the external input.	1
INP_EXT_SYNC_CNT	INP_H_EDGE_SEL	Selects the Hsync reference for BT656 input.	0
INP_EXT_SYNC_CNT	INP_F525_625	Sets the number of lines for BT656 input.	0
INP_EXT_SYNC_CNT	INP_H_POS[1:0]	Sets the data start timing with respect to the Hsync in the BT656/601 format.	0
INP_VSYNC_PH_ADJ	INP_FH50[9:0]	Sets the 1/2fH phase in clock cycle units.	858
INP_VSYNC_PH_ADJ	INP_FH25[9:0]	Sets the 1/4fH phase in clock cycle units.	429
INP_DLY_ADJ	INP_VS_DLY_L[2:0]	Sets the number of lines for delaying the Vsync signal and field differentiation signal.	0
INP_DLY_ADJ	INP_VS_DLY[7:0]	Sets the amount of delay of the Vsync signal in clock cycle units.	0
INP_DLY_ADJ	INP_HS_DLY[7:0]	Sets the amount of delay of the Hsync signal in clock cycle units.	0
INP_DLY_ADJ	INP_FLD_DLY[7:0]	Sets the amount of delay of the field differentiation signal in clock units.	0

Note: Some registers require, after they are set, that the INP_EXT_UPDATE and INP_IMG_UPDATE bits in INP_UPDATE should be set to 1.

30.3.2 Usage Method of Conversion Color Matrix

Typical data conversion setting examples are shown below.

Table 30.31 Conversion Color Matrix

Register Name	Bit Name	GBR to GBR	GBR to YCbCr	YCbCr to GBR	YCbCr to YCbCr
IMGCNT_MTX_MODE	IMGCNT_MTX_MD[1:0]	0	1	2	3
IMGCNT_MTX_YG_ADJ0	IMGCNT_MTX_YG[7:0]	128	128	128	128
IMGCNT_MTX_YG_ADJ0	IMGCNT_MTX_GG[10:0]	256	150	256	256
IMGCNT_MTX_YG_ADJ1	IMGCNT_MTX_GB[10:0]	0	29	1960	0
IMGCNT_MTX_YG_ADJ1	IMGCNT_MTX_GR[10:0]	0	77	1865	0
IMGCNT_MTX_CBB_ADJ0	IMGCNT_MTX_B[7:0]	128	128	128	128
IMGCNT_MTX_CBB_ADJ0	IMGCNT_MTX_BG[10:0]	0	1963	256	0
IMGCNT_MTX_CBB_ADJ1	IMGCNT_MTX_BB[10:0]	256	128	454	256
IMGCNT_MTX_CBB_ADJ1	IMGCNT_MTX_BR[10:0]	0	2005	0	0
IMGCNT_MTX_CRR_ADJ0	IMGCNT_MTX_R[7:0]	128	128	128	128
IMGCNT_MTX_CRR_ADJ0	IMGCNT_MTX_RG[10:0]	0	1941	256	0
IMGCNT_MTX_CRR_ADJ1	IMGCNT_MTX_RB[10:0]	0	2027	0	0
IMGCNT_MTX_CRR_ADJ1	IMGCNT_MTX_RR[10:0]	256	128	359	256

Note: The registers require, after they are set, that the IMGCNT_VEN bit in IMGCNT_UPDATE should be set to 1.

31. Video Display Controller 5 (3): Scaler

31.1 Scaler

31.1.1 Overview of Functions

The scaler subjects the YCbCr and RGB signals output from the input controller, to sync signal generation; and reduction, enlargement, and rotation of the images.

The scaler also records video image in the frame buffer.

In scaler 0, either enlargement process or graphics 0 process can be used.

The functional block diagram of scaler 0 is shown below.

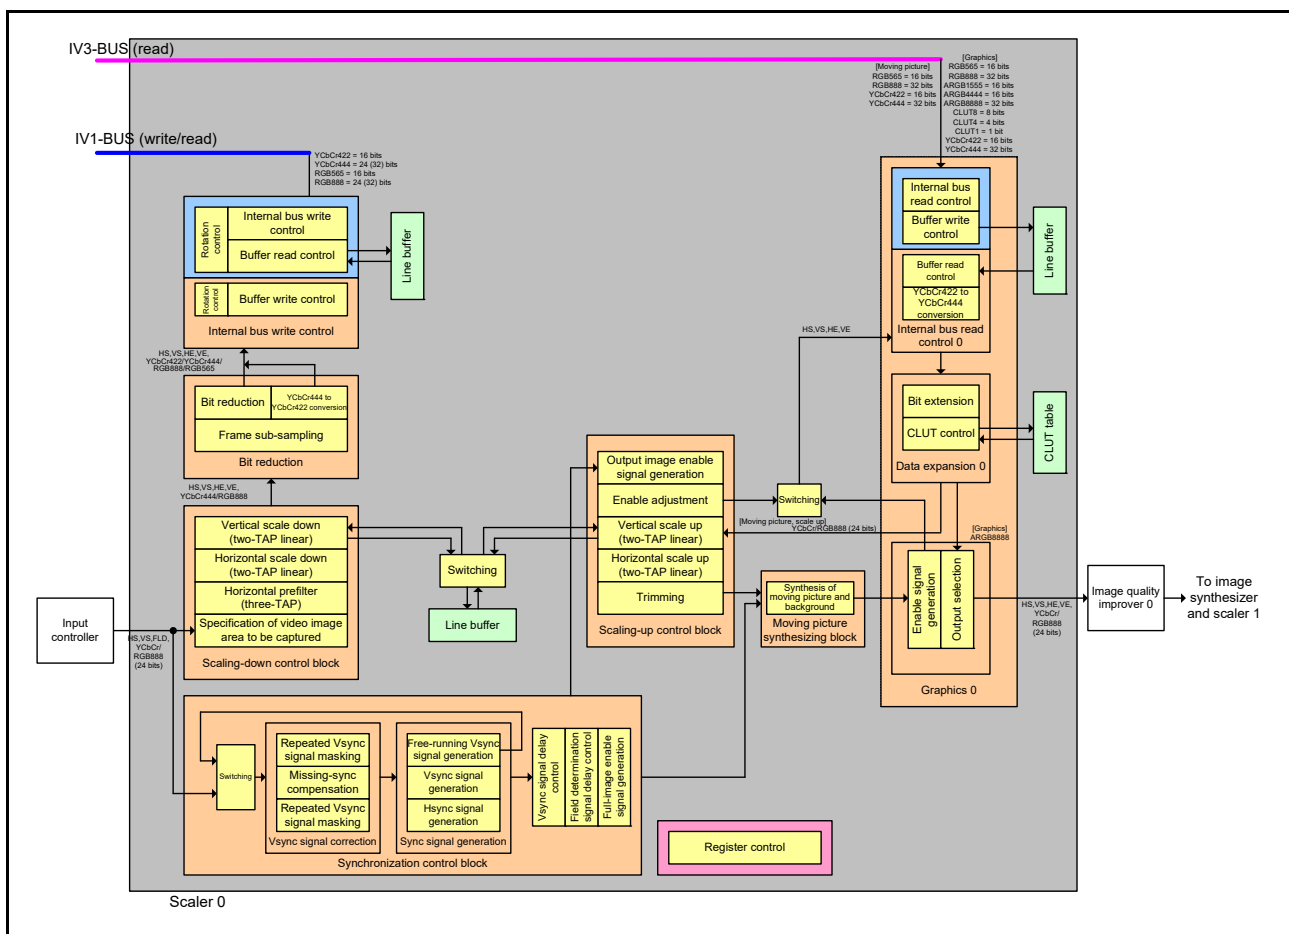

Figure 31.1 Functional Block Diagram of Scaler 0

The registers and bits in the scaler are named SC0_xxxx and those in the graphics blocks are named GR0_xxxx, but in this section, they are collectively called SC_xxxx or GR_xxxx.

31.1.2 Register Control

(1) Updating Registers

The Vsync signal is used to control the update timing of all the registers of the scaling and graphics blocks except some registers of the sync control block and some of the other blocks.

After 1 is set to the bits in the update control register, the contents of the relevant registers are modified at the rising edge of the Vsync signal. The update control register is automatically cleared to 0 after the modification.

Table 31.1 Register Update Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_UPDATE	SC_SCL0_UPDATE	0	SYNC Control Register Update 0: Registers are not updated. 1: Registers are updated.
SC_SCL0_UPDATE	SC_SCL0_VEN_D	0	Scaling-Up Control and Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
SC_SCL0_UPDATE	SC_SCL0_VEN_C	0	Scaling-Down Control and Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
SC_SCL0_UPDATE	SC_SCL0_VEN_B	0	Synchronization Control and Scaling-up Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
SC_SCL0_UPDATE	SC_SCL0_VEN_A	0	Scaling-Down Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
SC_SCL1_UPDATE	SC_SCL1_UPDATE_B	0	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated.
SC_SCL1_UPDATE	SC_SCL1_UPDATE_A	0	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated.
SC_SCL1_UPDATE	SC_SCL1_VEN_B	0	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
SC_SCL1_UPDATE	SC_SCL1_VEN_A	0	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
GR_UPDATE	GR_UPDATE	0	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated.
GR_UPDATE	GR_P_VEN	0	Graphics Display Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
GR_UPDATE	GR_IBUS_VEN	0	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

The registers controlled by SC_SCL0_VEN_A, SC_SCL0_VEN_C, SC_SCL1_VEN_A, and SC_SCL1_VEN_B are modified at the rising edge of the input Vsync signal.

The registers controlled by SC_SCL0_VEN_B, SC_SCL0_VEN_D, GR_P_VEN, and GR_IBUS_VEN are modified at the rising edge of the output Vsync signal.

31.1.3 Synchronization Control

(1) Selecting Vsync Signal

The Vsync signal to be output from the scaler can be selected.

When an external input signal is to be displayed, an external input Vsync signal should be selected to be output.

When an external input signal is not provided, a free-running Vsync signal should be selected to be output.

Table 31.2 Vsync Signal Selection Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_FRC3	SC_RES_VS_SEL	1	Vsync Signal Output Select 0: External input Vsync signal 1: Internally generated free-running Vsync signal

(2) Masking Repeated Vsync Signals

It is possible to prevent receiving the Vsync signal with a period shorter than the standard period. This is achieved by setting the start timing to receive the next Vsync signal after receiving an input Vsync signal.

The Vsync signal reception masking period is set with the SC_RES_VMASK[15:0] bits.

$$\text{Masking period [usec]} = \text{SC_RES_VMASK} \times 128 \div \text{pixel clock frequency [MHz]}$$

This function is enabled or disabled by the SC_RES_VMASK_ON bit.

Figure 31.2 Timing for Masking Repeated Vsync Signals

Table 31.3 Repeated Vsync Signal Mask Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_FRC1	SC_RES_VMASK_ON	1	Repeated Vsync Signal Masking Control 0: Repeated Vsync signal masking control is disabled. 1: Repeated Vsync signal masking control is enabled.
SC_SCL0_FRC1	SC_RES_VMASK[15:0]	2800	Repeated Vsync Signal Masking Period Sets the repeated Vsync signal masking period beginning at a Vsync signal in terms of 128 pixel-clock periods. Masking period [usec] = SC_RES_VMASK × 128 ÷ pixel clock frequency [MHz]

(3) Compensating for Missing Vsync Signals

It is possible to prevent output of the Vsync signal with a period longer than the standard period. This is achieved by setting the wait time after reception of an input Vsync signal until reception of the next Vsync signal.

If no Vsync signals are received during the wait time, an internally generated sync signal is inserted.

The wait time can be set using the SC_RES_VLACK[15:0] bits.

$$\text{Wait time [usec]} = \text{SC_RES_VLACK} \times 128 \div \text{pixel clock frequency [MHz]}$$

This function is enabled or disabled by the SC_RES_VLACK_ON bit.

If no Vsync signals are input during the Vsync signal reception time, the SC_RES_QVLACK bit is set to the high level.

If Vsync signals are continuously detected four or more times during the Vsync signal reception time, the SC_RES_QVLOCK bit is set to the high level.

The SC_RES_QVLOCK bit is valid even when both the SC_RES_VMASK_ON and SC_RES_VLACK_ON bits are set to turn off the corresponding functions.

Note that, however, the SC_RES_VMASK and SC_RES_VLACK bits must be set correctly.

Figure 31.3 Compensation of Missing Vsync Signals

Table 31.4 Missing Vsync Compensation Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_FRC2	SC_RES_VLACK_ON	1	Missing Vsync Signal Compensation 0: Compensation of missing Vsync signals is disabled. 1: Compensation of missing Vsync signals is enabled.
SC_SCL0_FRC2	SC_RES_VLACK[15:0]	3600	Missing-Sync Compensating Pulse Output Wait Time Sets the wait time before outputting a missing-sync compensating pulse after a Vsync signal. Wait time [usec] = SC_RES_VLACK × 128 ÷ pixel clock frequency [MHz]
SC_SCL0_FRC9	SC_RES_QVLACK	—	Missing Vsync Signal Detection Flag 1: Missing Vsync signal input has been detected. 0: No missing Vsync signal input has been detected.
SC_SCL0_FRC9	SC_RES_QVLOCK	—	Locked Vsync Signal Detection Flag 1: No repeated or missing Vsync signal input has been detected for four or more vertical periods. 0: Repeated or missing Vsync signal input has been detected.

For the Vsync signal, repeated-signal masking is first carried out and then missing-signal compensation is carried out, followed by another repeated-signal masking.

Repetition masking is inserted after missing-Vsync compensation to prevent output of the Vsync signal even in cases such as the input of a Vsync signal immediately after the input of a pulse to compensate for a missing Vsync signal.

On/off control of the missing-Vsync compensation also applies to the second repeated-Vsync masking; and masking period setting of the first repeated-Vsync masking also applies to the second repeated-Vsync masking.

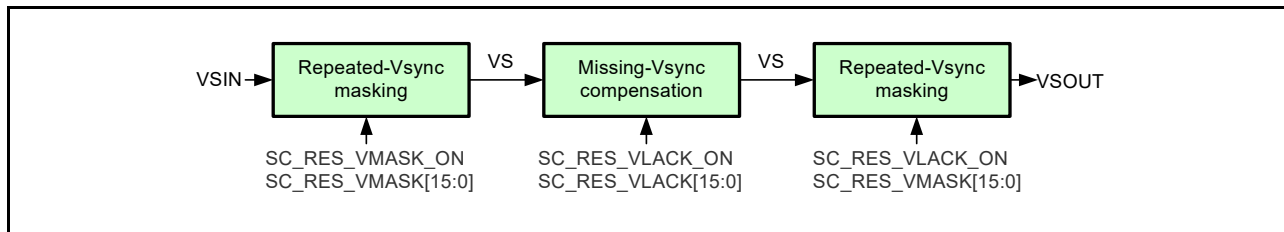

Figure 31.4 Repeated-Vsync Masking and Missing-Vsync Compensation

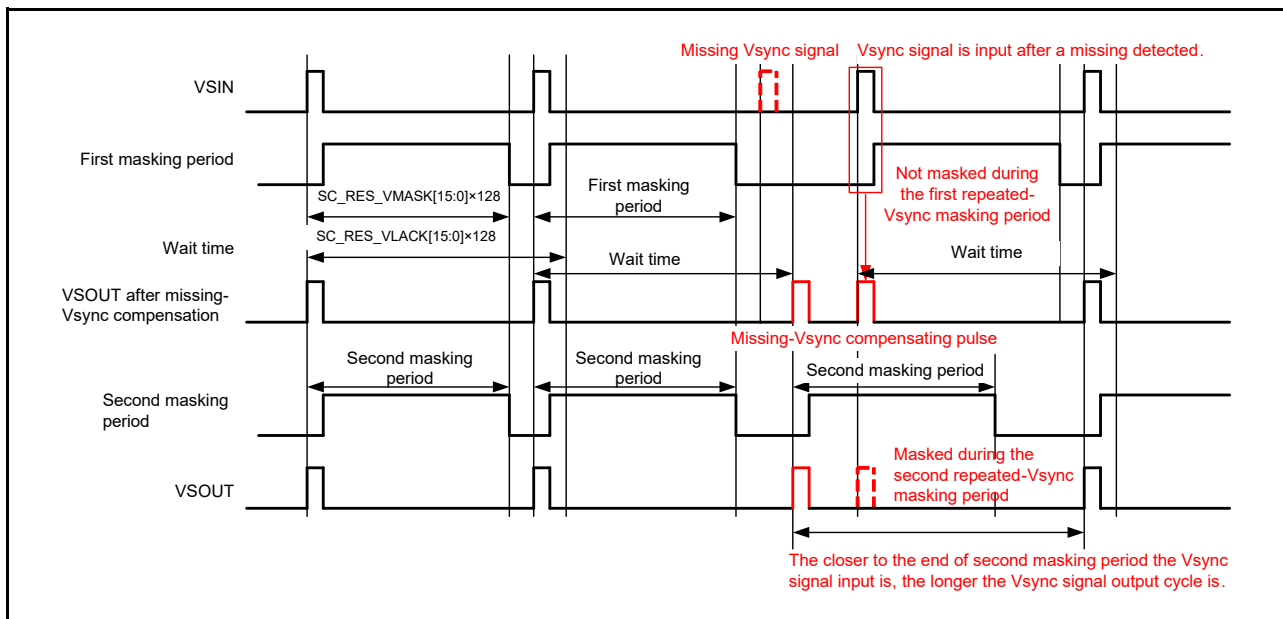

Figure 31.5 Timing for Masking Repeated Vsync Signals and Missing Vsync Signal Compensation

(4) Free-Running Period

Free-running Vsync and Hsync periods can be set.

$$\text{Hsync period [usec]} = (\text{SC_RES_FH} + 1) \div \text{pixel clock frequency [MHz]}$$

$$\text{Vsync period [usec]} = \text{horizontal period [usec]} \times (\text{SC_RES_FV} + 1)$$

Table 31.5 Free-Running Period Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_FRC4	SC_RES_FV[10:0]	524	Free-Running Vsync Period Setting Free-running Vsync period = (SC_RES_FV + 1) × horizontal period [usec]
SC_SCL0_FRC4	SC_RES_FH[10:0]	799	Hsync Period Setting Hsync period [usec] = (SC_RES_FH + 1) ÷ pixel clock frequency [MHz]

When selecting an external input Vsync signal, set the SC_RES_VS_SEL bit to 0. At this time, the internally generated free-running Vsync signal is not output.

In the meantime, the Hsync signal is always generated according to the free-running signal setting and output from the scaler.

(5) Vsync Signal Delay Control

Delay of Vsync signal output from the scaler can be controlled.

The delay is used to adjust the frame buffer read timing.

Table 31.6 Vsync Output Delay Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_FRC5	SC_RES_VSDLY[7:0]	1	Vsync Signal Delay Control Adjusts the Vsync signal delay in the output Hsync period units. Vsync signal delay [usec]: SC_RES_VSDLY × output Hsync period [usec]

Figure 31.6 Vsync Signal Phases (Two Frame-Buffer Planes Used)

Figure 31.7 Vsync Signal Phases (One Frame-Buffer Plane Used)

31.1.4 Setting Angle of View

(1) Setting Image Area to be Captured

The image area to be captured can be set for reduction or enlargement.

The area is defined by specifying its start position and width based on the input Hsync and Vsync signals.

Table 31.7 Control of Image Area to be Captured

Register Name	Bit Name	Initial Value	Description
SC_SCL0_DS2	SC_RES_VS[10:0]	18	Vertical Position Setting for Video Signal Capturing (VSYNC + (V backporch - 1) lines) Note: The set value should be four or more (lines). SC_RES_VS + SC_RES_VW should be equal to or less than 2039 (lines).
SC_SCL0_DS2	SC_RES_VW[10:0]	240	Vertical Width of Video Signal to be Captured (lines) Note: SC_RES_VS + SC_RES_VW should be equal to or less than 2039 (lines).
SC_SCL0_DS3	SC_RES_HS[10:0]	244	Horizontal Position Setting for Video Signal Capturing (HSYNC + H backporch video-image clock cycles) Note: The set value should be 16 or more (clock cycles). SC_RES_HS + SC_RES_HW should be equal to or less than 2015 (clock cycles).
SC_SCL0_DS3	SC_RES_HW[10:0]	1440	Horizontal Width of Video Signal to be Captured (video-image clock cycles) Note: SC_RES_HS + SC_RES_HW should be equal to or less than 2015 (clock cycles).

(2) Generating a Full-Screen Enable Signal

The valid period of the full screen to be output from the scaler can be set.

The valid period is defined by specifying its start position and width based on the Hsync and Vsync signals output from the scaler.

The vertical front porch should be set to four or more lines, and the horizontal front porch should be 16 or more clock cycles.

Table 31.8 Full-Screen Enable Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_FRC6	SC_RES_F_VS[10:0]	35	Vertical Enable Signal Start Position for Full Screen. (VSYNC + V backporch lines) Note: The set value should be four or more (lines). SC_RES_F_VS + SC_RES_F_VW should be equal to or less than 2039 (lines).
SC_SCL0_FRC6	SC_RES_F_VW[10:0]	480	Vertical Enable Signal Width for Full Screen (lines) Note: SC_RES_F_VS + SC_RES_F_VW should be equal to or less than 2039 (lines).
SC_SCL0_FRC7	SC_RES_F_HS[10:0]	144	Horizontal Enable Signal Start Position for Full Screen. (HSYNC + H backporch pixel-clock cycles) Note: The set value should be 16 or more (clock cycles). SC_RES_F_HS + SC_RES_F_HW should be equal to or less than 2015 (clock cycles).
SC_SCL0_FRC7	SC_RES_F_HW[10:0]	640	Horizontal Enable Signal Width for Full Screen (pixel-clock cycles) Note 1. SC_RES_F_HS + SC_RES_F_HW should be equal to or less than 2015 (clock cycles). Note 2. The set value should be equal to (horizontal signal width for full screen + 2) when serial RGB output is selected as an LCD output signal.

(3) Generating an Image Output Enable Signal

The valid period of the image to be output can be set.

The valid period is defined by specifying its start position and width based on the Hsync and Vsync signals output from the scaler.

Table 31.9 Image Output Enable Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_US2	SC_RES_P_VS[10:0]	35	Vertical Enable Signal Start Position for Output Image. (VSYNC + V backporch lines) Note: The set value should be four or more (lines). SC_RES_P_VS + SC_RES_P_VW should be equal to or less than 2039 (lines).
SC_SCL0_US2	SC_RES_P_VW[10:0]	480	Vertical Enable Signal Width for Output Image (lines) Note: SC_RES_P_VS + SC_RES_P_VW should be equal to or less than 2039 (lines).
SC_SCL0_US3	SC_RES_P_HS[10:0]	144	Horizontal Enable Signal Start Position for Output Image. (HSYNC + H backporch pixel-clock cycles) Note: The set value should be 16 or more (clock cycles). SC_RES_P_HS + SC_RES_P_HW should be equal to or less than 2015 (clock cycles).
SC_SCL0_US3	SC_RES_P_HW[10:0]	640	Horizontal Enable Signal Width for Output Image (pixel-clock cycles) Note: SC_RES_P_HS + SC_RES_P_HW should be equal to or less than 2015 (clock cycles).

Figure 31.8 Enable Settings

31.1.5 Scaling Settings

(1) Scaling Processing Block

The scaling-down control block scales down the input image from the input controller.

When rotation is required, the scaling-down control block first scales down the image and then rotates it before writing it into the frame buffer.

The scaling-up control block reads the rotated image from the frame buffer and scales it up.

Table 31.10 Rotation and Scaling Process

Rotation	Horizontal Scaling	Vertical Scaling	Scaling-Down Control Block	Scaling-Up Control Block
Normal	Horizontal scale down	Vertical scale down	Horizontal scale down/ vertical scale down	Horizontal 100% scale up/ vertical 100% scale up
	Horizontal scale down	Vertical scale up	Horizontal scale down/ vertical 100% scale up	Horizontal 100% scale up/ vertical scale up
	Horizontal scale up	Vertical scale down	Horizontal 100% scale up/ vertical scale down	Horizontal scale up/ vertical 100% scale up
	Horizontal scale up	Vertical scale up	Horizontal 100% scale up/ vertical 100% scale up	Horizontal scale up/ vertical scale up
Horizontal mirroring	Horizontal scale down	Vertical scale down	Horizontal scale down/ vertical scale down	Horizontal 100% scale up/ vertical 100% scale up
	Horizontal scale down	Vertical scale up	Horizontal scale down/ vertical 100% scale up	Horizontal 100% scale up/ vertical scale-up
	Horizontal scale up	Vertical scale down	Horizontal 100% scale up/ vertical scale down	Horizontal scale up/ vertical 100% scale up
	Horizontal scale up	Vertical scale up	Horizontal 100% scale up/ vertical 100% scale up	Horizontal scale up/ vertical scale up
90° rotation	(Horizontal input → vertical output) scale down	(Vertical input → horizontal output) scale down	Horizontal scale down/ vertical scale down	Horizontal 100% scale up/ vertical 100% scale up
	(Horizontal input → vertical output) scale down	(Vertical input → horizontal output) scale up	Horizontal scale down/ vertical 100% scale up	Horizontal scale up/ vertical 100% scale up
	(Horizontal input → vertical output) scale up	(Vertical input → horizontal output) scale up	Horizontal 100% scale up/ vertical 100% scale up	Horizontal scale up/ vertical scale up
180° rotation	Horizontal scale down	Vertical scale down	Horizontal scale down/ vertical scale down	Horizontal 100% scale up/ vertical 100% scale up
	Horizontal scale down	Vertical scale up	Horizontal scale down/ vertical 100% scale up	Horizontal 100% scale up/ vertical scale up
	Horizontal scale up	Vertical scale down	Horizontal 100% scale up/ vertical scale down	Horizontal scale up/ vertical 100% scale up
	Horizontal scale up	Vertical scale up	Horizontal 100% scale up/ vertical 100% scale up	Horizontal scale up/ vertical scale up
270° rotation	(Horizontal input→vertical output) scale down	(Vertical input→horizontal output) scale down	Horizontal scale down/ vertical scale down	Horizontal 100% scale up/ vertical 100% scale up
	(Horizontal input → vertical output) scale down	(Vertical input → horizontal output) scale up	Horizontal scale down/ vertical 100% scale up	Horizontal scale up/ vertical 100% scale up
	(Horizontal input → vertical output) scale up	(Vertical input → horizontal output) scale up	Horizontal 100% scale up/ vertical 100% scale up	Horizontal scale up/ vertical scale up

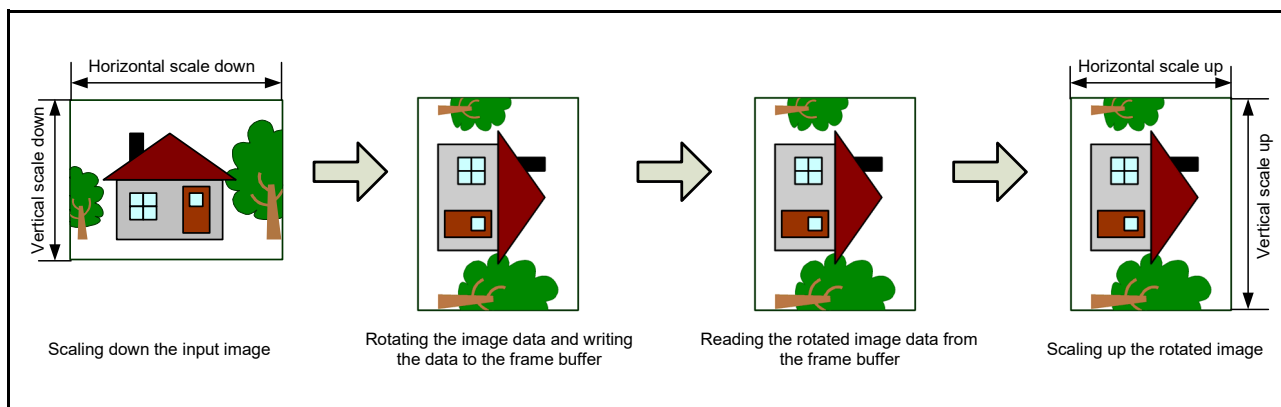

Figure 31.9 Rotation and Scaling Process

It is impossible to use vertical reduction by the scaling-down control block and vertical enlargement by the scaling-up control block simultaneously because they are mutually exclusive. Thus, the following scaling processes cannot be performed with 90° rotation or 270° rotation.

Table 31.11 Impossible Scaling Process

Rotation	Horizontal Scaling	Vertical Scaling	Scaling-Down Control Block	Scaling-Up Control Block
90° rotation 270° rotation	(Horizontal input → vertical output) scale up	(Vertical input → horizontal output) scale down	Horizontal 100% scale up/ vertical scale down	Horizontal 100% scale up/ vertical scale up

Figure 31.10 Impossible Scaling Process

31.1.6 Horizontal Prefilter

The horizontal prefilter can be turned on or off for brightness (Y) and RGB signals to suppress the frequency band of the signals during horizontal size reduction. The input format depends on the SC_RES_MD[1:0] bit setting in the writing mode register (SC_SCL1_WR1).

When the horizontal reduction ratio is high and there is too much folding frequency component to ignore, the horizontal prefilter should be turned on.

Table 31.12 Horizontal Prefilter Settings

Input Format	SC_RES_PFIL_SEL	Operation
YCbCr input	1	Turns on the horizontal prefilter for Y signal and turns off the horizontal prefilter for Cb/Cr signal.
	0	Turns off the horizontal prefilter.
RGB input	1	Turns on the horizontal prefilter for RGB signal.
	0	Turns off the horizontal prefilter.

Table 31.13 Horizontal Prefilter Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_DS4	SC_RES_PFIL_SEL	0	Prefilter Mode Select for Brightness Signals 0: The prefilter is turned off. 1: The prefilter is turned on. (1/4 + 1/2 + 1/4)

31.1.7 Horizontal Scale-Down

The number of horizontally arranged pixels can be decreased at a desired ratio in the range of 1/1 to 1/8 using pixel conversion.

For the scaling filter, either hold or linear interpolation mode can be selected.

(1) One-TAP Hold Interpolation

When the interpolation position is between input pixels X_n and X_{n+1} , the $X_{interpo}$ interpolation value is defined as follows.

$$X_{interpo} = X_n$$

(2) Two-TAP Linear Interpolation

When the interpolation position is between input pixels X_n and X_{n+1} , the $X_{interpo}$ interpolation value is defined as follows based on the interpolation position "phase".

$$X_{interpo} = (X_n \times (4096 - \text{phase}) + X_{n+1} \times \text{phase}) / 4096$$

(3) Calculation of Horizontal Scale Down Ratio

The value to be set to the horizontal scale-down ratio SC_RES_DS_H_RATIO can be obtained using the following equation based on the number of input pixels SC_RES_HW and number of output pixels SC_RES_OUT_HW, where the decimals are rounded off.

$$\text{SC_RES_DS_H_RATIO} = \text{round}(\text{SC_RES_HW} \div \text{SC_RES_OUT_HW} \times 4096)$$

Note that, for 100% horizontal scale-up, the SC_RES_HW and SC_RES_OUT_HW values should be identical and the SC_RES_DS_H_RATIO bits should be set to 4096.

(4) Handling for Lack of Last-Input Pixel

Interpolation is carried out between the second-last-input and last-input pixels to produce the last-output pixel at the right end of a screen. The interpolation position of the last-output pixel may be close to the second-last-input pixel depending on the horizontal scale-down ratio; in this case, it may appear that the last-input pixel is lacking.

The undesirable influence by lack of last-input pixel can be decreased by appropriately adjusting the horizontal scale-down ratio using the following equations.

Pre-adjustment horizontal scale-down ratio $RATIO_org$ should be calculated first to find adjustment value σ , and then scale-down ratio $SC_RES_DS_H_RATIO$ should be determined.

$$RATIO_org = \text{round} (SC_RES_HW \div SC_RES_OUT_HW \times 4096)$$

$$\sigma = (RATIO_org \times (SC_RES_OUT_HW - 1) - (SC_RES_HW - 1) \times 4096) \div (SC_RES_OUT_HW - 1)$$

$$SC_RES_DS_H_RATIO = \text{roundup} (RATIO_org - \sigma)$$

Table 31.14 Horizontal Scale Down Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_DS1	SC_RES_DS_H_ON	1	Horizontal Scale Down On/Off 0: Off 1: On
SC_SCL0_DS7	SC_RES_OUT_HW[10:0]	640	Number of Valid Horizontal Pixels Output by Scaling-down Control Block (Video-image clock cycles)
SC_SCL0_DS4	SC_RES_DS_H_INTERPOTYP	1	Horizontal Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation
SC_SCL0_DS4	SC_RES_DS_H_RATIO[15:0]	9224	Horizontal Scale Down Ratio ([15:12]: Integer part, [11:0]: Decimal part) $\text{round}(SC_RES_HW \div SC_RES_OUT_HW \times 4096)$ $SC_RES_DS_H_RATIO < 4096$: Setting prohibited $SC_RES_DS_H_RATIO = 4096$: 100% scale up $SC_RES_DS_H_RATIO > 4096$: Scale down

Note: The $SC_RES_OUT_HW$ value should be aligned in 4-pixel units and equal to or smaller than the SC_RES_HW value.

31.1.8 Vertical Scale-Down

The number of lines can be decreased in the vertical direction at a desired ratio in the range of 1/1 to 1/8 using pixel conversion.

For the scaling filter, either hold or linear interpolation mode can be selected.

(1) One-TAP Hold Interpolation

When the interpolation position is between input lines X_n and X_{n+1} , the $X_{interpo}$ interpolation value is defined as follows.

$$X_{interpo} = X_n$$

(2) Two-TAP Linear Interpolation

When the interpolation position is between input lines X_n and X_{n+1} , the $X_{interpo}$ interpolation value is defined as follows based on the interpolation position "phase".

$$X_{interpo} = (X_n \times (4096 - \text{phase}) + X_{n+1} \times \text{phase}) / 4096$$

(3) Calculation of Vertical Scale Down Ratio

The value to be set to the vertical scale-down ratio SC_RES_V_RATIO can be obtained using the following equation based on the number of input lines SC_RES_VW and number of output lines SC_RES_OUT_VW, where the decimals are rounded off.

$$\text{SC_RES_V_RATIO} = \text{round} (\text{SC_RES_VW} \div \text{SC_RES_OUT_VW} \times 4096)$$

Note that the SC_RES_VW and SC_RES_OUT_VW values should be identical for vertical enlargement or 100% vertical enlargement.

For 100% vertical enlargement, reduction is carried out assuming SC_RES_V_RATIO as 4096.

(4) Handling for Lack of Last-Input Line

Interpolation is carried out between the second-last-input and last-input lines to produce the last-output line at the lower end of a screen. The interpolation position of the last-output line may be close to the second-last-input line depending on the vertical scale-down ratio; in this case, it may appear that the last-input line is lacking.

The undesirable influence by the lack of last-input line can be decreased by appropriately adjusting the vertical scale-down ratio using the following equations.

Pre-adjustment vertical scale-down ratio RATIO_org should be calculated first to find adjustment value σ , and then scale-down ratio SC_RES_V_RATIO should be determined.

$$\text{RATIO_org} = \text{round} (\text{SC_RES_VW} \div \text{SC_RES_OUT_VW} \times 4096)$$

$$\sigma = (\text{RATIO_org} \times (\text{SC_RES_OUT_VW} - 1) - (\text{SC_RES_VW} - 1) \times 4096) \div (\text{SC_RES_OUT_VW} - 1)$$

$$\text{SC_RES_V_RATIO} = \text{round} (\text{RATIO_org} - \sigma)$$

Table 31.15 Vertical Scale Down Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_DS1	SC_RES_DS_V_ON	1	Vertical Scale Down On/Off 0: Off 1: On
SC_SCL0_DS7	SC_RES_OUT_VW [10:0]	240	Number of Valid Lines in Vertical Direction Output by Scaling-Down Control Block (lines) This bit setting is used for the number of lines to be written to the frame buffer. When SC_SCL1_WR1.SC_RES_LOOP is 0 (frame write mode), these bits specify the number of lines for one frame. When SC_SCL1_WR1.SC_RES_LOOP is 1 (line write mode), these bits specify the number of lines for writing in a ring configuration.
SC_SCL0_DS5	SC_RES_V_INTERPOTYP	1	Vertical Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation
SC_SCL0_DS6	SC_RES_V_RATIO [15:0]	2044	Vertical Scale UP/Down Ratio ([15:12]: Integer part, [11:0]: Decimal part) For scale down: $\text{round}(\text{SC_RES_VW} + \text{SC_RES_OUT_VW} \times 4096)$ For scale up: $\text{round}(\text{SC_RES_IN_VW} + \text{SC_RES_P_VW} \times 4096)$ SC_RES_V_RATIO < 4096: Scale up SC_RES_V_RATIO = 4096: 100% scale up SC_RES_V_RATIO > 4096: Scale down

Note: SC_RES_V_RATIO and SC_RES_V_INTERPOTYP are both shared by vertical reduction and vertical enlargement.

It is impossible to use vertical reduction and vertical enlargement simultaneously because they are mutually exclusive.

The SC_RES_OUT_VW value should be aligned in 4-line units and equal to or smaller than the SC_RES_VW value.

31.1.9 Horizontal Scale Up

The number of horizontally arranged pixels can be increased at a desired ratio in the range of 1/1 to 8/1 using pixel conversion.

For the scaling filter, either hold or linear interpolation mode can be selected.

(1) One-TAP Hold Interpolation

When the interpolation position is between input pixels X_n and X_{n+1} , the $X_{interpo}$ interpolation value is defined as follows.

$$X_{interpo} = X_n$$

(2) Two-TAP Linear Interpolation

When the interpolation position is between input pixels X_n and X_{n+1} , the $X_{interpo}$ interpolation value is defined as follows based on the interpolation position "phase".

$$X_{interpo} = (X_n \times (4096 - \text{phase}) + X_{n+1} \times \text{phase}) / 4096$$

(3) Calculation of Horizontal Scale Up Ratio

The value to be set to the horizontal scale-up ratio SC_RES_US_H_RATIO can be obtained using the following equation based on the number of input pixels SC_RES_IN_HW and number of output pixels SC_RES_P_HW, where the decimals are rounded off.

$$\text{SC_RES_US_H_RATIO} = \text{round} (\text{SC_RES_IN_HW} \div \text{SC_RES_P_HW} \times 4096)$$

Note that, for 100% horizontal scale-up, the SC_RES_IN_HW and SC_RES_P_HW values should be identical and the SC_RES_US_H_RATIO bits should be set to 4096.

(4) Folding Handling

Since interpolation is carried out between the last-input pixel and second-last-input folding pixel to produce the last-output pixel at the right end of a screen, folding may undesirably stand out depending on the horizontal scale up ratio.

The undesirable influence by folding pixels can be decreased by appropriately adjusting the horizontal scale-up ratio using the following equations.

Pre-adjustment horizontal scale-up ratio RATIO_org should be calculated first to find adjustment value σ , and then scale-up ratio SC_RES_US_H_RATIO should be determined.

$$\text{RATIO_org} = \text{round} (\text{SC_RES_IN_HW} \div \text{SC_RES_P_HW} \times 4096)$$

$$\sigma = (\text{RATIO_org} \times (\text{SC_RES_P_HW} - 1) - (\text{SC_RES_IN_HW} - 1) \times 4096) \div (\text{SC_RES_P_HW} - 1)$$

$$\text{SC_RES_US_H_RATIO} = \text{round} (\text{RATIO_org} - \sigma)$$

Table 31.16 Horizontal Scale Up Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_US1	SC_RES_US_H_ON	1	Horizontal Scale Up On/Off 0: Off 1: On
SC_SCL0_US4	SC_RES_IN_HW[10:0]	640	Number of Valid Horizontal Pixels Input to Scaling-up Control Block (Pixel-clock cycles)
SC_SCL0_US6	SC_RES_US_H_INTERPOTYP	1	Horizontal Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation
SC_SCL0_US5	SC_RES_US_H_RATIO [15:0]	9224	Horizontal Scale Up Ratio ([15:12]: Integer part, [11:0]: Decimal part) $\text{round}(\text{SC_RES_IN_HW} \div \text{SC_RES_P_HW} \times 4096)$ SC_RES_US_H_RATIO < 4096: Scale up SC_RES_US_H_RATIO = 4096: 100% scale-up SC_RES_US_H_RATIO > 4096: Setting prohibited

31.1.10 Vertical Scale-Up

The number of lines can be increased in the vertical direction at a desired ratio in the range of 1/1 to 8/1 using pixel conversion.

For the scaling filter, either hold or linear interpolation mode can be selected.

(1) One-TAP Hold Interpolation

When the interpolation position is between input lines X_n and X_{n+1} , the $X_{interpo}$ interpolation value is defined as follows.

$$X_{interpo} = X_n$$

(2) Two-TAP Linear Interpolation

When the interpolation position is between input lines X_n and X_{n+1} , the $X_{interpo}$ interpolation value is defined as follows based on the interpolation position "phase".

$$X_{interpo} = (X_n \times (4096 - \text{phase}) + X_{n+1} \times \text{phase}) / 4096$$

(3) Calculation of Vertical Scale Up Ratio

The value to be set to the vertical scale-up ratio SC_RES_V_RATIO can be obtained using the following equation based on the number of input lines SC_RES_IN_VW and number of output lines SC_RES_P_VW, where the decimals are rounded off.

$$\text{SC_RES_V_RATIO} = \text{round}(\text{SC_RES_IN_VW} \div \text{SC_RES_P_VW} \times 4096)$$

Note that, for 100% vertical enlargement or vertical reduction, the SC_RES_IN_VW and SC_RES_P_VW values should be identical.

(4) Folding Handling

The last line to be output at the bottom of the screen is produced by interpolation between the last line and line for folding (second-last line to be input). According to the vertical scale-up rate, this may cause folding to stand out.

The undesirable influence by folding lines can be decreased by appropriately adjusting the vertical scale-up ratio using the following equations.

Pre-adjustment vertical scale-up ratio $RATIO_org$ should be calculated first to find adjustment value σ , and then scale-up ratio $SC_RES_V_RATIO$ should be determined.

$$RATIO_org = \text{round} (SC_RES_IN_VW \div SC_RES_P_VW \times 4096)$$

$$\sigma = (RATIO_org \times (SC_RES_P_VW - 1) - (SC_RES_IN_VW - 1) \times 4096) \div (SC_RES_P_VW - 1)$$

$$SC_RES_V_RATIO = \text{round} (RATIO_org - \sigma)$$

Table 31.17 Vertical Scale Up Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_US1	SC_RES_US_V_ON	1	Vertical Scale Up On/Off 0: Off 1: On
SC_SCL0_US4	SC_RES_IN_VW[10:0]	240	Number of Valid Lines in Vertical Direction Input to Scaling-up Control Block (Lines)
SC_SCL0_DS5	SC_RES_V_INTERPOTYP	1	Vertical Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation
SC_SCL0_DS6	SC_RES_V_RATIO[15:0]	2044	Vertical Scale Up Ratio ([15:12]: Integer part, [11:0]: Decimal part) For scale down: $\text{round}(SC_RES_VW + SC_RES_OUT_VW \times 4096)$ For scale up: $\text{round}(SC_RES_IN_VW + SC_RES_P_VW \times 4096)$ $SC_RES_V_RATIO < 4096$: Scale up $SC_RES_V_RATIO = 4096$: 100% scale up $SC_RES_V_RATIO > 4096$: Scale down

Note: $SC_RES_V_RATIO$ and $SC_RES_V_INTERPOTYP$ are both shared by vertical reduction and vertical enlargement.

It is impossible to use vertical reduction and vertical enlargement simultaneously because they are mutually exclusive.

31.1.11 IP Conversion

(1) Initial Phase Control

When interlaced signals are input, line flickering caused by the line offset between the top and bottom fields can be decreased before being displayed by independently adjusting the initial scaling phases of the fields.

For various operations, appropriate settings should be made referring to the relevant registers as listed in Table 31.18.

Table 31.18 Initial Scaling Phase Settings (Standard Values) for IP Conversion

Rotation	Horizontal Scaling	Vertical Scaling	Reference Bit (Setting)
Normal	Horizontal scale down	Vertical scale down	SC_RES_TOP_INIPHASE = 2048
	Horizontal scale down	Vertical scale up	SC_RES_TOP_INIPHASE = 2048
	Horizontal scale up	Vertical scale down	SC_RES_TOP_INIPHASE = 2048
	Horizontal scale up	Vertical scale up	SC_RES_TOP_INIPHASE = 2048
Horizontal mirroring	Horizontal scale down	Vertical scale down	SC_RES_TOP_INIPHASE = 2048
	Horizontal scale down	Vertical scale up	SC_RES_TOP_INIPHASE = 2048
	Horizontal scale up	Vertical scale down	SC_RES_TOP_INIPHASE = 2048
	Horizontal scale up	Vertical scale up	SC_RES_TOP_INIPHASE = 2048
90° rotation	(Horizontal input → vertical output) scale down	(Vertical input → horizontal output) scale down	SC_RES_TOP_INIPHASE = 2048
	(Horizontal input → vertical output) scale down	(Vertical input → horizontal output) scale up	SC_RES_TOP_INIPHASE = 2048
	(Horizontal input → vertical output) scale up	(Vertical input → horizontal output) scale up	SC_RES_US_HB_INIPHASE = 2048
180° rotation	Horizontal scale down	Vertical scale down	SC_RES_TOP_INIPHASE = 2048
	Horizontal scale down	Vertical scale up	SC_RES_BTM_INIPHASE = 2048
	Horizontal scale up	Vertical scale down	SC_RES_TOP_INIPHASE = 2048
	Horizontal scale up	Vertical scale up	SC_RES_BTM_INIPHASE = 2048
270° rotation	(Horizontal input → vertical output) scale down	(Vertical input → horizontal output) scale down	SC_RES_TOP_INIPHASE = 2048
	(Horizontal input → vertical output) scale down	(Vertical input → horizontal output) scale up	SC_RES_TOP_INIPHASE = 2048
	(Horizontal input → vertical output) scale up	(Vertical input → horizontal output) scale up	SC_RES_US_HT_INIPHASE = 2048

Note: Set 0 to the initial phase control registers where the specific value is not shown in the table.
Set 0 to all the initial phase control registers when progressive signals are input.

Table 31.19 Initial Scaling Phase Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_DS5	SC_RES_BTM_INIPHASE [11:0]	0	Vertical Interpolation Start Phase for Bottom Field 0 to 4095 (0 to approx. 1.0)
SC_SCL0_DS5	SC_RES_TOP_INIPHASE [11:0]	2048	Vertical Interpolation Start Phase for Top Field 0 to 4095 (0 to approx. 1.0)
SC_SCL0_US6	SC_RES_US_HB_INIPHASE [11:0]	0	Horizontal Interpolation Start Phase for Bottom Field 0 to 4095 (0 to approx. 1.0)
SC_SCL0_US6	SC_RES_US_HT_INIPHASE [11:0]	0	Horizontal Interpolation Start Phase for Top Field 0 to 4095 (0 to approx. 1.0)

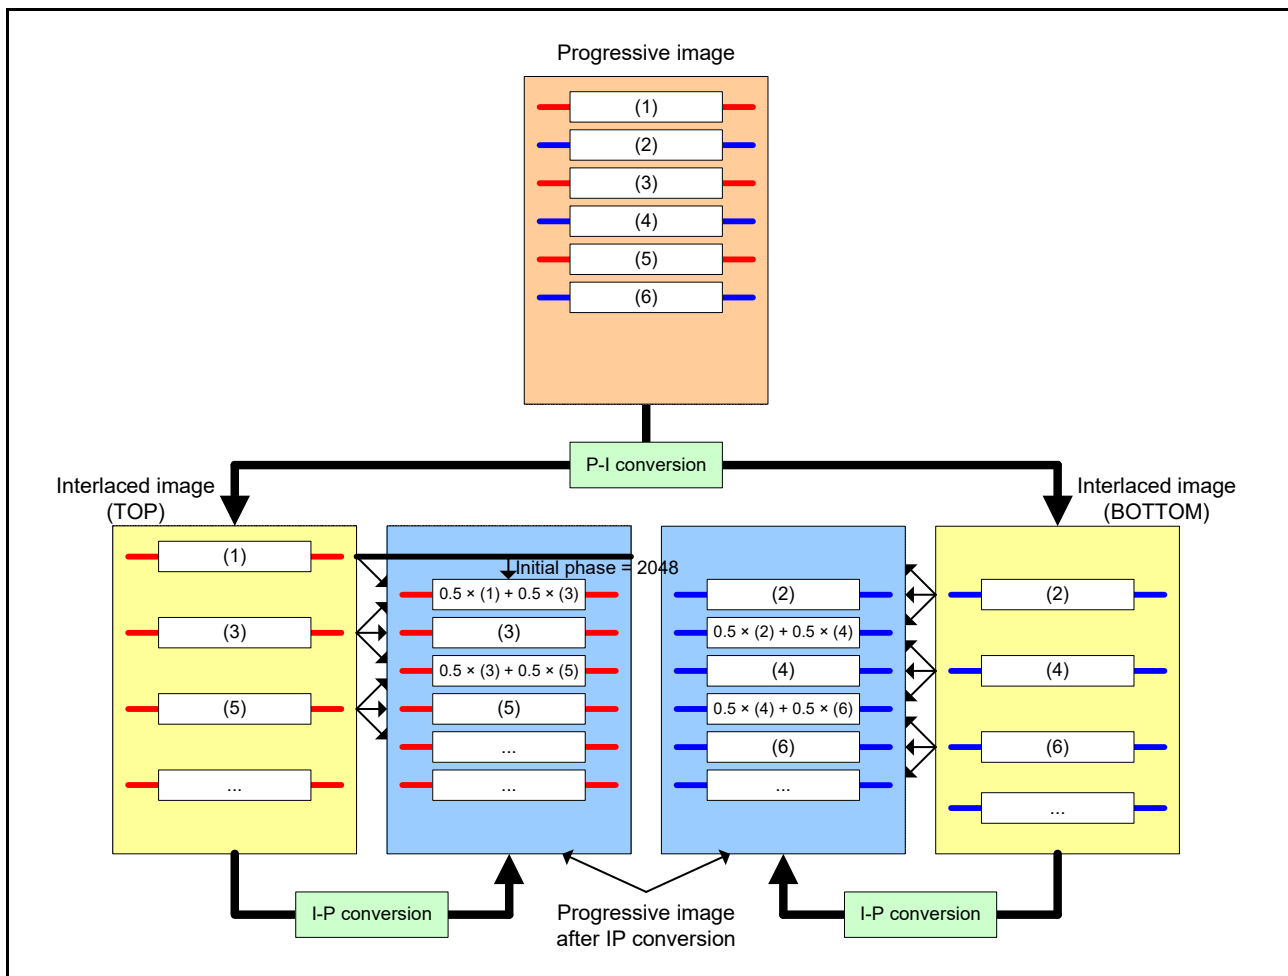

Figure 31.11 IP Conversion Processing Schematic Diagram

(2) Field Determination Signal Control

When interlaced signals are input, the field determination signal can be controlled, which is output to the scaling-up control block during vertical scaling.

When progressive signals are input or vertical scaling is carried out by the scaling-down control block, the field determination signal output to the scaling-up control block is fixed to the specific level, and thus either 0 or 1 can be set to the SC_RES_FLD_DLY_SEL bit.

Table 31.20 Settings for Field Determination Signal Control

Input Signal	Rotation	Vertical Processing	Frame Buffer	SC_RES_FLD_DLY_SEL
Progressive	—	—	—	—
Interlace	Normal Horizontal mirroring 180° rotation	Vertical scale down	—	—
		Vertical scale up	One plane or less	0
	90° rotation 270° rotation	(Horizontal input → vertical output) scale down	—	—
		(Horizontal input → vertical output) scale up	Two planes or more	1

Table 31.21 Field Determination Signal Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_FRC5	SC_RES_FLD_DLY_SEL	1	Field Determination Signal Delay Control 0: No delay 1: Delay of one vertical cycle

31.1.12 Control of Interrupt on Specified Image Line before Scaling-down, and Reading of Current Image Line before Scaling-down

When the location of the image line input to the scaling-down control block matches the SC_SCL1_LINE setting, an interrupt processing is done. In addition, the current location of the line input to the scaling-down control block can be read from a register.

Table 31.22 Control of Interrupt on Specified Image Line before Scaling-down, and Reading of Current Image line before Scaling-down

Register Name	Bit Name	Initial Value	Description
SC_SCL0_INT	SC_RES_LINE[10:0]	All 0	Setting of Interrupt on Image Line Input to Scaling-down Control Block When the location of the image line input to the scaling-down control block matches the SC_SCL0_LINE setting, an interrupt signal is output. (Setting prohibited in this product)
SC_SCL0_MON0	SC_RES_LIN_STAT[10:0]	All 0	Current Location of Image Line Input to Scaling-down Control Block

31.1.13 Trimming

The upper, lower, right, and left parts of a post-scaling image can be trimmed off as specified by the SC_RES_V CUT and SC_RES_H CUT bits before being output.

The frame lines of the post-scaling image can also be displayed by setting the SC_RES_DISP_ON bit to 1.

Figure 31.12 Area Relationship for Trimming (Frame Lines Displayed)

Table 31.23 Trimming Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_US7	SC_RES_H CUT[7:0]	0	Horizontal Amount of Cut-off Post-Scaling Image (Right and Left Parts) Sets the number of pixel-clock cycles.
SC_SCL0_US7	SC_RES_V CUT[7:0]	0	Vertical Amount of Cut-off Post-Scaling Image (Upper and Lower Parts) Sets the number of lines.
SC_SCL0_US8	SC_RES_DISP_ON	0	Post-Scaling Image Frame Display On/Off 0: Frame display on 1: Frame display off

31.1.14 Screen Synthesis

During the valid full-screen period, the image area can be overlaid before being output. If the image area to be output is smaller than a full-screen, the background color specified by the SC_RES_BK_COL_R, SC_RES_BK_COL_G, and SC_RES_BK_COL_B bits are displayed to fill the background.

Table 31.24 Screen Synthesis Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_OVR1	SC_RES_BK_COL_R [7:0]	128	Background Color Setting R/Cr Signal R: 8 bits; unsigned (0 to 255 [LSB]) Cr: 8 bits; 128 offset binary; unsigned (0 to 255 [LSB])
SC_SCL0_OVR1	SC_RES_BK_COL_B [7:0]	128	Background Color Setting B/Cb Signal B: 8 bits; unsigned (0 to 255 [LSB]) Cb: 8 bits; 128 offset binary; unsigned (0 to 255 [LSB])
SC_SCL0_OVR1	SC_RES_BK_COL_G [7:0]	0	Background Color Setting G/Y Signal G/Y: 8 bits; unsigned (0 to 255 [LSB])

Figure 31.13 Area Relationship with Output Image Size Smaller than a Full Screen

31.1.15 Selecting Format for Writing Video Image Signals to Frame Buffer

A format can be selected for writing video image signals to the frame buffer.

Although 24-bit YCbCr signals or 24-bit RGB signals are input to the scaling control block, they are converted into 16-bit YCbCr422 signals, 16-bit RGB565 signals, 32-bit YCbCr444 signals, or 32-bit RGB888 signals before being written to the frame buffer.

As bit reduction processing of RGB565, rounding off or 2×2 pattern dither can be selected with the SC_RES_DTH_ON bit. For details on pattern dither, see section 34.1.7, Dither Process in section 34., Video Display Controller 5 (7): Output Controller.

Table 31.25 Frame Buffer Writing Mode Setting

RES_BITDEC_ON	SC_RES_MD[1:0]	Writing Mode
0	3	YCbCr444 (normal, horizontal mirroring)
0	2	RGB888 (normal, horizontal mirroring)
1	1	RGB565 (normal, horizontal mirroring, rotation)
*	0	YCbCr422 (normal, horizontal mirroring, rotation)

Table 31.26 Video Signal Writing Format Selection Control

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR1	SC_RES_MD[1:0]	0	Frame Buffer Video-Signal Writing Format 0: YCbCr422 (16 bits) 1: RGB565 (16 bits) 2: RGB888 (24 (32) bits) 3: YCbCr444 (24 (32) bits)
SC_SCL1_WR6	SC_RES_BITDEC_ON	0	Bit Reduction On/Off 0: Off 1: On
SC_SCL1_WR6	SC_RES_DTH_ON	0	Dither Correction On/Off 0: Off (rounded off) 1: On (2×2 pattern dither)

31.1.16 Horizontal Mirroring and Rotation

Horizontal mirroring and rotation can be carried out for scaled-down images before being written to the frame buffer.

Table 31.27 and Table 31.28 show the relationship between various writing modes for image processing and video signals.

Table 31.27 Relationship between Writing Modes and Video Signals

RES_DS_WR_MD[2:0]	Writing Modes	YCbCr444	YCbCr422	RGB565	RGB888
0	Normal writing	Enabled	Enabled	Enabled	Enabled
1	Horizontal mirroring	Enabled	Enabled	Enabled	Enabled
2	90° rotation	Disabled	Enabled	Enabled	Disabled
3	180° rotation	Disabled	Enabled	Enabled	Disabled
4	270° rotation	Disabled	Enabled	Enabled	Disabled
5 to 7	Setting prohibited	—	—	—	—

Table 31.28 Horizontal Mirroring and Rotation Control

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR1	SC_RES_DS_WR_MD [2:0]	0	Frame Buffer Writing Mode for Image Processing 0: Normal 1: Horizontal mirroring 2: 90° rotation 3: 180° rotation 4: 270° rotation 5 to 7: Setting prohibited

31.1.17 Writing to Frame Buffer

(1) Frame Buffer Transfer Mode

Either 32-byte or 128-byte transfer mode can be selected for accessing the frame buffer in which video image data and graphics data are stored.

Table 31.29 Frame Buffer Transfer Mode

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR1	SC_RES_BST_MD	0	Transfer Burst Length for Frame Buffer Writing 0: 32-byte 1: 128-byte

(2) Frame Buffer Write Control

Frame buffer writing is enabled or disabled.

Table 31.30 Frame Buffer Writing Control

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR5	SC_RES_WENB	0	Frame Buffer Write Enable After making the setting to enable writing, writing starts from the second frame. 0: Frame buffer writing is disabled. 1: Frame buffer writing is enabled.

(3) Frame Buffer Writing Rate Selection

A frame buffer writing rate can be selected from among 1/1, 1/2, 1/4, and 1/8 the vertical frequency of the input signal.

When 1/2, 1/4, or 1/8 is selected, either the top or bottom field can be selected for writing.

Table 31.31 Frame Buffer Write Control

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR5	SC_RES_FS_RATE [1:0]	0	Writing Rate Sets the frame buffer writing rate to the vertical frequency of the input signal. 0: 1/1 an input signal (The SC_RES_FLD_SEL setting is invalid.) 1: 1/2 an input signal 2: 1/4 an input signal 3: 1/8 an input signal
SC_SCL1_WR5	SC_RES_FLD_SEL	0	Write Field Select 0: Top field 1: Bottom field
SC_SCL1_WR5	SC_RES_INTER	1	Field Operating Mode Select 0: Progressive 1: Interlace

(4) Frame Buffer Write Addresses

Frame buffer addresses are specified using the base address, line offset address, frame offset address, data size of a line, and the number of lines in a frame. When an interlaced video image is input, the top and bottom field data can be separately stored in the frame buffer.

The SC_RES_BASE[31:0], SC_RES_LN_OFF[14:0], and SC_RES_FLM_OFF[22:0] bits should be set in 32-byte units (the lower five bits should be fixed to 0).

For 128-byte transfer, bits [6:5] in the address control registers should be fixed to 0 since addresses should be specified in 128-byte units.

For the data size of a line and the number of lines in a frame, the relevant register values set for the scaling-down control block are used.

Table 31.32 Frame Buffer Write Address Control

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR1	SC_RES_TB_ADD_MOD	0	Top and Bottom Data Write Address Specification Method 0: A write address is specified in common for top and bottom data. 1: Separate write addresses are specified for top and bottom data.
SC_SCL1_WR2	SC_RES_BASE [31:0]	0	Frame Buffer Base Address Sets the start address of the frame buffer to store the frame data for the top field when SC_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC_RES_TB_ADD_MOD = 0. For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000.
SC_SCL1_WR8	SC_RES_BASE_B [31:0]	0	Frame Buffer Base Address for Bottom Sets the start address of the frame buffer to store the frame data for the bottom field when SC_RES_TB_ADD_MOD = 1. For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000.
SC_SCL1_WR3	SC_RES_LN_OFF [14:0]	2048	Frame Buffer Line Offset Address Sets the line offset address for calculating the line start address for the top field when SC_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC_RES_TB_ADD_MOD = 0. Line 0: SC_RES_BASE Line 1: SC_RES_BASE + SC_RES_LN_OFF × 1 : Line n: SC_RES_BASE + SC_RES_LN_OFF × n For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000.
SC_SCL1_WR9	SC_RES_LN_OFF_B [14:0]	2048	Frame Buffer Line Offset Address for Bottom Sets the line offset address for calculating the line start address for the bottom field when SC_RES_TB_ADD_MOD = 1. Line 0: SC_RES_BASE_B Line 1: SC_RES_BASE_B + SC_RES_LN_OFF_B × 1 : Line n: SC_RES_BASE_B + SC_RES_LN_OFF_B × n For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000.
SC_SCL1_WR4	SC_RES_FLM_OFF [22:0]	524288	Frame Buffer Frame Offset Address Sets the frame offset address for calculating the start address of each frame for the top field when SC_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC_RES_TB_ADD_MOD = 0. Buffer 0: SC_RES_BASE Buffer 1: SC_RES_BASE + SC_RES_FLM_OFF × 1 : Buffer n: SC_RES_BASE + SC_RES_FLM_OFF × n For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000.

Table 31.32 Frame Buffer Write Address Control

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR10	SC_RES_FLM_OFF_B [22:0]	524288	<p>Frame Buffer Frame Offset Address for Bottom</p> <p>Sets the frame offset address for calculating the start address of each frame for the bottom field when SC_RES_TB_ADD_MOD = 1.</p> <p>Buffer 0: SC_RES_BASE_B Buffer 1: SC_RES_BASE_B + SC_RES_FLM_OFF_B × 1 : Buffer n: SC_RES_BASE_B + SC_RES_FLM_OFF_B × n</p> <p>For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000.</p>

Figure 31.14 Data Arrangement in Frame Buffer

Figure 31.15 Data Arrangement in Frame Buffer in Various Writing Modes

(5) Frame Buffer Management

The scaling control block can handle multiple frames as the frame buffer.

Data is written to the buffer in cyclic mode according to the number of frames specified by the SC_RES_FLM_NUM bits.

For rotation, the SC_RES_FLM_NUM bits should be set to two or more frames.

To use the frame buffer as the ring buffer in line mode, the SC_RES_FLM_NUM bits should be set to 0 (1 frame) and the SC_RES_LOOP bit to 1.

Table 31.33 Frame Buffer Write Control

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR3	SC_RES_FLM_NUM[9:0]	1	Number of Frames of Buffer to be Written to Sets the number of frames for the top field when SC_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC_RES_TB_ADD_MOD = 0 Number of frames defined by SC_RES_FLM_NUM + 1 are used.
SC_SCL1_WR9	SC_RES_FLM_NUM_B[9:0]	1	Number of Frames of Buffer to be Written to for Bottom Field when SC_RES_TB_ADD_MOD = 1 Number of frames defined by SC_RES_FLM_NUM_B + 1 are used.
SC_SCL1_WR1	SC_RES_LOOP	0	Frame Buffer Write Mode Select 0: Frame mode 1: Line mode (read as ring buffer)
SC_SCL1_WR7	SC_RES_FLM_CNT[9:0]	—	Frame Number of Frame Being Accessed Frame number of the frame being accessed in the top field when SC_RES_TB_ADD_MOD = 1 or that in the top or bottom field when SC_RES_TB_ADD_MOD = 0.
SC_SCL1_WR11	SC_RES_FLM_CNT_B[9:0]	—	Frame Number of Frame Being Accessed in Bottom Field Frame number of the frame being accessed in the bottom field when SC_RES_TB_ADD_MOD = 1.

(6) Buffer Overflow Handling

If writing to the frame buffer cannot be completed due to bus-traffic related problems, an overflow interrupt can be output to the interrupt controller.

Table 31.34 Buffer Overflow Detection

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR7	SC_RES_OVERFLOW	—	Line Buffer Overflow Detect 1: Line buffer has overflowed. 0: Line buffer has not overflowed.

(7) Frame Buffer Write End Flag

When writing one frame of data to the frame buffer is completed, a frame buffer write end interrupt can be output to the interrupt controller.

31.1.18 Selecting a Scaling-up Process or Graphics 0 Process

Scaling-up process and graphics 0 process are mutually exclusive and thus frame buffer cannot be read out simultaneously for the processes.

When displaying input video image signals or displaying enlarged graphics, data is read from the frame buffer via the scaling-up control block.

However, graphics can be enlarged and displayed by the scaling-up control block only when the RGB565, RGB888, YCbCr422, or YCbCr444 format is used.

When displaying graphics without enlargement, the data is read from the frame buffer via the graphics 0 processing block.

With the SC_RES_IBUS_SYNC_SEL bit, sync signals for reading out the frame buffer and read size setting bits are selected.

Table 31.35 Selection of Scaling-Up Process and Graphics 0 Process

Type of Output Scaling Display	SC_RES_IBUS_SYNC_SEL	Sync Signals for Frame Buffer Read	Frame Buffer Read Size Setting Bits	Display Enabling Bits
Input video signal display Enlarged graphics display	0	Output from scaling-up control block	SC_RES_IN_VW SC_RES_IN_HW	SC_RES_P_VS SC_RES_P_VW SC_RES_P_HS SC_RES_P_HW
Graphics display	1	Output from graphics 0 processing block	GR_FLM_LNUM* GR_HW*	GR_GRC_VS GR_GRC_VW GR_GRC_HS GR_GRC_HW

Note: * The value set to the register + 1 is the actual read size.

Figure 31.16 Area Setting for Input Video Image Signal Display and Enlarged Graphics Display

Figure 31.17 Area Setting for Graphics Display

Table 31.36 Scaling-Up Process or Graphics 0 Process Selection

Register Name	Bit Name	Initial Value	Description
SC_SCL0_US8	SC_RES_IBUS_SYNC_SEL	0	Sync Signal Select for Frame Buffer Read Block 0: Sync signals from the scaling-up control block 1: Sync signals from the graphics processing block

The GR_DISP_SEL bits are used to select a display by the scaling-up control block (video image display or enlarged graphics display) or graphics display.

For details on the graphics processing, refer to the section 33., Video Display Controller 5 (5): Image Synthesizer.

31.1.19 Selecting Field for Frame Buffer Reading

For the next frame buffer to be read, the top or bottom field can be selected. This field selection is used in the scaling-up control block.

Table 31.37 Field Specification for Frame Buffer Reading

Register Name	Bit Name	Initial Value	Description
GR_FLM1	GR_FLD_SEL	0	Enables or disables top or bottom field selection for the next frame buffer to be read. 0: Field selection is disabled. 1: Top or bottom field can be selected.
GR_FLM3	GR_FLD_NXT	0	Selects the top or bottom field for the next frame buffer. 0: Bottom 1: Top

31.1.20 Pointer Buffer and Frame Buffer Reading Processing

(1) Pointer Buffers

The pointer buffers can be used to control the frame buffer for the input video image. They are mainly used to prevent flicker in the output video image, which occurs when the input and output vertical sync signals are asynchronous.

Four pointer buffers are provided and each pointer buffer has a start address register that shows the start location of the frame buffer and a field information register that shows the current field is the top or bottom field. The four pointer buffers are arranged in a ring structure and a write pointer is provided to indicate the pointer buffer corresponding to the location currently being written to. The location pointed to by the write pointer is being written to, and the corresponding pointer buffer value is undetermined. The value in the pointer buffer corresponding to the location being written to and the value in the write pointer are automatically updated when frame data writing is completed.

When the frame buffer address setting signal is linked with the pointer buffer ($GR_FLM_SEL = 3$), frame buffer reading can be controlled by using the read pointer that indicates the pointer buffer corresponding to the location being read; the start address and field information of the next frame buffer to be read should be read from the pointer buffer and they should be set in the frame buffer base address and field information. The read pointer value is automatically updated at the rising edge of the vertical sync signal on the reading side.

(2) Write Pointer Control

The write pointer is incremented by one every time frame data writing is completed.

(3) Read Pointer Control

The read pointer is updated at the rising edge of the vertical sync signal on the reading side according to the difference between the read and write pointer values as follows.

(A) When $(\text{write pointer value}) - (\text{read pointer value}) \leq 1$

The read pointer value is not updated (the same frame is displayed continuously).

(B) When $(\text{write pointer value}) - (\text{read pointer value}) = 2$

The read pointer is incremented by one with the next updating timing.

(C) When $(\text{write pointer value}) - (\text{read pointer value}) \geq 3$

The read pointer is incremented by two with the next updating timing.

(One frame is skipped.)

(4) Frame Buffer Read Control

(A) When $SC_RES_WENB = 0$

Frame data is not written to the frame buffer, and the frame buffer is not read.

(B) When frame data writing is terminated with $SC_RES_WENB = 1$

As the pointer buffer value is determined, the frame buffer is read.

Table 31.38 Frame Buffer Control

Register Name	Bit Name	Initial Value	Description
SC_SCL1_PBUF0	SC_BUF0_ADD	0	Start address of the write buffer pointed to by pointer buffer 0
SC_SCL1_PBUF1	SC_BUF1_ADD	0	Start address of the write buffer pointed to by pointer buffer 1
SC_SCL1_PBUF2	SC_BUF2_ADD	0	Start address of the write buffer pointed to by pointer buffer 2
SC_SCL1_PBUF3	SC_BUF3_ADD	0	Start address of the write buffer pointed to by pointer buffer 3
SC_SCL1_PBUF_FLD	SC_FLD_INF0	0	Top or bottom field information pointed to by pointer buffer 0 0: Bottom 1: Top
SC_SCL1_PBUF_FLD	SC_FLD_INF1	0	Top or bottom field information pointed to by pointer buffer 1 0: Bottom 1: Top
SC_SCL1_PBUF_FLD	SC_FLD_INF2	0	Top or bottom field information pointed to by pointer buffer 2 0: Bottom 1: Top
SC_SCL1_PBUF_FLD	SC_FLD_INF3	0	Top or bottom field information pointed to by pointer buffer 3 0: Bottom 1: Top
SC_SCL1_PBUF_CNT	SC_PBUF_RST	0	Reset Control for the Pointer Buffer 0: Pointer buffer is not reset. 1: Pointer buffer is reset.
SC_SCL1_MON1	SC_PBUF_NUM	0	Write pointer indicating the pointer buffer number corresponding to the location currently being written to.
SC_SCL1_WR5	SC_RES_WENB	0	Frame Buffer Write Enable After making the setting to enable writing, writing starts from the second frame. 0: Writing is disabled. 1: Writing is enabled.
GR_FLM1	GR_FLM_SEL	0	Frame Buffer Address Setting Signal Selection 0: Links to scaling-down process. (This setting is prohibited when separate write addresses are specified for the top and bottom fields; that is, SC_RES_TB_ADD_MOD = 1 in SC_SCL1_WR1.) 1: Selects GR0_FLM_NUM. 2: Setting prohibited 3: Links to pointer buffer.
GR_FLM2	GR_BASE	0	Frame Buffer Base Address Sets the start address of the frame buffer where frame data is to be stored. GR_BASE[4:3] and GR_BASE[6:3] are referred to during 32-byte burst transfer and 128-byte burst transfer, respectively, to skip the start line data. The lower three bits should be fixed to 000.

For other frame buffer read operation and graphics processing, refer to section 33., Video Display Controller 5 (5): Image Synthesizer.

31.2 Register Descriptions

Table 31.39 shows the register configuration.

- Symbols used in Register Description:

Initial value: Register value after a reset

—: Undefined value

R/W: Readable/writable. The written value can be read.

R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.

R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.

R: Read-only. The write value should always be 0.

—/W: Write-only. The read value is undefined.

Table 31.39 Register Configuration of the Scaler

Name	Abbreviation	R/W	Initial Value	Address	Access Size

31.2.1 SCL0 Register Update Control Register (SC0_SCL0_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	SC0_SCL0_VEN_D	SC0_SCL0_VEN_C	—	—	—	SC0_SCL0_UPDATE	—	—	—	SC0_SCL0_VEN_B	—	—	—	SC0_SCL0_VEN_A
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/WC1	R/WC1	R	R	R	R/WC1	R	R	R	R/WC1	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13	SC0_SCL0_VEN_D	0	R/WC1	Scaling-Up Control and Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
12	SC0_SCL0_VEN_C	0	R/WC1	Scaling-Down Control and Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	SC0_SCL0_UPDATE	0	R/WC1	SYNC Control Register Update 0: Registers are not updated. 1: Registers are updated.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC0_SCL0_VEN_B	0	R/WC1	Synchronization Control and Scaling-up Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_SCL0_VEN_A	0	R/WC1	Scaling-Down Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

31.2.2 Mask Control Register (SC0_SCL0_FRC1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SC0_RES_VMASK[15:0]															
Initial value:	0	0	0	0	1	0	1	0	1	1	1	1	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_VMASK_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	SC0_RES_VMASK [15:0]	2800	R/W	Repeated Vsync Signal Masking Period Sets the repeated Vsync signal masking period beginning at a Vsync signal in terms of 128 pixel-clock periods. Masking period [usec] = SC0_RES_VMASK × 128 ÷ pixel clock frequency [MHz]
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_VMASK_ON	1	R/W	Repeated Vsync Signal Masking Control 0: Repeated Vsync signal masking control is disabled. 1: Repeated Vsync signal masking control is enabled.

Note: This register is updated when the SC0_SCL0_UPDATE bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.3 Missing Vsync Compensation Control Register (SC0_SCL0_FRC2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SC0_RES_VLACK[15:0]															
Initial value:	0	0	0	0	1	1	1	0	0	0	0	1	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_VLACK_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	SC0_RES_VLACK [15:0]	3600	R/W	Missing-Sync Compensating Pulse Output Wait Time Sets the wait time before outputting a missing-sync compensating pulse after a Vsync signal. Wait time [usec] = SC0_RES_VLACK × 128 ÷ pixel clock frequency [MHz]
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_VLACK_ON	1	R/W	Missing Vsync Signal Compensation 0: Compensation of missing Vsync signals is disabled. 1: Compensation of missing Vsync signals is enabled.

Note: This register is updated when the SC0_SCL0_UPDATE bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.4 Output Sync Select Register (SC0_SCL0_FRC3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_VS_SEL
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_VS_SEL	1	R/W	Vsync Signal Output Select 0: Externally input Vsync signal 1: Internally generated free-running Vsync signal

Note: This register is updated when the SC0_SCL0_UPDATE bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.5 Free-Running Period Control Register (SC0_SCL0_FRC4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_FV[10:0]										
Initial value:	0	0	0	0	0	0	1	0	0	0	0	0	1	1	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_FH[10:0]										
Initial value:	0	0	0	0	0	0	1	1	0	0	0	1	1	1	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC0_RES_FV [10:0]	524	R/W	Free-Running Vsync Period Setting Free-running Vsync period = (SC0_RES_FV + 1) × horizontal period [usec]
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_FH [10:0]	799	R/W	Hsync Period Setting Hsync period [usec] = (SC0_RES_FH + 1) ÷ pixel clock frequency [MHz]

Note: This register is updated when the SC0_SCL0_UPDATE bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.6 Output Delay Control Register (SC0_SCL0_FRC5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SC0_RES_FLD_DLY_SEL	SC0_RES_VSDLY[7:0]							
Initial value:	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	SC0_RES_FLD_DLY_SEL	1	R/W	Field Determination Signal Delay Control 0: No delay 1: Delay of one vertical cycle
7 to 0	SC0_RES_VSDLY[7:0]	1	R/W	Vsync Signal Delay Control Adjusts the Vsync signal delay in the output Hsync period units. Vsync signal delay [usec]: SC0_RES_VSDLY × output Hsync period [usec]

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.7 Full-Screen Vertical Size Register (SC0_SCL0_FRC6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_F_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_F_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC0_RES_F_VS[10:0]	35	R/W	Vertical Enable Signal Start Position for Full Screen. (VSYNC + V backporch lines) Note: The set value should be four or more (lines). SC0_RES_F_VS + SC0_RES_F_VW should be equal to or less than 2039 (lines).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_F_VW[10:0]	480	R/W	Vertical Enable Signal Width for Full Screen (lines) Note: SC0_RES_F_VS + SC0_RES_F_VW should be equal to or less than 2039 (lines).

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.8 Full-Screen Horizontal Size Register (SC0_SCL0_FRC7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_F_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_F_HW[10:0]										
Initial value:	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC0_RES_F_HS[10:0]	144	R/W	Horizontal Enable Signal Start Position for Full Screen. (HSYNC+H backporch pixel-clock cycles) Note: The set value should be 16 or more (clock cycles). SC0_RES_F_HS + SC0_RES_F_HW should be equal to or less than 2015 (clock cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_F_HW[10:0]	640	R/W	Horizontal Enable Signal Width for Full Screen (pixel-clock cycles) Note 1. SC0_RES_F_HS + SC0_RES_F_HW should be equal to or less than 2015 (clock cycles). Note 2. The set value should be equal to (horizontal signal width for full screen + 2) when serial RGB output is selected as an LCD output signal.

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.9 Vsync Detection Register (SC0_SCL0_FRC9)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_QVLOCK	—	—	—	SC0_RES_QVLACK
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC0_RES_QVLOCK	0	R	Locked Vsync Signal Detection Flag 1: No repeated or missing Vsync signal input has been detected for four or more vertical periods. 0: Repeated or missing Vsync signal input has been detected.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_QVLACK	0	R	Missing Vsync Signal Detection Flag 1: Missing Vsync signal input has been detected. 0: No missing Vsync signal input has been detected.

31.2.10 Status Monitor 0 Register (SC0_SCL0_MON0)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_LIN_STAT[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_LIN_STAT [10:0]	All 0	R	Current location of the image line input to the scaling-down control block.

31.2.11 Interrupt Control Register (SC0_SCL0_INT)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_LINE[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_LINE[10:0]	All 0	R/W	Setting of Interrupt on Image Line Input to Scaling-down Control Block When the location of the image line input to the scaling-down control block matches the SC0_RES_LINE setting, an interrupt signal is output. (Setting prohibited in this product)

Note: This register is updated when the SC0_SCL0_VEN_A bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.12 Scaling-Down Control Register (SC0_SCL0_DS1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_DS_V_ON	—	—	—	SC0_RES_DS_H_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC0_RES_DS_V_ON	1	R/W	Vertical Scale Down On/Off 0: Off 1: On
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_DS_H_ON	1	R/W	Horizontal Scale Down On/Off 0: Off 1: On

Note: This register is updated when the SC0_SCL0_VEN_A bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.13 Vertical Capture Size Register (SC0_SCL0_DS2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	1	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC0_RES_VS [10:0]	18	R/W	Vertical Position Setting for Video Signal Capturing (VSYNC + (V backporch - 1) lines) Note: The set value should be four or more (lines). SC0_RES_VS + SC0_RES_VW should be equal to or less than 2039 (lines).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_VW [10:0]	240	R/W	Vertical Width of Video Signal to be Captured (Lines) Note: SC0_RES_VS + SC0_RES_VW should be equal to or less than 2039 (lines).

Note: This register is updated when the SC0_SCL0_VEN_A bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.14 Horizontal Capture Size Register (SC0_SCL0_DS3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	0	1	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_HW[10:0]										
Initial value:	0	0	0	0	0	1	0	1	1	0	1	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC0_RES_HS [10:0]	244	R/W	Horizontal Position Setting for Video Signal Capturing (HSYNC + H backporch video-image clock cycles) Note: The set value should be 16 or more (clock cycles). SC0_RES_HS + SC0_RES_HW should be equal to or less than 2015 (clock cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_HW [10:0]	1440	R/W	Horizontal Width of Video Signal to be Captured (Video-image clock cycles) Note: SC0_RES_HS + SC0_RES_HW should be equal to or less than 2015 (clock cycles).

Note: This register is updated when the SC0_SCL0_VEN_A bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.15 Horizontal Scale Down Register (SC0_SCL0_DS4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	SC0_RES_PFIL_SEL	SC0_RES_DS_H_INTERPOTYP	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_RES_DS_H_RATIO[15:0]															
Initial value:	0	0	1	0	0	1	0	0	0	0	0	0	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
29	SC0_RES_PFIL_SEL	0	R/W	Prefilter Mode Select for Brightness Signals 0: The prefilter is turned off. 1: The prefilter is turned on. ($1/4 + 1/2 + 1/4$)
28	SC0_RES_DS_H_INTERPOTYP	1	R/W	Horizontal Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation
27 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	SC0_RES_DS_H_RATIO[15:0]	9224	R/W	Horizontal Scale Down Ratio ([15:12]: Integer part, [11:0]: Decimal part) $\text{round}(\text{SC0_RES_HW} + \text{SC0_RES_OUT_HW} \times 4096)$ SC0_RES_DS_H_RATIO < 4096: Setting prohibited SC0_RES_DS_H_RATIO = 4096: 100% scale up SC0_RES_DS_H_RATIO > 4096: Scale down

Note: This register is updated when the SC0_SCL0_VEN_A bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.16 Initial Vertical Phase Register (SC0_SCL0_DS5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	SC0_RES_V_INTERPOTYP	SC0_RES_TOP_INIPHASE[11:0]											
Initial value:	0	0	0	1	1	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	SC0_RES_BTM_INIPHASE[11:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	SC0_RES_V_INTERPOTYP	1	R/W	Vertical Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation
27 to 16	SC0_RES_TOP_INIPHASE [11:0]	2048	R/W	Vertical Interpolation Start Phase for Top Field 0 to 4095 (0 to approx. 1.0)
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	SC0_RES_BTM_INIPHASE [11:0]	0	R/W	Vertical Interpolation Start Phase for Bottom Field 0 to 4095 (0 to approx. 1.0)

Note: This register is updated when the SC0_SCL0_VEN_A and SC0_SCL0_VEN_B bits in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) are 1.

31.2.17 Vertical Scaling Register (SC0_SCL0_DS6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_RES_V_RATIO[15:0]															
Initial value:	0	0	0	0	0	1	1	1	1	1	1	1	1	1	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	SC0_RES_V_RATIO [15:0]	2044	R/W	Vertical Scale Up/Down Ratio ([15:12]: Integer part, [11:0]: Decimal part) For scale down: $\text{round}(\text{SC0_RES_VW} \div \text{SC0_RES_OUT_VW} \times 4096)$ For scale up: $\text{round}(\text{SC0_RES_IN_VW} \div \text{SC0_RES_P_VW} \times 4096)$ SC0_RES_V_RATIO < 4096: Scale up SC0_RES_V_RATIO = 4096: 100% scale up SC0_RES_V_RATIO > 4096: Scale down

Note: These bits updated when the SC0_SCL0_VEN_A and SC0_SCL0_VEN_B bits in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) are 1. Accordingly, even a scaled-up graphics display requires both an input Vsync signal and output Vsync signal.

31.2.18 Scaling-Down Control Block Output Size Register (SC0_SCL0_DS7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_OUT_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_OUT_HW[10:0]										
Initial value:	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC0_RES_OUT_VW [10:0]	240	R/W	Number of Valid Lines in Vertical Direction Output by Scaling-down Control Block (lines) This bit setting is used for the number of lines to be written to the frame buffer. When SC0_SCL1_WR1.SC0_RES_LOOP is 0 (frame write mode), specify the number of lines for one frame. When SC0_SCL1_WR1.SC0_RES_LOOP is 1 (line write mode), specify the number of lines for repeated write. Note: The SC0_RES_OUT_VW value should be aligned in 4-line units and equal to or smaller than the SC0_RES_VW value.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_OUT_HW [10:0]	640	R/W	Number of Valid Horizontal Pixels Output by Scaling-Down Control Block (video-image clock cycles) Note: The SC0_RES_OUT_HW value should be aligned in 4-pixel units and equal to or smaller than the SC0_RES_HW value.

Note: This register is updated when the SC0_SCL0_VEN_A and SC0_SCL0_VEN_C bits in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) are 1.

31.2.19 Scaling-Up Control Register (SC0_SCL0_US1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	SC0 RES_US_ V_ON	—	—	—	SC0 RES_US_ H_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC0_RES_US_ V_ON	1	R/W	Vertical Scale Up On/Off 0: Off 1: On
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_US_ H_ON	1	R/W	Horizontal Scale Up On/Off 0: Off 1: On

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.20 Output Image Vertical Size Register (SC0_SCL0_US2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_P_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_P_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC0_RES_P_VS[10:0]	35	R/W	Vertical Enable Signal Start Position for Output Image (VSYNC + V backporch lines) Note: The set value should be four or more (lines). SC0_RES_P_VS + SC0_RES_P_VW should be equal to or less than 2039 (lines).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_P_VW[10:0]	480	R/W	Vertical Enable Signal Width for Output Image (lines) Note: SC0_RES_P_VS + SC0_RES_P_VW should be equal to or less than 2039 (lines).

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.21 Output Image Horizontal Size Register (SC0_SCL0_US3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_P_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_P_HW[10:0]										
Initial value:	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC0_RES_P_HS[10:0]	144	R/W	Horizontal Enable Signal Start Position for Output Image (HSYNC+H backporch pixel-clock cycles) Note: The set value should be 16 or more (clock cycles). SC0_RES_P_HS + SC0_RES_P_HW should be equal to or less than 2015 (clock cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_P_HW[10:0]	640	R/W	Horizontal Enable Signal Width for Output Image (pixel-clock cycles) Note: SC0_RES_P_HS + SC0_RES_P_HW should be equal to or less than 2015 (clock cycles).

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.22 Scaling-Up Control Block Input Size Register (SC0_SCL0_US4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_IN_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_IN_HW[10:0]										
Initial value:	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC0_RES_IN_VW[10:0]	240	R/W	Number of Valid Lines in Vertical Direction Input to Scaling-up Control Block (lines)
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_IN_HW[10:0]	640	R/W	Number of Valid Horizontal Pixels Input to Scaling-up Control Block (pixel-clock cycles)

Note: This register is updated when the SC0_SCL0_VEN_B and SC0_SCL0_VEN_D bits in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) are 1.

31.2.23 Horizontal Scale Up Register (SC0_SCL0_US5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_RES_US_H_RATIO[15:0]															
Initial value:	0	0	1	0	0	1	0	0	0	0	0	0	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	SC0_RES_US_H_RATIO[15:0]	9224	R/W	Horizontal Scale Up Ratio ([15:12]: Integer part, [11:0]: Decimal part) round (SC0_RES_IN_HW ÷ SC0_RES_P_HW × 4096) SC0_RES_US_H_RATIO < 4096: Scale up SC0_RES_US_H_RATIO = 4096: 100% scale up SC0_RES_US_H_RATIO > 4096: Setting prohibited

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.24 Horizontal Scale Up Initial Phase Register (SC0_SCL0_US6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	SC0_RES_US_H_INT INTERPOTYP	SC0_RES_US_HT_INIPHASE[11:0]											
Initial value:	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	SC0_RES_US_HB_INIPHASE[11:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	SC0_RES_US_H_INTERPOTYP	1	R/W	Horizontal Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation
27 to 16	SC0_RES_US_HT_INIPHASE[11:0]	0	R/W	Horizontal Interpolation Start Phase for Top Field 0 to 4095 (0 to approx. 1.0)
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	SC0_RES_US_HB_INIPHASE[11:0]	0	R/W	Horizontal Interpolation Start Phase for Bottom Field 0 to 4095 (0 to approx. 1.0)

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.25 Trimming Register (SC0_SCL0_US7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_RES_HCUT[7:0]							SC0_RES_V CUT[7:0]								
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 8	SC0_RES_HCUT[7:0]	0	R/W	Horizontal Amount of Cut-off Post-Scaling Image (Right and Left Parts) Sets the number of pixel-clock cycles.
7 to 0	SC0_RES_V CUT[7:0]	0	R/W	Vertical Amount of Cut-off Post-Scaling Image (Upper and Lower Parts) Sets the number of lines.

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.26 Frame Buffer Read Select Register (SC0_SCL0_US8)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_IBUS_SYNC_SEL	—	—	—	SC0_RES_DISP_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC0_RES_IBUS_SYNC_SEL	0	R/W	Sync Signal Select for Frame Buffer Read Block 0: Sync signals from the scaling-up control block 1: Sync signals from the graphics processing block
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_DISP_ON	0	R/W	Post-Scaling Image Frame Display On/Off 0: Frame display on 1: Frame display off

Note: SC0_RES_IBUS_SYNC_SEL is updated when the SC0_SCL0_VEN_B and SC0_SCL0_VEN_D bits in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) are 1.
SC0_RES_DISP_ON is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.27 Background Color Register (SC0_SCL0_OVR1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	SC0_RES_BK_COL_R[7:0]							
Initial value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_RES_BK_COL_G[7:0]								SC0_RES_BK_COL_B[7:0]							
Initial value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	SC0_RES_BK_CLO_R[7:0]	128	R/W	Background Color Setting R/Cr Signal R: 8 bits; unsigned (0 to 255 [LSB]) Cr: 8 bits; 128 offset binary; unsigned (0 to 255 [LSB])
15 to 8	SC0_RES_BK_COL_G[7:0]	0	R/W	Background Color Setting G/Y Signal G/Y: 8 bits; unsigned (0 to 255 [LSB])

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SC0_RES_BK_COL_B[7:0]	128	R/W	Background Color Setting B/Cb Signal B: 8 bits; unsigned (0 to 255 [LSB]) Cb: 8 bits; 128 offset binary; unsigned (0 to 255 [LSB])

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.28 SCL1 Register Update Control Register (SC0_SCL1_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	SC0_SCL1_UPDATE_B	—	—	—	SC0_SCL1_UPDATE_A
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/WC1	R	R	R	R/WC1

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	SC0_SCL1_VEN_B	—	—	—	SC0_SCL1_VEN_A
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/WC1	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	SC0_SCL1_UPDATE_B	0	R/WC1	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated.
19 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	SC0_SCL1_UPDATE_A	0	R/WC1	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated.
15 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC0_SCL1_VEN_B	0	R/WC1	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_SCL1_VEN_A	0	R/WC1	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

31.2.29 Writing Mode Register (SC0_SCL1_WR1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_WRSWA [2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	SC0_RES_TB_ADD_MOD		SC0_RES_DS_WR_MD[2:0]		SC0_RES_MD[1:0]	SC0_RES_LOOP	SC0_RES_BST_MD
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
18 to 16	SC0_RES_WRSWA[2:0]	All 0	R/W	8-Bit, 16-Bit, or 32-Bit Swap Setting These bits control swapping in frame buffer writing as follows. Bit 0 0: Swapped in 8-bit units. 1: Not swapped in 8-bit units. Bit 1 0: Swapped in 16-bit units. 1: Not swapped in 16-bit units. Bit 2 0: Swapped in 32-bit units. 1: Not swapped in 32-bit units. According to the setting of these bits, data is swapped as follows. Each number in parentheses ((1) to (8)) indicates 8-bit data. 000: (1) (2) (3) (4) (5) (6) (7) (8) [Not swapped] 001: (2) (1) (4) (3) (6) (5) (8) (7) [Swapped in 8-bit units] 010: (3) (4) (1) (2) (7) (8) (5) (6) [Swapped in 16-bit units] 011: (4) (3) (2) (1) (8) (7) (6) (5) [Swapped in 16-bit units + 8-bit units] 100: (5) (6) (7) (8) (1) (2) (3) (4) [Swapped in 32-bit units] 101: (6) (5) (8) (7) (2) (1) (4) (3) [Swapped in 32-bit units + 8-bit units] 110: (7) (8) (5) (6) (3) (4) (1) (2) [Swapped in 32-bit units + 16-bit units] 111: (8) (7) (6) (5) (4) (3) (2) (1) [Swapped in 32-bit units + 16-bit units + 8-bit units] Note: When YCbCr422 or RGB565 is selected as a frame buffer video-signal writing format, these bits should be set to 000 [Not swapped].
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	SC0_RES_TB_ADD_MOD	0	R/W	Top and Bottom Data Write Address Specification Method 0: A write address is specified in common for top and bottom data. 1: Separate write addresses are specified for top and bottom data.
6 to 4	SC0_RES_DS_WR_MD[2:0]	0	R/W	Frame Buffer Writing Mode for Image Processing 0: Normal 1: Horizontal mirroring 2: 90° rotation 3: 180° rotation 4: 270° rotation 5 to 7: Setting prohibited

Bit	Bit Name	Initial Value	R/W	Description
3, 2	SC0_RES_MD [1:0]	0	R/W	Frame Buffer Video-Signal Writing Format 0: YCbCr422 (16 bits) 1: RGB565 (16 bits) 2: RGB888 (24 (32) bits) 3: YCbCr444 (24 (32) bits)
1	SC0_RES_LOOP	0	R/W	Frame Buffer Write Mode Select 0: Frame mode 1: Line mode (read as ring buffer)
0	SC0_RES_BST_MD	0	R/W	Transfer Burst Length for Frame Buffer Writing 0: 32-byte 1: 128-byte

Note: SC0_RES_LOOP and SC0_RES_BST_MD are updated when the SC0_SCL1_VEN_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

SC0_RES_TB_ADD_MOD, SC0_RES_DS_WR_MD, and SC0_RES_MD are updated when the SC0_SCL1_VEN_A and SC0_SCL1_VEN_B bits in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) are 1.

SC0_RES_WRSWA is updated when the SC0_SCL1_UPDATE_A bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

31.2.30 Write Address Register 1T (SC0_SCL1_WR2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SC0_RES_BASE[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_RES_BASE[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SC0_RES_BASE [31:0]	0	R/W	Frame Buffer Base Address Sets the start address of the frame buffer to store the frame data for the top field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 0. For 32-byte transfer: The lower five bits should be fixed to 0 0000. For 128-byte transfer: The lower seven bits should be fixed to 000 0000.

Note: This register is updated when the SC0_SCL1_VEN_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

31.2.31 Write Address Register 2T (SC0_SCL1_WR3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	SC0_RES_LN_OFF[14:0]														
Initial value:	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SC0_RES_FLM_NUM[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 16	SC0_RES_LN_OFF [14:0]	2048	R/W	Frame Buffer Line Offset Address Sets the line offset address for calculating the line start address for the top field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 0. Line 0: SC0_RES_BASE Line 1: SC0_RES_BASE + SC0_RES_LN_OFF × 1 : Line n: SC0_RES_BASE + SC0_RES_LN_OFF × n For 32-byte transfer: The lower five bits should be fixed to 0 0000. For 128-byte transfer: The lower seven bits should be fixed to 000 0000.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	SC0_RES_FLM_NUM [9:0]	1	R/W	Number of Frames of Buffer to be Written to Sets the number of frames for the top field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 0 Number of frames defined by SC0_RES_FLM_NUM + 1 are used.

Note: This register is updated when the SC0_SCL1_VEN_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

31.2.32 Write Address Register 3T (SC0_SCL1_WR4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	SC0_RES_FLM_OFF[22:16]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_RES_FLM_OFF[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 0	SC0_RES_FLM_OFF [22:0]	524288	R/W	Frame Buffer Frame Offset Address Sets the frame offset address for calculating the start address of each frame for the top field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 0. Buffer 0: SC0_RES_BASE Buffer 1: SC0_RES_BASE + SC0_RES_FLM_OFF × 1 : Buffer n: SC0_RES_BASE + SC0_RES_FLM_OFF × n For 32-byte transfer: The lower five bits should be fixed to 0 0000. For 128-byte transfer: The lower seven bits should be fixed to 000 0000.

Note: This register is updated when the SC0_SCL1_VEN_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

31.2.33 Frame Sub-Sampling Register (SC0_SCL1_WR5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	SC0_RES_INTER	—	—	SC0_RES_FS_RATE[1:0]	—	—	—	SC0_RES_FLD_SEL	—	—	—	—	SC0_RES_WENB
Initial value:	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R/W	R/W	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	SC0_RES_INTER	1	R/W	Field Operating Mode Select 0: Progressive 1: Interlace
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	SC0_RES_FS_RATE[1:0]	0	R/W	Writing Rate Sets the frame buffer writing rate to the vertical frequency of the input signal. 0: 1/1 an input signal (The SC0_RES_FLD_SEL setting is invalid.) 1: 1/2 an input signal 2: 1/4 an input signal 3: 1/8 an input signal
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC0_RES_FLD_SEL	0	R/W	Write Field Select 0: Top field 1: Bottom field
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_WENB	0	R/W	Frame Buffer Write Enable After making the setting to enable writing, writing starts from the second frame. 0: Frame buffer writing is disabled. 1: Frame buffer writing is enabled.

Note: SC0_RES_INTER, SC0_RES_FS_RATE[1:0], and SC0_RES_FLD_SEL are updated when the SC0_SCL1_VEN_A bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1. SC0_RES_WENB is updated when the SC0_SCL1_VEN_A and SC0_SCL1_VEN_B bits in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) are 1.

31.2.34 Bit Reduction Register (SC0_SCL1_WR6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_DTH_ON	—	—	—	SC0_RES_BITDEC_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC0_RES_DTH_ON	0	R/W	Dither Correction On/Off 0: Off (rounded off) 1: On (2 × 2 dither pattern)
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_BITDEC_ON	0	R/W	Bit Reduction On/Off 0: Off 1: On

Note: This register is updated when the SC0_SCL1_VEN_A bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

31.2.35 Write Detection Register (SC0_SCL1_WR7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_OVERFLOW	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	SC0_RES_OVERFLOW	0	R	Line Buffer Overflow Detect 1: Line buffer has overflowed. 0: Line buffer has not overflowed.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	SC0_RES_FLM_CNT [9:0]	0	R	Frame Number of Frame Being Accessed Frame number of the frame being accessed in the top field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1 or that in the top or bottom field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 0.

31.2.36 Write Address Register 1B (SC0_SCL1_WR8)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SC0_RES_BASE_B[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_RES_BASE_B[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SC0_RES_BASE_B [31:0]	0	R/W	Frame Buffer Base Address for Bottom Sets the start address of the frame buffer to store the frame data for the bottom field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1. For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000.

Note: This register is updated when the SC0_SCL1_VEN_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

31.2.37 Write Address Register 2B (SC0_SCL1_WR9)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	SC0_RES_LN_OFF_B[14:0]														
Initial value:	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SC0_RES_FLM_NUM_B[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 16	SC0_RES_LN_OFF_B [14:0]	2048	R/W	Frame Buffer Line Offset Address for Bottom Sets the line offset address for calculating the line start address for the bottom field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1. Line 0: SC0_RES_BASE_B Line 1: SC0_RES_BASE_B + SC0_RES_LN_OFF_B × 1 : Line n: SC0_RES_BASE + SC0_RES_LN_OFF_B × n For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	SC0_RES_FLM_NUM_B [9:0]	1	R/W	Number of Frames of Buffer to be Written to for Bottom Field Number of frames defined by SC0_RES_FLM_NUM_B + 1 are used when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1.

Note: This register is updated when the SC0_SCL1_VEN_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

31.2.38 Write Address Register 3B (SC0_SCL1_WR10)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	SC0_RES_FLM_OFF_B[22:16]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_RES_FLM_OFF_B[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 0	SC0_RES_FLM_OFF_B[22:0]	524288	R/W	Frame Buffer Frame Offset Address for Bottom Sets the frame offset address for calculating the start address of each frame for the bottom field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1. Buffer 0: SC0_RES_BASE_B Buffer 1: SC0_RES_BASE_B + SC0_RES_FLM_OFF_B × 1 : Buffer n: SC0_RES_BASE_B + SC0_RES_FLM_OFF_B × n For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000.

Note: This register is updated when the SC0_SCL1_VEN_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

31.2.39 Write Detection Register B (SC0_SCL1_WR11)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SC0_RES_FLM_CNT_B[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	SC0_RES_FLM_CNT_B[9:0]	0	R	Frame Number of Frame Being Accessed in Bottom Field Frame number of the frame being accessed in the bottom field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1.

31.2.40 Status Monitor 1 Register (SC0_SCL1_MON1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SC0_PBUF_NUM [1:0]	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	SC0_PBUF_NUM[1:0]	All 0	R	Write pointer indicating the pointer buffer number corresponding to the location currently being written to.
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

31.2.41 Pointer Buffer 0 Register (SC0_SCL1_PBUF0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SC0_PBUF0_ADD[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_PBUF0_ADD[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SC0_PBUF0_ADD[31:0]	All 0	R	Start address of the write buffer pointed to by pointer buffer 0.

31.2.42 Pointer Buffer 1 Register (SC0_SCL1_PBUF1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SC0_PBUF1_ADD[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_PBUF1_ADD[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SC0_PBUF1_ADD[31:0]	All 0	R	Start address of the write buffer pointed to by pointer buffer 1.

31.2.43 Pointer Buffer 2 Register (SC0_SCL1_PBUF2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SC0_PBUF2_ADD[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_PBUF2_ADD[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SC0_PBUF2_ADD[31:0]	All 0	R	Start address of the write buffer pointed to by pointer buffer 2.

31.2.44 Pointer Buffer 3 Register (SC0_SCL1_PBUF3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SC0_PBUF3_ADD[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_PBUF3_ADD[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SC0_PBUF3_ADD[31:0]	All 0	R	Start address of the write buffer pointed to by pointer buffer 3.

31.2.45 Pointer Buffer and Field Information Register (SC0_SCL1_PBUF_FLD)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	SC0_FLD_INF3	—	—	—	—	—	—	—	SC0_FLD_INF2
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SC0_FLD_INF1	—	—	—	—	—	—	—	SC0_FLD_INF0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	SC0_FLD_INF3	0	R	Top or bottom field information of the frame buffer pointed to by pointer buffer 3. 0: Bottom 1: Top
23 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	SC0_FLD_INF2	0	R	Top or bottom field information of the frame buffer pointed to by pointer buffer 2. 0: Bottom 1: Top
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	SC0_FLD_INF1	0	R	Top or bottom field information of the frame buffer pointed to by pointer buffer 1. 0: Bottom 1: Top
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
0	SC0_FLD_INF0	0	R	Top or bottom field information of the frame buffer pointed to by pointer buffer 0. 0: Bottom 1: Top

31.2.46 Pointer Buffer Control Register (SC0_SCL1_PBUF_CNT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SC0_PBUF_RST
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	SC0_PBUF_RST	0	R/W	Reset Control for Pointer Buffer 0: Pointer buffer is not reset. 1: Pointer buffer is reset.
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note: This register is updated when the SC0_SCL1_UPDATE_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

31.2.47 Graphics 0 Register Update Control Register (GR0_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	GR0_UPDATE	—	—	—	GR0_P_VEN	—	—	—	GR0_IBUS_VEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/WC1	R	R	R	R/WC1	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	GR0_UPDATE	0	R/WC1	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	GR0_P_VEN	0	R/WC1	Graphics Display Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR0_IBUS_VEN	0	R/WC1	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

31.2.48 Frame Buffer Read Control Register (Graphics 0) (GR0_FLM_RD)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR0_R_ENB
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR0_R_ENB	0	R/W	Frame Buffer Read Enable 0: Frame buffer reading is disabled. 1: Frame buffer reading is enabled.

Note: This register is updated when the GR0_IBUS_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

31.2.49 Frame Buffer Control Register 1 (Graphics 0) (GR0_FLM1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR0_FLD_SEL	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR0_LN_OFF_DIR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	GR0_FLM_SEL[1:0]	—	—	—	—	—	—	—	—	GR0_BST_MD
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	GR0_FLD_SEL	0	R/W	Enables or disables top or bottom field selection for the next frame buffer to be read. 0: Field selection is disabled. 1: Top or bottom field can be selected.
30 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	GR0_LN_OFF_DIR	0	R/W	Selects the line offset address direction of the frame buffer. 0: Increments the address by the line offset address. 1: Decrements the address by the line offset address.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	GR0_FLM_SEL [1:0]	0	R/W	Selects a frame buffer address setting signal. 0: Links to scaling-down process. (This setting is prohibited when separate write addresses are specified for the top and bottom fields; that is, SC0_RES_TB_ADD_MOD = 1 in SC0_SCL1_WR1.) 1: Selects GR0_FLM_NUM. 2: Setting prohibited 3: Links to pointer buffer.
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR0_BST_MD	0	R/W	Frame Buffer Burst Transfer Mode 0: 32-byte transfer 1: 128- byte transfer

Note: GR0_FLD_SEL is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

GR0_LN_OFF_DIR is updated when the GR0_IBUS_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

GR0_FLM_SEL is updated when the GR0_P_VEN and GR0_IBUS_VEN bits in the graphics 0 register update control register (GR0_UPDATE) are 1.

GR0_BST_MD is updated when the GR0_IBUS_VEN and GR0_P_VEN bits in the graphics 0 register update control register (GR0_UPDATE) are 1.

31.2.50 Frame Buffer Control Register 2 (Graphics 0) (GR0_FLM2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR0_BASE[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR0_BASE[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	GR0_BASE [31:0]	0	R/W	Frame Buffer Base Address Sets the start address of the frame buffer where frame data is to be stored. GR0_BASE[4:3] and GR0_BASE[6:3] are referred to during 32-byte burst transfer and 128-byte burst transfer, respectively, to skip the start line data. The lower three bits should be fixed to 000.

Note: This register is updated when the GR0_IBUS_VEN and GR0_P_VEN bits in the graphics 0 register update control register (GR0_UPDATE) are 1.

31.2.51 Frame Buffer Control Register 3 (Graphics 0) (GR0_FLM3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR0_FLD_NXT	GR0_LN_OFF[14:0]														
Initial value:	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	GR0_FLM_NUM[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	GR0_FLD_NXT	0	R/W	Top or Bottom Field Selection for Next Frame Buffer 0: Bottom 1: Top
30 to 16	GR0_LN_OFF[14:0]	2048	R/W	Frame Buffer Line Offset Address Sets the line offset address for calculating the start address of each line. Line 0: GR0_BASE Line 1: GR0_BASE + GR0_LN_OFF × 1 : Line n: GR0_BASE + GR0_LN_OFF × n For 32-byte transfer: The lower five bits should be fixed to 0 0000. For 128-byte transfer: The lower seven bits should be fixed to 000 0000.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	GR0_FLM_NUM[9:0]	1	R/W	Frame Number of Frame Buffer Manually set the frame number when GR0_FLM_SEL = 1.

Note: GR0_FLD_NXT is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

GR0_LN_OFF[14:0] and GR0_FLM_NUM[9:0] are updated when the GR0_IBUS_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

31.2.52 Frame Buffer Control Register 4 (Graphics 0) (GR0_FLM4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	GR0_FLM_OFF[22:16]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR0_FLM_OFF[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 0	GR0_FLM_OFF[22:0]	524288	R/W	Frame Buffer Frame Offset Address Specifies the frame offset address used for calculating the start address of each frame buffer when more than one buffer is used. Buffer 0: GR0_BASE Buffer 1: GR0_BASE + GR0_FLM_OFF × 1 : Buffer n: GR0_BASE + GR0_FLM_OFF × n For 32-byte transfer: The lower five bits should be fixed to 0 0000. For 128-byte transfer: The lower seven bits should be fixed to 000 0000.

Note: This register is updated when the GR0_IBUS_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

31.2.53 Frame Buffer Control Register 5 (Graphics 0) (GR0_FLM5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR0_FLM_LNUM[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR0_FLM_LOOP[10:0]										
Initial value:	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR0_FLM_LNUM[10:0]	0	R/W	Sets number of lines in a frame Number of lines is (GR0_FLM_LNUM + 1).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR0_FLM_LOOP[10:0]	1023	R/W	Number of lines when reading the addresses repeatedly by returning to the start address after reaching the end address. (GR0_FLM_LOOP + 1) lines are read.

Note: This register is updated when the GR0_IBUS_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

31.2.54 Frame Buffer Control Register 6 (Graphics 0) (GR0_FLM6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR0_FORMAT[3:0]				—	GR0_HW[10:0]										
Initial value:	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR0_YCC_SWAP[2:0]			GR0_RDSWA[2:0]		—	GR0_CNV444_MD	—	—	GR0_STA_POS[5:0]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	GR0_FORMAT[3:0]	8	R/W	Sets the format of the frame buffer read signal. 0: RGB565 1: RGB888 2: α RGB1555 3: α RGB4444 4: α RGB8888 5: CLUT8 6: CLUT4 7: CLUT1 8: YCbCr422 9: YCbCr444 10: RGB α 5551 11: RGB α 8888 12 to 15: Setting prohibited
27	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
26 to 16	GR0_HW[10:0]	0	R/W	Sets the width of the horizontal valid period. The width is (GR0_HW + 1) pixels. Note: The set value should be equal to or more than two.
15 to 13	GR0_YCC_SWAP[2:0]	0	R/W	Controls swapping of data read from buffer in the YCbCr422 format. 0: Cb/Y0/Cr/Y1 1: Y0/Cb/Y1/Cr 2: Cr/Y0/Cb/Y1 3: Y0/Cr/Y1/Cb 4: Y1/Cr/Y0/Cb 5: Cr/Y1/Cb/Y0 6: Y1/Cb/Y0/Cr 7: Cb/Y1/Cr/Y0

Bit	Bit Name	Initial Value	R/W	Description
12 to 10	GR0_RDSWA [2:0]	0	R/W	<p>8-Bit, 16-Bit, or 32-Bit Swap Setting</p> <p>These bits control swapping in frame buffer reading as follows.</p> <p>Bit 0 0: Swapped in 8-bit units. 1: Not swapped in 8-bit units.</p> <p>Bit 1 0: Swapped in 16-bit units. 1: Not swapped in 16-bit units.</p> <p>Bit 2 0: Swapped in 32-bit units. 1: Not swapped in 32-bit units.</p> <p>According to the setting of these bits, data is swapped as follows. Each number in parentheses ((1) to (8)) indicates 8-bit data.</p> <p>000: (1) (2) (3) (4) (5) (6) (7) (8) [Not swapped]</p> <p>001: (2) (1) (4) (3) (6) (5) (8) (7) [Swapped in 8-bit units]</p> <p>010: (3) (4) (1) (2) (7) (8) (5) (6) [Swapped in 16-bit units]</p> <p>011: (4) (3) (2) (1) (8) (7) (6) (5) [Swapped in 16-bit units + 8-bit units]</p> <p>100: (5) (6) (7) (8) (1) (2) (3) (4) [Swapped in 32-bit units]</p> <p>101: (6) (5) (8) (7) (2) (1) (4) (3) [Swapped in 32-bit units + 8-bit units]</p> <p>110: (7) (8) (5) (6) (3) (4) (1) (2) [Swapped in 32-bit units + 16-bit units]</p> <p>111: (8) (7) (6) (5) (4) (3) (2) (1) [Swapped in 32-bit units + 16-bit units + 8-bit units]</p>
9	—	0	R	<p>Reserved</p> <p>This bit is always read as 0. The write value should always be 0.</p>
8	GR0_CNV444_MD	0	R/W	<p>Sets the interpolation mode for YCbCr422 to YCbCr444 conversion.</p> <p>0: Hold interpolation 1: Average interpolation</p>
7, 6	—	All 0	R	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>
5 to 0	GR0_STA_POS[5:0]	0	R/W	<p>Sets the amount of data to be skipped through.</p> <p>Specifically data amount equal to the amount indicated by GR0_STA_POS is skipped from the start of the line.</p>

Note: GR0_YCC_SWAP, GR0_CNV444, and GR0_STA_POS are updated when GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

GR0_RDSWA is updated when the GR0_UPDATE bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

GR0_FORMAT and GR0_HW are updated when GR0_IBUS_VEN and GR0_P_VEN bits in the graphics 0 register update control register (GR0_UPDATE) are 1.

31.2.55 Alpha Blending Control Register 1 (Graphics 0) (GR0_AB1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	GR0_GRC_DISP_ON	—	—	GR0_DISP_SEL[1:0]	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	GR0_GRC_DISP_ON	0	R/W	Turns on/off frame-line display of the graphics image area. 0: Frame-line display off 1: Frame-line display on
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	GR0_DISP_SEL[1:0]	0	R/W	Selects the graphics display mode. 0: Background color display (GR0_BASE) 1: Lower-layer graphics display When displaying video image or enlarged graphics, select this setting. 2: Current graphics display When displaying graphics, select this setting. 3: Blended display of lower-layer graphics and current graphics* Note: * Select this setting whenever chroma-key processing is to proceed. Since only current graphics are to be displayed by chroma-key processing, set the α values for both pixels to be subject to chroma-keying and pixels not to be subject to chroma-keying to 255.

Note: This register is updated when GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

31.2.56 Alpha Blending Control Register 2 (Graphics 0) (GR0_AB2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR0_GRC_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR0_GRC_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR0_GRC_VS[10:0]	0	R/W	Vertical Start Position of Graphics Image Area. Note: The set value should be four or more (lines). GR0_GRC_VS + GR0_GRC_VW should be equal to or less than 2039 (lines).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR0_GRC_VW[10:0]	0	R/W	Vertical Width of Graphics Image Area.

Note: This register is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

31.2.57 Alpha Blending Control Register 3 (Graphics 0) (GR0_AB3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR0_GRC_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR0_GRC_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR0_GRC_HS[10:0]	0	R/W	Horizontal Start Position of Graphics Image Area. Note: The set value should be 16 or more (clock cycles). GR0_GRC_HS + GR0_GRC_HW should be equal to or less than 2015 (clock cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR0_GRC_HW[10:0]	0	R/W	Horizontal Width of Graphics Image Area. Note: For displaying an image with 1- or 2-pixel horizontal width, set GR0_HW to 2 and GR0_GRC_HW to 1 (1 pixel) or 2 (2 pixels).

Note: This register is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

31.2.58 Alpha Blending Control Register 7 (Graphics 0) (GR0_AB7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR0 CK_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR0_CK_ON	0	R/W	CLUT-Index/RGB-Index Chroma-Key Processing On/Off 0: Off 1: On

Note: This register is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

31.2.59 Alpha Blending Control Register 8 (Graphics 0) (GR0_AB8)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR0_CK_KCLUT[7:0]								GR0_CK_KG[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR0_CK_KB[7:0]								GR0_CK_KR[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR0_CK_KCLUT[7:0]	0	R/W	CLUT Signal for CLUT-Index Chroma-Key Processing CLUT: Unsigned 8 bits (0 to 255 [LSB])
23 to 16	GR0_CK_KG[7:0]	0	R/W	G Signal for RGB-Index Chroma-Key Processing G: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR0_CK_KB[7:0]	0	R/W	B Signal for RGB-Index Chroma-Key Processing B: Unsigned 8 bits (0 to 255 [LSB])
7 to 0	GR0_CK_KR[7:0]	0	R/W	R Signal for RGB-Index Chroma-Key Processing R: Unsigned 8 bits (0 to 255 [LSB])

Note: This register is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

31.2.60 Alpha Blending Control Register 9 (Graphics 0) (GR0_AB9)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR0_CK_A[7:0]								GR0_CK_G[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR0_CK_B[7:0]								GR0_CK_R[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR0_CK_A [7:0]	0	R/W	Replaced Alpha Signal after RGB-Index Chroma-Key Processing α : Unsigned 8 bits (0 to 255 [LSB]) Note: These bits should always be set to 255 to display the current graphics only.
23 to 16	GR0_CK_G [7:0]	0	R/W	Replaced G Signal after RGB-Index Chroma-Key Processing G: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR0_CK_B [7:0]	0	R/W	Replaced B Signal after RGB-Index Chroma-Key Processing B: Unsigned 8 bits (0 to 255 [LSB])
7 to 0	GR0_CK_R [7:0]	0	R/W	Replaced R Signal after RGB-Index Chroma-Key Processing R: Unsigned 8 bits (0 to 255 [LSB])

Note: This register is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

31.2.61 Alpha Blending Control Register 10 (Graphics 0) (GR0_AB10)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	GR0_BASE_ G[7:0]	0	R/W	Background Color G/Y Signal G/Y: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR0_BASE_ B[7:0]	128	R/W	Background Color B/Cb Signal B: Unsigned 8 bits (0 to 255 [LSB]) Cb: 8 bits; 128 offset binary; unsigned (0 to 255 [LSB])

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	GR0_BASE_R[7:0]	128	R/W	Background Color R/Cr Signal R: Unsigned 8 bits (0 to 255 [LSB]) Cr: 8 bits; 128 offset binary; unsigned (0 to 255 [LSB])

Note: This register is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

31.2.64 CLUT Table Control Register (Graphics 0) (GR0_CLUT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR0_CLT_SEL
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	GR0_CLT_SEL	0	R/W	CLUT Table Select Signal 0: Selects CLUT table 0. Referring to the CLUT table 0 value to expand to α RGB8888 The CPU side can read-access or write-access to the CLUT table 1. 1: Selects CLUT table 1. Referring to the CLUT table 1 value to expand to α RGB8888 The CPU side can read-access or write-access to the CLUT table 0.
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note: This register is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

31.3 Usage Method

31.3.1 Scaling Setting Example for 525i Video Input and VGA-Size (640 x 480) Video Output

(1) Angles of View for Input and Output

This section describes an example of setting the signals of the input and output angles of view shown in Table 31.40.

Here, the over-scan rate is assumed to be 100%.

Table 31.40 Input and Output Angles for 525i Video Input and VGA-Size (640 x 480) Video Output

Input Signal	Output Signal	Signal Format	Rotation	Buffer Planes	Scaling Filter
1440 x 240	640 x 480	YCbCr	Normal	Two planes	2-tap linear

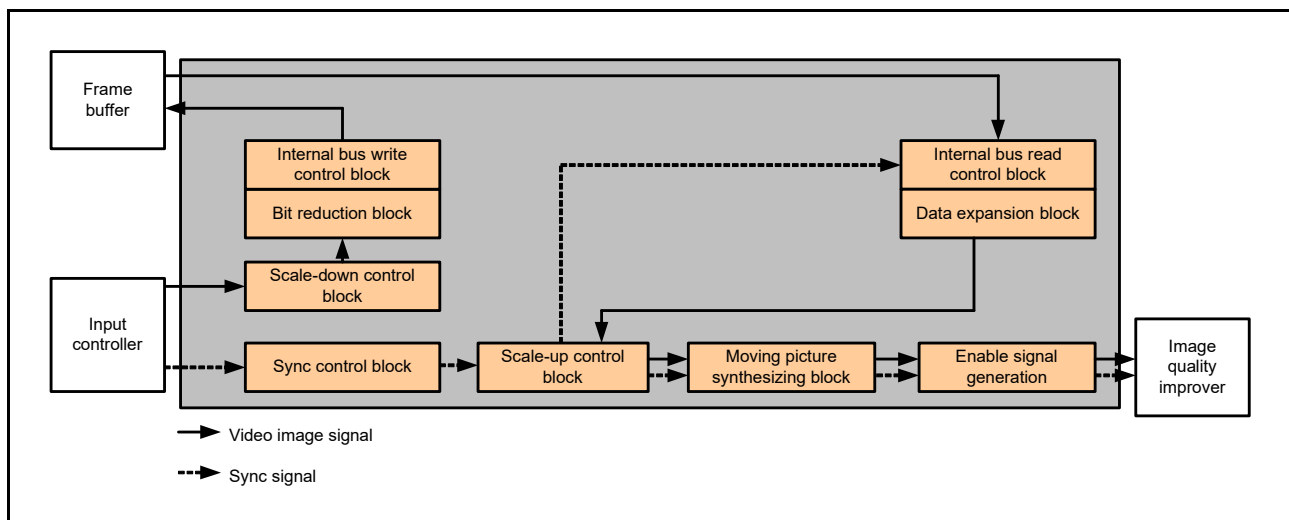

Figure 31.18 Signal Paths for Displaying Input Video Image

(2) Horizontal Scaling (Horizontal Scale Down, Scaling Filter: 2-Tap Linear)

The scaling rate for folding can be calculated as shown below.

$$\text{RATIO_org} = \text{round}(1440 \div 640 \times 4096) = 9216$$

$$\sigma = (9216 \times (640 - 1) - (1440 - 1) \times 4096) \div (640 - 1) = -8.01$$

$$\text{Horizontal scaling ratio} = \text{roundup}(9216 - (-8.01)) = 9225$$

(3) Vertical Scaling (Vertical Scale Up, Scaling Filter: 2-Tap Linear)

The scaling rate for folding can be calculated as shown below.

$$\text{RATIO_org} = \text{round}(240 \div 480 \times 4096) = 2048$$

$$\sigma = (2048 \times (480 - 1) - (240 - 1) \times 4096) \div (480 - 1) = 4.27$$

$$\text{Vertical scaling ratio} = \text{round}(2048 - (4.07)) = 2044$$

(4) Setting Frame Buffer Access Area

Since video data is written to the frame buffer after scaled down, the write size is 640×240 pixels.

The frame buffer area required is 640 pixels or more for line offset and line offset \times 240 pixels or more for frame offset.

Here, the frame buffer work area is assumed to be 1024×256 pixels.

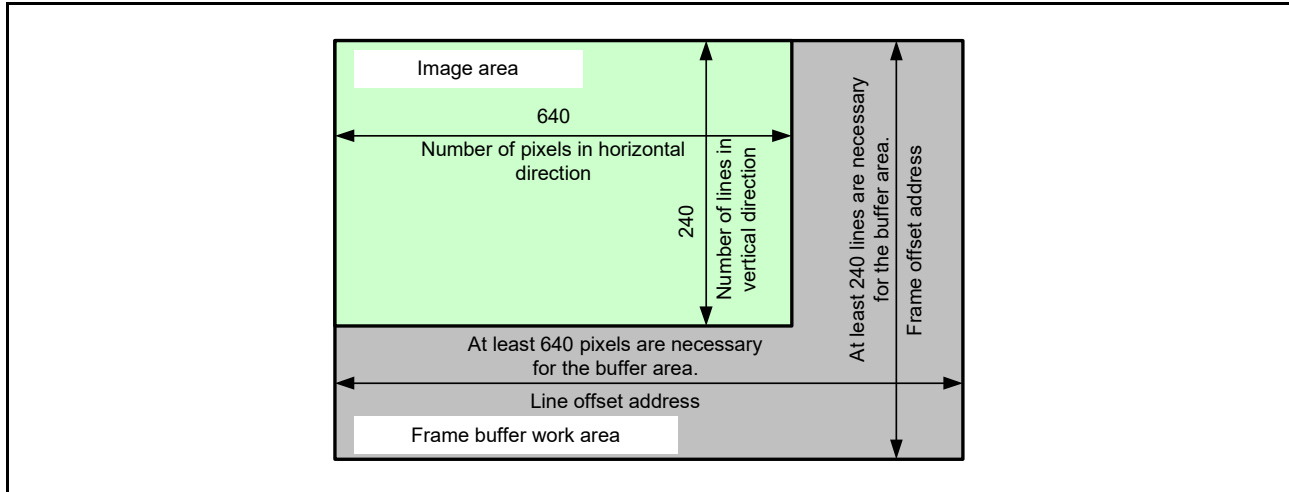

Figure 31.19 Frame Buffer Access Area Setting

Since the frame buffer is accessed in 64-bit units, YCbCr422 (16 bits) is accessed in 4-pixel units.

The line offset address values to be set are:

$$SC_RES_LN_OFF[14:0] = 1024 \times 2 = 2048$$

$$GR_LN_OFF[14:0] = 1024 \times 2 = 2048$$

The frame offset address values to be set are:

$$SC_RES_FLM_OFF[22:0] = SC_RES_LN_OFF[14:0] \times 256 = 524288$$

$$GR_FLM_OFF[22:0] = GR_LN_OFF[14:0] \times 256 = 524288$$

(5) Register Setting Example

Table 31.41 Register Setting Example for 525i Video Input and VGA-Size Video Output

Register Name	Bit Name	Settings	Remarks
Synchronization Control			
SC_SCL0_FRC3	SC_RES_VS_SEL	0	External Vsync selected
SC_SCL0_FRC4	SC_RES_FH[10:0]	799	Horizontal period width of output signal (period width = set value + 1)
Size of Angle of View			
SC_SCL0_DS2	SC_RES_VS[10:0]	15	Vertical capture start position of input signal
SC_SCL0_DS2	SC_RES_VW[10:0]	240	Vertical capture width of input signal
SC_SCL0_DS3	SC_RES_HS[10:0]	244	Horizontal capture start position of input signal
SC_SCL0_DS3	SC_RES_HW[10:0]	1440	Horizontal capture width of input signal
SC_SCL0_FRC6	SC_RES_F_VS[10:0]	35	Vertical valid start position of full screen
SC_SCL0_FRC6	SC_RES_F_VW[10:0]	480	Vertical valid width of full screen
SC_SCL0_FRC7	SC_RES_F_HS[10:0]	144	Horizontal valid start position of full screen
SC_SCL0_FRC7	SC_RES_F_HW[10:0]	640	Horizontal valid width of full screen
SC_SCL0_US2	SC_RES_P_VS[10:0]	35	Vertical valid start position of output image
SC_SCL0_US2	SC_RES_P_VW[10:0]	480	Vertical valid width of output image
SC_SCL0_US3	SC_RES_P_HS[10:0]	144	Horizontal valid start position of output image
SC_SCL0_US3	SC_RES_P_HW[10:0]	640	Horizontal valid width of output image
Scaling Setting			
SC_SCL0_DS4	SC_RES_DS_H_RATIO [15:0]	9224	Horizontal scaling-down because SC_RES_DS_H_RATIO is equal to or larger than 4096
SC_SCL0_DS1	SC_RES_DS_H_ON	1	Horizontal scaling-down on
SC_SCL0_US1	SC_RES_US_H_ON	0	Horizontal scaling-up off
SC_SCL0_US5	SC_RES_US_H_RATIO [15:0]	4096	Horizontal scaling-up off because SC_RES_US_H_RATIO is equal to or larger than 4096
SC_SCL0_DS1	SC_RES_DS_V_ON	0	Vertical scaling-down off
SC_SCL0_US1	SC_RES_US_V_ON	1	Vertical scaling-up on
SC_SCL0_DS6	SC_RES_V_RATIO[15:0]	2044	Vertical scaling-up because SC_RES_V_RATIO is smaller than 4096
SC_SCL0_DS7	SC_RES_OUT_VW[10:0]	240	Vertical valid input width because the vertical scaling-down function is off
SC_SCL0_DS7	SC_RES_OUT_HW[10:0]	640	Horizontal image size after horizontal scaling-down
SC_SCL0_US4	SC_RES_IN_VW[10:0]	240	Vertical width of frame buffer read
SC_SCL0_US4	SC_RES_IN_HW[10:0]	640	Horizontal width of frame buffer read
IP Conversion Setting			
SC_SCL0_DS5	SC_RES_TOP_ INIPHASE[11:0]	2048	Top field adjusted by 0.5-line phase
SC_SCL0_DS5	SC_RES_BTM_ INIPHASE[11:0]	0	No phase adjustment for bottom field
SC_SCL0_FRC5	SC_RES_FLD_DLY_SEL	1	IP conversion with two planes of frame buffer used for vertical scaling-up
Frame Buffer Write Setting			
SC_SCL1_WR1	SC_RES_DS_WR_MD [2:0]	0	Normal write mode for rotation control
SC_SCL1_WR1	SC_RES_MD[1:0]	0	Frame buffer write format YCbCr422 (16 bits)
SC_SCL1_WR2	SC_RES_BASE[31:0]	0	Frame buffer write start address (0 in setting example)
SC_SCL1_WR3	SC_RES_LN_OFF[14:0]	2048	Frame buffer write line offset

Table 31.41 Register Setting Example for 525i Video Input and VGA-Size Video Output

Register Name	Bit Name	Settings	Remarks
SC_SCL1_WR3	SC_RES_FLM_NUM[9:0]	1	Two planes of frame buffer used

31.3.2 Scaling Setting Example for Graphics Display

(1) Angle of View for Graphics Display

This section describes an example of setting the signals of the input and output angles of view shown in Table 31.42.

Table 31.42 Input and Output Angles of View for Graphics Display

Graphics Size	Output Signal	Graphics Signal Format
640 × 480	640 × 480	RGB888

Figure 31.20 Signal Paths for Graphics Display

(2) Setting Frame Buffer Access Area

In the frame buffer in which graphics data is stored, graphics data needs to be expanded in the area of 640×480 pixels or larger.

Here, the frame buffer area in which graphics data is expanded is assumed to be 640×480 pixels.

Since the frame buffer is accessed in 64-bit units, RGB888 (32 bits) is accessed in 2-pixel units.

The line offset address values to be set are:

$$\text{GR_LN_OFF}[14:0] = 640 \times 4 = 2560$$

The frame offset address values to be set are:

$$\text{GR_FLM_OFF}[22:0] = \text{GR_LN_OFF}[14:0] \times 480 = 1228800$$

(3) Register Setting Example

Table 31.43 Register Setting Example for Graphics Display

Register Name	Bit Name	Settings	Remarks
Synchronization Control			
SC_SCL0_FRC3	SC_RES_VS_SEL	1	Free-running Vsync selected (when the appropriate input signal is available, an external sync can also be selected)
SC_SCL0_FRC4	SC_RES_FV[10:0]	524	Vertical period width of output signal (period width = set value + 1)
SC_SCL0_FRC4	SC_RES_FH[10:0]	799	Horizontal period width of output signal (period width = set value + 1)
Size of Angle of View			
SC_SCL0_FRC6	SC_RES_F_VS[10:0]	35	Vertical valid start position of full screen
SC_SCL0_FRC6	SC_RES_F_VW[10:0]	480	Vertical valid width of full screen
SC_SCL0_FRC7	SC_RES_F_HS[10:0]	144	Horizontal valid start position of full screen
SC_SCL0_FRC7	SC_RES_F_HW[10:0]	640	Horizontal valid width of full screen
GR_AB2	GR_GRC_VS[10:0]	35	Vertical valid start position of graphics output
GR_AB2	GR_GRC_VW[10:0]	480	Vertical valid width of graphics output

Frame Buffer Read Setting			
GR_FLM1	GR_FLM_SEL[1:0]	1	Frame number setting with register
GR_FLM3	GR_FLM_NUM[9:0]	0	Frame number of frame buffer (0 in setting example)
GR_FLM5	GR_FLM_LNUM[9:0]	479	Number of graphics lines (number of lines = set value + 1)
GR_FLM6	GR_HW[9:0]	639	Horizontal valid width of graphics (valid width = set value + 1)
GR_FLM2	GR_BASE[31:0]	0	Conforming to graphics expansion setting (0 in setting example)
GR_FLM3	GR_LN_OFF[14:0]	2560	Conforming to graphics expansion setting
Frame Buffer Read Setting			
GR_FLM4	GR_FLM_OFF[22:0]	1228800	Conforming to graphics expansion setting
GR_FLM6	GR_FORMAT[3:0]	1	Frame buffer read format RGB888
GR_FLM_RD	GR_R_ENB	1	Frame buffer read enabled

Table 31.43 Register Setting Example for Graphics Display

Register Name	Bit Name	Settings	Remarks
Scaling-up Selection			
SC_SCL0_US8	SC_RES_IBUS_SYNC_SEL	1	Graphics output displayed
GR_AB1	GR_DISP_SEL[1:0]	2	Graphics display selected

31.3.3 Scaling Setting Example for Scaled-up Graphics Display

(1) Angles of View for Input and Output

This section describes an example of setting the signals of the input and output angles of view shown in Table 31.44.

Table 31.44 Input and Output Angles of View for Scaled-up Graphics Display

Graphics Size	Output Signal	Graphics Signal Format
640 × 480	800 × 600	RGB565

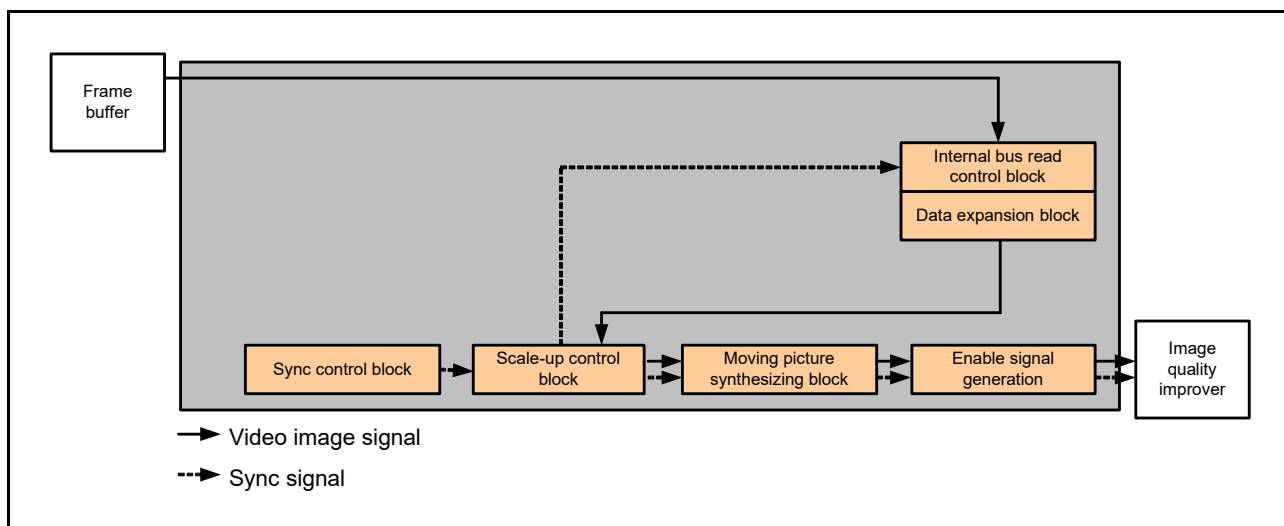

Figure 31.21 Signal Paths for Scaled-up Graphics Display

(2) Horizontal Scaling (Horizontal Scale Up, Scaling Filter: 2-Tap Linear)

The scaling rate for folding can be calculated as shown below.

$$\text{RATIO_org} = \text{round} (640 \div 800 \times 4096) = 3277$$

$$\sigma = (3277 \times (800 - 1) - (640 - 1) \times 4096) \div (800 - 1) = 1.23$$

$$\text{Horizontal scaling ratio} = \text{round} (3277 - (1.23)) = 3276$$

(3) Vertical Scaling (Vertical Scale Up, Scaling Filter: 2-Tap Linear)

The scaling rate for folding can be calculated as shown below.

$$\text{RATIO_org} = \text{round} (480 \div 600 \times 4096) = 3277$$

$$\sigma = (3277 \times (600 - 1) - (480 - 1) \times 4096) \div (600 - 1) = 1.57$$

$$\text{Vertical scaling ratio} = \text{round} (3277 - (1.57)) = 3275$$

(4) Setting Frame Buffer Access Area

In the frame buffer in which graphics data is stored, graphics data needs to be expanded in the area of 640×480 pixels or larger.

Here, the frame buffer area in which graphics data is expanded is assumed to be 640×480 pixels.

Since the frame buffer is accessed in 64-bit units, RGB565 (16 bits) is accessed in 4-pixel units.

The line offset address values to be set are:

$$\text{GR_LN_OFF}[14:0] = 640 \times 2 = 1280$$

The frame offset address values to be set are:

$$\text{GR_FLM_OFF}[22:0] = \text{GR_LN_OFF}[14:0] \times 480 = 614400$$

(5) Register Setting Example

Table 31.45 Register Setting Example for Scaled-up Graphics Display

Register Name	Bit Name	Settings	Remarks
Synchronization Control			
SC_SCL0_FRC3	SC_RES_VS_SEL	1	Free-running Vsync selected (when the appropriate input signal is available, an external sync can also be selected)
SC_SCL0_FRC4	SC_RES_FV[10:0]	668	Vertical period width of output signal (period width = set value + 1)

32. Video Display Controller 5 (4): Image Quality Improver

32.1 Image Quality Improver

32.1.1 Overview of Functions

The image quality improver subjects scaled YCbCr signals to black stretching, LTI/sharpness processing, and GBR conversion by using a color matrix.

The image quality improver does not act on RGB signals.

Figure 32.1 is a functional block diagram of the image quality improver. Image quality improver 0 is connected to scaler 0.

Figure 32.1 Functional Block Diagram of Image Quality Improver

32.1.2 Register Update Control

The control register for image quality improver controls the update timing entirely by vertical synchronous signals.

The vertical synchronous signal launched after the update control register is set to 1 is reflected in various registers, following which the update control register is automatically cleared to 0.

Note that registers for the improver can be identified by the number in the register name like ADJ0_xxxx. In the sections except for Register Description, however, the number is omitted like ADJ_xxxx for convenience sake.

Table 32.1 Register Update Control

Register Name	Bit Name	Initial Value	Description
ADJ_UPDATE	ADJ_VEN	0	Image Quality Improver Register Update 0: Register is not updated. 1: Register is updated by launch of vertical synchronous signal.

32.1.3 Black Stretch

Black stretch refers to the black stretch correction of the Y signal of the input video signal of YCbCr format.

Correction of the Y signal is done by adjusting the time constant, depth (gain), and start point.

Figure 32.2 is a drawing illustrating black stretch correction.

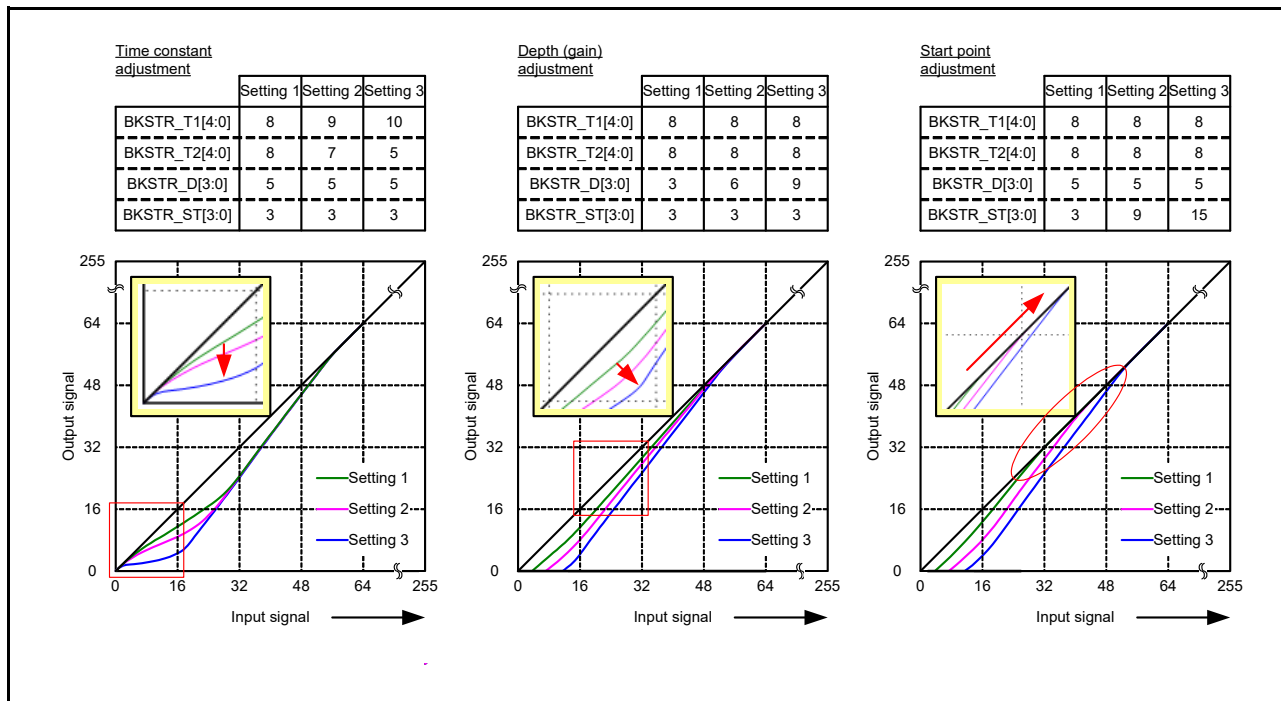

Figure 32.2 Black Stretch Correction (With Sample Settings)

Table 32.2 Black Stretch Control

Register Name	Bit Name	Initial Value	Description
ADJ_BKSTR_SET	BKSTR_ON	0	Black Stretch On/Off Control 0: Black Stretch Off 1: Black Stretch On
ADJ_BKSTR_SET	BKSTR_ST[3:0]	0	Black Stretch Start Point 0 (low) to 15 (high)
ADJ_BKSTR_SET	BKSTR_T1[4:0]	0	Black Stretch Time Constant (T1) 0 (small) to 31 (large)
ADJ_BKSTR_SET	BKSTR_T2[4:0]	0	Black Stretch Time Constant (T2) 0 (small) to 30 (large), 31: Setting prohibited
ADJ_BKSTR_SET	BKSTR_D[3:0]	0	Black Stretch Depth 0 (shallow) to 15 (deep)

32.1.4 Enhancer

The enhancer subjects the scaled Y signal input to transient improvement (LTI) and sharpness processing in the horizontal direction.

(1) Enhancer Area Specification

The operating area of the enhancer is specified with reference to the rising edges of the Hsync signal and Vsync signal. ENH_HS should be set to four or greater clocks, and ENH_VS should be set to two or greater lines. Figure 32.3 shows enhancer area setting.

Figure 32.3 Period when Enhancer is Enabled

Setting ENH_DISP_ON to 1 displays the enhancer-enabled area with frame lines.

Table 32.3 Enhancer Area Control

Register Name	Bit Name	Initial Value	Description
ADJ_ENH_TIM1	ENH_MD	1	Operating Mode 0: RGB mode 1: YCbCr mode
ADJ_ENH_TIM2	ENH_VS[10:0]	0	Start Position of Vertical Valid Image Area in Enhancer-Enabled Area Note: Set to 2 or greater lines.
ADJ_ENH_TIM2	ENH_VW[10:0]	0	Width of Vertical Valid Image Area in Enhancer-Enabled Area

Table 32.3 Enhancer Area Control

Register Name	Bit Name	Initial Value	Description
ADJ_ENH_TIM3	ENH_HS[10:0]	0	Start Position of Horizontal Valid Image Area in Enhancer-Enabled Area Note: Set to 4 or greater clocks.
ADJ_ENH_TIM3	ENH_HW[10:0]	0	Width of Horizontal Valid Image Area in Enhancer-Enabled Area
ADJ_ENH_TIM1	ENH_DISP_ON	0	Frame Line Display in Enhancer-Enabled Area 0: Off 1: On

(2) LTI (Luminance Transient Improvement)

The enhancer subjects the Y signal input to transient improvement in the horizontal direction.

Transient improvement of the blanking signal is turned off.

Figure 32.4 LTI Correction

After edge detection of the image, the LTI can be independently controlled in the two horizontal bands.

In LTI, the median filter is inserted after edge detection of the image.

In LTI (H4), the reference pixels of the median filter can be selected.

However, under normal operations, half the tap data (second adjacent pixel) at edge detection is used as reference.

Table 32.4 Reference Pixel Table for LTI

LTI Band	Reference Pixel for Edge Detection	LPF Application	Median Filter Reference Pixels
Horizontal LTI (H2)	Second adjacent pixel used as reference	LPF not applied or LPF (1,2,1)	Adjacent pixel used as reference
Horizontal LTI (H4)	Fourth adjacent pixel used as reference	LPF (1,2,1)	Adjacent pixel or second adjacent pixel used as reference

In LTI, the detection result can be subjected to a coring process.

The core value set in the register is subtracted from the edge detection result, and LTI correction is performed on the coring output after subtraction.

Figure 32.5 LTI Coring

Table 32.5 LTI Control

Register Name	Bit Name	Initial Value	Description
ADJ_ENH_LTI1	LTI_H_ON	0	LTI On/Off Control 0: LTI off 1: LTI on
ADJ_ENH_LTI1	LTI_H2_INC_ZERO [7:0]	10	Median Filter LTI Correction Threshold LTI correction is disabled when: $ \text{right TAP value} - \text{center TAP value} < \text{LTI1_H2_INC_ZERO}$ or $ \text{left TAP value} - \text{center TAP value} < \text{LTI1_H2_INC_ZERO}$.
ADJ_ENH_LTI1	LTI_H2_LPF_SEL	0	LPF Selection for Folding Prevention Before H2 Edge Detection 0: LPF not selected 1: LPF selected
ADJ_ENH_LTI1	LTI_H2_GAIN[7:0]	0	LTI Edge Amplitude Value Gain 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times)
ADJ_ENH_LTI1	LTI_H2_CORE[7:0]	0	LTI Coring (Maximum core value of 255) Amplitude smaller than or equal to the value of LTI_H2_CORE is cored from the edge amplitude value. (A core value setting of 128 remains unchanged.)
ADJ_ENH_LTI2	LTI_H4_INC_ZERO[7:0]	10	Median Filter LTI Correction Threshold LTI correction is disabled when: $ \text{right TAP value} - \text{center TAP value} < \text{LTI1_H4_INC_ZERO}$ or $ \text{left TAP value} - \text{center TAP value} < \text{LTI1_H4_INC_ZERO}$.
ADJ_ENH_LTI2	LTI_H4_MEDIAN_TAP_SEL	0	Median Filter Reference Pixel Select 0: Second adjacent pixel selected as reference 1: Adjacent pixel selected as reference
ADJ_ENH_LTI2	LTI_H4_GAIN[7:0]	0	LTI Edge Amplitude Value Gain 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times)
ADJ_ENH_LTI2	LTI_H4_CORE[7:0]	0	LTI Coring (Maximum core value of 255) Amplitude less than or equal to the value of LTI_H4_CORE is cored from the edge amplitude value. (A core value setting of 128 remains unchanged.)

(3) Sharpness Process

The enhancer performs edge enhancement on the Y signal input by adding overshoot and undershoot to the original signal. Edge enhancement of the blanking signal is turned off.

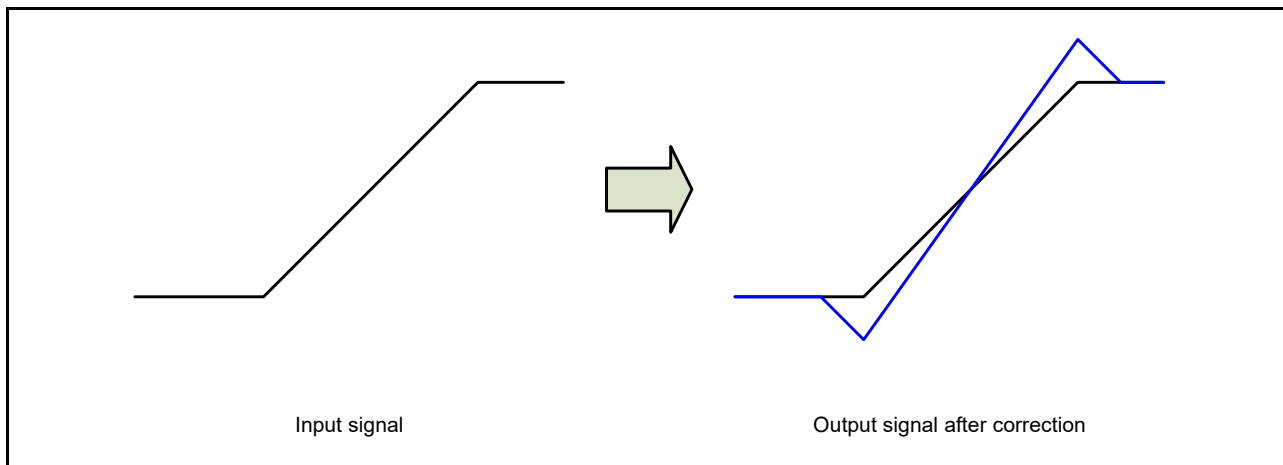

Figure 32.6 Sharpness Correction

After edge detection of the image, the sharpness can be independently controlled in the three horizontal bands.

In horizontal sharpness, a 3-tap low-pass filter (LPF) is inserted before edge detection to prevent folding. The LPF can be turned on or off by register setting.

Table 32.6 Reference Pixel Table for Sharpness

Sharpness Band	Reference Pixel for Edge Detection	LPF Application
Horizontal sharpness (H1)	Adjacent pixel used as reference	LPF not applied
Horizontal sharpness (H2)	Second adjacent pixel used as reference	LPF not applied or LPF (1,2,1)
Horizontal sharpness (H3)	Third adjacent pixel used as reference	LPF (1,2,1)

The edge amplitude of the edge to be enhanced is adjusted according to the value of SHP_CORE.

Edge enhancement is accomplished when the edge detection result of the image is greater than the value of SHP_CORE.

In edge enhancement, a correction value is output by multiplying (edge amplitude value - SHP_CORE) by sharpness gain.

Sharpness is turned off when the edge detection result of the image is smaller than the value of SHP_CORE.

Figure 32.7 Sharpness Characteristics

Table 32.7 Sharpness Control

Register Name	Bit Name	Initial Value	Description
ADJ_ENH_SHP1	SHP_H_ON	0	Sharpness On/Off Control 0: Horizontal sharpness off 1: Horizontal sharpness on
ADJ_ENH_SHP3	SHP_H2_LPF_SEL	0	LPF Selection for Folding Prevention Before H2 Edge Detection 0: LPF not selected 1: LPF selected
ADJ_ENH_SHP2	SHP_H1_CLIP_O[7:0]	0	Sharpness Correction Value Clipping (on the Overshoot Side) Correction value clipped according to SHP_H1_CLIP_O
ADJ_ENH_SHP2	SHP_H1_CLIP_U[7:0]	0	Sharpness Correction Value Clipping (on the Undershoot Side) Correction value clipped according to SHP_H1_CLIP_U
ADJ_ENH_SHP2	SHP_H1_GAIN_O[7:0]	0	Sharpness Edge Amplitude Value Gain (on the Overshoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H1_GAIN_O × (edge amplitude value – SHP_H1_CORE)
ADJ_ENH_SHP2	SHP_H1_GAIN_U[7:0]	0	Sharpness Edge Amplitude Value Gain (on the Undershoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H1_GAIN_U × (edge amplitude value – SHP_H1_CORE)
ADJ_ENH_SHP1	SHP_H1_CORE[6:0]	0	Active Sharpness Range Edge amplitude value ≥ SHP_H1_CORE: Sharpness processing on Edge amplitude value < SHP_H1_CORE: Sharpness processing off Sharpness processing is always on when the edge detection value is 128 or greater.
ADJ_ENH_SHP4	SHP_H2_CLIP_O[7:0]	0	Sharpness Correction Value Clipping (on the Overshoot Side) Correction value clipped according to SHP_H2_CLIP_O
ADJ_ENH_SHP4	SHP_H2_CLIP_U[7:0]	0	Sharpness Correction Value Clipping (on the Undershoot Side) Correction value clipped according to SHP_H2_CLIP_U
ADJ_ENH_SHP4	SHP_H2_GAIN_O[7:0]	0	Sharpness Edge Amplitude Value Gain (on the Overshoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H2_GAIN_O × (edge amplitude value – SHP_H2_CORE)
ADJ_ENH_SHP4	SHP_H2_GAIN_U[7:0]	0	Sharpness Edge Amplitude Value Gain (on the Undershoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H2_GAIN_U × (edge amplitude value – SHP_H2_CORE)
ADJ_ENH_SHP3	SHP_H2_CORE[6:0]	0	Active Sharpness Range Edge amplitude value ≥ SHP_H2_CORE: Sharpness processing on Edge amplitude value < SHP_H2_CORE: Sharpness processing off Sharpness processing is always on when the edge detection value is 128 or greater.
ADJ_ENH_SHP6	SHP_H3_CLIP_O[7:0]	0	Sharpness Correction Value Clipping (on the Overshoot Side) Correction value clipped according to SHP_H3_CLIP_O
ADJ_ENH_SHP6	SHP_H3_CLIP_U[7:0]	0	Sharpness Correction Value Clipping (on the Undershoot Side) Correction value clipped according to SHP_H3_CLIP_U
ADJ_ENH_SHP6	SHP_H3_GAIN_O[7:0]	0	Sharpness Edge Amplitude Value Gain (on the Overshoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H3_GAIN_O × (edge amplitude value – SHP_H3_CORE)
ADJ_ENH_SHP6	SHP_H3_GAIN_U[7:0]	0	Sharpness Edge Amplitude Value Gain (on the Undershoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H3_GAIN_U × (edge amplitude value – SHP_H3_CORE)
ADJ_ENH_SHP5	SHP_H3_CORE[6:0]	0	Active Sharpness Range Edge amplitude value ≥ SHP_H3_CORE: Sharpness processing on Edge amplitude value < SHP_H3_CORE: Sharpness processing off Sharpness processing is always on when the edge detection value is 128 or greater.

32.1.5 Color Matrix

Color matrix is performed by adjusting the offset of each input signal and nine-axis gain. This allows YCbCr to GBR conversion.

(1) GBR to GBR Conversion

$$YGIN_A = YGIN + ADJ_MTX_YG - 128$$

$$CBBIN_A = CBBIN + ADJ_MTX_B - 128$$

$$CRRIN_A = CRRIN + ADJ_MTX_R - 128$$

$$YGOUT = (ADJ_MTX_GG \times YGIN_A + ADJ_MTX_GB \times CBBIN_A + ADJ_MTX_GR \times CRRIN_A) \div 256$$

$$CBBOUT = (ADJ_MTX_BG \times YGIN_A + ADJ_MTX_BB \times CBBIN_A + ADJ_MTX_BR \times CRRIN_A) \div 256$$

$$CRROUT = (ADJ_MTX_RG \times YGIN_A + ADJ_MTX_RB \times CBBIN_A + ADJ_MTX_RR \times CRRIN_A) \div 256$$

(2) YCbCr to GBR Conversion

$$YGIN_A = YGIN + ADJ_MTX_YG - 128$$

$$CBBIN_A = CBBIN - 128$$

$$CRRIN_A = CRRIN - 128$$

$$YGOUT = (ADJ_MTX_GG \times YGIN_A + ADJ_MTX_GB \times CBBIN_A + ADJ_MTX_GR \times CRRIN_A) \div 256$$

$$CBBOUT = (ADJ_MTX_BG \times YGIN_A + ADJ_MTX_BB \times CBBIN_A + ADJ_MTX_BR \times CRRIN_A) \div 256$$

$$CRROUT = (ADJ_MTX_RG \times YGIN_A + ADJ_MTX_RB \times CBBIN_A + ADJ_MTX_RR \times CRRIN_A) \div 256$$

Table 32.8 Matrix Coefficients (Standard Values) of SMPTE 293M

32.2 Register Description

Table 32.10 shows the register configuration.

[Symbols used in Register Description]

Initial value	: Register value after a reset
—	: Undefined value
R/W	: Readable/writable. The written value can be read.
R/WC0	: Read and write. Bit is initialized if 0 is written, and ignored if 1 is written.
R/WC1	: Read and write. Bit is initialized if 1 is written, and ignored if 0 is written.
R	: Read-only. The write value should always be 0.
—/W	: Write-only. Read value is undefined.

R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	ENH_MD	1	R/W	Operating Mode 0: RGB mode 1: YCbCr mode
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	ENH_DISP_ON	0	R/W	Frame Line Display On/Off of Enhancer-Enabled Area 0: Display off 1: Display on

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

32.2.4 Enhancer Timing Adjustment Register 2 (ADJ0_ENH_TIM2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	ENH_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	ENH_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	ENH_VS[10:0]	35	R/W	Start Position of Vertical Valid Image Area in Enhancer-Enabled Area Note: Set to 2 or greater lines.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	ENH_VW[10:0]	480	R/W	Width of Vertical Valid Image Area in Enhancer-Enabled Area

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

32.2.5 Enhancer Timing Adjustment Register 3 (ADJ0_ENH_TIM3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	ENH_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	0	0	1	0	0	0	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	ENH_HW[10:0]										
Initial value:	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	ENH_HS[10:0]	145	R/W	Start Position of Horizontal Valid Image Area in Enhancer-Enabled Area Note: Set to 4 or greater clocks.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	ENH_HW[10:0]	640	R/W	Width of Horizontal Valid Image Area in Enhancer-Enabled Area

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

32.2.6 Enhancer Sharpness Register 1 (ADJ0_ENH_SHP1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SHP_H_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	SHP_H1_CORE[6:0]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	SHP_H_ON	0	R/W	Sharpness On/Off Control 0: Horizontal sharpness off 1: Horizontal sharpness on
15 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
6 to 0	SHP_H1_CORE[6:0]	0	R/W	Active Sharpness Range Edge amplitude value \geq SHP_H1_CORE: Sharpness processing on Edge amplitude value $<$ SHP_H1_CORE: Sharpness processing off Sharpness processing is always on when the edge detection value is 128 or greater.

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

32.2.7 Enhancer Sharpness Register 2 (ADJ0_ENH_SHP2)

	Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
		SHP_H1_CLIP_O[7:0]								SHP_H1_CLIP_U[7:0]							
Initial value:		0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
	Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
		SHP_H1_GAIN_O[7:0]								SHP_H1_GAIN_U[7:0]							
Initial value:		0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	SHP_H1_CLIP_O [7:0]	0	R/W	Sharpness Correction Value Clipping (on the Overshoot Side) Correction value clipped according to SHP_H1_CLIP_O
23 to 16	SHP_H1_CLIP_U [7:0]	0	R/W	Sharpness Correction Value Clipping (on the Undershoot Side) Correction value clipped according to SHP_H1_CLIP_U
15 to 8	SHP_H1_GAIN_O [7:0]	0	R/W	Sharpness Edge Amplitude Value Gain (on the Overshoot Side) 0 (0 times) to 64 (+1 times) to 255 (+approx. 4 times) Sharpness correction value = SHP_H1_GAIN_O × (edge amplitude value – SHP_H1_CORE)
7 to 0	SHP_H1_GAIN_U [7:0]	0	R/W	Sharpness Edge Amplitude Value Gain (on the Undershoot Side) 0 (0 times) to 64 (+1 times) to 255 (+approx. 4 times) Sharpness correction value = SHP_H1_GAIN_U × (Edge amplitude value – SHP_H1_CORE)

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

32.2.8 Enhancer Sharpness Register 3 (ADJ0_ENH_SHP3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SHP_H2_LPF_SEL
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	SHP_H2_CORE[6:0]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	SHP_H2_LPF_SEL	0	R/W	LPF Selection for Folding Prevention before H2 Edge Detection 0: LPF not selected 1: LPF selected
15 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
6 to 0	SHP_H2_CORE[6:0]	0	R/W	Active Sharpness Range Edge amplitude value \geq SHP_H2_CORE: Sharpness processing on Edge amplitude value $<$ SHP_H2_CORE: Sharpness processing off Sharpness processing is always on when the edge detection value is 128 or greater.

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

32.2.9 Enhancer Sharpness Register 4 (ADJ0_ENH_SHP4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SHP_H2_CLIP_O[7:0]								SHP_H2_CLIP_U[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SHP_H2_GAIN_O[7:0]								SHP_H2_GAIN_U[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	SHP_H2_CLIP_O[7:0]	0	R/W	Sharpness Correction Value Clipping (on the Overshoot Side) Correction value clipped according to SHP_H2_CLIP_O
23 to 16	SHP_H2_CLIP_U[7:0]	0	R/W	Sharpness Correction Value Clipping (on the Undershoot Side) Correction value clipped according to SHP_H2_CLIP_U
15 to 8	SHP_H2_GAIN_O[7:0]	0	R/W	Sharpness Edge Amplitude Value Gain (on the Overshoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H2_GAIN_O × (edge amplitude value – SHP_H2_CORE)
7 to 0	SHP_H2_GAIN_U[7:0]	0	R/W	Sharpness Edge Amplitude Value Gain (on the Undershoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H2_GAIN_U × (edge amplitude value – SHP_H2_CORE)

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

32.2.10 Enhancer Sharpness Register 5 (ADJ0_ENH_SHP5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	SHP_H3_CORE[6:0]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
6 to 0	SHP_H3_CORE[6:0]	0	R/W	Active Sharpness Range Edge amplitude value ≥ SHP_H3_CORE: Sharpness processing on Edge amplitude value < SHP_H3_CORE: Sharpness processing off Sharpness processing is always on when the edge detection value is 128 or greater.

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

32.2.11 Enhancer Sharpness Register 6 (ADJ0_ENH_SHP6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SHP_H3_CLIP_O[7:0]								SHP_H3_CLIP_U[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SHP_H3_GAIN_O[7:0]								SHP_H3_GAIN_U[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	SHP_H3_CLIP_O[7:0]	0	R/W	Sharpness Correction Value Clipping (on the Overshoot Side) Correction value clipped according to SHP_H3_CLIP_O
23 to 16	SHP_H3_CLIP_U[7:0]	0	R/W	Sharpness Correction Value Clipping (on the Undershoot Side) Correction value clipped according to SHP_H3_CLIP_U
15 to 8	SHP_H3_GAIN_O[7:0]	0	R/W	Sharpness Edge Amplitude Value Gain (on the Overshoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H3_GAIN_O × (Edge amplitude value – SHP_H3_CORE)
7 to 0	SHP_H3_GAIN_U[7:0]	0	R/W	Sharpness Edge Amplitude Value Gain (on the Undershoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H3_GAIN_U × (Edge amplitude value – SHP_H3_CORE)

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

32.2.12 Enhancer LTI Register 1 (ADJ0_ENH_LTI1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	LTI_H_ON	—	—	—	—	—	—	LTI_H2_LPF_SEL	LTI_H2_INC_ZERO[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	0	1	0
R/W:	R/W	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LTI_H2_GAIN[7:0]								LTI_H2_CORE[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	LTI_H_ON	0	R/W	LTI On/Off Control 0: LTI off 1: LTI on
30 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	LTI_H2_LPF_SEL	0	R/W	LPF Selection for Folding Prevention before H2 Edge Detection 0: LPF not selected 1: LPF selected
23 to 16	LTI_H2_INC_ZERO[7:0]	10	R/W	Median Filter LTI Correction Threshold LTI correction is disabled when right TAP value – center TAP value < LTI_H2_INC_ZERO or left TAP value – center TAP value < LTI_H2_INC_ZERO
15 to 8	LTI_H2_GAIN[7:0]	0	R/W	LTI Edge Amplitude Value Gain 0 (0 times) to 64 (+ 1 times) to 255 (+ approx. 4 times)
7 to 0	LTI_H2_CORE[7:0]	0	R/W	LTI Coring (Maximum Core value of 255) Amplitude less than or equal to the value of LTI_H2_CORE is cored from the edge amplitude value. (A core value setting of 128 remains unchanged)

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

32.2.13 Enhancer LTI Register 2 (ADJ0_ENH_LTI2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	LTI_H4_MEDIAN_TAP_SEL	LTI_H4_INC_ZERO[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	0	1	0
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LTI_H4_GAIN[7:0]								LTI_H4_CORE[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	LTI_H4_MEDIAN_TAP_SEL	0	R/W	Median Filter Reference Pixel Select 0: Second adjacent pixel selected as reference 1: Adjacent pixel selected as reference
23 to 16	LTI_H4_INC_ZERO[7:0]	10	R/W	Median Filter LTI Correction Threshold LTI correction is disabled when right TAP value – center TAP value < LTI_H4_INC_ZERO or left TAP value – center TAP value < LTI_H4_INC_ZERO
15 to 8	LTI_H4_GAIN[7:0]	0	R/W	LTI Edge Amplitude Value Gain 0 (0 times) to 64 (+ 1 times) to 255 (+ approx. 4 times)
7 to 0	LTI_H4_CORE[7:0]	0	R/W	LTI Coring (Maximum Core value of 255) Amplitude less than or equal to the value of LTI_H4_CORE is cored from the edge amplitude value (A core value setting of 128 remains unchanged)

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

32.2.14 Matrix Mode Register in Image Quality Improver (ADJ0_MTX_MODE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ADJ0_MTX_MD[1:0]
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	ADJ0_MTX_MD[1:0]	2	R/W	Operating Mode 0: GBR → GBR 1: Setting prohibited 2: YCbCr → GBR 3: Setting prohibited

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

32.2.15 Matrix YG Control Register 0 in Image Quality Improver (ADJ0_MTX_YG_ADJ0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	ADJ0_MTX_YG[7:0]							
Initial value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	ADJ0_MTX_GG[10:0]										
Initial value:	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	ADJ0_MTX_YG[7:0]	128	R/W	Y/G Signal Offset (DC) Adjustment Unsigned (0 (-128) to 128 (0) to 255 (+127) [LSB])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	ADJ0_MTX_GG[10:0]	256	R/W	Gain Adjustment of Y/G Signal of G Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

32.2.16 Matrix YG Control Register 1 in Image Quality Improver (ADJ0_MTX_YG_ADJ1)

R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	ADJ0_MTX_RB [10:0]	0	R/W	Gain Adjustment of Cb/B Signal of R Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	ADJ0_MTX_RR [10:0]	359	R/W	Gain Adjustment of Cr/R Signal of R Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

32.3 Usage Method

32.3.1 Black Stretch Usage Method

The degree of black stretch can be adjusted by setting the depth (BKSTR_D[3:0]) and the start point (BKSTR_ST[3:0]) of the black stretch. The variation in the black stretch time axis can be adjusted by setting the time constant (BKSTR_T1[4:0] and BKSTR_T2[4:0]). By setting the time constant, changes that occur abruptly due to swapping of the scene can be controlled.

Table 32.11 Black Stretch Setting Register

Register Name	Bit Name	Set Value
ADJ_BKSTR_SET	BKSTR_ON	When black stretch is on: 1
ADJ_BKSTR_SET	BKSTR_D[3:0]	Set the depth of black stretch. The depth increases as the value becomes larger.
ADJ_BKSTR_SET	BKSTR_ST[3:0]	Set the start point of black stretch. The stretching area becomes larger as the value becomes larger.
ADJ_BKSTR_SET	BKSTR_T1[4:0]	Set the time constant of black stretch in the positive direction. The changes are more delayed as the value becomes larger.
ADJ_BKSTR_SET	BKSTR_T2[4:0]	Set the time constant of black stretch in the negative direction. The changes are more delayed as the value becomes larger.

Note: ADJ_VEN in ADJ_UPDATE should be set to 1 after setting the registers.

32.3.2 LTI Processing of Enhancer

Figure 32.8 shows an example of LTI adjustment.

Figure 32.8 Example of LTI Adjustment

32.3.3 Sharpness Processing of Enhancer

Figure 32.9 shows an example of sharpness adjustment.

Figure 32.9 Example of Sharpness Adjustment

32.3.4 Setting Method for Color Matrix Data Conversion

GBR signals are assumed to be input to the circuit subsequent to the image quality improver; therefore, the output from the color matrix circuit should be in the GBR format.

Table 32.12 shows an example of GBR conversion setting.

Table 32.12 Recommended Setting Values for Matrix Conversion

Register Name	Bit Name	GBR to GBR Conversion	YCBCR to GBR Conversion
		Recommended Values	Recommended Values
ADJ_MTX_MODE	ADJ_MTX_MD[1:0]	0	2
ADJ_MTX_YG_ADJ0	ADJ_MTX_YG[7:0]	128	128
ADJ_MTX_CBB_ADJ0	ADJ_MTX_B[7:0]	128	128
ADJ_MTX_CRR_ADJ0	ADJ_MTX_R[7:0]	128	128
ADJ_MTX_YG_ADJ0	ADJ_MTX_GG[10:0]	256	256
ADJ_MTX_YG_ADJ1	ADJ_MTX_GB[10:0]	0	1960
ADJ_MTX_YG_ADJ1	ADJ_MTX_GR[10:0]	0	1865
ADJ_MTX_CBB_ADJ0	ADJ_MTX_BG[10:0]	0	256
ADJ_MTX_CBB_ADJ1	ADJ_MTX_BB[10:0]	256	454
ADJ_MTX_CBB_ADJ1	ADJ_MTX_BR[10:0]	0	0

ADJ_MTX_CRR_ADJ1	ADJ_MTX_RR[10:0]	256	359

Note: ADJ_VEN in ADJ_UPDATE should be set to 1 after setting the registers.

33. Video Display Controller 5 (5): Image Synthesizer

33.1 Image Synthesizer

33.1.1 Overview of Functions

The image synthesizer reads graphics data from the frame buffer and displays the synthesized image on the screen.

One video plane + two graphics planes, or three graphics planes can be selected for synthesis.

RGB565, RGB888, α RGB1555, α RGB4444, α RGB8888, RGB α 5551, RGB α 8888, CLUT8, CLUT4, CLUT1, YCbCr422 (for the graphics 0 process), and YCbCr444 (for the graphics 0 process) formats can be used for graphics data, and RGB565, RGB888, YCbCr422, and YCbCr444 formats for video data.

On each of the graphics planes, background color, lower-layer graphics, current graphics, or blended image (for the graphics 2 and 3 processes) of lower-layer graphics and current graphics can be displayed.

It is recommend that the frame buffer is placed in the on-chip large-capacity RAM. Both the on-chip large-capacity RAM and an external SDRAM can be used for the frame buffer, but the bus bandwidth might become short and display might not be possible if an external SDRAM is used for the frame buffer.

The functional block diagram of the image synthesizer is shown below.

Figure 33.1 Functional Block Diagram of Image Synthesizer

33.1.2 Graphics Data Read Control

Graphics data read can be controlled for the three processes: the graphics 0 process in the scaler 0, and the graphics 2 and 3 processes in the image synthesizer.

The register bits of each process can be identified by the number in the register name like GR0_XXXX, GR2_XXXX, and GR3_XXXX, respectively. In the sections except for Register Descriptions, however, the number is omitted like GR_XXXX for convenience sake.

In the VIN synthesizer, graphics data read is not controlled. In this manual, the name is omitted like GR_XXXX for convenience sake. The synthesizer does not have the read control register (GR_FLM).

(1) Updating Registers

The Vsync signal is used to control the update timing of the registers for graphics display and frame buffer read control, except for some of the registers.

After 1 is set to the bits in the update control register, the contents of the relevant registers are actually modified at the rising edge of the Vsync signal, when the update control register is automatically cleared to 0.

Table 33.1 Register Update Control

Register Name	Bit Name	Initial Value	Description
GR_UPDATE	GR_UPDATE	0	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated.
GR_UPDATE	GR_P_VEN	0	Graphics Display Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
GR_UPDATE	GR_IBUS_VEN	0	Frame Buffer Read Register Update* 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

Note: * This bit is not supported for the VIN synthesizer.

(2) Frame Buffer Burst Transfer Mode

Either 32-byte or 128-byte transfer mode can be selected for accessing the frame buffer in which video data and graphics data are stored.

Table 33.2 Frame Buffer Burst Transfer Mode

Register Name	Bit Name	Initial Value	Description
GR_FLM1	GR_BST_MD	0	Frame Buffer Burst Transfer Mode 0: 32-byte transfer 1: 128- byte transfer

(3) Frame Buffer Control Mode

More than one frame of data is read from the frame buffer.

For graphics data, set the GR_FLM_SEL[1:0] bits to 1, and set the specific display frame number with the GR_FLM_NUM[9:0] bits. For video data, select a mode with the GR_FLM_SEL[1:0] bits depending on the writing process used; the quantity of the frames used for video data is set in the writing process block.

Table 33.3 Frame Buffer Control Mode

Register Name	Bit Name	Initial Value	Description
GR_FLM1	GR_FLM_SEL[1:0]	0	Frame Buffer Address Setting Signal Select 0: Control linked to scaling-down process, or frame 0 selected.*1 1: Register GR_FLM_NUM selected. 2: Frame 0 selected. 3: Control linked to pointer buffer, or setting prohibited.*2
GR_FLM3	GR_FLM_NUM[9:0]	0	Frame Number of Frame Buffer Manually set the frame number when GR_FLM_SEL = 1.

Notes: 1. For the graphics 0 process, frame buffer control links to the scaling-down process. For the graphics 2 and 3 processes, frame 0 is selected.
2. For the graphics 0 process, frame buffer control links to the pointer buffer. For the graphics 2 and 3 processes, setting is prohibited.

(4) Frame Buffer Read Control

The following bit enables or disables read access to the frame buffer.

Table 33.4 Frame Buffer Read Control

Register Name	Bit Name	Initial Value	Description
GR_FLM_RD	GR_R_ENB	0	Frame Buffer Read Enable 0: Disables read access to the frame buffer. 1: Enables read access to the frame buffer.

(5) Frame Buffer Size

The following bits set the size of the frame buffer to be read.

The numbers of horizontal pixels and of lines in the vertical direction are set with the GR_HW[10:0] and GR_FLM_LNUM[10:0] bits, respectively.

Table 33.5 Frame Buffer Size

Register Name	Bit Name	Initial Value	Description
GR_FLM6	GR_HW[10:0]	0	Sets the width of the horizontal valid period. The width is (GR_HW + 1) pixels. Note: Set to 2 or greater.
GR_FLM5	GR_FLM_LNUM[10:0]	0	Sets the number of lines in a frame The number of lines is (GR_FLM_LNUM + 1).

(6) Calculating Addresses in Frame Buffer

The data area in the frame buffer is defined using the addresses specified by GR_BASE[31:0], GR_LN_OFF[14:0], and GR_FLM_OFF[22:0] bits and the display frame number.

The GR_LN_OFF[14:0] and GR_FLM_OFF[22:0] bits should be set in units of 32/128 bytes (the lower 5/7 bits should be fixed to 0).

The GR_BASE[31:0] bits should be set in units of 64 bits to set the display data start position (the lower three bits should be fixed).

Figure 33.2 Data Arrangement in Frame Buffer

Table 33.6 Calculation of Addresses in Frame Buffer

Register Name	Bit Name	Initial Value	Description
GR_FLM2	GR_BASE[31:0]	0	<p>Frame Buffer Base Address</p> <p>Sets the start address of the frame buffer where frame data is to be stored.</p> <p>GR_BASE[4:3] and GR_BASE[6:3] are referred to during 32-byte burst transfer and 128-byte burst transfer, respectively, to skip the start line data.</p> <p>The lower 3 bits should be set to 000.</p>
GR_FLM3	GR_LN_OFF[14:0]	0	<p>Frame Buffer Line Offset Address</p> <p>Sets the line offset address for calculating the start address of each line.</p> <p>Line 0: GR_BASE</p> <p>Line 1: GR_BASE + GR_LN_OFF × 1</p> <p>:</p> <p>Line n: GR_BASE + GR_LN_OFF × n</p> <p>For 32-byte transfer, the lower 5 bits should be fixed to 0_0000.</p> <p>For 128-byte transfer, the lower 7 bits should be fixed to 000_0000.</p>
GR_FLM4	GR_FLM_OFF[22:0]	0	<p>Frame Buffer Frame Offset Address (lower)</p> <p>Specifies the frame offset address used for calculating the start address of each frame buffer when more than one buffer is used.</p> <p>Buffer 0: GR_BASE</p> <p>Buffer 1: GR_BASE + GR_FLM_OFF × 1</p> <p>:</p> <p>Buffer n: GR_BASE + GR_FLM_OFF × n</p> <p>For 32-byte transfer, the lower 5 bits should be fixed to 0_0000.</p> <p>For 128-byte transfer, the lower 7 bits should be fixed to 000_0000.</p>

(7) Setting Frame Buffer Size Smaller than One Frame

Frame buffer size can be set in one-line units.

When the number of lines set with the GR_FLM_LOOP[10:0] bits is smaller than the value of the GR_FLM_LNUM[10:0] bits, data is again read from the start address of the frame buffer after the number of lines set with the (GR_FLM_LOOP[10:0] + 1) bits have been read.

Table 33.7 Setting of Frame Buffer Size Smaller than One Frame

Register Name	Bit Name	Initial Value	Description
GR_FLM5	GR_FLM_LOOP[10:0]	1023	<p>Number of lines when reading the addresses repeatedly by returning to the start address after reaching the end address.</p> <p>The number of lines is (GR_FLM_LOOP + 1).</p>

(8) Line Offset Control for Frame Buffer

The following bit sets the line offset address direction of the frame buffer.

Table 33.8 Line Offset Address Direction Control for Frame Buffer

Register Name	Bit Name	Initial Value	Description
GR_FLM1	GR_LN_OFF_DIR	0	Selects the line offset address direction of the frame buffer. 0: Increments the address by the line offset address. 1: Decrements the address by the line offset address.

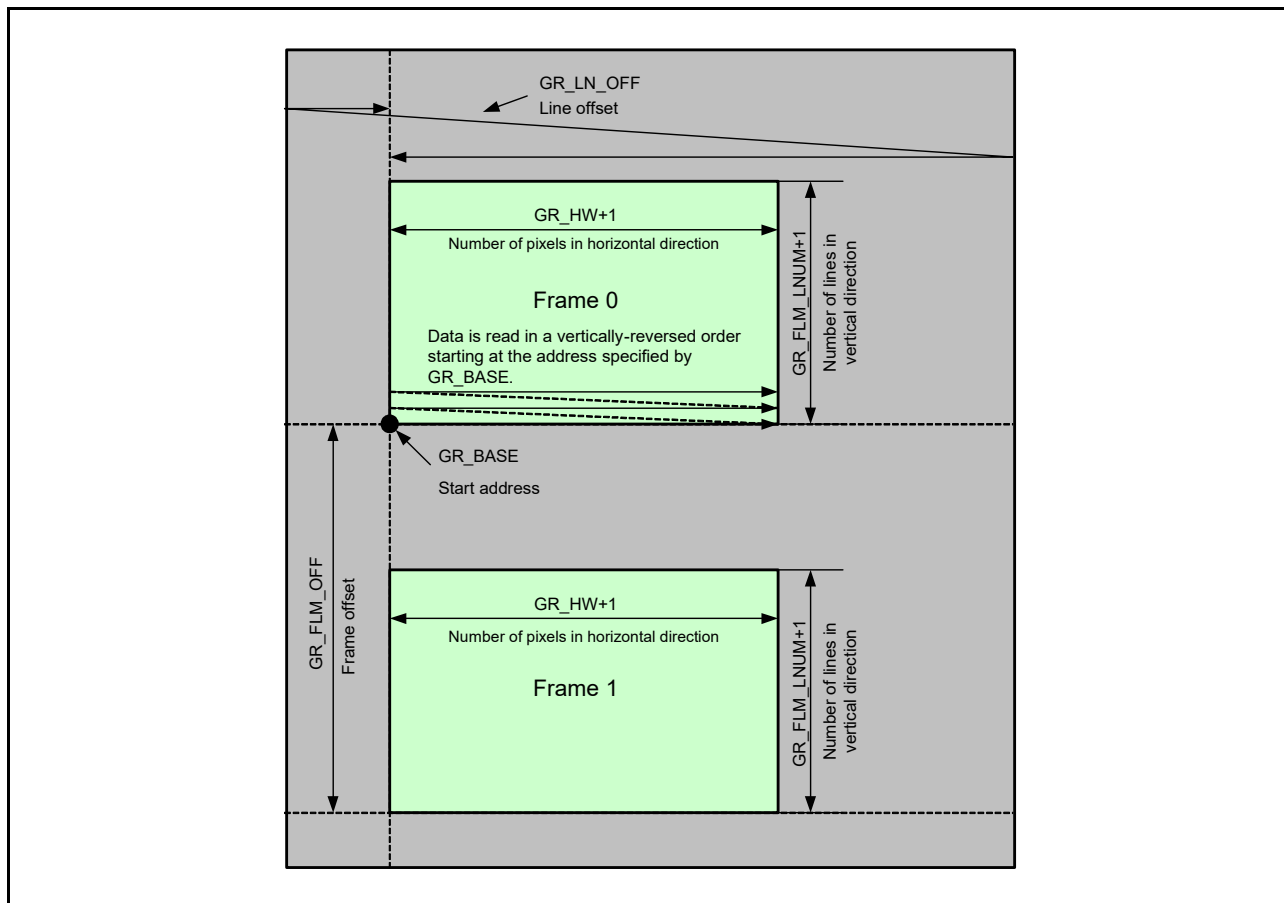

Figure 33.3 Data Arrangement with Line Offset and Decrement Control

(9) Selecting Format of Frame Buffer Read Signal

Signal formats RGB565, RGB888, αRGB1555, αRGB4444, αRGB8888, RGBα5551, RGBα8888, CLUT8, CLUT4 and CLUT1 are supported for the graphics 0, 2, and 3 processes. The YCbCr422 and YCbCr444 formats are also supported for the graphics 0 process.

The GR_FORMAT[3:0] bits select a signal format.

Table 33.9 Format Selection for Frame Buffer Read Signal

Register Name	Bit Name	Initial Value	Description
GR_FLM6	GR_FORMAT[3:0]	0	Sets the format of the frame buffer read signal. 0: RGB565 1: RGB888 2: αRGB1555 3: αRGB4444 4: αRGB8888 5: CLUT8 6: CLUT4 7: CLUT1 8: YCbCr422 or setting prohibited * 9: YCbCr444 or setting prohibited * 10: RGBα5551 11: RGBα8888 12 to 15: Setting prohibited

Note: * Setting this value selects YCbCr422 and YCbCr444 for the graphics 0 process, and is prohibited for the graphics 2 and 3 processes.

(10) Endian Control

In the frame buffer, data is handled in 64-bit units, and endian of the data to be read can be controlled by setting the GR_RDSWA[2:0] bits. Bit 0 of these bits indicates whether 8-bit data is swapped. Bit 1 indicates whether 16-bit data is swapped. Bit 2 indicates whether 32-bit data is swapped. In the YCbCr422 format, data can be arranged with the GR_YCC_SWAP[2:0] bits.

Figure 33.4 Data Arrangement with Endian Control Disabled (GR_RDSWA = 000)

GR_RDSWA = 000	(1) 8 bits	(2) 8 bits	(3) 8 bits	(4) 8 bits	(5) 8 bits	(6) 8 bits	(7) 8 bits	(8) 8 bits

Figure 33.6 YCbCr422 Data Arrangement with Swapping Enabled

Table 33.10 Endian Control

Register Name	Bit Name	Initial Value	Description
GR_FLM6	GR_RDSWA[2:0]	0	<p>Sets 8-, 16-, and 32-bit swap.</p> <p>These three bits specify the method for swapping the bits of frame buffer read data as follows.</p> <p>Bit 0</p> <p>0: 8 bits are not swapped.</p> <p>1: 8 bits are swapped.</p> <p>Bit 1</p> <p>0: 16 bits are not swapped.</p> <p>1: 16 bits are swapped.</p> <p>Bit 2</p> <p>0: 32 bits are not swapped.</p> <p>1: 32 bits are swapped.</p> <p>When eight bits are put together, they are swapped as follows. Each of (1) to (8) indicates eight-bit data.</p> <p>000: (1) (2) (3) (4) (5) (6) (7) (8) [No swap]</p> <p>001: (2) (1) (4) (3) (6) (5) (8) (7) [8-bit swap]</p> <p>010: (3) (4) (1) (2) (7) (8) (5) (6) [16-bit swap]</p> <p>011: (4) (3) (2) (1) (8) (7) (6) (5) [16-bit swap + 8-bit swap]</p> <p>100: (5) (6) (7) (8) (1) (2) (3) (4) [32-bit swap]</p> <p>101: (6) (5) (8) (7) (2) (1) (4) (3) [32-bit swap + 8-bit swap]</p> <p>110: (7) (8) (5) (6) (3) (4) (1) (2) [32-bit swap + 16-bit swap]</p> <p>111: (8) (7) (6) (5) (4) (3) (2) (1) [32-bit swap + 16-bit swap + 8-bit swap]</p>

Table 33.10 Endian Control

Register Name	Bit Name	Initial Value	Description
GR_FLM6	GR_YCC_SWAP [2:0]	0	Controls swapping of data read from buffer in the YCbCr422 format. * 0: Cb/Y0/Cr/Y1 1: Y0/Cb/Y1/Cr 2: Cr/Y0/Cb/Y1 3: Y0/Cr/Y1/Cb 4: Y1/Cr/Y0/Cb 5: Cr/Y1/Cb/Y0 6: Y1/Cb/Y0/Cr 7: Cb/Y1/Cr/Y0

Note: * These bits are supported for the graphics 0 process only.

(11) Display Start Pixel Setting for Read Data

When a horizontal offset is applied to display the image data in the frame buffer, the display start pixel is set with the GR_BASE[31:0] and GR_STA_POS[5:0] bits. Calculation of the values for the GR_BASE[31:0] and GR_STA_POS[5:0] bits depends on the signal format. The display start pixel can be calculated with the formulas in the table below, where H_OFF is a horizontal offset from the display start pixel.

Table 33.11 Calculation of Display Start Position for Various Signal Formats

Signal Format of Video/Graphics	Number of Bits per Pixel	Calculation Formula *1
RGB888 αRGB8888, RGBα8888 YCbCr422*2 YCbCr444*3	32	GR_BASE[31:3] = t (H_OFF ÷ 2) GR_STA_POS[5:0] = mod (H_OFF ÷ 2)
RGB565 αRGB1555, RGBα5551 αRGB4444	16	GR_BASE[31:3] = int (H_OFF ÷ 4) GR_STA_POS[5:0] = mod (H_OFF ÷ 4)
CLUT8	8	GR_BASE[31:3] = int (H_OFF ÷ 8) GR_STA_POS[5:0] = mod (H_OFF ÷ 8)
CLUT4	4	GR_BASE[31:3] = int (H_OFF ÷ 16) GR_STA_POS[5:0] = mod (H_OFF ÷ 16)
CLUT1	1	GR_BASE[31:3] = int (H_OFF ÷ 64) GR_STA_POS[5:0] = mod (H_OFF ÷ 64)

- Notes:
1. The functions int() and mod() output a quotient and a remainder, respectively.
 2. The YCbCr422 format is not supported for the graphics 2 and 3 processes.
In the YCbCr422 format, 32 bits are used for two pixels (Cb, Y0, Cr, and Y1 components). Therefore, the start position is controlled in units of 32 bits.
 3. The YCbCr444 format is not supported for the graphics 2 and 3 processes.

Table 33.12 Setting of Display Start Pixel of Read Data

Register Name	Bit Name	Initial Value	Description
GR_FLM6	GR_STA_POS[5:0]	0	Sets the amount of data to be skipped through. Specifically data amount equal to the amount indicated by GR_STA_POS is skipped from the start of the line.
GR_FLM2	GR_BASE[31:0]	0	Frame Buffer Base Address Sets the start address of the frame buffer where frame data is to be stored. GR_BASE[4:3] and GR_BASE[6:3] are referred to during 32-byte burst transfer and 128-byte burst transfer, respectively, to skip the start line data. The lower 3 bits should be fixed to 000.

(12) YCbCr422 to YCbCr444 Conversion

Data format for the graphics 0 process is converted from YCbCr422 to YCbCr444.

This function is not supported for the graphics 2 and 3 processes.

Table 33.13 YCbCr422 to YCbCr444 Conversion

Register Name	Bit Name	Initial Value	Description
GR_FLM6	GR_CNV444_MD	0	Sets the interpolation mode for YCbCr422 to YCbCr444 conversion. * 0: Hold interpolation 1: Average interpolation

Note: * This bit is not provided for the graphics 2 and 3 processes, for which the YCbCr422 format is not supported.

(13) Bit Extension

When the value of the GR_FORMAT[3:0] bits is 0 to 3, the RGB565, RGB888, α RGB1555, and α RGB4444 formats are converted to the α RGB8888 format. When the value of the GR_FORMAT[3:0] bits is 10, the RGB α 5551 format is converted to the RGB α 8888 format. The RGB α 5551 to RGB α 8888 format conversion is omitted because it differs from the α RGB5551 to α RGB8888 format conversion only in the position of α .

- RGB565 to α RGB8888 Format Conversion

After conversion, $\alpha[7:0]$ is fixed to 255.

After conversion, $R[7:0] = R[4:0] \times 263 \div 32$ (round off to an integer), approximation of $\#R[4:0] \times 255 \div 31$

After conversion $G[7:0] = G[5:0] \times 259 \div 64$ (round off to an integer), approximation of $\#G[5:0] \times 255 \div 63$

After conversion, $B[7:0] = B[4:0] \times 263 \div 32$ (round off to an integer), approximation of $\#B[4:0] \times 255 \div 31$

- RGB888 to α RGB8888 Format Conversion

After conversion, $\alpha[7:0]$ is fixed to 255.

- α RGB1555 to α RGB8888 Format Conversion

After conversion, $\alpha[7:0]$ is GR_A1 when α input is 1, and GR_A0 when 0.

After conversion, $R[7:0] = R[4:0] \times 263 \div 32$ (round off to an integer), approximation of $\#R[4:0] \times 255 \div 31$

After conversion, $G[7:0] = G[4:0] \times 263 \div 32$ (round off to an integer), approximation of $\#G[4:0] \times 255 \div 31$

After conversion, $B[7:0] = B[4:0] \times 263 \div 32$ (round off to an integer), approximation of $\#B[4:0] \times 255 \div 31$

- α RGB4444 to α RGB8888 Format Conversion

After conversion, $\alpha[7:0] = \alpha[3:0] \times 17$

After conversion, $R[7:0] = R[3:0] \times 17$

After conversion, $G[7:0] = G[3:0] \times 17$

After conversion, $B[7:0] = B[3:0] \times 17$

(14) Buffer Underflow Processing

When data read from the frame buffer cannot be completed due to bus-traffic related problems, an underflow interrupt signal is output.

33.1.3 Setting Graphics Display Area

The graphics display area is set with the GR_GRC_HS[10:0], GR_GRC_HW[10:0], GR_GRC_VS[10:0], and GR_GRC_VW[10:0] bits based on the rising edges of the Hsync and Vsync signals.

Figure 33.7 shows the graphics display area.

Figure 33.7 Graphics Display Area

The frame line of the graphics area can be displayed by setting the GR_GRC_DISP_ON bit to 1.

Table 33.14 Graphics Image Area Setting

Register Name	Bit Name	Initial Value	Description
GR_AB3	GR_GRC_HS[10:0]	0	Sets the horizontal start position of the graphics image area. Note: Set to 16 or greater clocks and the result of GR_GRC_HS + GR_GRC_HW should be smaller than or equal to 2015 clocks.
GR_AB3	GR_GRC_HW[10:0]	0	Sets the horizontal width of the graphics image area. Note: For displaying an image with 1- or 2-pixel horizontal width, set GR_HW to 2 and GR_GRC_HW to 1 (1-pixel) or 2 (2-pixel).
GR_AB2	GR_GRC_VS[10:0]	0	Sets the vertical start position of the graphics image area. Note: Set to 4 or greater lines and the result of GR_GRC_VS + GR_GRC_VW should be smaller than or equal to 2039 lines.
GR_AB2	GR_GRC_VW[10:0]	0	Sets the vertical width of the graphics image area.
GR_AB1	GR_GRC_DISP_ON	0	Turns on/off frame-line display of the graphics image area. 0: Frame-line display off 1: Frame-line display on

33.1.4 Interrupt Generation at Specified Line

An interrupt signal can be generated at the line specified with the GR_LINE[10:0] bits.

Table 33.15 Interrupt Generation at Specified Line

Register Name	Bit Name	Initial Value	Description
GR_CLUT_INT	GR_LINE[10:0]	0	Line Interrupt Set * When the number of lines matches the value of the GR_LINE bits, an interrupt signal is output. This function is supported for the graphics 3 process only. This function supported for the graphics 3 process is enabled even when the graphics 3 process is not used.

Note: * This function is supported for the graphics 3 process only; these bits are not supported for the graphics 0 and 2 processes.

33.1.5 Formats of Frame Buffer Read Signals and Corresponding Alpha Blending Types

Setting the GR_FORMAT[3:0] bits selects the format of the signal read from the frame buffer.

Table 33.16 shows the signal formats and the corresponding alpha blending types. The priority of the alpha value is: alpha blending in rectangular area > chroma-key processing > alpha blending in pixel units.

Table 33.16 Formats of Frame Buffer Read Signal and Corresponding Alpha Blending Types

GR_FORMAT[3:0]	Signal Format	Alpha Blending in Rectangular Area	RGB-Index Chroma-Key Processing	CLUT-Index Chroma-Key Processing	Alpha Blending in Pixel Units
0	RGB565	Supported	Supported *1	Not supported	Not supported *2
1	RGB888	Supported	Supported	Not supported	Not supported *2
2	α RGB1555	Supported	Supported *1*3	Not supported	Supported *3
3	α RGB4444	Supported	Supported *1	Not supported	Supported
4	α RGB8888	Supported	Supported	Not supported	Supported
5	CLUT8	Supported	Not supported	Supported	Supported
6	CLUT4	Supported	Not supported	Supported	Supported
7	CLUT1	Supported *4	Not supported	Supported *4	Supported *4
8	YCbCr422	Not supported *5	Not supported *5	Not supported *5	Not supported *5
9	YCbCr444	Not supported *5	Not supported *5	Not supported *5	Not supported *5
10	RGB α 5551	Supported	Supported *1*3	Not supported	Supported *3
11	RGB α 8888	Supported	Supported	Not supported	Supported

Notes: 1. When each color component of the RGB signal read from the frame buffer is not 8 bits, it is converted to 8 bits by calculation in RGB-index chroma-key processing. (See section 33.1.2 (13) Bit Extension.)
 2. Since α value is 255, the current graphics is always displayed.
 3. α value for data read from the frame buffer is specified with one bit. This one-bit signal selects one of the two registers, each of which holds an 8-bit α value.
 4. CLUT value for the frame buffer signal is specified with one bit. This one-bit signal selects one of the two registers, each of which holds the α , G, B, and R values (8 bits for each value). The CLUT table is not referenced.
 5. YCbCr422 and YCbCr444 are supported for the graphics 0 process, but any type of blending and chroma-key processing cannot be used.

33.1.6 Display Selection

The GR_DISP_SEL[1:0] bits select the graphics to be displayed from the background color, the lower-layer graphics, the current graphics, and the blended image of the lower-layer graphics and the current graphics. For blending, alpha blending in a rectangular area, multiplication with current alpha at alpha blending in a rectangular area, RGB-index chroma-key processing, CLUT-index chroma-key processing, alpha blending in one-pixel units, or premultiplication at alpha blending in one-pixel units can be selected.

This function is not supported for the VIN synthesizer.

Table 33.17 shows the settings for various display types.

Table 33.17 Settings for Various Display Types

GR_DISP_SEL [1:0]	GR_ARC_ON	GR_CK_ON	GR_ARC_MUL	GR_ACALC_MD	Processing for Graphics Area	Processing for the Area outside the Graphics Area
0	—	—	—	—	Background color	Background color
1	—	—	—	—	Lower-layer graphics	Lower-layer graphics
2	—	—	—	—	Current graphics	Background color
3	1	—	0	0	Alpha blending in a rectangular area*1	Lower-layer graphics
3	1	—	0	1	Setting prohibited	
3	1	—	1	0	Multiplication with current alpha at alpha blending in a rectangular area*2	Lower-layer graphics
3	1	—	1	1	Multiplication with current alpha at alpha blending in a rectangular area with alpha premultiplied*2	Lower-layer graphics
3	0	1	—	—	RGB-index or CLUT-index chroma-key processing	Lower-layer graphics
3	0	0	—	0	Alpha blending in one-pixel units*2	Lower-layer graphics
3	0	0	—	1	Premultiplication at alpha blending in one-pixel units*2	Lower-layer graphics

- Notes: 1. The alpha blending in a rectangular area is not supported for the graphics 0 process in the scaler.
 2. The multiplication with current alpha at alpha blending in a rectangular area and alpha blending function in one-pixel units are supported for the graphics 2 and 3 processes only.

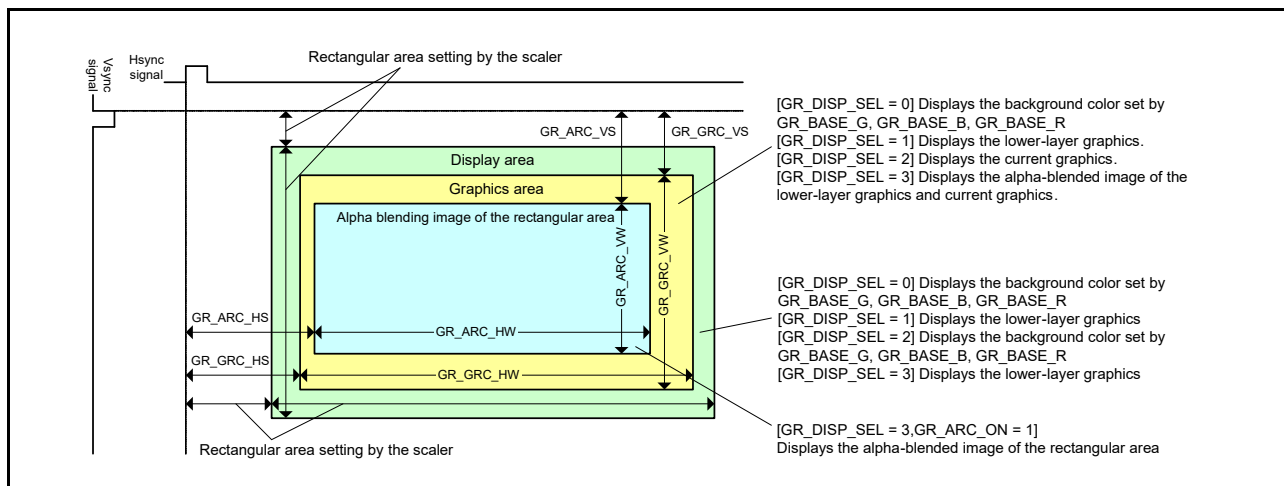

Figure 33.8 Graphic Display Types

Figure 33.9 shows the graphics planes displayed when the GR_DISP_SEL bits are set to 3.

For correspondence between the lower-layer graphics and the current graphics, see Figure 33.1.

Figure 33.9 Graphics Planes with GR_DISP_SEL Set to 3

Table 33.18 Alpha Blending Setting

Register Name	Bit Name	Initial Value	Description
GR_AB1	GR_DISP_SEL [1:0]	0	Selects the graphics display mode. 0:Background color display 1:Lower-layer graphics display 2:Current graphics display 3:Blended display of lower-layer graphics and current graphics*1
GR_AB1	GR_ARC_ON	0	Turns on/off alpha blending in a rectangular area.*2 0: Off 1: On
GR_AB1	GR_ARC_MUL	0	Turns on/off multiplication processing with current alpha at alpha blending in a rectangular area *3 0: Off 1: On
GR_AB1	GR_ACALC_MD	0	Turns on/off premultiplication processing at alpha blending in one-pixel units *3 0: Off 1: On
GR_AB7	GR_CK_ON	0	Turns on/off CLUT-index/RGB-index chroma-key processing. 0: Off 1: On

- Notes:
1. The graphics 0 process supports the chroma-key processing only. When performing chroma-key processing, set the α value for converting the pixels to be subjected to chroma-key processing, and the α value of the pixels not to be subjected to the chroma-key processing to 255 to display the current graphics only.
 2. This function is supported only for the graphics 2 and 3 processes. This bit is not provided for the graphics 0 process.
 3. This function is supported only for the graphics 2 and 3 processes. This bit is not provided for the graphics 0 process.

33.1.7 Background Color Display Processing

The color set with the GR_BASE_G[7:0], GR_BASE_B[7:0], and GR_BASE_R[7:0] bits is displayed.

G output = GR_BASE_G

B output = GR_BASE_B

R output = GR_BASE_R

Table 33.19 Background Color Setting

Register Name	Bit Name	Initial Value	Description
GR_BASE	GR_BASE_G[7:0]	0	Background color G signal G: 8 bits; unsigned (0 to 255 [LSB])
GR_BASE	GR_BASE_B[7:0]	0	Background color B signal B: 8 bits; unsigned (0 to 255 [LSB])
GR_BASE	GR_BASE_R[7:0]	0	Background color R signal R: 8 bits; unsigned (0 to 255 [LSB])

33.1.8 Lower-Layer Graphics Display Processing

The lower-layer graphics are displayed as follows:

G output = G input of lower-layer graphics

B output = B input of lower-layer graphics

R output = R input of lower-layer graphics

33.1.9 Current Graphics Display Processing

The current graphics are displayed as follows:

G output = G input of current graphics

B output = B input of current graphics

R output = R input of current graphics

33.1.10 Display with Alpha Blending in a Rectangular Area

The rectangular area subjected to alpha blending is set with the GR_ARC_HS[10:0], GR_ARC_HW[10:0], GR_ARC_VS[10:0], and GR_ARC_VW[10:0] bits based on the rising edges of the Hsync and Vsync signals. This function is not supported for the graphics 0 process.

Figure 33.10 shows the rectangular area setting for alpha blending.

Figure 33.10 Rectangular Area Setting for Alpha Blending

The frame line of graphics area can be displayed by setting the GR_ARC_DISP_ON bit to 1.

Table 33.20 Setting of Rectangular Area for Alpha Blending

Register Name	Bit Name	Initial Value	Description
GR_AB5	GR_ARC_HS[10:0]	0	Sets the horizontal start position of the valid image area for alpha blending in a rectangular area.
GR_AB5	GR_ARC_HW[10:0]	0	Sets the horizontal width of the valid image area for alpha blending in a rectangular area.
GR_AB4	GR_ARC_VS[10:0]	0	Sets the vertical start position of the valid image area for alpha blending in a rectangular area.
GR_AB4	GR_ARC_VW[10:0]	0	Sets the vertical width of the valid image area for alpha blending in a rectangular area.
GR_AB1	GR_ARC_DISP_ON	0	Turns on/off frame-line display of the valid image area for alpha blending in a rectangular area. 0: Frame-line display off 1: Frame-line display on

In alpha blending in a rectangular area, the current graphics are faded in or out by setting the fade-in or fade-out coefficients with the GR_ARC_DEF[7:0], GR_ARC_MODE, GR_ARC_COEF[7:0], and GR_ARC_RATE[7:0] bits.

First, the value of the GR_ARC_DEF[7:0] bits is assigned to the α value.

Then, each time the Vsync signal rises for the number of times set with the GR_ARC_RATE[7:0] bits + 1, the value of the GR_ARC_COEF[7:0] bit is added to or subtracted from the α value.

**Figure 33.11 Fade In and Fade Out****Table 33.21 Setting for Alpha Blending in a Rectangular Area**

Register Name	Bit Name	Initial Value	Description
GR_AB7	GR_ARC_DEF[7:0]	0	Sets the initial alpha value for alpha blending in a rectangular area.
GR_AB6	GR_ARC_MODE	0	Alpha Blending Mode in Rectangular Area 0: Addition 1: Subtraction
GR_AB6	GR_ARC_COEF[7:0]	0	Sets the alpha coefficient for alpha blending in a rectangular area. (0 to 255) [7:0]: Variation (absolute value)
GR_AB6	GR_ARC_RATE[7:0]	0	Sets the value obtained by subtracting 1 from the frame rate for alpha blending in a rectangular area.
GR_MON	GR_ARC_ST	—	Status Flag for Alpha Blending in Rectangular Area 0: Addition or subtraction has been completed. (α value is 0 or 255) 1: Addition or subtraction is in progress.

The values specified with the following expressions are used in the alpha blending calculation described in section 33.1.14, Alpha Blending Calculation.

α value = Fade-in/out coefficient

G value = G input of the current graphics

B value = B input of the current graphics

R value = R input of the current graphics

33.1.11 RGB-Index Chroma-Key Processing

The pixels that satisfy all the expressions below are subjected to RGB-index chroma-key processing.

G input of the current graphics = GR_CK_KG

B input of the current graphics = GR_CK_KB

R input of the current graphics = GR_CK_KR

In RGB-index chroma-key processing, the values specified with the following expressions are used in the alpha blending calculation described in section 33.1.14, Alpha Blending Calculation. This function is not supported in the VIN synthesizer.

α value = GR_CK_A

G value = GR_CK_G

B value = GR_CK_B

R value = GR_CK_R

For the pixels that are not subjected to RGB-index chroma-key processing, the values specified with the following expressions are used in the alpha blending calculation described in section 33.1.14, Alpha Blending Calculation.

α value = α input of the current graphics

G value = G input of the current graphics

B value = B input of the current graphics

R value = R input of the current graphics

Table 33.22 Setting for RGB-Index Chroma-Key Processing

Register Name	Bit Name	Initial Value	Description
GR_AB8	GR_CK_KG[7:0]	0	G Signal for RGB-Index Chroma-Key Processing G: 8 bits; unsigned (0 to 255 [LSB])
GR_AB8	GR_CK_KB[7:0]	0	B Signal for RGB-Index Chroma-Key Processing B: 8 bits; unsigned (0 to 255 [LSB])
GR_AB8	GR_CK_KR[7:0]	0	R Signal for RGB-Index Chroma-Key Processing R: 8 bits; unsigned (0 to 255 [LSB])
GR_AB9	GR_CK_A[7:0]	0	Replaced Alpha Signal after RGB-Index Chroma-Key Processing* α : 8 bits; unsigned (0 to 255 [LSB])
GR_AB9	GR_CK_G[7:0]	0	Replaced G Signal after RGB-Index Chroma-Key Processing G: 8 bits; unsigned (0 to 255 [LSB])
GR_AB9	GR_CK_B[7:0]	0	Replaced B Signal after RGB-Index Chroma-Key Processing B: 8 bits; unsigned (0 to 255 [LSB])
GR_AB9	GR_CK_R[7:0]	0	Replaced R Signal after RGB-Index Chroma-Key Processing R: 8 bits; unsigned (0 to 255 [LSB])

Note: * To use this function for the graphics 0 process, the alpha value should be set to 255.

33.1.12 CLUT-Index Chroma-Key Processing

The pixels that satisfy the expression below are subjected to CLUT-index chroma-key processing.

$$\text{CLUT input of the current graphics} = \text{GR_CK_KCLUT}$$

In CLUT-index chroma-key processing, the values specified with the following expressions are used in the alpha blending calculation described in section 33.1.14, Alpha Blending Calculation. This function is not supported in the VIN synthesizer.

$$\alpha \text{ value} = \text{GR_CK_A}$$

$$\text{G value} = \text{GR_CK_G}$$

$$\text{B value} = \text{GR_CK_B}$$

$$\text{R value} = \text{GR_CK_R}$$

For the pixels that are not subjected to CLUT-index chroma-key processing, the values specified with the following expressions are used in the alpha blending calculation described in section 33.1.14, Alpha Blending Calculation.

$$\alpha \text{ value} = \alpha \text{ input of the current graphics}$$

$$\text{G value} = \text{G input of the current graphics}$$

$$\text{B value} = \text{B input of the current graphics}$$

$$\text{R value} = \text{R input of the current graphics}$$

Table 33.23 Setting for CLUT-Index Chroma-Key Processing

Register Name	Bit Name	Initial Value	Description
GR_AB8	GR_CK_ KCLUT[7:0]	0	CLUT Signal for CLUT-Index Chroma-Key Processing CLUT: 8 bits; unsigned (0 to 255 [LSB])
GR_AB10	GR_A0[7:0]	0	CLUT1 α 0 Signal* Replaced with α signal when in the CLUT1 format and CLUT1 = 0. Replaced with α signal when in the α RGB1555 format and $\alpha = 0$.
GR_AB10	GR_G0[7:0]	0	CLUT1 G0 Signal Replaced with G signal when in the CLUT1 format and CLUT1 = 0.
GR_AB10	GR_B0[7:0]	0	CLUT1 B0 Signal Replaced with B signal when in the CLUT1 format and CLUT1 = 0.
GR_AB10	GR_R0[7:0]	0	CLUT1 R0 Signal Replaced with R signal when in the CLUT1 format and CLUT1 = 0.
GR_AB11	GR_A1[7:0]	0	CLUT1 α 1 Signal* Replaced with α signal when in the CLUT1 format and CLUT1 = 1. Replaced with α signal when in the α RGB1555 format and $\alpha = 1$.
GR_AB11	GR_G1[7:0]	0	CLUT1 G1 Signal Replaced with G signal when in the CLUT1 format and CLUT1 = 1.
GR_AB11	GR_B1[7:0]	0	CLUT1 B1 Signal Replaced with B signal when in the CLUT1 format and CLUT1 = 1.
GR_AB11	GR_R1[7:0]	0	CLUT1 R1 Signal Replaced with R signal when in the CLUT1 format and CLUT1 = 1.

Note: * To use this function for the graphics 0 process, the alpha value should be set to 255.

33.1.13 Display with Alpha Blending in One-Pixel Units

In the alpha blending in one-pixel units, the values specified with the following expressions are used in the alpha blending calculation described in section 33.1.14, Alpha Blending Calculation. This function is not supported in the graphics 0 process and the VIN synthesizer.

α value = α input of the current graphics

G value = G input of the current graphics

B value = B input of the current graphics

R value = R input of the current graphics

33.1.14 Alpha Blending Calculation

Alpha blending of two input signals is performed using the α value as described below (rounded up if the result includes a decimal fraction).

[GR_ACALC_MD = 0]

$$G \text{ output} = (G \text{ value} \times \alpha \text{ value} + G \text{ input of the lower-layer graphics} \times (255 - \alpha \text{ value})) \div 256$$

$$B \text{ output} = (B \text{ value} \times \alpha \text{ value} + B \text{ input of the lower-layer graphics} \times (255 - \alpha \text{ value})) \div 256$$

$$R \text{ output} = (R \text{ value} \times \alpha \text{ value} + R \text{ input of the lower-layer graphics} \times (255 - \alpha \text{ value})) \div 256$$

[GR_ACALC_MD = 1 (premultiplication)]

$$G \text{ output} = (G \text{ value} + G \text{ input of the lower-layer graphics} \times (255 - \alpha \text{ value})) \div 256$$

$$B \text{ output} = (B \text{ value} + B \text{ input of the lower-layer graphics} \times (255 - \alpha \text{ value})) \div 256$$

$$R \text{ output} = (R \text{ value} + R \text{ input of the lower-layer graphics} \times (255 - \alpha \text{ value})) \div 256$$

33.1.15 CLUT Table

When the signal format is CLUT8 or CLUT4, the format is converted to α RGB8888 based on the CLUT table. When the format is CLUT1, it is converted to α RGB8888 based on the register value.

Figure 33.12 shows data arrangement in the CLUT table.

Figure 33.12 Data Arrangement in CLUT Table

The CLUT tables are arranged in the following addresses:

- Graphics 0 CLUT table: H'FCFF6000 to H'FCFF63FF
(For CLUT4, addresses H'FCFF6000 to H'FCFF603F are valid.)
- Graphics 2 CLUT table: H'FCFF6800 to H'FCFF6BFF
(For CLUT4, addresses H'FCFF6800 to H'FCFF683F are valid.)
- Graphics 3 CLUT table: H'FCFF6C00 to H'FCFF6FFF
(For CLUT4, addresses H'FCFF6C00 to H'FCFF6C3F are valid.)

Two CLUT tables (CLUT table 0, CLUT table 1) on the different planes are allocated to the same address and one of the tables is selected with the GR_CLT_SEL bit. This allows rewriting one CLUT table when this module refers to the other CLUT table.

When switching the CLUT after overwriting the CLUT, please execute a dummy read of the CLUT table address. And switch the CLUT table by GR_CLT_SEL after dummy-read. switch the CLUT table by GR_CLT_SEL after dummy-read.

Table 33.24 CLUT Table Selection

Register Name	Bit Name	Initial Value	Description
GR_CLUT	GR_CLT_SEL	0	<p>CLUT Table Select Signal</p> <p>0: Selects CLUT table 0. The format is converted to αRGB8888 based on the CLUT table 0. CLUT table 1 can be read from or written to by the CPU.</p> <p>1: Selects CLUT table 1. The format is converted to αRGB8888 based on the CLUT table 1. CLUT table 0 can be read from or written to by the CPU.</p>

33.1.16 Multiplication Processing with Current Alpha at Alpha Blending in Rectangular Area

In multiplication processing with current alpha at alpha blending in a rectangular area, the values specified with the following expressions are used in the alpha blending calculation described in section 33.1.14, Alpha Blending Calculation.

[GR_ARC_MUL = 0]

α value = Fade-in/out coefficient

G value = G input of the current graphics

B value = B input of the current graphics

R value = R input of the current graphics

[GR_ARC_MUL = 1 (multiplication)]

α value = Fade-in/out coefficient x α input of current graphics

G value = G input of the current graphics

B value = B input of the current graphics

R value = R input of the current graphics

33.1.17 Selection of Lower-Layer Graphics in VIN Synthesizer

Graphics 0 is allocated to the lower-layer graphics in the VIN synthesizer.

Table 33.25 Selection of Lower-Layer Plane in Scaler

Register Name	Bit Name	Initial Value	Description
GR_VIN_AB1	GR_VIN_SCL_UND_SEL	0	<p>Specifies lower-layer plane in the scaler.</p> <p>0: Selects graphics 0 as lower-layer graphics.</p> <p>1: Setting prohibited</p>

33.2 Register Descriptions

Table 33.26 to Table 33.29 show the register configuration.

- Symbols used in Register Description:

Initial value: Register value after a reset

—: Undefined value

R/W: Readable/writable. The written value can be read.

R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.

R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.

R: Read-only. The write value should always be 0.

—/W: Write-only. The read value is undefined.

Table 33.26 shows the register configuration for the graphics 2 process.

Table 33.27 shows the register configuration for the graphics 3 process.

Table 33.28 shows the CLUT table configuration.

Table 33.29 shows the register configuration for the VIN synthesizer.

The register configuration for the graphics 0 process is described in section 31, Video Display Controller 5 (3): Scaler.

Table 33.26 Register Configuration of the Image Synthesizer (Graphics 2 Process)

Name	Abbreviation	R/W	Initial Value	Address	Access Size
Graphics 2 register update control register	GR2_UPDATE	R/WC1	H'0000 0000	H'FCFF 7700	32
Frame buffer read control register (Graphics 2)	GR2_FLM_RD	R/W	H'0000 0000	H'FCFF 7704	32
Frame buffer control register 1 (Graphics 2)	GR2_FLM1	R/W	H'0000 0000	H'FCFF 7708	32

R/W:	R	R	R	R	R	R	R	R/WC1	R	R	R	R/WC1	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	GR2_UPDATE	0	R/WC1	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	GR2_P_VEN	0	R/WC1	Graphics Display Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR2_IBUS_VEN	0	R/WC1	Frame Buffer Read Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

33.2.2 Frame Buffer Read Control Register (Graphics 2) (GR2_FLM_RD)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR2_R_ENB
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR2_R_ENB	0	R/W	Frame Buffer Read Enable 0: Frame buffer reading is disabled. 1: Frame buffer reading is enabled.

Note: This register is updated when GR2_IBUS_VEN in GR2_UPDATE is 1.

33.2.3 Frame Buffer Control Register 1 (Graphics 2) (GR2_FLM1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR2_LN_OFF_DIR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	GR2_FLM_SEL[1:0]		—	—	—	—	—	—	—	GR2_BST_MD
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	GR2_LN_OFF_DIR	0	R/W	Selects the line offset address direction of the frame buffer. 0: Increments the address by the line offset address. 1: Decrements the address by the line offset address.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	GR2_FLM_SEL [1:0]	0	R/W	Selects a frame buffer address setting signal. 0: Selects frame 0. 1: Selects register GR2_FLM_NUM. 2: Selects frame 0. 3: Setting prohibited
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR2_BST_MD	0	R/W	Frame Buffer Burst Transfer Mode 0: 32-byte transfer 1: 128- byte transfer

Note: GR2_LN_OFF_DIR and GR2_FLM_SEL are updated when GR2_IBUS_VEN in GR2_UPDATE is 1.
GR2_BST_MD is updated when GR2_IBUS_VEN and GR2_P_VEN in GR2_UPDATE are 1.

33.2.4 Frame Buffer Control Register 2 (Graphics 2) (GR2_FLM2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR2_BASE[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR2_BASE[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	GR2_BASE [31:0]	0	R/W	Frame Buffer Base Address (upper) Sets the start address of the frame buffer where frame data is to be stored. GR_BASE[4:3] and GR_BASE[6:3] are referred to during 32-byte burst transfer and 128-byte burst transfer, respectively, to skip the start line data. The lower 3 bits should be fixed to 000.

Note: This register is updated when GR2_IBUS_VEN and GR2_P_VEN in GR2_UPDATE are 1.

33.2.5 Frame Buffer Control Register 3 (Graphics 2) (GR2_FLM3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	GR2_LN_OFF[14:0]														
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	GR2_FLM_NUM[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 16	GR2_LN_ OFF[14:0]	0	R/W	Frame Buffer Line Offset Address Sets the line offset address for calculating the start address of each line. Line 0: GR2_BASE Line 1: GR2_BASE + GR2_LN_OFF × 1 : Line n: GR2_BASE + GR2_LN_OFF × n For 32 byte transfer, the lower 5 bits should be fixed to 0_0000. For 128 byte transfer, the lower 7 bits should be fixed to 000_0000.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	GR2_FLM_ NUM[9:0]	0	R/W	Frame Number of Frame Buffer Manually set the frame number when GR2_FLM_SEL = 1.

Note: This register is updated when GR2_IBUS_VEN in GR2_UPDATE is 1.

33.2.6 Frame Buffer Control Register 4 (Graphics 2) (GR2_FLM4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	GR2_FLM_OFF[22:16]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR2_FLM_OFF[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 0	GR2_FLM_OFF[22:0]	0	R/W	Frame Buffer Frame Offset Address (upper) Specifies the frame offset address used for calculating the start address of each frame buffer when more than one buffer is used. Buffer 0: GR2_BASE Buffer 1: GR2_BASE + GR2_FLM_OFF × 1 : Buffer n: GR2_BASE + GR2_FLM_OFF × n For 32 byte transfer, the lower 5 bits should be fixed to 0_0000. For 128 byte transfer, the lower 7 bits should be fixed to 000_0000.

Note: This register is updated when GR2_IBUS_VEN in GR2_UPDATE is 1.

33.2.7 Frame Buffer Control Register 5 (Graphics 2) (GR2_FLM5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR2_FLM_LNUM[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR2_FLM_LOOP[10:0]										
Initial value:	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR2_FLM_LNUM[10:0]	0	R/W	Sets number of lines in a frame The number of lines is (GR2_FLM_LNUM + 1).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR2_FLM_LOOP[10:0]	1023	R/W	Number of lines when reading the addresses repeatedly by returning to the start address after reaching the end address. The number of lines is (GR2_FLM_LOOP + 1).

Note: This register is updated when GR2_IBUS_VEN in GR2_UPDATE is 1.

33.2.8 Frame Buffer Control Register 6 (Graphics 2) (GR2_FLM6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR2_FORMAT[3:0]				—	GR2_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	GR2_RDSWA[2:0]		—	—	—	—	GR2_STA_POS[5:0]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	GR2_FORMAT[3:0]	0	R/W	Sets the format of the frame buffer read signal. 0: RGB565 1: RGB888 2: αRGB1555 3: αRGB4444 4: αRGB8888 5: CLUT8 6: CLUT4 7: CLUT1 8: Setting prohibited 9: Setting prohibited 10: RGBα5551 11: RGBα8888 12 to 15: Setting prohibited
27	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
26 to 16	GR2_HW[10:0]	0	R/W	Sets the width of the horizontal valid period. The width is (GR2_HW + 1) pixels. Note: Set to 2 or greater.
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 10	GR2_RDSWA[2:0]	0	R/W	Sets 8-, 16-, and 32-bit swap. These three bits specify the method for swapping the bits of frame buffer read data as follows. Bit 0 0: 8 bits are not swapped. 1: 8 bits are swapped. Bit 1 0: 16 bits are not swapped. 1: 16 bits are swapped. Bit 2 0: 32 bits are not swapped. 1: 32 bits are swapped. When eight bits are put together, they are swapped as follows. Each of (1) to (8) indicates eight-bit data. 000: (1) (2) (3) (4) (5) (6) (7) (8) [No swap] 001: (2) (1) (4) (3) (6) (5) (8) (7) [8-bit swap] 010: (3) (4) (1) (2) (7) (8) (5) (6) [16-bit swap] 011: (4) (3) (2) (1) (8) (7) (6) (5) [16-bit swap + 8-bit swap] 100: (5) (6) (7) (8) (1) (2) (3) (4) [32-bit swap] 101: (6) (5) (8) (7) (2) (1) (4) (3) [32-bit swap + 8-bit swap] 110: (7) (8) (5) (6) (3) (4) (1) (2) [32-bit swap + 16-bit swap] 111: (8) (7) (6) (5) (4) (3) (2) (1) [32-bit swap + 16-bit swap + 8-bit swap]
9 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
5 to 0	GR2_STA_POS [5:0]	0	R/W	Sets the amount of data to be skipped through. Specifically data amount equal to the amount indicated by GR2_STA_POS is skipped from the start of the line.

Note: GR2_STA_POS is updated when GR2_P_VEN in GR2_UPDATE is 1. GR2_RDSWA is updated when GR2_UPDATE in GR2_UPDATE is 1. GR2_FORMAT and GR2_HW are updated when GR2_IBUS_VEN and GR2_P_VEN in GR2_UPDATE are 1.

33.2.9 Alpha Blending Control Register 1 (Graphics 2) (GR2_AB1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR2_ARC_MUL	GR2_ACALC_MD	—	GR2_ARC_ON	—	—	—	GR2_ARC_DISP_ON	—	—	—	GR2_GRC_DISP_ON	—	—	GR2_DISP_SEL[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	GR2_ARC_MUL	0	R/W	Turns on/off multiplication processing with current alpha at alpha blending in a rectangular area. 0: Off 1: On
14	GR2_ACALC_MD	0	R/W	Turns on/off premultiplication processing at alpha blending in one-pixel units. 0: Off 1: On
13	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
12	GR2_ARC_ON	0	R/W	Turns on/off alpha blending in a rectangular area. 0: Off 1: On
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	GR2_ARC_DISP_ON	0	R/W	Turns on/off frame-line display of the image area for alpha blending in a rectangular area. 0: Frame-line display off 1: Frame-line display on
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	GR2_GRC_DISP_ON	0	R/W	Turns on/off frame-line display of the graphics image area. 0: Frame-line display off 1: Frame-line display on
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
1, 0	GR2_DISP_SEL[1:0]	0	R/W	Selects the graphics display mode. 0: Background color display 1: Lower-layer graphics display 2: Current graphics display 3: Blended display of lower-layer graphics and current graphics

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

33.2.10 Alpha Blending Control Register 2 (Graphics 2) (GR2_AB2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR2_GRC_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR2_GRC_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR2_GRC_VS[10:0]	0	R/W	Sets the vertical start position of the graphics image area. Note: Set to 4 or greater lines and the result of GR2_GRC_VS + GR2_GRC_VW should be smaller than or equal to 2039 lines.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR2_GRC_VW[10:0]	0	R/W	Sets the vertical width of the graphics image area.

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

33.2.11 Alpha Blending Control Register 3 (Graphics 2) (GR2_AB3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR2_GRC_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR2_GRC_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR2_GRC_HS[10:0]	0	R/W	Sets the horizontal start position of the graphics image area. Note: Set to 16 or greater clocks and the result of GR2_GRC_HS + GR2_GRC_HW should be smaller than or equal to 2015 clocks.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR2_GRC_HW[10:0]	0	R/W	Sets the horizontal width of the graphics image area. Note: For displaying an image with 1- or 2-pixel horizontal width, set GR2_HW to 2 and GR2_GRC_HW to 1 (1-pixel) or 2 (2-pixel).

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

33.2.12 Alpha Blending Control Register 4 (Graphics 2) (GR2_AB4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR2_ARC_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR2_ARC_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR2_ARC_VS[10:0]	0	R/W	Sets the vertical start position of the valid image area for alpha blending in a rectangular area.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR2_ARC_VW[10:0]	0	R/W	Sets the vertical width of the valid image area for alpha blending in a rectangular area.

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

33.2.13 Alpha Blending Control Register 5 (Graphics 2) (GR2_AB5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR2_ARC_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR2_ARC_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR2_ARC_HS[10:0]	0	R/W	Sets the horizontal start position of the valid image area for alpha blending in a rectangular area.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR2_ARC_HW[10:0]	0	R/W	Sets the horizontal width of the valid image area for alpha blending in a rectangular area.

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

33.2.14 Alpha Blending Control Register 6 (Graphics 2) (GR2_AB6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	GR2_ARC_MODE	GR2_ARC_COEF[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	GR2_ARC_RATE[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	GR2_ARC_MODE	0	R/W	Alpha Blending Mode in Rectangular Area 0: Addition 1: Subtraction
23 to 16	GR2_ARC_COEF[7:0]	0	R/W	Sets the alpha coefficient for alpha blending in a rectangular area. (0 to 255) [7:0]: Variation (absolute value)
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	GR2_ARC_RATE[7:0]	0	R/W	Sets the value obtained by subtracting 1 from the frame rate for alpha blending in a rectangular area.

Note: This bit is updated when GR2_P_VEN in GR2_UPDATE is 1.

33.2.15 Alpha Blending Control Register 7 (Graphics 2) (GR2_AB7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	GR2_ARC_DEF[7:0]							
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR2_CK_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	GR2_ARC_DEF[7:0]	255	R/W	Sets the initial alpha value for alpha blending in a rectangular area.
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR2_CK_ON	0	R/W	Turns on/off CLUT-index/RGB-index chroma-key processing. 0: Off 1: On

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

33.2.16 Alpha Blending Control Register 8 (Graphics 2) (GR2_AB8)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR2_CK_KCLUT[7:0]								GR2_CK_KG[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR2_CK_KB[7:0]								GR2_CK_KR[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR2_CK_KCLUT[7:0]	0	R/W	CLUT Signal for CLUT-Index Chroma-Key Processing CLUT: Unsigned 8 bits (0 to 255 [LSB])
23 to 16	GR2_CK_KG[7:0]	0	R/W	G Signal for RGB-Index Chroma-Key Processing G: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR2_CK_KB[7:0]	0	R/W	B Signal for RGB-Index Chroma-Key Processing B: Unsigned 8 bits (0 to 255 [LSB])
7 to 0	GR2_CK_KR[7:0]	0	R/W	R Signal for RGB-Index Chroma-Key Processing R: Unsigned 8 bits (0 to 255 [LSB])

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

33.2.17 Alpha Blending Control Register 9 (Graphics 2) (GR2_AB9)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR2_CK_A[7:0]								GR2_CK_G[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR2_CK_B[7:0]								GR2_CK_R[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR2_CK_A [7:0]	0	R/W	Replaced Alpha Signal after RGB/CLUT-Index Chroma-Key Processing α : Unsigned 8 bits (0 to 255 [LSB])
23 to 16	GR2_CK_G [7:0]	0	R/W	Replaced G Signal after RGB/CLUT-Index Chroma-Key Processing G: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR2_CK_B [7:0]	0	R/W	Replaced B Signal after RGB/CLUT-Index Chroma-Key Processing B: Unsigned 8 bits (0 to 255 [LSB])
7 to 0	GR2_CK_R [7:0]	0	R/W	Replaced R Signal after RGB/CLUT-Index Chroma-Key Processing R: Unsigned 8 bits (0 to 255 [LSB])

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

33.2.18 Alpha Blending Control Register 10 (Graphics 2) (GR2_AB10)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR2_A0[7:0]								GR2_G0[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR2_B0[7:0]								GR2_R0[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR2_A0 [7:0]	0	R/W	CLUT1 α 0 Signal Replaced with α signal when in the CLUT1 format and CLUT1= 0. Replaced with α signal when in the α RGB1555 or RGB α 5551 format and α = 0.
23 to 16	GR2_G0 [7:0]	0	R/W	CLUT1 G0 Signal Replaced with G signal when in the CLUT1 format and CLUT1 = 0.
15 to 8	GR2_B0 [7:0]	0	R/W	CLUT1 B0 Signal Replaced with B signal when in the CLUT1 format and CLUT1 = 0.
7 to 0	GR2_R0 [7:0]	0	R/W	CLUT1 R0 Signal Replaced with R signal when in the CLUT1 format and CLUT1 = 0.

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

33.2.19 Alpha Blending Control Register 11 (Graphics 2) (GR2_AB11)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR2_A1[7:0]								GR2_G1[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR2_B1[7:0]								GR2_R1[7:0]

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR2_A1 [7:0]	0	R/W	CLUT1 α 1 Signal Replaced with α signal when in the CLUT1 format and CLUT1 = 1. Replaced with α signal when in the α RGB1555 or RGB α 5551 format and α = 1.
23 to 16	GR2_G1 [7:0]	0	R/W	CLUT1 G1 Signal Replaced with G signal when in the CLUT1 format and CLUT1 = 1.
15 to 8	GR2_B1 [7:0]	0	R/W	CLUT1 B1 Signal Replaced with B signal when in the CLUT1 format and CLUT1 = 1.
7 to 0	GR2_R1 [7:0]	0	R/W	CLUT1 R1 Signal Replaced with R signal when in the CLUT1 format and CLUT1 = 1.

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

33.2.20 Background Color Control Register (Graphics 2) (GR2_BASE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	GR2_BASE_G[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR2_BASE_B[7:0]								GR2_BASE_R[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	GR2_BASE_G [7:0]	0	R/W	Background Color G Signal G: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR2_BASE_B [7:0]	0	R/W	Background Color B Signal B: Unsigned 8 bits (0 to 255 [LSB])
7 to 0	GR2_BASE_R [7:0]	0	R/W	Background Color R Signal R: Unsigned 8 bits (0 to 255 [LSB])

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

33.2.21 CLUT Table Control Register (Graphics 2) (GR2_CLUT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR2_CLT_SEL
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	GR2_CLT_SEL	0	R/W	CLUT Table Select Signal 0: Selects CLUT table 0. The format is converted to α RGB8888 based on the CLUT table 0. CLUT table 1 can be read from or written to by the CPU. 1: Selects CLUT table 1. The format is converted to α RGB8888 based on the CLUT table 1. CLUT table 0 can be read from or written to by the CPU.
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

33.2.22 Status Monitor Register (Graphics 2) (GR2_MON)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR2_ARC_ST
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR2_ARC_ST	0	R	Status Flag for Alpha Blending in Rectangular Area 0: Addition or subtraction has been completed. (α value is 0 or 255) 1: Addition or subtraction is in progress.

33.2.23 Graphics 3 Register Update Control Register (GR3_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	GR3_UPDATE	—	—	—	GR3_P_VEN	—	—	—	GR3_IBUS_VEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/WC1	R	R	R	R/WC1	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	GR3_UPDATE	0	R/WC1	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	GR3_P_VEN	0	R/WC1	Graphics Display Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR3_IBUS_VEN	0	R/WC1	Frame Buffer Read Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

33.2.24 Frame Buffer Read Control Register (Graphics 3) (GR3_FLM_RD)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR3_R_ENB
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR3_R_ENB	0	R/W	Frame Buffer Read Enable 0: Frame buffer reading is disabled. 1: Frame buffer reading is enabled.

Note: This register is updated when GR3_IBUS_VEN in GR3_UPDATE is 1.

33.2.25 Frame Buffer Control Register 1 (Graphics 3) (GR3_FLM1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR3_LN_OFF_DIR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	GR3_FLM_SEL[1:0]	—	—	—	—	—	—	—	—	GR3_BST_MD
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	GR3_LN_OFF_DIR	0	R/W	Selects the line offset address direction of the frame buffer. 0: Increments the address by the line offset address. 1: Decrements the address by the line offset address.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	GR3_FLM_SEL[1:0]	0	R/W	Selects a frame buffer address setting signal. 0: Selects frame 0. 1: Selects register GR3_FLM_NUM. 2: Selects frame 0. 3: Setting prohibited
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR3_BST_MD	0	R/W	Frame Buffer Burst Transfer Mode 0: 32-byte transfer 1: 128- byte transfer

Note: GR3_LN_OFF_DIR and GR3_FLM_SEL are updated when GR3_IBUS_VEN in GR3_UPDATE is 1.
GR3_BST_MD is updated when GR3_IBUS_VEN and GR3_P_VEN in GR3_UPDATE are 1.

33.2.26 Frame Buffer Control Register 2 (Graphics 3) (GR3_FLM2)

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	GR3_BASE [31:0]	0	R/W	Frame Buffer Base Address (upper) Sets the start address of the frame buffer where frame data is to be stored. GR_BASE[4:3] and GR_BASE[6:3] are referred to during 32-byte burst transfer and 128-byte burst transfer, respectively, to skip the start line data. The lower 3 bits should be fixed to 000.

Note: This register is updated when GR3_IBUS_VEN and GR3_P_VEN in GR3_UPDATE are 1.

33.2.27 Frame Buffer Control Register 3 (Graphics 3) (GR3_FLM3)

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 16	GR3_LN_ OFF[14:0]	0	R/W	Frame Buffer Line Offset Address Sets the line offset address for calculating the start address of each line. Line 0: GR3_BASE Line 1: GR3_BASE + GR3_LN_OFF × 1 : Line n: GR3_BASE + GR3_LN_OFF × n For 32 byte transfer, the lower 5 bits should be fixed to 0_0000. For 128 byte transfer, the lower 7 bits should be fixed to 000_0000.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	GR3_FLM_ NUM[9:0]	0	R/W	Frame Number of Frame Buffer Manually set the frame number when GR3_FLM_SEL = 1.

Note: This register is updated when GR3_IBUS_VEN in GR3_UPDATE is 1.

33.2.28 Frame Buffer Control Register 4 (Graphics 3) (GR3_FLM4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	GR3_FLM_OFF[22:16]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR3_FLM_OFF[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 0	GR3_FLM_OFF[22:0]	0	R/W	Frame Buffer Frame Offset Address (upper) Specifies the frame offset address used for calculating the start address of each frame buffer when more than one buffer is used. Buffer 0: GR3_BASE Buffer 1: GR3_BASE + GR3_FLM_OFF × 1 : Buffer n: GR3_BASE + GR3_FLM_OFF × n For 32 byte transfer, the lower 5 bits should be fixed to 0_0000. For 128 byte transfer, the lower 7 bits should be fixed to 000_0000.

Note: This register is updated when GR3_IBUS_VEN in GR3_UPDATE is 1.

33.2.29 Frame Buffer Control Register 5 (Graphics 3) (GR3_FLM5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR3_FLM_LNUM[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR3_FLM_LOOP[10:0]										
Initial value:	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR3_FLM_LNUM[10:0]	0	R/W	Sets number of lines in a frame The number of lines is (GR3_FLM_LNUM + 1).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR3_FLM_LOOP[10:0]	1023	R/W	Number of lines when reading the addresses repeatedly by returning to the start address after reaching the end address. The number of lines is (GR3_FLM_LOOP + 1).

Note: This register is updated when GR3_IBUS_VEN in GR3_UPDATE is 1.

33.2.30 Frame Buffer Control Register 6 (Graphics 3) (GR3_FLM6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR3_FORMAT[3:0]				—	GR3_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	GR3_RDSWA[2:0]		—	—	—	—	GR3_STA_POS[5:0]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	GR3_FORMAT [3:0]	0	R/W	Sets the format of the frame buffer read signal. 0: RGB565 1: RGB888 2: α RGB1555 3: α RGB4444 4: α RGB8888 5: CLUT8 6: CLUT4 7: CLUT1 8: Setting prohibited 9: Setting prohibited 10: RGB α 5551 11: RGB α 8888 12 to 15: Setting prohibited
27	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
26 to 16	GR3_HW [10:0]	0	R/W	Sets the width of the horizontal valid period. The width is (GR3_HW + 1) pixels. Note: Set to 2 or greater.
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 10	GR3_RDSWA [2:0]	0	R/W	Sets 8-, 16-, and 32-bit swap. These three bits specify the method for swapping the bits of frame buffer read data as follows. Bit 0 0: 8 bits are not swapped. 1: 8 bits are swapped. Bit 1 0: 16 bits are not swapped. 1: 16 bits are swapped. Bit 2 0: 32 bits are not swapped. 1: 32 bits are swapped. When eight bits are put together, they are swapped as follows. Each of (1) to (8) indicates eight-bit data. 000: (1) (2) (3) (4) (5) (6) (7) (8) [No swap] 001: (2) (1) (4) (3) (6) (5) (8) (7) [8-bit swap] 010: (3) (4) (1) (2) (7) (8) (5) (6) [16-bit swap] 011: (4) (3) (2) (1) (8) (7) (6) (5) [16-bit swap + 8-bit swap] 100: (5) (6) (7) (8) (1) (2) (3) (4) [32-bit swap] 101: (6) (5) (8) (7) (2) (1) (4) (3) [32-bit swap + 8-bit swap] 110: (7) (8) (5) (6) (3) (4) (1) (2) [32-bit swap + 16-bit swap] 111: (8) (7) (6) (5) (4) (3) (2) (1) [32-bit swap + 16-bit swap + 8-bit swap]
9 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
5 to 0	GR3_STA_POS[5:0]	0	R/W	Sets the amount of data to be skipped through. Specifically data amount equal to the amount indicated by GR3_STA_POS is skipped from the start of the line.

Note: GR3_STA_POS is updated when GR3_P_VEN in GR3_UPDATE is 1. GR3_RDSWA is updated when GR3_UPDATE in GR3_UPDATE is 1.
GR3_FORMAT and GR3_HW are updated when GR3_IBUS_VEN and GR3_P_VEN in GR3_UPDATE are 1.

33.2.31 Alpha Blending Control Register 1 (Graphics 3) (GR3_AB1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR3_ARC_MUL	GR3_ACALC_MD	—	GR3_ARC_ON	—	—	—	GR3_ARC_DISP_ON	—	—	—	GR3_GRC_DISP_ON	—	—	GR3_DISP_SEL[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	GR3_ARC_MUL	0	R/W	Turns on/off multiplication processing with current alpha at alpha blending in a rectangular area. 0: Off 1: On
14	GR3_ACALC_MD	0	R/W	Turns on/off premultiplication processing at alpha blending in one-pixel units. 0: Off 1: On
13	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
12	GR3_ARC_ON	0	R/W	Turns on/off alpha blending in a rectangular area. 0: Off 1: On
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	GR3_ARC_DISP_ON	0	R/W	Turns on/off frame-line display of the image area for alpha blending in a rectangular area. 0: Frame-line display off 1: Frame-line display on
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	GR3_GRC_DISP_ON	0	R/W	Turns on/off frame-line display of the graphics image area. 0: Frame-line display off 1: Frame-line display on
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	GR3_DISP_SEL[1:0]	0	R/W	Selects the graphics display mode. 0: Background color display 1: Lower-layer graphics display 2: Current graphics display 3: Blended display of lower-layer graphics and current graphics

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

33.2.32 Alpha Blending Control Register 2 (Graphics 3) (GR3_AB2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR3_GRC_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR3_GRC_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR3_GRC_VS[10:0]	0	R/W	Sets the vertical start position of the graphics image area. Note: Set to 4 or greater lines and the result of GR3_GRC_VS + GR3_GRC_VW should be smaller than or equal to 2039 lines.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR3_GRC_VW[10:0]	0	R/W	Sets the vertical width of the graphics image area.

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

33.2.33 Alpha Blending Control Register 3 (Graphics 3) (GR3_AB3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR3_GRC_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR3_GRC_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR3_GRC_HS[10:0]	0	R/W	Sets the horizontal start position of the graphics image area. Note: Set to 16 or greater clocks and the result of GR3_GRC_HS + GR3_GRC_HW should be smaller than or equal to 2015 clocks.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR3_GRC_HW[10:0]	0	R/W	Sets the horizontal width of the graphics image area. Note: For displaying an image with 1- or 2-pixel horizontal width, set GR3_HW to 2 and GR3_GRC_HW to 1 (1-pixel) or 2 (2-pixel).

Note: All the bits assigned to this address are updated when GR3_P_VEN in GR3_UPDATE is 1.

33.2.34 Alpha Blending Control Register 4 (Graphics 3) (GR3_AB4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR3_ARC_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR3_ARC_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR3_ARC_VS[10:0]	0	R/W	Sets the vertical start position of the valid image area for alpha blending in a rectangular area.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR3_ARC_VW[10:0]	0	R/W	Sets the vertical width of the valid image area for alpha blending in a rectangular area.

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

33.2.35 Alpha Blending Control Register 5 (Graphics 3) (GR3_AB5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR3_ARC_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR3_ARC_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR3_ARC_HS[10:0]	0	R/W	Sets the horizontal start position of the valid image area for alpha blending in a rectangular area.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR3_ARC_HW[10:0]	0	R/W	Sets the horizontal width of the valid image area for alpha blending in a rectangular area.

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

33.2.36 Alpha Blending Control Register 6 (Graphics 3) (GR3_AB6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	GR3_ARC_MODE	GR3_ARC_COEF[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	GR3_ARC_RATE[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	GR3_ARC_MODE	0	R/W	Alpha Blending Mode in Rectangular Area 0: Addition 1: Subtraction
23 to 16	GR3_ARC_COEF[7:0]	0	R/W	Sets the alpha coefficient for alpha blending in a rectangular area. (0 to 255) [7:0]: Variation (absolute value)
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	GR3_ARC_RATE[7:0]	0	R/W	Sets the value obtained by subtracting 1 from the frame rate for alpha blending in a rectangular area.

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

33.2.37 Alpha Blending Control Register 7 (Graphics 3) (GR3_AB7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	GR3_ARC_DEF[7:0]							
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR3_CK_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	GR3_ARC_DEF[7:0]	255	R/W	Sets the initial alpha value for alpha blending in a rectangular area.
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR3_CK_ON	0	R/W	Turns on/off CLUT-index/RGB-index chroma-key processing. 0: Off 1: On

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

33.2.38 Alpha Blending Control Register 8 (Graphics 3) (GR3_AB8)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR3_CK_KCLUT[7:0]								GR3_CK_KG[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR3_CK_KB[7:0]								GR3_CK_KR[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR3_CK_KCLUT[7:0]	0	R/W	CLUT Signal for CLUT-Index Chroma-Key Processing CLUT: Unsigned 8 bits (0 to 255 [LSB])
23 to 16	GR3_CK_KG[7:0]	0	R/W	G Signal for RGB-Index Chroma-Key Processing G: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR3_CK_KB[7:0]	0	R/W	B Signal for RGB-Index Chroma-Key Processing B: Unsigned 8 bits (0 to 255 [LSB])
7 to 0	GR3_CK_KR[7:0]	0	R/W	R Signal for RGB-Index Chroma-Key Processing R: Unsigned 8 bits (0 to 255 [LSB])

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

33.2.39 Alpha Blending Control Register 9 (Graphics 3) (GR3_AB9)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR3_CK_A[7:0]								GR3_CK_G[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR3_CK_B[7:0]								GR3_CK_R[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR3_CK_A [7:0]	0	R/W	Replaced Alpha Signal after RGB/CLUT-Index Chroma-Key Processing α : Unsigned 8 bits (0 to 255 [LSB])
23 to 16	GR3_CK_G [7:0]	0	R/W	Replaced G Signal after RGB/CLUT-Index Chroma-Key Processing G: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR3_CK_B [7:0]	0	R/W	Replaced B Signal after RGB/CLUT-Index Chroma-Key Processing B: Unsigned 8 bits (0 to 255 [LSB])
7 to 0	GR3_CK_R [7:0]	0	R/W	Replaced R Signal after RGB/CLUT-Index Chroma-Key Processing R: Unsigned 8 bits (0 to 255 [LSB])

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

33.2.40 Alpha Blending Control Register 10 (Graphics 3) (GR3_AB10)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR3_A0[7:0]								GR3_G0[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR3_B0[7:0]								GR3_R0[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR3_A0 [7:0]	0	R/W	CLUT1 α 0 Signal Replaced with α signal when in the CLUT1 format and CLUT1 = 0. Replaced with α signal when in the α RGB1555 or RGB α 5551 format and α = 0.
23 to 16	GR3_G0 [7:0]	0	R/W	CLUT1 G0 Signal Replaced with G signal when in the CLUT1 format and CLUT1 = 0.
15 to 8	GR3_B0 [7:0]	0	R/W	CLUT1 B0 Signal Replaced with B signal when in the CLUT1 format and CLUT1 = 0.
7 to 0	GR3_R0 [7:0]	0	R/W	CLUT1 R0 Signal Replaced with R signal when in the CLUT1 format and CLUT1 = 0.

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

33.2.41 Alpha Blending Control Register 11 (Graphics 3) (GR3_AB11)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR3_A1[7:0]								GR3_G1[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR3_B1[7:0]								GR3_R1[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR3_A1 [7:0]	0	R/W	CLUT1 α 1 Signal Replaced with α signal when in the CLUT1 format and CLUT1 = 1. Replaced with α signal when in the α RGB1555 or RGB α 5551 format and α = 1.
23 to 16	GR3_G1 [7:0]	0	R/W	CLUT1 G1 Signal Replaced with G signal when in the CLUT1 format and CLUT1 = 1.
15 to 8	GR3_B1 [7:0]	0	R/W	CLUT1 B1 Signal Replaced with B signal when in the CLUT1 format and CLUT1 = 1.
7 to 0	GR3_R1 [7:0]	0	R/W	CLUT1 R1 Signal Replaced with R signal when in the CLUT1 format and CLUT1 = 1.

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

33.2.42 Background Color Control Register (Graphics 3) (GR3_BASE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	GR3_BASE_G[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR3_BASE_B[7:0]								GR3_BASE_R[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	GR3_BASE_G [7:0]	0	R/W	Background Color G Signal G: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR3_BASE_B [7:0]	0	R/W	Background Color B Signal B: Unsigned 8 bits (0 to 255 [LSB])
7 to 0	GR3_BASE_R [7:0]	0	R/W	Background Color R Signal R: Unsigned 8 bits (0 to 255 [LSB])

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

33.2.43 CLUT Table and Interrupt Control Register (Graphics 3) (GR3_CLUT_INT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR3_CLT_SEL
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR3_LINE[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	GR3_CLT_SEL	0	R/W	CLUT Table Select Signal 0: Selects CLUT table 0. The format is converted to α RGB8888 based on the CLUT table 0. CLUT table 1 can be read from or written to by the CPU. 1: Selects CLUT table 1. The format is converted to α RGB8888 based on the CLUT table 1. CLUT table 0 can be read from or written to by the CPU.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
10 to 0	GR3_LINE [10:0]	0	R/W	Line Interrupt Set When number of lines matches the value of the GR3_LINE bits, an interrupt signal is output. This function is enabled even when the graphics 3 process is not used.

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

33.2.44 Status Monitor Register (Graphics 3) (GR3_MON)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR3_LIN_STAT[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR3_ARC_ST
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR3_LIN_STAT[10:0]	0	R	Line Position of Image being Currently Read
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR3_ARC_ST	0	R	Status Flag for Alpha Blending in Rectangular Area 0: Addition or subtraction has been completed. (α value is 0 or 255) 1: Addition or subtraction is in progress.

33.2.45 VIN Synthesizer Register Update Control Register (GR_VIN_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2	GR_VIN_SCL_UND_SEL	0	R/W	Selection of Lower-Layer Plane in Scaler 0: Selects graphics 0 as lower-layer graphics. 1: Setting prohibited
1, 0	GR_VIN_DISP_SEL [1:0]	0	R/W	Selects the graphics display mode. 0: Background color display (fixed to black) 1: Lower-layer graphics display 2: Setting prohibited 3: Setting prohibited

Notes: GR_VIN_SCL_UND_SEL is updated when GR_VIN_UPDATE in GR_VIN_UPDATE is 1. The other bits of this register are updated when GR_VIN_P_VEN in GR_VIN_UPDATE is 1.

33.3 Usage Method

33.3.1 Mute Image

The initial values of the GR0_DISP_SEL[1:0], GR2_DISP_SEL[1:0], GR3_DISP_SEL[1:0], and GR_VIN_DISP_SEL[1:0] bits are all 0. Accordingly, in the initial setting, a background color is displayed both inside and outside the graphics area for the graphics 0, 2, and 3 processes and the VIN synthesizer. Since the default background color is black, the black mute image is displayed in the initial state. Note that the background color for the VIN synthesizer is fixed to black.

33.3.2 Alpha Blending in Rectangular Area

The alpha coefficient and the frame rate can be changed during fade in and fade out by modifying the GR_ARC_MODE, GR_ARC_COEF[7:0] and GR_ARC_RATE[7:0] bits, respectively.

34. Video Display Controller 5 (7): Output Controller

34.1 Output Controller

34.1.1 Overview of Functions

The output controller subjects RGB signals output from the image synthesizer to brightness adjustment, contrast adjustment, gamma correction of individual RGB, dither process, and output format conversion.

Figure 34.1 shows the function block diagram of the output controller.

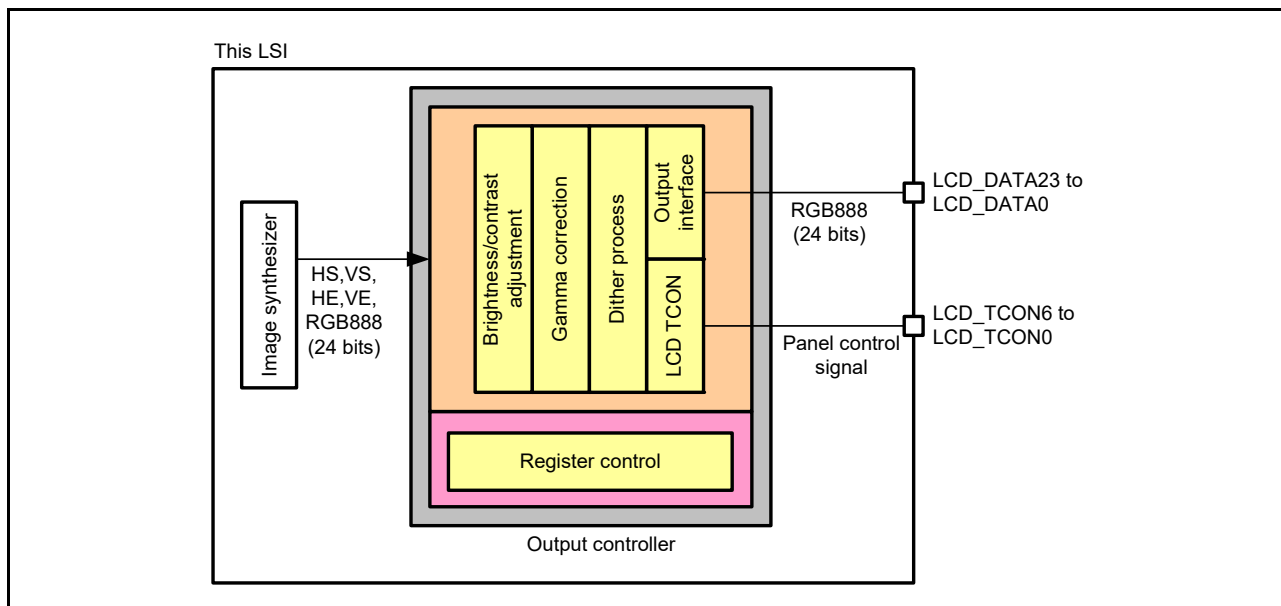

Figure 34.1 Functional Block Diagram of Output Controller

34.1.2 Register Update Control

The Vsync signal is used to control the update timing of all the registers of the output controller.

After 1 is set to the bits in the update control register, the contents of the relevant registers are actually modified at the rising edge of the Vsync signal, when the update control register is automatically cleared to 0.

Table 34.1 Register Update Control

Register Name	Bit Name	Initial Value	Description
OUT_UPDATE	OUTCNT_VEN	0	Brightness/Contrast Control, Dither Process, Output Interface Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
GAM_G_UPDATE	GAM_G_VEN	0	Gamma Correction (G) Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
GAM_B_UPDATE	GAM_B_VEN	0	Gamma Correction (B) Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
GAM_R_UPDATE	GAM_R_VEN	0	Gamma Correction (R) Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
TCON_UPDATE	TCON_VEN	0	LCD TCON Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

34.1.3 Route Selection

The processing sequence of the brightness/contrast control and gamma correction control can be swapped according to the settings of the register.

Table 34.2 Route Selection

Register Name	Bit Name	Initial Value	Description
OUT_CLK_PHASE	OUTCNT_ FRONT_GAM	0	Correction Circuit Sequence Control 0: Brightness → contrast → gamma correction 1: Gamma correction → brightness → contrast

34.1.4 Panel Brightness Adjustment

Brightness (DC) adjustment is individually performed for RGB signals from the image synthesizer.

(BRT_R/G/BOUT after brightness adjustment has many bits to prevent overflow or underflow. The overflow or underflow process is performed at contrast calculation.)

(1) Calculation formulas for brightness (DC) adjustment

$$\text{BRT_GOUT} = \text{GIN} + \text{PBRT_G} - 512$$

$$\text{BRT_BOU} = \text{BIN} + \text{PBRT_B} - 512$$

$$\text{BRT_ROU} = \text{RIN} + \text{PBRT_R} - 512$$

Table 34.3 Brightness (DC) Adjustment

Register Name	Bit Name	Initial Value	Description
OUT_BRIGHT1	PBRT_G[9:0]	512	Brightness (DC) Adjustment of G Signal Unsigned (0 (-512) to 512 (0) to 1023 (+511) [LSB], 512 [LSB] with offset)
OUT_BRIGHT2	PBRT_B[9:0]	512	Brightness (DC) Adjustment of B Signal Unsigned (0 (-512) to 512 (0) to 1023 (+511) [LSB], 512 [LSB] with offset)
OUT_BRIGHT2	PBRT_R[9:0]	512	Brightness (DC) Adjustment of R Signal Unsigned (0 (-512) to 512 (0) to 1023 (+511) [LSB], 512 [LSB] with offset)

34.1.5 Contrast Adjustment

Contrast is calculated for RGB signals obtained after brightness calculation.

(If an overflow or underflow occurs, contrast is clipped to the maximum or minimum value.)

(1) Calculation formulas for contrast (gain) adjustment

$$\text{GOUT} = \text{BRT_GOUT} \times \text{CONT_G}/128$$

$$\text{BOU} = \text{BRT_BOU} \times \text{CONT_B}/128$$

$$\text{ROU} = \text{BRT_ROU} \times \text{CONT_R}/128$$

Table 34.4 Contrast (Gain) Adjustment

Register Name	Bit Name	Initial Value	Description
OUT_CONTRAST	CONT_G [7:0]	128	Contrast (Gain) Adjustment of G Signal 0/128 to 255/128 (approx.2 times)
OUT_CONTRAST	CONT_B [7:0]	128	Contrast (Gain) Adjustment of B Signal 0/128 to 255/128 (approx.2 times)
OUT_CONTRAST	CONT_R [7:0]	128	Contrast (Gain) Adjustment of R Signal 0/128 to 255/128 (approx.2 times)

34.1.6 Gamma Correction

Gamma correction is carried out by dividing an input signal having 256 gradation levels into 32 and controlling the gain of each area. Gain coefficient of each area can be set as 0 to approx. 2.0 [times]

(1) Gamma correction formula for each area

$$DOUT = ((DIN - TH_{(n)}) \times GAIN_{(n)} + OFFSET_{(n)})/256$$

DIN: Input signal (8-bit)

DOUT: Output signal (10-bit)

TH(n): Threshold (8-bit)

OFFSET(n): Offset value (19-bit)

GAIN(n): Gain coefficient (11-bit)

(2) Offset calculation formulas for each area

$$OFFSET_{(n)} = OFFSET_{(n-1)} + DEF_O_{(n)} \text{ (When } n = 0, \text{ } OFFSET_{(0)} = 0.)$$

$$DEF_O_{(n)} = (TH_{(n)} - TH_{(n-1)}) \times GAIN_{(n-1)} \text{ (When } n = 0, \text{ } OFFSET_{(0)} = 0.)$$

OFFSET(n): Offset value of current area (19-bit)

OFFSET(n-1): Offset value of previous area (19-bit)

DEF_O(n): Difference in offset value of Current and previous area (19-bit)

TH(n): Threshold of current area (8-bit)

TH(n-1): Threshold of previous area (8-bit)

GAIN(n-1): Gain coefficient of previous area (11-bit)

Figure 34.2 Corresponding Chart of Offset Calculation Formulas

Figure 34.3 Example of Input-Output Characteristics of Gamma Correction

GAM_R_LUT1 to GAM_R_LUT16	GAM_R_GAIN_00 to GAM_R_GAIN_31[10:0]	1024	Gain Adjustment of Area 0 to 31 of R Signal Unsigned (0 to 2047 [LSB], 1024 [LSB] = 1.0 [times])

34.1.7 Dither Process

Dither process is carried out by adjusting brightness/contrast or reducing 10-bit RGB signals output from the gamma correction block to 8-bit, 6-bit, or 5-bit RGB signals. The operation mode of dither process can be selected from truncate mode, round-off mode, 2 × 2 pattern dither mode and random pattern dither mode.

Figure 34.4 Operation Specification of 2 × 2 Pattern Dither

The conversion equations are as follows.

[Truncate mode]

- (a) 10 bits to 8 bits

$$\text{Output RGB data}[7:0] = \text{Input RGB data}[9:0] \div 4 \text{ (truncate the number below the decimal point)}$$

- (b) 10 bits to 6 bits

$$\text{Output RGB data}[7:2] = \text{Input RGB data}[9:0] \div 16 \text{ (truncate the number below the decimal point)}$$

- (c) 10 bits to 5 bits

$$\text{Output RGB data}[7:3] = \text{Input RGB data}[9:0] \div 32 \text{ (truncate the number below the decimal point)}$$

[Round-off mode]

(a) 10 bits to 8 bits

Output RGB data[7:0] = Input RGB data[9:0] ÷ 4 (round off to an integer)

(b) 10 bits to 6 bits

Output RGB data[7:2] = Input RGB data[9:0] ÷ 16 (round off to an integer)

(c) 10 bits to 5 bits

Output RGB data[7:3] = Input RGB data[9:0] ÷ 32 (round off to an integer)

[2 × 2 pattern dither mode, random pattern dither mode]

(a) 10 bits to 8 bits

Output RGB data[7:0] = Input RGB data[9:0] ÷ 4 + pattern value at the first decimal place (truncate the number below the decimal point after addition)

(b) 10 bits to 6 bits

Output RGB data[7:2] = Input RGB data[9:0] ÷ 16 + pattern value at the first decimal place (truncate the number below the decimal point after addition)

(c) 10 bits to 5 bits

Output RGB data[7:3] = Input RGB data[9:0] ÷ 32 + pattern value at the first decimal place (truncate the number below the decimal point after addition)

Table 34.6 Panel Dither Correction

Register Name	Bit Name	Initial Value	Description
OUT_PDTHA	PDTH_SEL[1:0]	0	Panel Dither Operation Mode 0: Truncate 1: Round-off 2: 2 × 2 pattern dither 3: Random pattern dither

OUT_PDTHA	PDTH_PC[1:0]	2	Pattern Value (C) of 2 × 2 Pattern Dither Unsigned (0 to 3 [LSB])
OUT_PDTHA	PDTH_PD[1:0]	1	Pattern Value (D) of 2 × 2 Pattern Dither Unsigned (0 to 3 [LSB])

34.1.8 Output Format Conversion

In output format conversion, the RGB signal after dither process is converted to LCD output signal having any of the following formats, namely, parallel RGB888, parallel RGB666, parallel RGB565, and serial RGB.

Further, converted data can be allocated to LCD output pins as selected.

(1) Bit Allocation of LCD Signals for RGB888 Output

Table 34.7 shows the RGB signal input allocated to the LCD signal output for RGB888 output.

R/G/BIN[7:0] are the RGB internal signals after dither process.

Table 34.7 Bit Allocation of RGB Signal Input for RGB888 Output

(4) Bit Allocation of LCD Signal for Serial RGB Output

For serial RGB output, RGB signal input shown Table 34.10 is allocated to rgb internal signals and the signals are converted from parallel to serial format and output as LCD signals. R/G/BIN[7:0] are the RGB internal signals after dither process.

The internal signals r[7:0], g[7:0], and b[7:0] are serially output to LCD_DATA7 to LCD_DATA0.

Table 34.10 Bit Allocation of RGB Signal Input for Serial RGB Output

(5) Parallel to Serial Conversion

As shown in Table 34.11, four types of parallel to serial conversions are possible by controlling clock speed mode and selecting the scan direction ('n' in the table are natural numbers).

Table 34.11 Specifications of Serial RGB Output

OUT_FRQ_SEL	1	1	2	2
OUT_DIR_SEL	0	1	0	1
Line (2n-1)	Repeated (r → g → b)	Repeated (b → g → r)	Repeated (r → g → b → X)	Repeated (X → b → g → r)
Line 2n	Repeated (g → b → r)	Repeated (r → b → g)	Repeated (r → g → b → X)	Repeated (X → b → g → r)

Figure 34.5 and Figure 34.6 show the timing of parallel to serial conversion in triple speed and quadruple speed modes, respectively.

Figure 34.5 Timing of Parallel to Serial Conversion in Triple Speed Mode

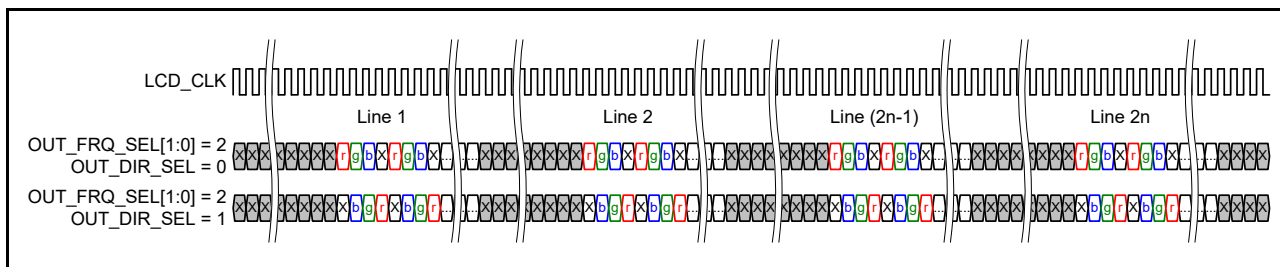

Figure 34.6 Timing of Parallel to Serial Conversion in Quadruple Speed Mode

During serial output, the phase timing with the HE signal can be adjusted by OUT_PHASE[0:1].

Figure 34.7 shows the timing of the clock phases of the serial RGB output (triple speed mode).

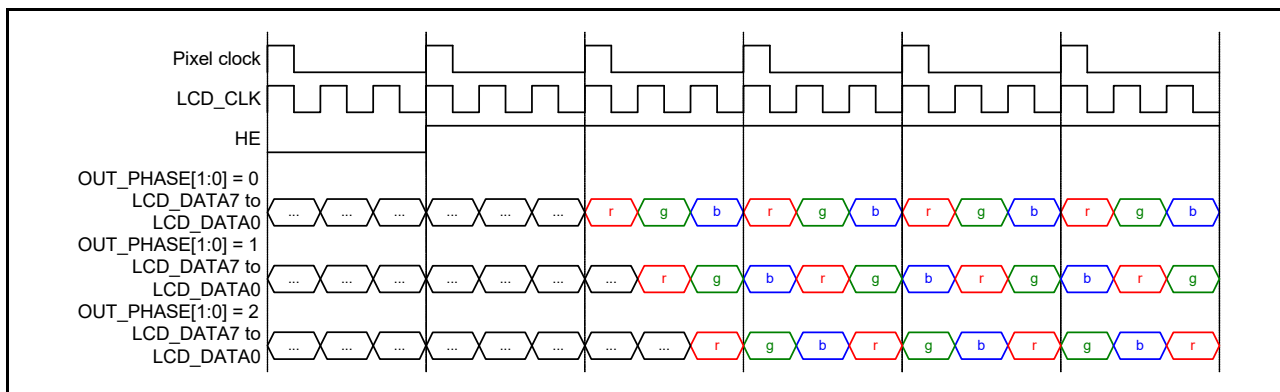

Figure 34.7 Timing of Clock Phases of Serial RGB Output (Triple Speed Mode)

Figure 34.8 shows the timing of the clock phases of the serial RGB output (quadruple speed mode).

34.1.9 LCD TCON

The LCD TCON generates various timing signals for driving the LCD panel.

Specifically, the timing include two vertical panel driver signals, five horizontal panel driver signals, and one composite signal of the vertical and horizontal panel driver signals. Table 34.13 lists the timing signals that are generated by LCD TCON

Table 34.13 Signals Generated by LCD TCON

Signal Name	Type	Description
STVA/VS	Vertical	<ul style="list-style-type: none"> Gate start signal The pulse width, pulse position, and pulse polarity of the signal can be controlled. Vsync signal The width, position, and polarity of the sync signal can be controlled.
STVB/VE	Vertical	<ul style="list-style-type: none"> Gate start signal The pulse width, pulse position, and pulse polarity of the signal can be controlled. Vertical enable signal The width, position, and polarity of the sync signal can be controlled.
STH/SP/HS	Horizontal	<ul style="list-style-type: none"> Source start signal The pulse width, pulse position, and pulse polarity of the signal can be controlled. Hsync signal The width, position, and polarity of the sync signal can be controlled.
STB/LP/HE	Horizontal	<ul style="list-style-type: none"> Source strobe signal The pulse width, pulse position, and pulse polarity of the signal can be controlled. Horizontal enable signal The width, position, and polarity of the enable signal can be controlled.
CPV/GCK	Horizontal	<ul style="list-style-type: none"> Gate clock signal The pulse width, pulse position, and pulse polarity of the signal can be controlled.
POLA	Horizontal	<ul style="list-style-type: none"> VCOM voltage polarity control signal The polarity inversion position, and polarity inversion operation (1 × 1, 1 × 2, 2 × 2) can be controlled.
POLB	Horizontal	<ul style="list-style-type: none"> VCOM voltage polarity control signal The polarity inversion position, and polarity inversion operation (1 × 1, 1 × 2, 2 × 2) can be controlled.
DE	Horizontal/Vertical	<ul style="list-style-type: none"> Data enable signal The width, position, and polarity of the enable signal can be controlled.

(1) Horizontal Reference Offset Control

The horizontal reference offset control enables generation of a reference signal with a clock delay equivalent to the value of TCON_OFFSET[10:0] from the rising edge of the Hsync signal. If a signal that spans across the Hsync signal needs to be generated, such a signal is generated with reference to the offset reference signal.

Figure 34.9 Generation of Offset Horizontal Reference (H_OFF) Signal

Table 34.14 Horizontal Reference Signal Selection

Signal Name	Bit Name	Initial Value	Description
TCON_TIM	TCON_OFFSET[10:0]	0	Offset Hsync Signal Timing Sets the clock cycle count from the rising edge of the Hsync signal.
TCON_TIM_STH2	TCON_STH_HS_SEL	0	STH Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
TCON_TIM_STB2	TCON_STB_HS_SEL	0	STB Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
TCON_TIM_CPV2	TCON_CPV_HS_SEL	0	CPV Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
TCON_TIM_POLA2	TCON_POLA_HS_SEL	0	POLA Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
TCON_TIM_POLB2	TCON_POLB_HS_SEL	0	POLB Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference

Note: When generating the POLA and POLB signals in reverse mode, the bits TCON_POLA_HS_SEL and TCON_POLB_HS_SEL should be set to 0.

(2) Horizontal Panel Driver Signal Generation (A)

Horizontal synchronous panel driver signal generation (A) involves generation of a timing signal that changes twice in a horizontal period according to the values of TCON_xxxx_HS[10:0] and TCON_xxxx_HW[10:0] bits, which set the first changing timing and the second changing timing, respectively.

The internal counter performs the following operations.

1. Resets the counter value at the rising edge of the Hsync signal as the reference.
2. Increments the counter value at the rising edge of the panel clock.

A fixed output value of 0 can be obtained by setting 0 in TCON_xxxx_HW[10:0], which set the second changing timing.

Figure 34.10 Horizontal Panel Driver Signal (in Normal Mode)

Figure 34.11 Horizontal Panel Driver Signal (in Normal Mode and When TCON_xxxx_HW_ = 0)

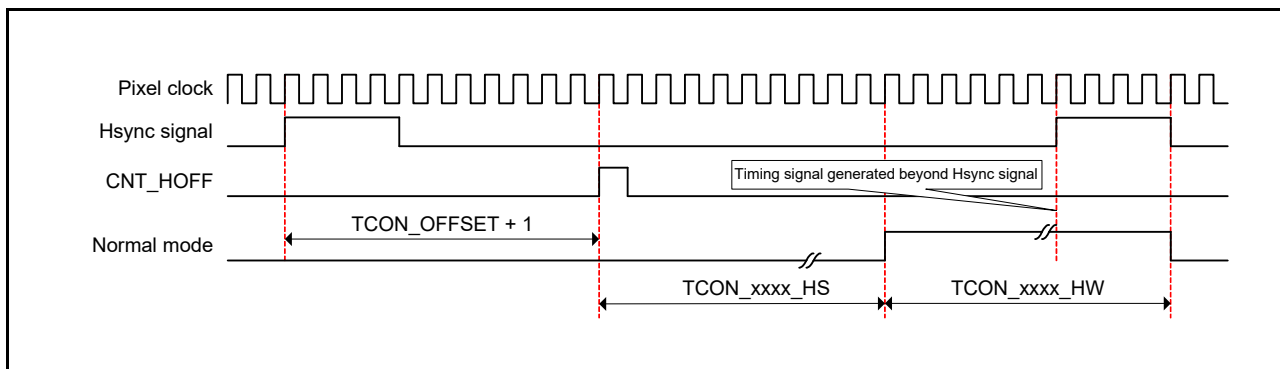

Figure 34.12 Horizontal Panel Driver Signal (in Normal Mode and When Offset Horizontal Reference is Used)

Table 34.15 Settings for Horizontal Panel Driver Signal Generation (A)

Register Name	Bit Name	Initial Value	Description
TCON_TIM_STH1	TCON_STH_HS[10:0]	0	STH Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STH_HS from the rising edge of the Hsync signal (clock cycles)
TCON_TIM_STH1	TCON_STH_HW[10:0]	96	STH Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STH_HW (clock cycles)
TCON_TIM_STB1	TCON_STB_HS[10:0]	144	STB Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STB_HS from the rising edge of the Hsync signal (clock cycles)
TCON_TIM_STB1	TCON_STB_HW[10:0]	640	STB Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STB_HW (clock cycles)
TCON_TIM_CPV1	TCON_CPV_HS[10:0]	0	CPV Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_CPV_HS from the rising edge of the Hsync signal (clock cycles)
TCON_TIM_CPV1	TCON_CPV_HW[10:0]	0	CPV Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_CPV_HW (clock cycles)

(3) Horizontal Panel Driver Signal Generation (B)

In addition to the normal mode operation described in (2), reverse mode operation, that is, horizontal panel driver signal generation (B) is provided. In reverse mode, operation starts at the rising edge of the Vsync signal as the reference and a signal is generated such that its polarity is inverted every horizontal period in the timing set by the TCON_xxxx_HS[10:0] bits, which set the first changing timing.

In reverse mode, regardless of whether the number of lines in the vertical direction is odd or even, the polarity of the signals generated is inverted every horizontal period. The following three reverse modes are selectable for polarity inversion operation.

Table 34.16 Horizontal Panel Driver Signal Generation Modes

Register Name	Bit Name	Initial Value	Description
TCON_TIM_POLA2	TCON_POLA_MD [1:0]	1	POLA Signal Generation Mode Select 0: Normal mode Generates the signal that changes twice a horizontal period. 1: 1 × 1 reverse mode Generates the signal whose polarity is inverted every horizontal period. 2: 1 × 2 reverse mode Generates the signal whose polarity is inverted in the first horizontal period and is subsequently inverted every two horizontal periods. 3: 2 × 2 reverse mode Generates the signal whose polarity is inverted every two horizontal periods.
TCON_TIM_POLB2	TCON_POLB_MD [1:0]	1	POLB Signal Generation Mode Select 0: Normal mode Generates the signal that changes twice a horizontal period. 1: 1 × 1 reverse mode Generates the signal whose polarity is inverted every horizontal period. 2: 1 × 2 reverse mode Generates the signal whose polarity is inverted in the first horizontal period and is subsequently inverted every two horizontal periods. 3: 2 × 2 reverse mode Generates the signal whose polarity is inverted every two horizontal periods.

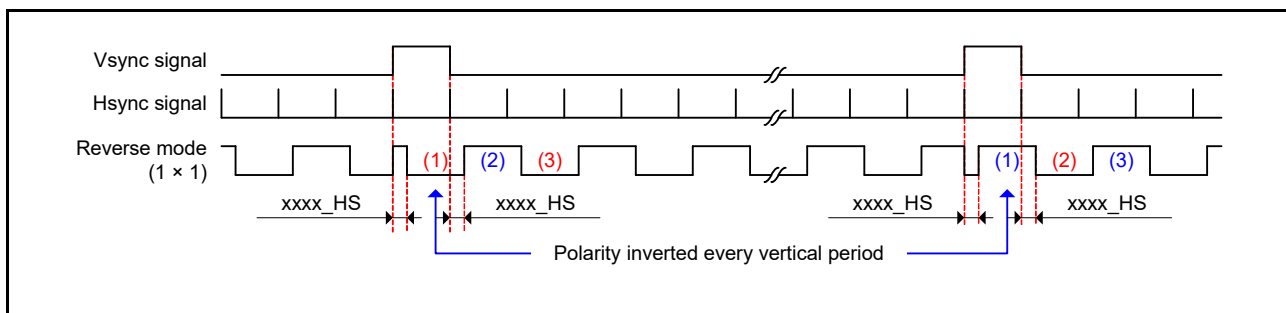

Figure 34.13 Horizontal Panel Driver Signal (in 1 × 1 Reverse Mode)

Figure 34.14 Horizontal Panel Driver Signal (in 1 × 2 Reverse Mode)

Figure 34.15 Horizontal Panel Driver Signal (in 2 × 2 Reverse Mode)

Table 34.17 Settings of Horizontal Panel Driver Signal Generation (B)

Register Name	Bit Name	Initial Value	Description
TCON_TIM_POLA1	TCON_POLA_HS [10:0]	0	POLA Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_POLA_HS + 1 from the rising edge of the Hsync signal (clock cycles) Note: When 1 × 1, 1 × 2, or 2 × 2 reverse mode is selected, these bits should be set to 1 or greater.
TCON_TIM_POLA1	TCON_POLA_HW [10:0]	0	POLA Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_POLA_HW (clock cycles)
TCON_TIM_POLB1	TCON_POLB_HS [10:0]	0	POLBA Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_POLB_HS + 1 from the rising edge of the Hsync signal (clock cycles) Note: When 1 × 1, 1 × 2, or 2 × 2 reverse mode is selected, these bits should be set to 1 or greater.
TCON_TIM_POLB1	TCON_POLB_HW [10:0]	0	POLB Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_POLB_HW (clock cycles)

(4) Vertical Panel Driver Signal Generation

The vertical synchronous panel driver signal generation involves the following operations.

1. Initialization at the rising edge of the Vsync signal
2. Generation of a timing signal that changes twice in a vertical period according to the values of the internal counter, and TCON_xxxx_VS[10:0] and TCON_xxxx_VW[10:0] bits, which set the first changing timing and the second changing timing, respectively.

The internal counter increments the counter value in the following two cases.

1. At the rising edge of the Hsync signal
2. At the point reached after a clock delay specified by the value of TCON_HALF[10:0] from the rising edge of the Hsync signal (normally, 1/2fH is set).

Figure 34.16 1/2 Pulse (H_HALF) Signal Generation

Table 34.18 Settings of 1/2 Pulse (H_HALF) Signal Generation

Register Name	Bit Name	Initial Value	Description
TCON_TIM	TCON_HALF[10:0]	400	1/2fH Timing Specifies the clock count from the rising edge of the Hsync signal as the counting timing of horizontal counter

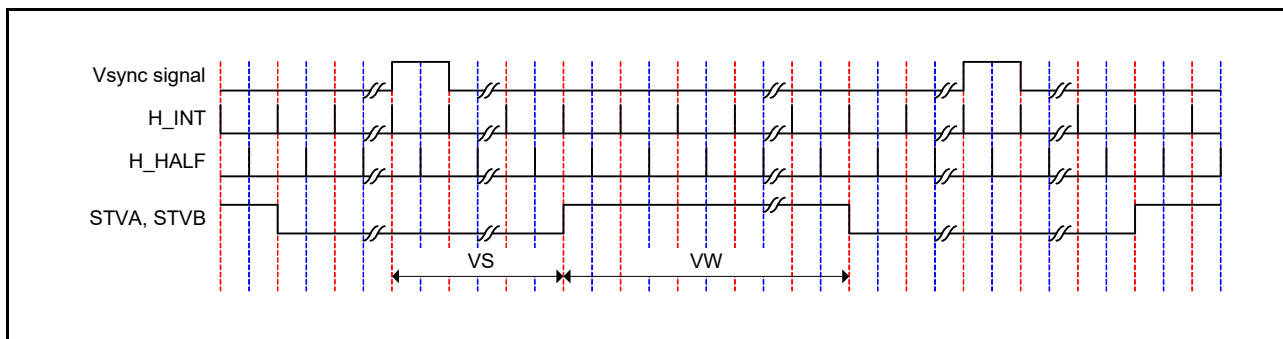

Figure 34.17 Vertical Panel Driver Signal (H_INT Reference Operation)

Figure 34.18 Vertical Panel Driver Signal (H_HALF Reference Operation)

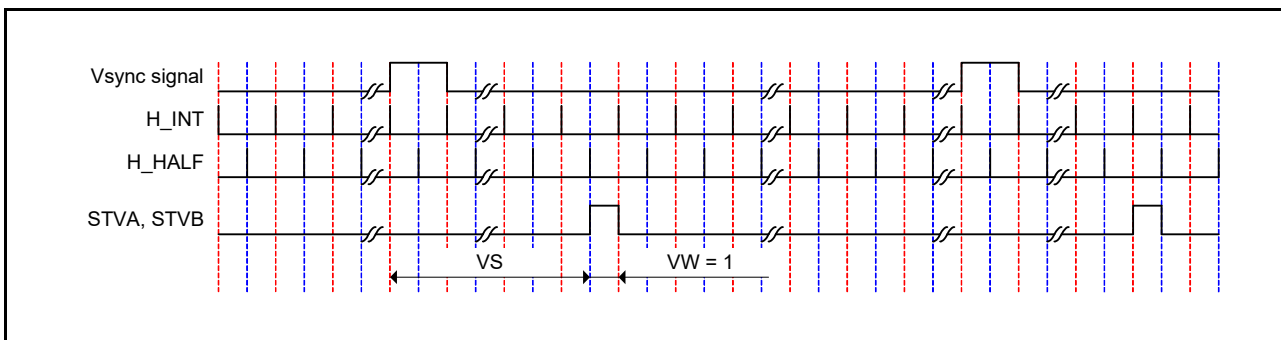

Figure 34.19 Vertical Panel Driver Signal (H_INT and H_HALF Reference Operation)

Table 34.19 Vertical Panel Driver Signal Generation

Register Name	Bit Name	Initial Value	Description
TCON_TIM_STVA1	TCON_STVA_VS[10:0]	0	STVA Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STVA_HS from the rising edge of the Vsync signal (1/2fH cycles)
TCON_TIM_STVA1	TCON_STVA_VW[10:0]	4	STVA Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STVA_HW (1/2fH cycles)
TCON_TIM_STVB1	TCON_STVB_VS[10:0]	70	STVB Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STVB_HS from the rising edge of the Vsync signal (1/2fH cycles)
TCON_TIM_STVB1	TCON_STVB_VW[10:0]	960	STVB Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STVB_HW (1/2fH cycles)

(5) DE Timing Signal Generation

DE timing signal generation involves generation of data enable signal (DE) that indicates the valid period of the video signal by synthesizing the horizontal panel driver (HE) signal and the vertical panel driver (VE) signal (AND).

Figure 34.20 Data Enable Signal Generation

(6) Polarity Inversion

Polarity inversion enables inversion of polarity of each signal generated by the signal generating circuit.

Table 34.20 Panel Driver Signal Polarity Inversion Control

Register Name	Bit Name	Initial Value	Description
TCON_TIM_STVA2	TCON_STVA_INV	1	Polarity Inversion Control of STVA Signal 0: Not inverted 1: Inverted
TCON_TIM_STVB2	TCON_STVB_INV	0	Polarity Inversion Control of STVB Signal 0: Not inverted 1: Inverted
TCON_TIM_STH2	TCON_STH_INV	1	Polarity Inversion Control of STH Signal 0: Not inverted 1: Inverted
TCON_TIM_STB2	TCON_STB_INV	0	Polarity Inversion Control of STB Signal 0: Not inverted 1: Inverted
TCON_TIM_CPV2	TCON_CPV_INV	0	Polarity Inversion Control of CPV Signal 0: Not inverted 1: Inverted
TCON_TIM_POLA2	TCON_POLA_INV	0	Polarity Inversion Control of POLA Signal 0: Not inverted 1: Inverted
TCON_TIM_POLB2	TCON_POLB_INV	0	Polarity Inversion Control of POLB Signal 0: Not inverted 1: Inverted
TCON_TIM_DE	TCON_DE_INV	0	Polarity Inversion Control of DE Signal 0: Not inverted 1: Inverted

(7) Output Selection

An output pin is selected for every signal subjected to polarity inversion control.

Table 34.21 Panel Driver Signal Output Selection

Register Name	Bit Name	Initial Value	Description
TCON_TIM_STVA2	TCON_STVA_SEL [2:0]	0	Output Signal Select for LCD_TCON0 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE

Table 34.21 Panel Driver Signal Output Selection

Register Name	Bit Name	Initial Value	Description
TCON_TIM_POLB2	TCON_POLB_SEL [2:0]	6	Output Signal Select for LCD_TCON6 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE

(8) Output Phase Selection

The output phase can be individually selected for the video output signal and the various timing output signals based on the LCD_CLK (panel clock).

Table 34.22 Panel Output Signal Phase Selection

Register Name	Bit Name	Initial Value	Description
OUT_CLK_PHASE	OUTCNT_LCD_EDGE	0	Output Phase Control of LCD_DATA23 to LCD_DATA0 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
OUT_CLK_PHASE	OUTCNT_STVA_EDGE	0	Output Phase Control of LCD_TCON0 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
OUT_CLK_PHASE	OUTCNT_STVB_EDGE	0	Output Phase Control of LCD_TCON1 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
OUT_CLK_PHASE	OUTCNT_STH_EDGE	0	Output Phase Control of LCD_TCON2 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
OUT_CLK_PHASE	OUTCNT_STB_EDGE	0	Output Phase Control of LCD_TCON3 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
OUT_CLK_PHASE	OUTCNT_CPV_EDGE	0	Output Phase Control of LCD_TCON4 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
OUT_CLK_PHASE	OUTCNT_POLA_EDGE	0	Output Phase Control of LCD_TCON5 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
OUT_CLK_PHASE	OUTCNT_POLB_EDGE	0	Output Phase Control of LCD_TCON6 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin

34.2 Register Descriptions

Table 34.23 to Table 34.25 show the register configuration.

- Symbols used in Register Description:

Initial value: Register value after a reset

—: Undefined value

R/W: Readable/writable. The written value can be read.

R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.

R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.

R: Read-only. The write value should always be 0.

—/W: Write-only. The read value is undefined.

TCON data enable polarity setting register	TCON_TIM_DE	R/W	H'0000 0000	H'FCFF 79C0	32

Table 34.25 Output Controller Register Configuration

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
Register update control register in output controller	OUT_UPDATE	R/WC1	H'0000 0000	H'FCFF 7A00	32
Output interface register	OUT_SET	R/W	H'001F 0000	H'FCFF 7A04	32
Brightness (DC) correction register 1	OUT_BRIGHT1	R/W	H'0000 0200	H'FCFF 7A08	32
Brightness (DC) correction register 2	OUT_BRIGHT2	R/W	H'0200 0200	H'FCFF 7A0C	32
Contrast (gain) correction register	OUT_CONTRAST	R/W	H'0080 8080	H'FCFF 7A10	32
Panel dither register	OUT_PDTHA	R/W	H'0000 3021	H'FCFF 7A14	32
Output phase control register	OUT_CLK_PHASE	R/W	H'0000 0000	H'FCFF 7A24	32

34.2.1 Register Update Control Register G in Gamma Correction Block (GAM_G_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GAM_G_VEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GAM_G_VEN	0	R/WC1	Gamma Correction (G) Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

34.2.2 Function Switch Register in Gamma Correction Block (GAM_SW)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GAM_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GAM_ON	0	R/W	Gamma Correction On/Off Control 0: Off 1: On

Note: This register is updated when GAM_G_VEN in GAM_G_UPDATE is 1.

34.2.3 Table Setting Register G1 to G16 in Gamma Correction Block (GAM_G_LUT1 to GAM_G_LUT16)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GAM_G_GAIN_xx[10:0]										
Initial value:	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GAM_G_GAIN_yy[10:0]										
Initial value:	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	*	1024	R/W	GAM_G_LUT1: Gain Adjustment of Area 0 of G Signal GAM_G_LUT2: Gain Adjustment of Area 2 of G Signal GAM_G_LUT3: Gain Adjustment of Area 4 of G Signal GAM_G_LUT4: Gain Adjustment of Area 6 of G Signal GAM_G_LUT5: Gain Adjustment of Area 8 of G Signal GAM_G_LUT6: Gain Adjustment of Area 10 of G Signal GAM_G_LUT7: Gain Adjustment of Area 12 of G Signal GAM_G_LUT8: Gain Adjustment of Area 14 of G Signal GAM_G_LUT9: Gain Adjustment of Area 16 of G Signal GAM_G_LUT10: Gain Adjustment of Area 18 of G Signal GAM_G_LUT11: Gain Adjustment of Area 20 of G Signal GAM_G_LUT12: Gain Adjustment of Area 22 of G Signal GAM_G_LUT13: Gain Adjustment of Area 24 of G Signal GAM_G_LUT14: Gain Adjustment of Area 26 of G Signal GAM_G_LUT15: Gain Adjustment of Area 28 of G Signal GAM_G_LUT16: Gain Adjustment of Area 30 of G Signal Unsigned (0 to 2047 [LSB], 1024 [LSB] = 1.0 [times])
26 to 16	*	1024	R/W	*: Bit Name GAM_G_LUT1: GAM_G_GAIN_00[10:0] GAM_G_LUT2: GAM_G_GAIN_02[10:0] GAM_G_LUT3: GAM_G_GAIN_04[10:0] GAM_G_LUT4: GAM_G_GAIN_06[10:0] GAM_G_LUT5: GAM_G_GAIN_08[10:0] GAM_G_LUT6: GAM_G_GAIN_10[10:0] GAM_G_LUT7: GAM_G_GAIN_12[10:0] GAM_G_LUT8: GAM_G_GAIN_14[10:0] GAM_G_LUT9: GAM_G_GAIN_16[10:0] GAM_G_LUT10: GAM_G_GAIN_18[10:0] GAM_G_LUT11: GAM_G_GAIN_20[10:0] GAM_G_LUT12: GAM_G_GAIN_22[10:0] GAM_G_LUT13: GAM_G_GAIN_24[10:0] GAM_G_LUT14: GAM_G_GAIN_26[10:0] GAM_G_LUT15: GAM_G_GAIN_28[10:0] GAM_G_LUT16: GAM_G_GAIN_30[10:0]
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
10 to 0	*	1024	R/W	GAM_G_LUT1: Gain Adjustment of Area 1 of G Signal GAM_G_LUT2: Gain Adjustment of Area 3 of G Signal GAM_G_LUT3: Gain Adjustment of Area 5 of G Signal GAM_G_LUT4: Gain Adjustment of Area 7 of G Signal GAM_G_LUT5: Gain Adjustment of Area 9 of G Signal GAM_G_LUT6: Gain Adjustment of Area 11 of G Signal GAM_G_LUT7: Gain Adjustment of Area 13 of G Signal GAM_G_LUT8: Gain Adjustment of Area 15 of G Signal GAM_G_LUT9: Gain Adjustment of Area 17 of G Signal GAM_G_LUT10: Gain Adjustment of Area 19 of G Signal
10 to 0	*	1024	R/W	GAM_G_LUT11: Gain Adjustment of Area 21 of G Signal GAM_G_LUT12: Gain Adjustment of Area 23 of G Signal GAM_G_LUT13: Gain Adjustment of Area 25 of G Signal GAM_G_LUT14: Gain Adjustment of Area 27 of G Signal GAM_G_LUT15: Gain Adjustment of Area 29 of G Signal GAM_G_LUT16: Gain Adjustment of Area 31 of G Signal Unsigned (0 to 2047 [LSB], 1024 [LSB] = 1.0 [times]) *: Bit Name GAM_G_LUT1: GAM_G_GAIN_01[10:0] GAM_G_LUT2: GAM_G_GAIN_03[10:0] GAM_G_LUT3: GAM_G_GAIN_05[10:0] GAM_G_LUT4: GAM_G_GAIN_07[10:0] GAM_G_LUT5: GAM_G_GAIN_09[10:0] GAM_G_LUT6: GAM_G_GAIN_11[10:0] GAM_G_LUT7: GAM_G_GAIN_13[10:0] GAM_G_LUT8: GAM_G_GAIN_15[10:0] GAM_G_LUT9: GAM_G_GAIN_17[10:0] GAM_G_LUT10: GAM_G_GAIN_19[10:0] GAM_G_LUT11: GAM_G_GAIN_21[10:0] GAM_G_LUT12: GAM_G_GAIN_23[10:0] GAM_G_LUT13: GAM_G_GAIN_25[10:0] GAM_G_LUT14: GAM_G_GAIN_27[10:0] GAM_G_LUT15: GAM_G_GAIN_29[10:0] GAM_G_LUT16: GAM_G_GAIN_31[10:0]

Note: This register is updated when GAM_G_VEN in GAM_G_UPDATE is 1.

34.2.4 Area Setting Register G1 in Gamma Correction Block (GAM_G_AREA1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

31 to 24	GAM_G_TH_08[7:0]	64	R/W	Start Threshold of Area 8 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
23 to 16	GAM_G_TH_09[7:0]	72	R/W	Start Threshold of Area 9 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
15 to 8	GAM_G_TH_10[7:0]	80	R/W	Start Threshold of Area 10 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
7 to 0	GAM_G_TH_11[7:0]	88	R/W	Start Threshold of Area 11 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area

Note: This register is updated when GAM_G_VEN in GAM_G_UPDATE is 1.

34.2.7 Area Setting Register G4 in Gamma Correction Block (GAM_G_AREA4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GAM_G_TH_12[7:0]								GAM_G_TH_13[7:0]							
Initial value:	0	1	1	0	0	0	0	0	0	1	1	0	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GAM_G_TH_14[7:0]								GAM_G_TH_15[7:0]							
Initial value:	0	1	1	1	0	0	0	0	0	1	1	1	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GAM_G_TH_12[7:0]	96	R/W	Start Threshold of Area 12 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
23 to 16	GAM_G_TH_13[7:0]	104	R/W	Start Threshold of Area 13 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
15 to 8	GAM_G_TH_14[7:0]	112	R/W	Start Threshold of Area 14 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
7 to 0	GAM_G_TH_15[7:0]	120	R/W	Start Threshold of Area 15 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area

Note: This register is updated when GAM_G_VEN in GAM_G_UPDATE is 1.

34.2.8 Area Setting Register G5 in Gamma Correction Block (GAM_G_AREA5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GAM_G_TH_16[7:0]								GAM_G_TH_17[7:0]							
Initial value:	1	0	0	0	0	0	0	0	1	0	0	0	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GAM_G_TH_18[7:0]								GAM_G_TH_19[7:0]							
Initial value:	1	0	0	1	0	0	0	0	1	0	0	1	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GAM_G_TH_16 [7:0]	128	R/W	Start Threshold of Area 16 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
23 to 16	GAM_G_TH_17 [7:0]	136	R/W	Start Threshold of Area 17 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
15 to 8	GAM_G_TH_18 [7:0]	144	R/W	Start Threshold of Area 18 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
7 to 0	GAM_G_TH_19 [7:0]	152	R/W	Start Threshold of Area 19 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area

Note: This register is updated when GAM_G_VEN in GAM_G_UPDATE is 1.

34.2.9 Area Setting Register G6 in Gamma Correction Block (GAM_G_AREA6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GAM_G_TH_20[7:0]								GAM_G_TH_21[7:0]							
Initial value:	1	0	1	0	0	0	0	0	1	0	1	0	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GAM_G_TH_22[7:0]								GAM_G_TH_23[7:0]							
Initial value:	1	0	1	1	0	0	0	0	1	0	1	1	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GAM_G_TH_20 [7:0]	160	R/W	Start Threshold of Area 20 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
23 to 16	GAM_G_TH_21 [7:0]	168	R/W	Start Threshold of Area 21 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
15 to 8	GAM_G_TH_22 [7:0]	176	R/W	Start Threshold of Area 22 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
7 to 0	GAM_G_TH_23 [7:0]	184	R/W	Start Threshold of Area 23 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area

Note: This register is updated when GAM_G_VEN in GAM_G_UPDATE is 1.

34.2.10 Area Setting Register G7 in Gamma Correction Block (GAM_G_AREA7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GAM_G_TH_24[7:0]								GAM_G_TH_25[7:0]							
Initial value:	1	1	0	0	0	0	0	0	1	1	0	0	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GAM_G_TH_26[7:0]								GAM_G_TH_27[7:0]							
Initial value:	1	1	0	1	0	0	0	0	1	1	0	1	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GAM_G_TH_24 [7:0]	192	R/W	Start Threshold of Area 24 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
23 to 16	GAM_G_TH_25 [7:0]	200	R/W	Start Threshold of Area 25 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
15 to 8	GAM_G_TH_26 [7:0]	208	R/W	Start Threshold of Area 26 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
7 to 0	GAM_G_TH_27 [7:0]	216	R/W	Start Threshold of Area 27 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area

Note: This register is updated when GAM_G_VEN in GAM_G_UPDATE is 1.

34.2.11 Area Setting Register G8 in Gamma Correction Block (GAM_G_AREA8)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GAM_G_TH_28[7:0]								GAM_G_TH_29[7:0]							
Initial value:	1	1	1	0	0	0	0	0	1	1	1	0	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GAM_G_TH_30[7:0]								GAM_G_TH_31[7:0]							
Initial value:	1	1	1	1	0	0	0	0	1	1	1	1	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GAM_G_TH_28 [7:0]	224	R/W	Start Threshold of Area 28 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
23 to 16	GAM_G_TH_29 [7:0]	232	R/W	Start Threshold of Area 29 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
15 to 8	GAM_G_TH_30 [7:0]	240	R/W	Start Threshold of Area 30 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
7 to 0	GAM_G_TH_31 [7:0]	248	R/W	Start Threshold of Area 31 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area ≤ 255

Note: This register is updated when GAM_G_VEN in GAM_G_UPDATE is 1.

34.2.12 Register Update Control Register B in Gamma Correction Block (GAM_B_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GAM_B _VEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GAM_B_VEN	0	R/WC1	Gamma Correction (B) Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

34.2.13 Table Setting Register B1 to B16 in Gamma Correction Block (GAM_B_LUT1 to GAM_B_LUT16)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GAM_B_GAIN_xx[10:0]										
Initial value:	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GAM_B_GAIN_yy[10:0]										
Initial value:	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	*	1024	R/W	GAM_B_LUT1: Gain Adjustment of Area 0 of B Signal GAM_B_LUT2: Gain Adjustment of Area 2 of B Signal GAM_B_LUT3: Gain Adjustment of Area 4 of B Signal GAM_B_LUT4: Gain Adjustment of Area 6 of B Signal GAM_B_LUT5: Gain Adjustment of Area 8 of B Signal GAM_B_LUT6: Gain Adjustment of Area 10 of B Signal GAM_B_LUT7: Gain Adjustment of Area 12 of B Signal GAM_B_LUT8: Gain Adjustment of Area 14 of B Signal GAM_B_LUT9: Gain Adjustment of Area 16 of B Signal GAM_B_LUT10: Gain Adjustment of Area 18 of B Signal GAM_B_LUT11: Gain Adjustment of Area 20 of B Signal GAM_B_LUT12: Gain Adjustment of Area 22 of B Signal GAM_B_LUT13: Gain Adjustment of Area 24 of B Signal GAM_B_LUT14: Gain Adjustment of Area 26 of B Signal GAM_B_LUT15: Gain Adjustment of Area 28 of B Signal GAM_B_LUT16: Gain Adjustment of Area 30 of B Signal Unsigned (0 to 2047 [LSB], 1024 [LSB] = 1.0 [times])
26 to 16	*	1024	R/W	*: Bit Name GAM_B_LUT1: GAM_B_GAIN_00[10:0] GAM_B_LUT2: GAM_B_GAIN_02[10:0] GAM_B_LUT3: GAM_B_GAIN_04[10:0] GAM_B_LUT4: GAM_B_GAIN_06[10:0] GAM_B_LUT5: GAM_B_GAIN_08[10:0] GAM_B_LUT6: GAM_B_GAIN_10[10:0] GAM_B_LUT7: GAM_B_GAIN_12[10:0] GAM_B_LUT8: GAM_B_GAIN_14[10:0] GAM_B_LUT9: GAM_B_GAIN_16[10:0] GAM_B_LUT10: GAM_B_GAIN_18[10:0] GAM_B_LUT11: GAM_B_GAIN_20[10:0] GAM_B_LUT12: GAM_B_GAIN_22[10:0] GAM_B_LUT13: GAM_B_GAIN_24[10:0] GAM_B_LUT14: GAM_B_GAIN_26[10:0] GAM_B_LUT15: GAM_B_GAIN_28[10:0] GAM_B_LUT16: GAM_B_GAIN_30[10:0]
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
10 to 0	*	1024	R/W	GAM_B_LUT1: Gain Adjustment of Area 1 of B Signal GAM_B_LUT2: Gain Adjustment of Area 3 of B Signal GAM_B_LUT3: Gain Adjustment of Area 5 of B Signal GAM_B_LUT4: Gain Adjustment of Area 7 of B Signal GAM_B_LUT5: Gain Adjustment of Area 9 of B Signal GAM_B_LUT6: Gain Adjustment of Area 11 of B Signal GAM_B_LUT7: Gain Adjustment of Area 13 of B Signal GAM_B_LUT8: Gain Adjustment of Area 15 of B Signal GAM_B_LUT9: Gain Adjustment of Area 17 of B Signal GAM_B_LUT10: Gain Adjustment of Area 19 of B Signal GAM_B_LUT11: Gain Adjustment of Area 21 of B Signal GAM_B_LUT12: Gain Adjustment of Area 23 of B Signal GAM_B_LUT13: Gain Adjustment of Area 25 of B Signal GAM_B_LUT14: Gain Adjustment of Area 27 of B Signal GAM_B_LUT15: Gain Adjustment of Area 29 of B Signal GAM_B_LUT16: Gain Adjustment of Area 31 of B Signal Unsigned (0 to 2047 [LSB], 1024 [LSB] = 1.0 [times]) *: Bit Name GAM_B_LUT1: GAM_B_GAIN_01[10:0] GAM_B_LUT2: GAM_B_GAIN_03[10:0] GAM_B_LUT3: GAM_B_GAIN_05[10:0] GAM_B_LUT4: GAM_B_GAIN_07[10:0] GAM_B_LUT5: GAM_B_GAIN_09[10:0] GAM_B_LUT6: GAM_B_GAIN_11[10:0] GAM_B_LUT7: GAM_B_GAIN_13[10:0] GAM_B_LUT8: GAM_B_GAIN_15[10:0] GAM_B_LUT9: GAM_B_GAIN_17[10:0] GAM_B_LUT10: GAM_B_GAIN_19[10:0] GAM_B_LUT11: GAM_B_GAIN_21[10:0] GAM_B_LUT12: GAM_B_GAIN_23[10:0] GAM_B_LUT13: GAM_B_GAIN_25[10:0] GAM_B_LUT14: GAM_B_GAIN_27[10:0] GAM_B_LUT15: GAM_B_GAIN_29[10:0] GAM_B_LUT16: GAM_B_GAIN_31[10:0]

Note: This register is updated when GAM_B_VEN in GAM_B_UPDATE is 1.

34.2.14 Area Setting Register B1 in Gamma Correction Block (GAM_B_AREA1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	GAM_B_TH_01[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GAM_B_TH_02[7:0]							GAM_B_TH_03[7:0]

R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GAM_R_TH_12[7:0]	96	R/W	Start Threshold of Area 12 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
23 to 16	GAM_R_TH_13[7:0]	104	R/W	Start Threshold of Area 13 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
15 to 8	GAM_R_TH_14[7:0]	112	R/W	Start Threshold of Area 14 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
7 to 0	GAM_R_TH_15[7:0]	120	R/W	Start Threshold of Area 15 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area

Note: This register is updated when GAM_R_VEN in GAM_R_UPDATE is 1.

34.2.28 Area Setting Register R5 in Gamma Correction Block (GAM_R_AREA5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GAM_R_TH_16[7:0]								GAM_R_TH_17[7:0]							
Initial value:	1	0	0	0	0	0	0	0	1	0	0	0	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GAM_R_TH_18[7:0]								GAM_R_TH_19[7:0]							
Initial value:	1	0	0	1	0	0	0	0	1	0	0	1	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GAM_R_TH_16[7:0]	128	R/W	Start Threshold of Area 16 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
23 to 16	GAM_R_TH_17[7:0]	136	R/W	Start Threshold of Area 17 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
15 to 8	GAM_R_TH_18[7:0]	144	R/W	Start Threshold of Area 18 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
7 to 0	GAM_R_TH_19[7:0]	152	R/W	Start Threshold of Area 19 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area

Note: This register is updated when GAM_R_VEN in GAM_R_UPDATE is 1.

34.2.29 Area Setting Register R6 in Gamma Correction Block (GAM_R_AREA6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GAM_R_TH_20[7:0]								GAM_R_TH_21[7:0]							
Initial value:	1	0	1	0	0	0	0	0	1	0	1	0	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GAM_R_TH_22[7:0]								GAM_R_TH_23[7:0]							
Initial value:	1	0	1	1	0	0	0	0	1	0	1	1	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GAM_R_TH_20[7:0]	160	R/W	Start Threshold of Area 20 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
23 to 16	GAM_R_TH_21[7:0]	168	R/W	Start Threshold of Area 21 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
15 to 8	GAM_R_TH_22[7:0]	176	R/W	Start Threshold of Area 22 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
7 to 0	GAM_R_TH_23[7:0]	184	R/W	Start Threshold of Area 23 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area

Note: This register is updated when GAM_R_VEN in GAM_R_UPDATE is 1.

34.2.30 Area Setting Register R7 in Gamma Correction Block (GAM_R_AREA7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GAM_R_TH_24[7:0]								GAM_R_TH_25[7:0]							
Initial value:	1	1	0	0	0	0	0	0	1	1	0	0	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GAM_R_TH_26[7:0]								GAM_R_TH_27[7:0]							
Initial value:	1	1	0	1	0	0	0	0	1	1	0	1	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GAM_R_TH_24[7:0]	192	R/W	Start Threshold of Area 24 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
23 to 16	GAM_R_TH_25[7:0]	200	R/W	Start Threshold of Area 25 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
15 to 8	GAM_R_TH_26[7:0]	208	R/W	Start Threshold of Area 26 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
7 to 0	GAM_R_TH_27[7:0]	216	R/W	Start Threshold of Area 27 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area

Note: This register is updated when GAM_R_VEN in GAM_R_UPDATE is 1.

34.2.31 Area Setting Register R8 in Gamma Correction Block (GAM_R_AREA8)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GAM_R_TH_28[7:0]								GAM_R_TH_29[7:0]							
Initial value:	1	1	1	0	0	0	0	0	1	1	1	0	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GAM_R_TH_30[7:0]								GAM_R_TH_31[7:0]							
Initial value:	1	1	1	1	0	0	0	0	1	1	1	1	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GAM_R_TH_28[7:0]	224	R/W	Start Threshold of Area 28 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
23 to 16	GAM_R_TH_29[7:0]	232	R/W	Start Threshold of Area 29 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
15 to 8	GAM_R_TH_30[7:0]	240	R/W	Start Threshold of Area 30 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
7 to 0	GAM_R_TH_31[7:0]	248	R/W	Start Threshold of Area 31 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area ≤ 255

Note: This register is updated when GAM_R_VEN in GAM_R_UPDATE is 1.

34.2.32 TCON Register Update Control Register (TCON_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TCON_VEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	TCON_VEN	0	R/WC1	LCD TCON Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

34.2.33 TCON Reference Timing Setting Register (TCON_TIM)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	TCON_HALF[10:0]										
Initial value:	0	0	0	0	0	0	0	1	1	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TCON_OFFSET[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	TCON_HALF[10:0]	400	R/W	1/2fH Timing Specifies the clock count from the rising edge of the Hsync signal as the counting timing of horizontal counter.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	TCON_OFFSET[10:0]	0	R/W	Offset Hsync Signal Timing Sets the clock cycle count from the rising edge of the Hsync signal.

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

34.2.34 TCON Vertical Timing Setting Register A1 (TCON_TIM_STVA1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	
	—	—	—	—	—	TCON_STVA_VS[10:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
	—	—	—	—	—	TCON_STVA_VW[10:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	TCON_STVA_VS [10:0]	0	R/W	STVA Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STVA_VS from the rising edge of the Vsync signal (1/2fH cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	TCON_STVA_VW [10:0]	4	R/W	STVA Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STVA_VW (1/2fH cycles).

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

34.2.35 TCON Vertical Timing Setting Register A2 (TCON_TIM_STVA2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	TCON_STVA_INV	—	TCON_STVA_SEL[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	TCON_STVA_INV	1	R/W	Polarity Inversion Control of STVA Signal 0: Not inverted 1: Inverted
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	TCON_STVA_SEL [2:0]	0	R/W	Output Signal Select for LCD_TCON0 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

34.2.36 TCON Vertical Timing Setting Register B1 (TCON_TIM_STVB1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	
	—	—	—	—	—	TCON_STVB_VS[10:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1	1	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
	—	—	—	—	—	TCON_STVB_VW[10:0]											
Initial value:	0	0	0	0	0	0	1	1	1	1	0	0	0	0	0	0	
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	TCON_STVB_VS [10:0]	70	R/W	STVB Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STVB_VS from the rising edge of the Vsync signal (1/2fH cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	TCON_STVB_VW [10:0]	960	R/W	STVB Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STVB_VW (1/2fH cycles).

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

34.2.37 TCON Vertical Timing Setting Register B2 (TCON_TIM_STVB2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	TCON_STVB_INV	—	TCON_STVB_SEL[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	TCON_STVB_INV	0	R/W	Polarity Inversion Control of STVB Signal 0: Not inverted 1: Inverted
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	TCON_STVB_SEL [2:0]	1	R/W	Output Signal Select for LCD_TCON1 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

34.2.38 TCON Horizontal Timing Setting Register STH1 (TCON_TIM_STH1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	TCON_STH_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TCON_STH_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	1	1	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	TCON_STH_HS [10:0]	0	R/W	STH Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STH_HS + 1 from the rising edge of the Hsync signal (clock cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	TCON_STH_HW [10:0]	96	R/W	STH Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STH_HW (clock cycles).

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

34.2.39 TCON Horizontal Timing Setting Register STH2 (TCON_TIM_STH2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TCON STH_HS_ SEL	—	—	—	TCON STH_INV	—	TCON_STH_SEL[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	1	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	TCON_STH_HS_SEL	0	R/W	STH Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	TCON_STH_INV	1	R/W	Polarity Inversion Control of STH Signal 0: Not inverted 1: Inverted
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	TCON_STH_SEL [2:0]	2	R/W	Output Signal Select for LCD_TCON2 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

34.2.40 TCON Horizontal Timing Setting Register STB1 (TCON_TIM_STB1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	TCON_STB_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TCON CPV_HS_ SEL	—	—	—	TCON CPV_INV	—	TCON_CPV_SEL[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	TCON_CPV_HS_SEL	0	R/W	CPV Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	TCON_CPV_INV	0	R/W	Polarity Inversion Control of CPV Signal 0: Not inverted 1: Inverted
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	TCON_CPV_SEL [2:0]	4	R/W	Output Signal Select for LCD_TCON4 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

34.2.44 TCON Horizontal Timing Setting Register POLA1 (TCON_TIM_POLA1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	TCON_POLA_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TCON_POLA_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	TCON_POLA_HS [10:0]	0	R/W	POLA Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_POLA_HS from the rising edge of the Hsync signal (clock cycles). Note: When 1 × 1, 1 × 2, or 2 × 2 reverse mode is selected, these bits should be set to 1 or greater.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	TCON_POLA_HW [10:0]	0	R/W	POLA Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_POLA_HW (clock cycles).

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

34.2.45 TCON Horizontal Timing Setting Register POLA2 (TCON_TIM_POLA2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	TCON_POLA_MD[1:0]	—	—	—	TCON_POLA_HS_SEL	—	—	—	TCON_POLA_INV	—	TCON_POLA_SEL[2:0]			
Initial value:	0	0	0	1	0	0	0	0	0	0	0	0	0	1	0	1
R/W:	R	R	R/W	R/W	R	R	R	R/W	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13, 12	TCON_POLA_MD [1:0]	1	R/W	POLA Signal Generation Mode Select 0: Normal mode Generates the signal that changes twice a horizontal period. 1: 1 × 1 reverse mode Generates the signal whose polarity is inverted every horizontal period. 2: 1 × 2 reverse mode Generates the signal whose polarity is inverted in the first horizontal period and is subsequently inverted every two horizontal periods. 3: 2 × 2 reverse mode Generates the signal whose polarity is inverted every two horizontal periods.
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	TCON_POLA_HS_SEL	0	R/W	POLA Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	TCON_POLA_INV	0	R/W	Polarity Inversion Control of POLA Signal 0: Not inverted 1: Inverted
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	TCON_POLA_SEL [2:0]	5	R/W	Output Signal Select for LCD_TCON5 pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

34.2.46 TCON Horizontal Timing Setting Register POLB1 (TCON_TIM_POLB1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	TCON_POLB_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TCON_POLB_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	TCON_POLB_HS [10:0]	0	R/W	POLB Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_POLB_HS from the rising edge of the Hsync signal (clock cycles). Note: When 1 × 1, 1 × 2, or 2 × 2 reverse mode is selected, these bits should be set to 1 or greater.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	TCON_POLB_HW [10:0]	0	R/W	POLB Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_POLB_HW (clock cycles).

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

34.2.47 TCON Horizontal Timing Setting Register POLB2 (TCON_TIM_POLB2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	TCON_POLB_MD[1:0]	—	—	—	TCON_POLB_HS_SEL	—	—	—	TCON_POLB_INV	—	TCON_POLB_SEL[2:0]	—	—	—
Initial value:	0	0	0	1	0	0	0	0	0	0	0	0	0	1	1	0
R/W:	R	R	R/W	R/W	R	R	R	R/W	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13, 12	TCON_POLB_MD [1:0]	1	R/W	POLB Signal Generation Mode Select 0: Normal mode Generates the signal that changes twice a horizontal period. 1: 1 × 1 reverse mode Generates the signal whose polarity is inverted every horizontal period. 2: 1 × 2 reverse mode Generates the signal whose polarity is inverted in the first horizontal period and is subsequently inverted every two horizontal periods. 3: 2 × 2 reverse mode Generates the signal whose polarity is inverted every two horizontal periods.
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	TCON_POLB_HS_SEL	0	R/W	POLB Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	TCON_POLB_INV	0	R/W	Polarity Inversion Control of POLB Signal 0: Not inverted 1: Inverted
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	TCON_POLB_SEL [2:0]	6	R/W	Output Signal Select for LCD_TCON6 pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

34.2.48 TCON Data Enable Polarity Setting Register (TCON_TIM_DE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TCON_DE_INV
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	TCON_DE_INV	0	R/W	Polarity Inversion Control of DE Signal 0: Not inverted 1: Inverted

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

34.2.49 Register Update Control Register in Output Controller (OUT_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	OUTCNT_VEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	OUTCNT_VEN	0	R/WC1	Brightness/Contrast, Dither Process, Output Interface Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

34.2.50 Output Interface Register (OUT_SET)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	OUT_ENDI- AN_ON	—	—	—	OUT_SWAP- ON	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1
R/W:	R	R	R	R/W	R	R	R	R/W	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	OUT- FORMAT[1:0]	—	—	—	OUT_FRQ- SEL[1:0]	—	—	—	—	OUT- DIR- SEL	—	—	—	OUT- PHASE[1:0]
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R	R	R/W	R/W	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	OUT_ENDI- AN_ON	0	R/W	Bit Endian Change On/Off Control 0: Off 1: On
27 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	OUT_SWAP- ON	0	R/W	B/R Signal Swap On/Off Control 0: Off 1: On
23 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20 to 16	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13, 12	OUT- FORMAT[1:0]	0	R/W	Output Format Select 0: RGB888 1: RGB666 2: RGB565 3: Serial RGB
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	OUT- FRQ- SEL [1:0]	0	R/W	Clock Frequency Control 0: 100% speed — (parallel RGB) 1: Triple speed — (serial RGB) 2: Quadruple speed — (serial RGB) 3: Setting prohibited
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	OUT- DIR- SEL	0	R/W	Scan Direction Select 0: Forward scan 1: Reverse scan
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
1, 0	OUT_PHASE[1:0]	0	R/W	Clock Phase Adjustment During Serial RGB Output Triple speed mode 0: 0 (clk) 1: 1 (clk) 2: 2 (clk) 3: Setting prohibited Quadruple speed mode 0: 0 (clk) 1: 1 (clk) 2: 2 (clk) 3: 3 (clk)

Note: This register is updated when OUTCNT_VEN in OUT_UPDATE is 1.

34.2.51 Brightness (DC) Correction Register 1 (OUT_BRIGHT1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial Value	R/W	Description
31 to 22	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
21, 20	PDTH_SEL[1:0]	0	R/W	Panel Dither Operation Mode 0: Truncate 1: Round-off 2: 2 × 2 pattern dither 3: Random pattern dither
19, 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
17, 16	PDTH_FORMAT [1:0]	0	R/W	Panel Dither Output Format Select 0: RGB888 1: RGB666 2: RGB565 3: Setting prohibited
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13, 12	PDTH_PA[1:0]	3	R/W	Pattern Value (A) of 2 × 2 Pattern Dither Unsigned (0 to 3 [LSB])
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	PDTH_PB[1:0]	0	R/W	Pattern Value (B) of 2 × 2 Pattern Dither Unsigned (0 to 3 [LSB])
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5, 4	PDTH_PC[1:0]	2	R/W	Pattern Value (C) of 2 × 2 Pattern Dither Unsigned (0 to 3 [LSB])
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	PDTH_PD[1:0]	1	R/W	Pattern Value (D) of 2 × 2 Pattern Dither Unsigned (0 to 3 [LSB])

Note: This register is updated when OUTCNT_VEN in OUT_UPDATE is 1.

34.2.55 Output Phase Control Register (OUT_CLK_PHASE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	OUTCNT_ FRONT_ GAM	—	—	—	OUTCNT_ LCD_ EDGE	—	OUTCNT_ STVA_ EDGE	OUTCNT_ STVB_ EDGE	OUTCNT_ STH_ EDGE	OUTCNT_ STB_ EDGE	OUTCNT_ CPV_ EDGE	OUTCNT_ POLA_ EDGE	OUTCNT_ POLB_ EDGE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	OUTCNT_ FRONT_ GAM	0	R/W	Correction Circuit Sequence Control 0: Brightness → contrast → gamma correction 1: Gamma correction → brightness → contrast
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	OUTCNT_ LCD_ EDGE	0	R/W	Output Phase Control of LCD_DATA23 to LCD_DATA0 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
6	OUTCNT_ STVA_ EDGE	0	R/W	Output Phase Control of LCD_TCON0 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
5	OUTCNT_ STVB_ EDGE	0	R/W	Output Phase Control of LCD_TCON1 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
4	OUTCNT_ STH_ EDGE	0	R/W	Output Phase Control of LCD_TCON2 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
3	OUTCNT_ STB_ EDGE	0	R/W	Output Phase Control of LCD_TCON3 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
2	OUTCNT_ CPV_ EDGE	0	R/W	Output Phase Control of LCD_TCON4 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
1	OUTCNT_ POLA_ EDGE	0	R/W	Output Phase Control of LCD_TCON5 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
0	OUTCNT_ POLB_ EDGE	0	R/W	Output Phase Control of LCD_TCON6 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin

Note: This register is updated when OUTCNT_VEN in OUT_UPDATE is 1.

34.3 Usage Methods

34.3.1 Gamma Correction Adjustment Method

The characteristics of G, B, R of each panel to be connected should be measured and gamma correction should be made to suit the panel.

Since the gamma correction adjustment depends on to the characteristics of the panel, there are no recommended setting values.

34.3.2 Dither Usage Method

Dither is used when pseudo contour is appeared on the display screen.

Table 34.26 Dither Settings

Bit Name	Setting Value
PDTH_FORMAT[1:0]	Selects the format. For RGB888: 0 For RGB666: 1 For RGB565: 2
PDTH_SEL[1:0]	When 2 × 2 pattern dither is to be used: 2
PDTH_PA[1:0]	Normally 3 (initial value)
PDTH_PB[1:0]	Normally 0 (initial value)
PDTH_PC[1:0]	Normally 2 (initial value)
PDTH_PD[1:0]	Normally 1 (initial value)

34.3.3 Output Format Adjustment Method

The setting example of the typical output format is shown in Table 34.27 and Table 34.28.

It is necessary to carry out the setting of synchronization system signals of each output format similarly as the setting of output after scaling.

Table 34.27 Setting Example of Synchronizing Signal

Register Name	Bit Name	VGA	SVGA	Description
TCON_TIM	TCON_HALF[10:0]	400	528	Sets the half value of 1H time period in clock units.
Vsync signal				
TCON_TIM_STVA1	TCON_STVA_VS[10:0]	0	0	Sets the pulse generation start position from the rising edge of the internal Vsync signal. A 1/2H time period is set as 1.
TCON_TIM_STVA1	TCON_STVA_VW[10:0]	4	8	Sets the changing point from the above pulse generation start position. A 1/2H time period is set as 1.
TCON_TIM_STVA2	TCON_STVA_INV	0	0	Sets the output polarity of the above pulse. For inverted output: 1
TCON_TIM_STVA2	TCON_STVA_SEL[2:0]	0	0	For STVA output selection: 0
Vertical enable signal				
TCON_TIM_STVB1	TCON_STVB_VS[10:0]	68	44	Sets the pulse generation start position from the rising edge of the internal Vsync signal. A 1/2H time period is set as 1.
TCON_TIM_STVB1	TCON_STVB_VW[10:0]	960	1200	Sets the changing point from the above pulse generation start position. A 1/2H time period is set as 1.
TCON_TIM_STVB2	TCON_STVB_INV	0	0	Sets the output polarity of the above pulse. For inverted output: 1
TCON_TIM_STVB2	TCON_STVB_SEL[2:0]	1	1	For STVB output selection: 1
Hsync signal				
TCON_TIM_STH1	TCON_STH_HS[10:0]	0	0	Sets the pulse generation start position from the rising edge of the internal Hsync signal.
TCON_TIM_STH1	TCON_STH_HW[10:0]	96	128	Sets the changing point from the above pulse generation start position.
TCON_TIM_STH2	TCON_STH_INV	0	0	Sets the output polarity of the above pulse. For inverted output: 1
TCON_TIM_STH2	TCON_STH_SEL[2:0]	2	2	For STH output selection: 2
Horizontal enable signal				
TCON_TIM_STB1	TCON_STB_HS[10:0]	128	192	Sets the pulse generation start position from the rising edge of the internal Hsync signal.
TCON_TIM_STB1	TCON_STB_HW[10:0]	640	800	Sets the changing point from the above pulse generation start position.
TCON_TIM_STB2	TCON_STB_INV	0	0	Sets the output polarity of the above pulse. For inverted output: 1
TCON_TIM_STB2	TCON_STB_SEL[2:0]	3	3	For STB output selection: 3

Table 34.28 Setting Example of Data System

Register Name	Bit Name	RGB888	Serial RGB (Triple Speed)	Description
OUT_SET	OUT_ENDIAN_ON	0	0	When bit endian is changed: 1
OUT_SET	OUT_SWAP_ON	0	0	When B/R is to be swapped: 1
OUT_SET	OUT_PIXEL_INV_ON	0	0	When the function of reducing number of simultaneous changes is to be used: 1
OUT_SET	OUT_SUM_MOVE[4:0]	31	31	When OUT_PIXEL_INV_ON = 1, this register becomes valid. Sets the simultaneous changing threshold.
OUT_SET	OUT_FORMAT[1:0]	0	3	Sets the output format. For RGB888: 0 For RGB666: 1 For RGB565: 2 For serial RGB: 3
OUT_SET	OUT_FRQ_SEL[1:0]	0	1	Sets the output clock. For RGB888, RGB666, RGB565: 0 For triple speed serial RGB output: 1 For quadruple serial RGB output: 2
OUT_SET	OUT_DIR_SEL	0	0	When data arrangement of the serial RGB output is to be reversed: 1
OUT_SET	OUT_PHASE[1:0]	0	0	Sets when output phase of the serial RGB is shifted. Not delayed Delayed by one clock cycle: 1 Delayed by two clock cycles: 2 Delayed by three clock cycles: 3 (applicable only for quadruple speed mode)

35. Video Display Controller 5 (8):System Controller

35.1 System Controller

35.1.1 Overview of Functions

The system controller provides interrupt control, panel clock control, CLUT table read select signal status flag output functions.

35.1.2 Interrupt Control

Ten interrupt signals are output from the scaler and image synthesizer. The system controller controls whether to output these interrupt signals.

One is written to the corresponding INT_STA* bit when an interrupt signal is to be accepted. After 1 has been written to the bit, however, its value is still read out as 0 until the interrupt signal is accepted. Once the interrupt signal has been accepted, the INT_STA* bit is read out as 1.

The bit for an accepted interrupt signal is cleared by writing 0 to the INT_STA* bit. If further interrupt signals are to be accepted after the INT_STA* bit has been cleared, 1 is again written to the bit.

Table 35.1 Interrupt Signals

Request Source Name	Bit Name	Function
S0_VI_VSYNC	INT_STA 0	Vsync signal input to scaler 0
S0_LO_VSYNC	INT_STA 1	Vsync signal output from scaler 0
S0_VSYNCERR	INT_STA 2	Missing Vsync signal for scaler 0
GR3_VLINE	INT_STA 3	Specified line signal for panel output in graphics 3
S0_VFIELD	INT_STA 4	Field end signal for recording function in scaler 0
IV1_VBUFERR	INT_STA 5	Frame buffer write overflow signal for scaler 0
IV3_VBUFERR	INT_STA 6	Frame buffer read underflow signal for graphics 0
IV5_VBUFERR	INT_STA 7	Frame buffer read underflow signal for graphics 2
IV6_VBUFERR	INT_STA 8	Frame buffer read underflow signal for graphics 3
S0_WLINE	INT_STA 9	Write specification line signal input to scaling-down control block in scaler 0 (This signal is not present in this product.)

Table 35.2 Interrupt Clear/Hold Settings

Register Name	Bit Name	Initial Value	Description
SYSCNT_INT1	INT_STA0	0	S0_VI_VSYNC Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT1	INT_STA1	0	S0_LO_VSYNC Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT1	INT_STA2	0	S0_VSYNCERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT1	INT_STA3	0	GR3_VLINE Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT1	INT_STA4	0	S0_VFIELD Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT1	INT_STA5	0	IV1_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT1	INT_STA6	0	IV3_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT1	INT_STA7	0	IV5_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT2	INT_STA8	0	IV6_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT2	INT_STA9	0	S0_WLINE Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. (Setting prohibited in this product) 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.

Table 35.3 Interrupt Output On/Off Settings

Register Name	Bit Name	Initial Value	Description
SYSCNT_INT4	INT_OUT0_ON	0	S0_VI_VSYNC Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT4	INT_OUT1_ON	0	S0_LO_VSYNC Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT4	INT_OUT2_ON	0	S0_VSYNCERR Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT4	INT_OUT3_ON	0	GR3_VLINE Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT4	INT_OUT4_ON	0	S0_VFIELD Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT4	INT_OUT5_ON	0	IV1_VBUFERR Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT4	INT_OUT6_ON	0	IV3_VBUFERR Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT4	INT_OUT7_ON	0	IV5_VBUFERR Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT5	INT_OUT8_ON	0	IV6_VBUFERR Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT5	INT_OUT9_ON	0	S0_WLINE Interrupt Output On/Off 0: Off 1: On (Setting prohibited in this product)

35.1.3 Panel Clock Control

The video image clock, external clock, or peripheral clock 1 is selectable as the source of the panel clock for supply to this module. The module is also equipped with a divider for scaling the frequency by factors from 1/1 to 1/32. The bits listed in Table 35.4 control the panel clock.

Table 35.4 Panel Clock Control

Register Name	Bit Name	Initial Value	Description
SYSCNT_PANEL_CLK	PANEL_ICKSEL [1:0]	0	Divided Clock Source Select 0: Video image clock (this is DV_CLK if INP_SEL = 1) 1: External clock (LCD0_EXTCLK) 2: Setting prohibited 3: Peripheral clock 1 (P1φ)
SYSCNT_PANEL_CLK	PANEL_ICKEN	0	Panel Clock Operation Enable 0: Disables operation of the panel clock operation block. 1: Enables operation of the panel clock operation block. Note: Set this bit to 0 before changing the value of the PANEL_ICKSEL or PANEL_DCDR bits.
SYSCNT_PANEL_CLK	PANEL_DCDR [5:0]	1	Clock Frequency Division Ratio Refer to Table 35.5 for details on the settings. Note: Settings other than those in Table 35.5 are prohibited.

Table 35.5 I/O Clock Frequency and Divisors

DCDR[5:0]	Clock Ratio	I/O Clock Frequency (MHz)		
		27.00	54.00	66.67
000001	1/1	27.00	54.00	66.67
000010	1/2	13.50	27.00	33.33
000011	1/3	9.00	18.00	22.22
000100	1/4	6.75	13.50	16.67
000101	1/5	5.40	10.80	13.33
000110	1/6	4.50	9.00	11.11
000111	1/7	3.86	7.71	9.52
001000	1/8	3.38	6.75	8.33
001001	1/9	3.00	6.00	7.41
001100	1/12	2.25	4.50	5.56
010000	1/16	1.69	3.38	4.17
011000	1/24	1.13	2.25	2.78
100000	1/32	0.84	1.69	2.08

35.1.4 CLUT Table Read Select Signal Status Flag

The CLUT read select signal status can be read using the flags shown in Table 35.6.

Table 35.6 CLUT Table Read Select Signal Status Flags

Register Name	Bit Name	Initial Value	Description
SYSCNT_CLUT	GR0_CLT_SEL_ST	—	Graphics 0 CLUT Table Read Select Signal Status Flag 0: CLUT table 0 is read out. 1: CLUT table 1 is read out.
SYSCNT_CLUT	GR2_CLT_SEL_ST	—	Graphics 2 CLUT Table Read Select Signal Status Flag 0: CLUT table 0 is read out. 1: CLUT table 1 is read out.
SYSCNT_CLUT	GR3_CLT_SEL_ST	—	Graphics 3 CLUT Table Read Select Signal Status Flag 0: CLUT table 0 is read out. 1: CLUT table 1 is read out.

35.2 Register Descriptions

The following register sets are allocated in the SH register map area.

- Symbols used in Register Descriptions

Initial value: Register value after a reset

—: Undefined value

R/W: Readable/writable. The written value can be read.

R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.

R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.

R: Read-only. The write value should always be 0.

—/W: Write-only. The read value is undefined.

Table 35.7 Register Configuration of System Controller (CH0)

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
Interrupt control register 1	SYSCNT_INT1	R/W	H'0000 0000	H'FCFF 7A80	32
Interrupt control register 2	SYSCNT_INT2	R/W	H'0000 0000	H'FCFF 7A84	32
Interrupt control register 4	SYSCNT_INT4	R/W	H'0000 0000	H'FCFF 7A8C	32
Interrupt control register 5	SYSCNT_INT5	R/W	H'0000 0000	H'FCFF 7A90	32
Panel clock control register	SYSCNT_PANEL_CLK	R/W	H'0001	H'FCFF 7A98	16
CLUT table read select signal status register	SYSCNT_CLUT	R	H'0000	H'FCFF 7A9A	16

35.2.1 Interrupt Control Register 1 (SYSCNT_INT1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	INT_STA7	—	—	—	INT_STA6	—	—	—	INT_STA5	—	—	—	INT_STA4

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	INT_OUT9_ON	0	R/W	S0_WLINE Interrupt Output On/Off 0: Off 1: On (Setting prohibited in this product)
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INT_OUT8_ON	0	R/W	IV6_VBUFERR Interrupt Output On/Off 0: Off 1: On

35.2.5 Panel Clock Control Register (SYSCNT_PANEL_CLK)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	PANEL_ICKSEL [1:0]	—	—	—	PANEL_ICKEN	—	—	PANEL_DCDR[5:0]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R/W	R/W	R	R	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13, 12	PANEL_ICKSEL [1:0]	All 0	R/W	Divided Clock Source Select 0: Video image clock (this is DV_CLK if INP_SEL = 1) 1: External clock (LCD0_EXTCLK) 2: Setting prohibited 3: Peripheral clock 1 (P1φ)
11 to 9	—	0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	PANEL_ICKEN	0	R/W	Panel Clock Operation Enable 0: Disables operation of the panel clock operation block. 1: Enables operation of the panel clock operation block. Note: Set this bit to 0 before changing the value of the PANEL_ICKSEL or PANEL_DCDR bits.
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5 to 0	PANEL_DCDR[5:0]	1	R/W	Clock Frequency Division Ratio Refer to Table 35.5 for details on the settings. Note: Settings other than those in Table 35.5 are prohibited.

35.2.6 CLUT Table Read Select Signal Status Register (SYSCNT_CLUT)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	GR3_CLT_SEL_ST	—	—	—	GR2_CLT_SEL_ST	—	—	—	—	—	—	—	GR0_CLT_SEL_ST
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15, 14	—	0	R	Reserved These bits are always read as 0. The write value should always be 0.
13	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
12	GR3_CLT_SEL_ST	—	R	Graphics 3 CLUT Table Read Select Signal Status Flag 0: CLUT table 0 is read out. 1: CLUT table 1 is read out.
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	GR2_CLT_SEL_ST	—	R	Graphics 2 CLUT Table Read Select Signal Status Flag 0: CLUT table 0 is read out. 1: CLUT table 1 is read out.
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR0_CLT_SEL_ST	—	R	Graphics 0 CLUT Table Read Select Signal Status Flag 0: CLUT table 0 is read out. 1: CLUT table 1 is read out.

36. Capture Engine Unit

The capture engine unit (CEU) is a capture module that fetches image data externally input and transfers it to the memory. The CEU is connected to the system bus via bus bridge modules.

36.1 Features of CEU

Lists the features of CEU as follows.

(1) Image data fetch

- Captures an image output from an external module and writes YCbCr data to the memory with it separated into Y data and CbCr data.
- Fetches image data other than YCbCr data, e.g. JPEG data, RGB565, from an externally connected module, such as a camera, and sequentially writes the image data to the memory.
- Fetches an interlace source image in both-field units or one-field units and writes it to the memory. In both-field capture, an image can be stored in the memory as a frame image.

(2) Filter processing

- Performs scale-down and removal of high-frequency components (only in the horizontal direction) for an image using internal filters. Note that the scaled-down image must not exceed VGA. The filter processing can be applied to only YCbCr input data.

(3) Format conversion

- Converts image data input in the YCbCr422 format into the YCbCr420 format and writes it to the memory. Note that the conversion algorithm is simple skipping in which the chrominance component (CbCr) of the even-numbered lines is skipped.

36.2 Functional Overview of CEU

The functional overview of the CEU is shown in Table 36.1, and the main functions and their details are shown in Table 36.1.

Table 36.1 Functional Overview of CEU

Classification	Item	Function	Description	Note
Connectable camera	Size	5 megapixels	2,560 pixels × 1,920 lines	Horizontal: 4-pixel units Vertical: 4-line units The range of the image size that can be input is as follows. Horizontal: 2,560 pixels to 128 pixels Vertical: 1,920 lines to 96 lines [Note] This depends on the AC characteristics of the device to be connected, frame rate of the connected device, and transfer speed to the destination RAM.
		3 megapixels	2,048 pixels × 1,536 lines	
		2 megapixels	1,632 pixels × 1,224 lines	
		UXGA	1,600 pixels × 1,200 lines	
		SXGA (1)	1,280 pixels × 1,024 lines	
		SXGA (2)	1,280 pixels × 960 lines	
		WXGA	1,280 pixels × 768 lines	
		XGA	1,024 pixels × 768 lines	
		SVGA	800 pixels × 600 lines	
		WVGA	800 pixels × 480 lines	
		VGA	640 pixels × 480 lines	
		CIF	352 pixels × 288 lines	
		WQVGA	480 pixels × 240 lines	
		QVGA	320 pixels × 240 lines, 240 pixels × 320 lines	
		QCIF	176 pixels × 144 lines	
QQVGA	160 pixels × 120 lines			
Sub-QCIF	128 pixels × 96 lines			
	Input format	YCbCr422 8 bits	Cb ₀ , Y ₀ , Cr ₀ , Y ₁ ... Cr ₀ , Y ₀ , Cb ₀ , Y ₁ ... Y ₀ , Cb ₀ , Y ₁ , Cr ₀ ... Y ₀ , Cr ₀ , Y ₁ , Cb ₀ ...	Supports clock ratio of 1:1
		Binary data	Specified amount to be fetched on edges of the sync signal Data is fetched with the horizontal sync signal as an enable signal (RZ/A1LU and RZ/A1LC only).	Written sequentially
	Horizontal and vertical sync signal polarities	Arbitrary	High-active and low-active	
	Capture start location	Arbitrary	Can be specified in camera input clock units	Horizontal: 1-cycle units Vertical: 1-HD (horizontal sync signal) units
	Number of captured pixels	Arbitrary	Can be specified in 4-pixel units horizontally and in 4-line units vertically	
	Interlace	Both-field capture	Stored as a field image Stored as a frame image	Capture: 2-VD (vertical sync signal) units
		One-field capture	Top field or bottom field can be specified	Capture: 1-VD units
Memory write	Output format	YCbCr422 YCbCr420	YCbCr420 is realized by simple skipping	
Filter function	No scaling or scale-down	Scale-down of captured display	Desired scaling factor from 1/16 to 1 (scaled-down display must not exceed VGA)	
	Low-pass filter		Removal of high-frequency components	Only in the horizontal direction

Table 36.2 Main Functions of CEU and Their Details

Main Function	Detailed Description
Image data fetch	<ul style="list-style-type: none"> • Captures an image output from an external module and writes YCbCr data to the memory with it separated into Y data and CbCr data. • Fetches image data other than YCbCr data, e.g. JPEG data, from an externally connected module, such as a camera, and sequentially writes the image data to the memory. • Fetches an interlace source image in both-field units or one-field units and writes it to the memory. In both-field capture, an image can be stored in the memory as a frame image.
Filter processing	<p>Performs scale-down and removal of high-frequency components (only in the horizontal direction) for an image using internal filters.</p> <p>Note that the scaled-down image must not exceed VGA. The filter processing can be applied to only YCbCr input data.</p>
Format conversion	<p>Converts image data input in the YCbCr422 format into the YCbCr420 format and writes it to the memory.</p> <p>Note that the conversion algorithm is simple skipping in which the chrominance component (CbCr) of the even-numbered lines is skipped.</p>

Figure 36.1 shows a block diagram of the CEU.

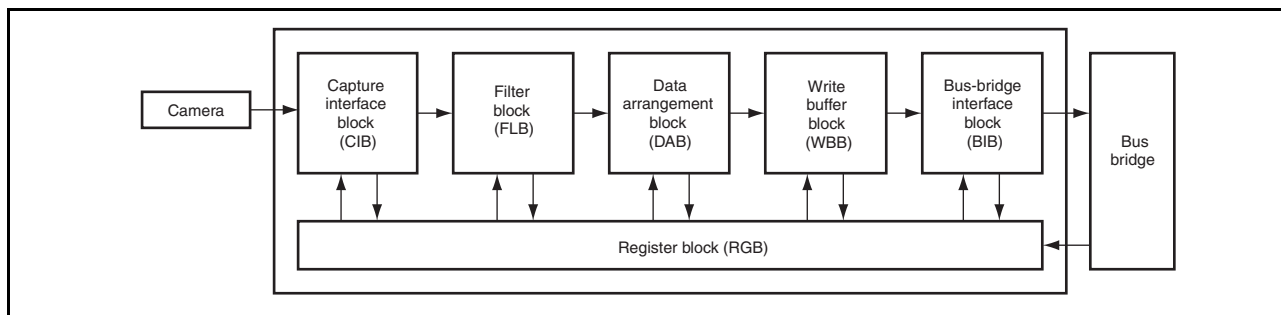

Figure 36.1 Block Diagram of CEU

36.3 Pin Configuration of CEU

The pin configuration of the CEU is shown in Table 36.3.

Table 36.3 Pin Configuration of CEU

Pin Name	Function	I/O	Description
VIO_D7 to VIO_D0*	CEU data bus	Input	Camera image data input to the CEU
VIO_CLK	CEU clock	Input	Camera clock input to the CEU
VIO_VD	CEU vertical sync	Input	Camera vertical sync signal input to the CEU
VIO_HD	CEU horizontal sync	Input	Camera horizontal sync signal input to the CEU
VIO_FLD	Field signal	Input	Field identification signal to the CEU

Note: * When the distinction according to the bus width for the data bus is not needed, VIO_D is used in this manual. Otherwise, VIO_D7 to VIO_D0 are used.

36.4 Register Descriptions of CEU

The register configuration of the CEU is shown in Table 36.4.

Most CEU registers have a 2-plane configuration (plane A and plane B). The CEU switches the planes when using these 2-plane registers. A mirror address, which is an address that can always access the register on the unused plane, is provided for each 2-plane register. Figure 36.2 shows the timing to switch the register planes. The CEU switches the register planes at the same time a VD interrupt is asserted.

In the following register descriptions, "during operation" indicates the period that begins when the CEU is activated by the CE bit in the capture start register (CAPSR) and ends when a capture end interrupt (CPE) of the capture event flag clear register (CETCR) occurs. In the read-only bits in each register, the write value should always be 0. If a value other than 0 is written to any of these bits, correct operation cannot be guaranteed.

Table 36.4 Register Configuration of CEU

Register Name	Abbr.	R/W	Addresses			Access Size
			Address (Plane A)	Address (Plane B)	Mirror Address	
CEU Capture start register	CAPSR	R/W	H'E821 0000	—	—	32
CEU Capture control register	CAPCR	R/W	H'E821 0004	—	—	32
CEU Capture interface control register*	CAMCR	R/W	H'E821 0008	—	—	32

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	CPKIL	0	R/W	Write 1 to this bit to perform a software reset of capturing. At a software reset, capturing ends immediately without completing capture operation until the end of a frame. Clear the CE bit to 0 when writing 1 to this bit. Processing of the capture software reset is indicated by this bit being set to 1. When this bit is 1, do not start capturing since reset processing is in progress. When restarting capture operations, after referring to the CPTON bit in CTSR to ensure that the CEU is halted (in the idle state), wait until this bit is cleared to 0. The timing of restarting capture operations is shown in Figure 36.6. When a software reset is generated by this bit, a capture end interrupt (CPE bit in CETCR) may be output immediately after the software reset. However, such kind of interrupt should be ignored. Also, even if the capture end interrupt is not output, the interrupt source (CPE bit) must be cleared before capturing of the next frame. 0: Normal state 1: Software reset of capturing
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
0	CE	0	R/W	<ul style="list-style-type: none"> • Single-capture <p>This bit reserves capturing of the next frame. When 1 is written to this bit, the capture of one frame starts from the next VD input, and stops when the one-frame capture end interrupt (CPE bit in CETCR) is asserted (Figure 36.7). To perform capture again, write 1 to this bit. After the VD or HD polarity is changed, do not write 1 to this bit until the next VD interrupt is asserted.</p> <p>As this bit indicates the capture reserve state, this bit is read as 1 after it is set to 1 and until VD is input. When VD is input, this bit returns to 0 and so is read as 0.</p> <p>The capture end is determined by the one-frame capture end interrupt (CPE bit). This is similar in data fetch mode.</p> <p>Registers should be set before the VD interrupt of the frame where capture starts next. The new register settings take effect at the next VD input. When registers are modified during capturing, the register settings take effect from the capture operations of the next VD input. If a setting register to which writing during capturing is prohibited is modified during capturing, an interrupt source (IGRW bit in CETCR) is generated. For details on the interrupt source, see the description on CETCR.</p> • Continuous capture <p>When this bit is set to 1 while the CTNCP bit in CAPCR is set to 1, continuous capture starts from the next frame (Figure 36.8). Note that this bit is not cleared to 0 but remains as 1. To stop capturing, clear this bit to 0; capturing stops after the current frame is completed.</p> <p>Continuous capture operations are possible in only image capture mode. The start address of the memory to which the captured data is written to must be set for each frame.</p> <p>0: Stops capturing 1: Starts capturing</p>

When both the VD (vertical sync signal) and HD (horizontal sync signal) polarities are high-active, one frame is defined as a period from a VD rising edge to the next VD rising edge, and one line as a period from an HD rising edge to the next HD rising edge. Figure 36.3 shows the timing of one frame (when both the VD and HD polarities are high-active).

Figure 36.3 Frame Timing

When both the VD and HD polarities are high-active, similar to one frame, one field is defined as follows:

- Period from a VD rising edge to the next VD rising edge
- One line is a period from an HD rising edge to the next HD rising edge

The field identification signal FLD should be fixed for at least 1-HD period from a VD input. Figure 36.4 shows the timing of one field (when both the VD and HD polarities are high-active).

Figure 36.4 One Field Timing

In data enable fetch (RZ/A1LU and RZ/A1LC only), one frame is defined as a period from a VD rising edge to the VD falling edge. With the HD as an enable signal (positive polarity), data of a cycle in which the HD is asserted is fetched while the VD is high. Figure 36.5 shows the timing of one frame for data enable fetch.

Figure 36.5 Frame Timing (Data Enable Fetch)

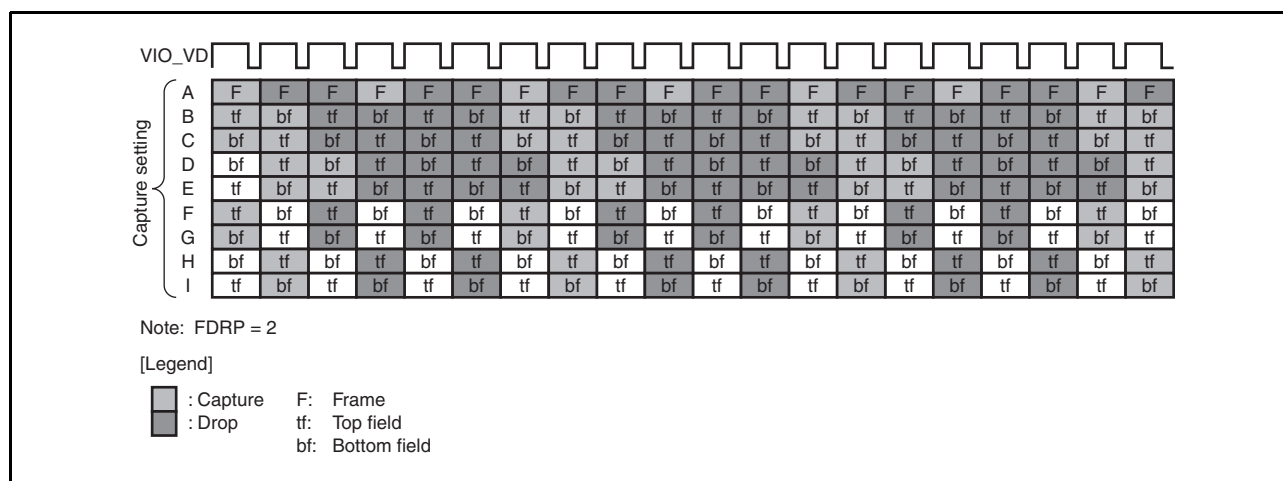

Figure 36.10 Image of Frame Drop Timing for Capture Settings (FDRP Bits = 2)

36.4.3 Capture Interface Control Register (CAMCR)

CAMCR sets the capture interface.

The following items are set by CAMCR.

- Selection between the rising edge or falling edge of the camera clock for signal capture or data fetch operation (RZ/A1LU and RZ/A1LC only)
- Selection between image capture operation or data fetch operation
- Polarities of the vertical and horizontal sync signals
- Input order of image data components (Y, Cb, and Cr) (only for image capture mode)
- Selection of digital image input pins (8 bits only)
- Polarity of the field identification signal

CAMCR must be set according to the module connected. In data fetch mode, set the DTARY bits to B'0. Do not modify this register during operation. If this register is modified during operation, correct operation cannot be guaranteed. In addition, the IGRW bit (interrupt source) in CETCR is set to B'1.

Note: After changing the setting of this register, do not start capture until at least 10 external input clock cycles have elapsed.

R/W:	R	R	R	R/W	R	R	R/W	R/W	R	R	R/W	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27	VDSEL*	0	R/W	Sets the edge for capturing the vertical sync signal (VD) from an external module. 0: VD is captured at the rising edge of the camera clock. 1: VD is captured at the falling edge of the camera clock.
26	HDSEL*	0	R/W	Sets the edge for capturing the horizontal sync signal (HD) from an external module. 0: HD is captured at the rising edge of the camera clock. 1: HD is captured at the falling edge of the camera clock.
25	FLDSEL*	0	R/W	Sets the edge for capturing the field identification signal (FLD) from an external module. 0: FLD is captured at the rising edge of the camera clock. 1: FLD is captured at the falling edge of the camera clock.
24	DSEL*	0	R/W	Sets the edge for fetching the image data (D7 to D0) from an external module. 0: D7 to D0 are fetched at the rising edge of the camera clock. 1: D7 to D0 are fetched at the falling edge of the camera clock.
23 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
16	FLDPOL	0	R/W	Sets the polarity of the field identification signal (FLD) from an external module. 0: When the FLD signal is high-active, the field is detected as the top field and when low-active, the field is detected as the bottom field. 1: When the FLD signal is low-active, the field is detected as the top field and when high-active, the field is detected as the bottom field.
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	DTIF	0	R/W	Sets the digital image input pins from which data is to be captured. The write value should always be 0.
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	DTARY[1:0]	00	R/W	These bits set the input order of the luminance component and chrominance component. The order in which the luminance component (Y) and chrominance component (Cb and Cr) are input from an external module differs among modules. The CEU supports the input orders shown in Figure 36.12. Set the corresponding value in these bits. In data fetch mode, set these bits to 00. 00: Image input data is fetched in the order of Cb ₀ , Y ₀ , Cr ₀ , and Y ₁ 01: Image input data is fetched in the order of Cr ₀ , Y ₀ , Cb ₀ , and Y ₁ 10: Image input data is fetched in the order of Y ₀ , Cb ₀ , Y ₁ , and Cr ₀ 11: Image input data is fetched in the order of Y ₀ , Cr ₀ , Y ₁ , and Cb ₀
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5, 4	JPG[1:0]	00	R/W	These bits select the fetched data type. 00: Image capture mode (input data are separated into Y data and CbCr data for output to the memory) 01: Data synchronous fetch mode (specified size of input data are output to the specified memory addresses in order of input and in synchronization with the sync signal) 10: Data enable fetch mode (RZ/A1LU and RZ/A1LC only) (input data are fetched with HD as an enable signal and output to the specified addresses in memory in order of input)
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	VDPOL	0	R/W	Sets the polarity for detection of the vertical sync signal input from an external module. Figure 36.14 and Figure 36.15 show the relationship between the VIO_VD and VIO_HD signals and VD interrupt when high-active is selected. Since a VD interrupt may occur when this bit value is modified, the VD bit in CETCR must always be cleared to 0 when this bit value is changed. In data enable fetch mode, this bit is not used and the sense for detection is always active high. 0: Vertical sync signal (VD) from an external module is detected as high-active 1: Vertical sync signal (VD) from an external module is detected as low-active
0	HDPOL	0	R/W	Sets the polarity for detection of the horizontal sync signal input from an external module. Figure 36.16 shows the relationship between the HD and HD interrupt when high-active is selected. Since an HD interrupt may occur when this bit value is modified, the HD bit in CETCR must always be cleared to 0 when this bit value is changed. 0: Horizontal sync signal (HD) from an external module is detected as high-active 1: Horizontal sync signal (HD) from an external module is detected as low-active

Note: * This bit is only present in the RZ/A1LU and RZ/A1LC. This is reserved in the RZ/A1L.

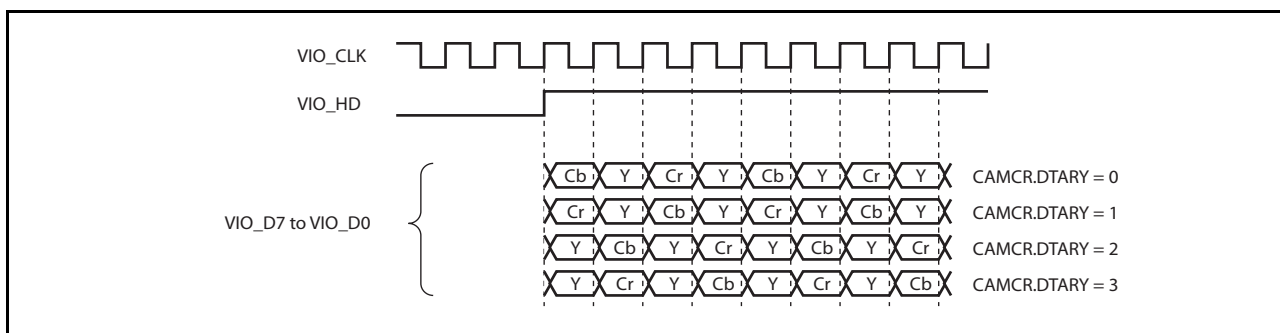

Figure 36.11 Input Order of Image Data

The JPG bit in CAMCR selects whether digital image data is fetched or data such as JPEG is fetched. In addition, when data such as JPEG is fetched, select whether the specified amount of data is continuously fetched in synchronization with the sync signal or data is fetched while the horizontal sync signal is enabled (RZ/A1LU and RZ/A1LC only).

In data enable fetch mode, one frame is defined as a period from the rising edge to the falling edge of the vertical sync signal (VD) for data fetching. The horizontal sync signal (HD) is enabled only when the VD is high and treated as an enable signal. Data input in the cycle in which the HD is asserted (high) is fetched and output to the memory continuously.

This module starts fetching data at the rising edge of the VD and stops fetching data at the falling edge of the VD in data enable fetch mode. Thus, if the VD remains high and does not go low, end processing does not start. In addition, if the VD remains high and the HD also remains asserted, data continues to be fetched.

Figure 36.12 and Figure 36.13 show the interface timing in data enable fetch mode.

Figure 36.12 Data Enable Fetch Timing (HD Asserted (High) While VD is High)

Figure 36.13 Data Enable Fetch Timing (HD Asserted (High) When VD is Not High)

In data enable fetch mode, this module generates a VD interrupt in response to detection of the active level of VD. In image capture mode and data synchronous fetch mode, this module generates a VD interrupt in response to the first detection of the active level of HD following detection of the active level of VD. Note that, when VD and HD are asserted and detected at the same time, this module generates a VD interrupt at that time.

Figures 36.14 to 36.16 show the relationships between the VIO_VD signal and the VD interrupt, the VIO_VD and VIO_HD signals and the VD interrupt, and the VIO_HD signal and the HD interrupt.

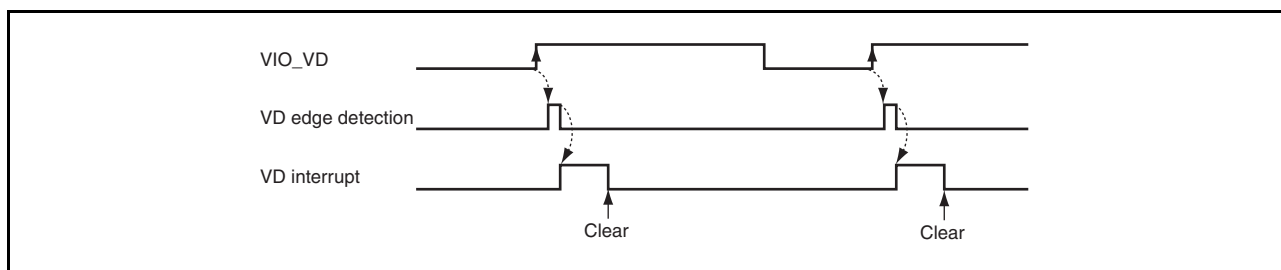

Figure 36.14 Relationship between VIO_VD and VD Interrupt when VD is High-Active (In Data Enable Fetch Mode)

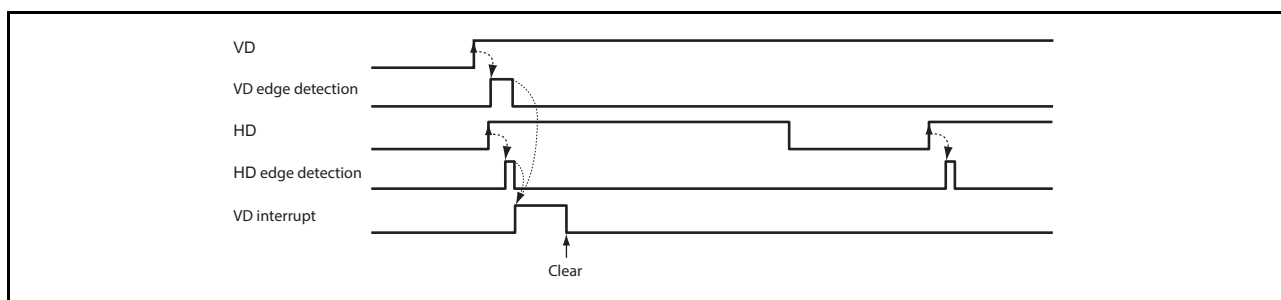

Figure 36.15 Relationship between the VIO_VD and VIO_HD signals and the VD Interrupt when VD and HD are High-Active (in Image Capture Mode or Data Synchronous Fetch Mode)

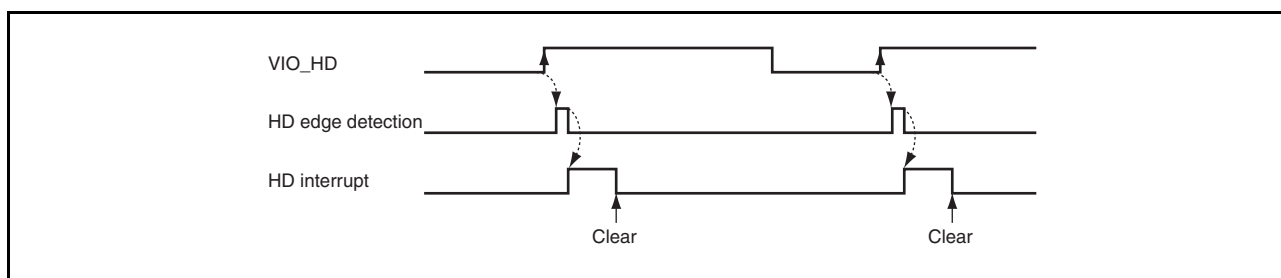

Figure 36.16 Relationship between VIO_HD and HD Interrupt when HD is High-Active

36.4.4 Capture Interface Cycle Register (CMCYR)

CMCYR is used to detect an illegal VD and an illegal HD. For HD, the number of cycles from a rising edge of HD to the next rising edge is set (falling edges when low-active is selected for HD). For VD, the number of HD inputs from a rising edge of VD to the next rising edge is set (falling edges when low-active is selected for VD).

Do not modify this register during operation. If this register is modified during operation, correct operation cannot be guaranteed. In addition, the IGRW bit (interrupt source) in CETCR is set to B'1.

Set 0 in all bits of this register, during data enable fetch mode.

Note: After changing the setting of this register, do not start capture until at least 10 external input clock cycles have elapsed.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—		VCYL[13:0]													
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—		HCYL[13:0]													
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
29 to 16	VCYL[13:0]	H'0000	R/W	Vertical HD Count of External Module These bits set the number of VD cycles of an external module with the number of HD inputs. The interrupt source bit IGVS in CETCR is set to 1 when the actual number of VD cycles input from the external module differs from this setting. Set these bits for detecting an illegal VD. When these bits are all cleared to 0, the interrupt source bit IGVS in CETCR is not set to 1. Though the interrupt source bit IGVS in CETCR may be set to 1 after the VDPOL bit (VD polarity) in CAMCR is changed, this interrupt should be ignored.
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13 to 0	HCYL[13:0]	H'0000	R/W	Horizontal Cycle Count of External Module These bits set the number of HD cycles of an external module. The interrupt source bit IGHS in CETCR is set to 1 when the actual number of HD cycles input from the external module differs from this setting. Set these bits for detecting an illegal HD. When these bits are all cleared to 0, the interrupt source bit IGHS in CETCR is not set to 1. Though the interrupt source bit IGHS in CETCR may be set to 1 after the HDPOL bit (HD polarity) in CAMCR is changed, this interrupt should be ignored.

36.4.5 Capture Interface Offset Register (CAMOR)

CAMOR sets the location to start capturing when capturing images.

Since the number of HD (horizontal sync signal) inputs from a VD (vertical sync signal) input to the start of a valid image period, and the number of clock cycles from an HD input to the start of a valid image period differ among external modules, these must be set in CAMOR. By setting a value greater than the valid image area, part of the image can be clipped for capture. When fetching data, the setting of this register becomes the number of cycles (HD count) up to the start of a valid data period.

This register is not used, during data enable fetch mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27 to 16	VOFST[11:0]	H'000	R/W	These bits specify the capture start location in terms of the HD count from a vertical sync signal (1-HD units). The blanking period from a vertical sync signal differs among external modules. Therefore, the vertical capture start location must be specified by these bits in terms of the HD count from a vertical sync signal so that an image can be captured from the valid image area (see Figure 36.17). Some external modules output a vertical sync signal as a data enable signal. In this case, there is no blanking period so these bits must be cleared to 0 (see Figure 36.18).
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 0	HOFST[12:0]	H'0000	R/W	These bits specify the capture start location in terms of the number of clock cycles from a horizontal sync signal (1-cycle units). The blanking period from a horizontal sync signal differs among external modules. Therefore, the horizontal capture start location must be specified by these bits in terms of external input clock cycles from a horizontal sync signal so that an image can be captured from the valid image area. This is similar in data synchronous fetch mode (see Figure 36.19). Some external modules output a horizontal sync signal as a data enable signal. In this case, there is no blanking period so these bits must be cleared to 0 (see Figure 36.20). Note: The first HD (horizontal sync signal) being input simultaneously or after the first VD (vertical sync signal) is the operating condition of the CEU. These inputs are affected by the polarities (set by the VDPOL and HDPOL bits in CAMCR).

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27 to 18	VWDTH[11:2]	H'000	R/W	These bits specify the vertical capture period (4-HD units). These bits specify the number of lines (HD count) to be captured from the location specified by the VOFST bits in CAMOR. Figure 36.21 shows the timing when the vertical blanking period is 0. The CEU captures only the number of lines (HD count) specified by these bits in the vertical direction. Make a setting in the same way to obtain data synchronization. The maximum value to be set is 1,920 HD (5 megapixels).
17, 16	VWDTH[1:0]		R	
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 1	HWDTH[12:1]	H'0000	R/W	These bits specify the horizontal capture period. These bits specify the number of cycles to be captured from the location specified by the HOFST bits. Figure 36.22 shows the timing when the horizontal blanking period is 0. The CEU captures for only the number of cycles specified by these bits in the horizontal direction. Make a similar setting for data synchronous fetch. The maximum value to be set is as follows: Image capture (8-cycle units) : 5,120 cycles (2,560 pixels) Data synchronous fetch (4-cycle units) : 2,560 cycles (2,560 bytes) Note: In data synchronous fetch mode, set CFSZR and CDWDR according to the values set in this register. For details, see the descriptions on CFSZR and CDWDR.

36.4.7 Capture Interface Input Format Register (CAIFR)

CAIFR sets the input mode (progressive or interlace) for capturing images, the images to be captured (frame, both-field, or one-field), and the image from which capturing starts (top field, bottom field, etc.). CAIFR is not used in data fetch mode.

Do not modify this register during operation. If this register is modified during operation, correct operation cannot be guaranteed. In addition, the IGRW bit (interrupt source) in CETCR is set to B'1.

The items set by CAIFR are listed in Table 36.7.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	IFS	0	R/W	Sets the input mode for capturing images. 0: Progressive 1: Interlace
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	CIM	0	R/W	Sets the images to be captured. Clear this bit to 0 when the input mode for image capture is progressive (frame image) or when the input mode for image capture is interlace for continuous capture of both the top and bottom fields. Set this bit to 1 when the input mode for image capture is interlace for capture of only a one-field image. 0: Capture of frame image (1 VD) or both-field image (2 VD) 1: Capture of one-field image (1 VD)
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	FCI[1:0]	00	R/W	These bits set the timing to start capturing. The timing to start capturing is set by specifying the image to be captured first. Set these bits to 00 when the input mode is progressive. 00: Capture starts from the VD input immediately after the CEU activation regardless of it being a top or bottom field 01: After the CEU activation, input of a top-field image is waited, and then capture starts from the top field 10: After the CEU activation, input of a bottom-field image is waited, and then capture starts from the bottom field 11: Setting prohibited

Table 36.7 CAIFR Setting Items

Input Mode	IFS Bit	Captured Image	CIM Bit	Image to Start Capture	FCI Bits
Progressive	0	Frame	0	Frame immediately after activation	00
Interlace	1	Both-field (2-VD capture)	0	Field immediately after activation	00
				Top field	01
				Bottom field	10
				Setting prohibited	11
		One-field (1-VD capture)	1	Field immediately after activation	00
				Top field	01
				Bottom field	10
				Setting prohibited	11

In frame image capture and one-field image capture, a one-frame capture end interrupt occurs when capture for 1 VD finishes. In both-field image capture, a one-field capture end interrupt occurs when capture for 1 VD finishes and a one-frame capture end interrupt occurs when capture for 2 VD finishes. At this time, a one-field capture end interrupt occurs simultaneously with a one-frame capture end interrupt. Figure 36.24 shows the timing of a one-frame capture end interrupt and one-field capture end interrupt in both-field image capture.

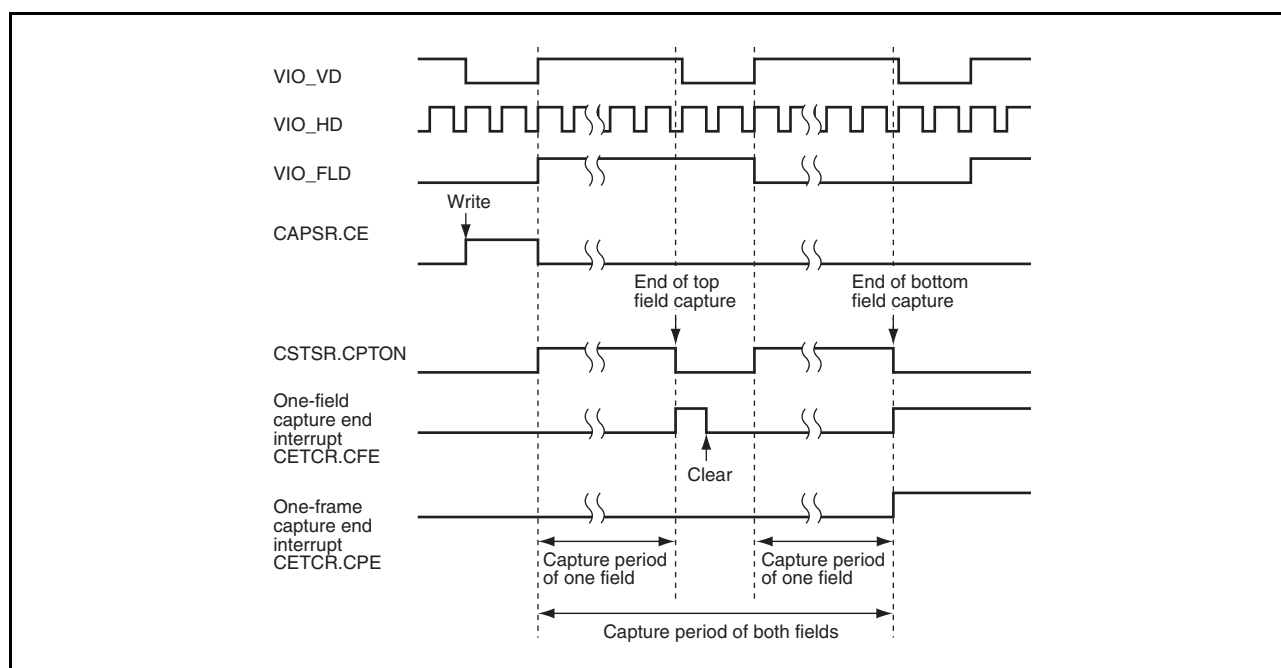

Figure 36.23 One-Frame Capture End Interrupt and One-Field Capture End Interrupt in Both-Field Image Capture

A captured frame image or captured one-field image is stored in the memory from the addresses set in CDAYR and CDACR (Figure 36.24). Captured both-field images are stored in different memory areas depending on whether it is a top-field or bottom-field image. A top-field image is stored in the memory from the addresses set in CDAYR and CDACR whereas a bottom-field image is stored in the memory from the addresses set in CDBYR and CDBCR (Figure 36.25).

Figure 36.24 Image of Storing Captured Frame Image or Captured One-Field Image in Memory

Figure 36.25 Image of Storing Captured Both-Field Images in Memory

If the FCI bits are set to B'00 for continuous capture in interlace input mode, images are continuously captured for 2 VD with the first captured field as the reference in both-field image capture (Figure 36.26). In one-field image capture, only the first captured field is continuously captured for 1 VD (Figure 36.27).

Figure 36.26 Continuous Both-Field Capture in Interlace Mode (Image Immediately after Activation is Top Field (FCI Bits = B'00))

Figure 36.27 Continuous One-Field Capture in Interlace Mode (Image Immediately after Activation is Top Field (FCI Bits = B'00))

(1) Storage of Interlace Input as Frame Image

The CEU can store an interlace source image in the memory as a frame image. To store an interlace source image as a frame image, make the following register settings:

Input mode: Interlace (IFS bit = B'1)

Capture image: Both-field (CIM bit = B'0)

Image to start capture: Any setting other than the prohibited setting (FCI bits = as desired)

Figure 36.28 shows a memory image of capturing both fields of an interlace input and storing it as a frame image in the memory. Set the start addresses of the memory destination for the captured top-field image in CDAYR and CDACR, and the start addresses of the memory destination for the captured bottom-field image in CDBYR and CDBCR. When storing an interlace image as a frame image in the memory, set the horizontal image size of the memory area in CDWDR with the top-field image and bottom-field image placed next to each other as shown in Figure 36.28. In addition, set the number of captured lines of the field image in the VWDTH bits in CAPWR.

A memory image of folding the horizontal image size of the memory area in Figure 36.28 at CDWDR/2 is shown in Figure 36.29. Setting the registers to form the image in Figure 36.28 enables an interlace image to be stored as a frame image in the memory as shown in Figure 36.29.

Figure 36.28 Image of Storing Captured Both-Fields of Interlace Input in Memory

Figure 36.29 Image of Storing Interlace Input as Frame Image in Memory

36.4.8 CEU Register Control Register (CRCNTR)

CRCNTR controls switching of the planes of registers with a 2-plane configuration.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	RVS	—	—	RS	RC
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	RVS	0	R/W	Sets the timing to switch the register plane in both-field capture. The setting of this bit is valid only when the RC bit is 1 in both-field capture. 0: Switches the register plane every 2 VD 1: Switches the register plane every 1 VD
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	RS	0	R/W	Specifies which register plane is used by the CEU in synchronization with VD. The setting of this bit is valid only when the RC bit is 0. 0: Uses plane A of the register 1: Uses plane B of the register
0	RC	0	R/W	Specifies switching of the register plane used by the CEU in synchronization with VD. If the register plane is not switched, the register plane specified by the RS bit is used. 0: Uses the specified register plane in synchronization with VD 1: Switches the register plane in synchronization with VD

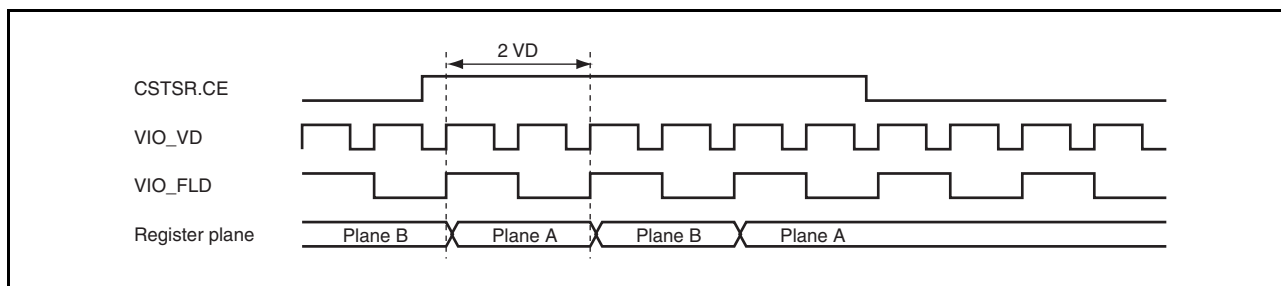

Figure 36.30 Timing for Register Plane Switching when RVS Bit is B'0

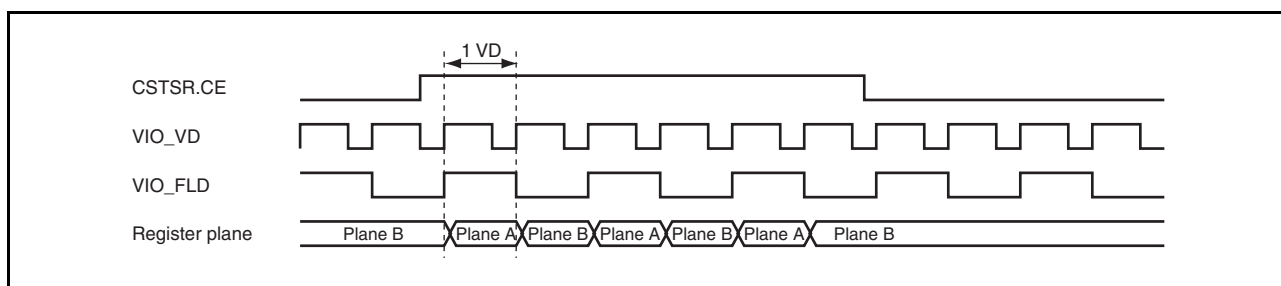

Figure 36.31 Timing for Register Plane Switching when RVS Bit is B'1

36.4.9 CEU Register Forcible Control Register (CRCMPR)

CRCMPR forcibly controls switching of the planes of registers with a 2-plane configuration. Setting this register enables direct control of register plane switching.

Do not modify this register during operation. If this register is modified during operation, correct operation cannot be guaranteed. In addition, the IGRW bit (interrupt source) in CETCR is set to B'1.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RA
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	RA	0	R/W	Indicates the register plane currently specified. This register value automatically changes in synchronization with VD for starting capture. To start capture with plane A of the register when a setting to switch the register plane in synchronization with VD has been made (RC bit in CRCNTR is 1), specify plane B of the register using this bit. 0: Specifies plane A of the register 1: Specifies plane B of the register

36.4.10 Capture Filter Control Register (CFLCR)

CFLCR sets the scale-down factor for the filter to scale images down.

The CEU has an image scale-down filter which can be used to scale down the captured images before storing them in the memory. Set CFLCR to 0 when not performing scale-down (same size output). If a value other than 0 is set in CFLCR, scale-down is performed. In data fetch mode, set CFLCR to 0.

When handling an interlace source image as a frame image, set CFLCR to 0 not to use the filter.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	
	VMANT[3:0]				VFRAC[11:0]												
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
	HMANT[3:0]				HFRAC[11:0]												
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	VMANT[3:0]	H'0	R/W	Mantissa Part of Vertical Scale-Down Factor The specifiable range is H'0 to H'F. When H'0 is set for the VMANT bits and H'000 is set for the VFRAC bits, the scale-down filter is not used.
27 to 19 18 to 16	VFRAC[11:3] VFRAC[2:0]	H'000	R/W R	Fraction Part of Vertical Scale-Down Factor The specifiable range is H'000 to H'FF8. The fraction of the scale-down factor that cannot be set with only the VMANT bits must be set with these bits.
15 to 12	HMANT[3:0]	H'0	R/W	Mantissa Part of Horizontal Scale-Down Factor The specifiable range is H'0 to H'F. When H'0 is set for the HMANT bits and H'000 is set for the HFRAC bits, the scale-down filter is not used.
11 to 3 2 to 0	HFRAC[11:3] HFRAC[2:0]	H'000	R/W R	Fraction Part of Horizontal Scale-Down Factor The specifiable range is H'000 to H'FF8. The fraction of the scale-down factor that cannot be set with only the HMANT bits must be specified with these bits.

An image scale-down filter is installed in the CEU, and the captured images can be scaled down and stored in the memory.

Figure 36.32 Scale-Down of Captured Image

The formulas for obtaining the MANT (VMANT or HMANT) and FRAC (VFRAC or HFRAC) values from the input pixel count and output pixel count of the filter are shown below. Set the MANT and FRAC bits in order to obtain the desired output pixel count from the number of pixels input to the CEU.

First, calculate preliminary MANT and FRAC values. The parameters needed for calculation are defined as follows:

$$\alpha = MANT \times 4096 + FRAC \quad \dots \text{Formula 1}$$

$$SCL \text{ (scaling factor)} = \frac{4096}{\alpha} \quad \dots \text{Formula 2}$$

Assuming an operator $\lfloor x \rfloor$ which discards fractions of an integer x , the MANT and FRAC values can be temporarily set as follows, according to formula 1 and formula 2.

$$MANT = \left\lfloor \frac{1}{SCL} \right\rfloor, \quad FRAC = \left\lfloor 512 \times \left(\frac{1}{SCL} - MANT \right) \right\rfloor \times 8$$

Here, the scaled-down filter output size ($SIZE_D$) can be calculated using the input image size S_{in} (half of the CAPWR setting) in the following formula.

$$SIZE_D = \left\lfloor 1 + \left(\left\lfloor \frac{1}{2} + \frac{S_{in} - 1}{MANT_{pre}} \right\rfloor - 1 \right) \times \frac{MANT_{pre} \times 4096}{\alpha} \right\rfloor \quad \dots \text{Formula 3}$$

$$\left[\begin{array}{l} MANT_{pre} = 1 \rightarrow (0 \leq MANT < 2) \\ MANT_{pre} = 2 \rightarrow (2 \leq MANT < 4) \\ MANT_{pre} = 4 \rightarrow (4 \leq MANT < 8) \\ MANT_{pre} = 8 \rightarrow (8 \leq MANT) \end{array} \right]$$

The number of output pixels can be obtained by substituting the temporarily calculated MANT, FRAC, and input image size into these formulas. If the calculated number of output pixels is smaller than the number of output pixels used to obtain the preliminary MANT and FRAC values, recalculate with a smaller FRAC (α) value, and set the MANT and FRAC values in this register so that a pixel value greater than the desired number of output pixels can be obtained.

Example: Scale down 640 pixels to 480 pixels

$SCL = 480/640 = 3/4$, and the preliminary settings of $MANT = 1$, $MANT_{pre} = 1$, and $FRAC = H'550$ are made. Substituting these in the following formula results in an output pixel count of 479.

$$SIZE_D = \left\lfloor 1 + \left(\left\lfloor \frac{1}{2} + \frac{S_{in} - 1}{MANT_{pre}} \right\rfloor - 1 \right) \times \frac{MANT_{pre} \times 4096}{\alpha} \right\rfloor \quad \dots \text{Formula 3}$$

Since this output pixel count is smaller than the desired output pixel count of 480, the formula is recalculated with a FRAC value of H'548, a value eight less than the previous time. The obtained result of output pixel count = 480 is equal to the desired output pixel count of 480, so this register is set as $MANT = 1$ and $FRAC = H'548$.

Table 36.8 Setting Examples for Each Scale-Down Filter Factor

Scale-Down Factor	FRAC		MANT	Input Pixel Count	Output Pixel Count	Clipping Size (CFSZR)
	Decimal	Hexadecimal				
7/8	576	H'240	1	640	560	560
3/4	1352	H'548	1	640	480	480
5/8	2448	H'990	1	640	400	400
1/2	0	H'0	2	640	320	320
3/8	2728	H'AA8	2	640	240	240
1/3	0.0	H'0	3	640	213	212
1/4	0.0	H'0	4	640	160	160
1/5	0.0	H'0	5	640	128	128
1/6	0.0	H'0	6	640	107	104
1/7	0.0	H'0	7	640	91	88
1/8	0.0	H'0	8	640	80	80
1/16	4088	H'FF8	15	640	40	40

Note: This scale-down filter uses a VGA-size line memory for scale-down. Therefore, when an image larger than the VGA size is input for scale-down, settings must be made so that the output image size is equal to or larger than the SubQCIF size and equal to or smaller than the VGA size. When an image is not scaled down (same size output), this restriction does not apply.

36.4.11 Capture Filter Size Clip Register (CFSZR)

CFSZR sets the clipping size for fine adjustment of the image size output from the filter, and must be set in combination with CFLCR. When clipping the output size of the filter, set the clipping size as a number of pixels, and the setting unit should be four pixels. CFSZR must be set even when scale-down is not performed (same size output).

In data synchronous fetch mode, set CFSZR according to the setting of CAPWR.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	VFCLP[11:0]

R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	HFCLP[11:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27 to 18 17, 16	VFCLP[11:2] VFCLP[1:0]	H'000	R/W R	These bits set the vertical clipping value of the filter output size (4-pixel units).
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 2 1, 0	HFCLP[11:2] HFCLP[1:0]	H'000	R/W R	These bits specify the horizontal clipping value of the filter output size (4-pixel units).

The scale-down filter in the CEU may output an odd number of pixels or lines depending on the settings. To adjust the output size of the filter, the CEU clips the destination image by using the number of pixels specified in CFSZR, as shown in Figure 36.33. The clipping size must be specified vertically and horizontally in 4-pixel units.

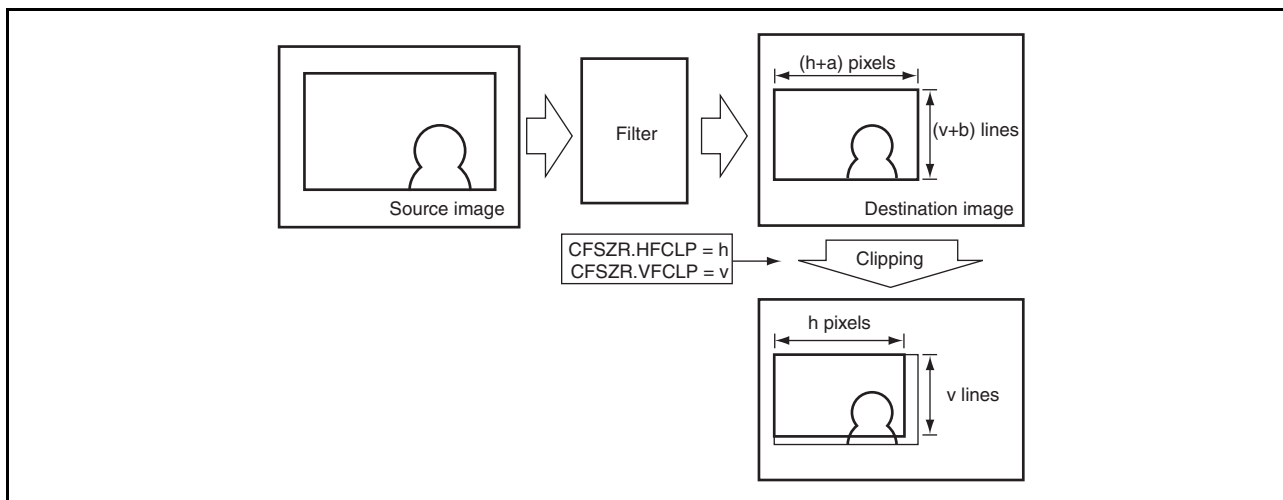

Figure 36.33 Clipping of Image Output from Filter

The pixels to be clipped are counted from the top-left corner of a display. The pixels located to the right of the specified number of pixels or below the specified number of lines are discarded by the clipping function. If the number of pixels specified in CFSZR is larger than that output from the filter, correct operation cannot be guaranteed. To avoid this, the clipping size specified in CFSZR must be equal to or smaller than the number of pixels output from the filter.

Note: In data synchronous fetch mode, the following settings are required. Data cannot be fetched correctly unless the following settings are made.

VFCLP = CAPWR.VWDTH

HFCLP = CAPWR.HWDTH/2

36.4.12 Capture Destination Width Register (CDWDR)

CDWDR sets the horizontal image size in the memory area where the captured image is to be output in 4-byte units (4-pixel units).

In data synchronous fetch mode, set CDWDR according to the setting of CAPWR.

This register is not used, during data enable fetch mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 2 1, 0	CHDW[12:2] CHDW[1:0]	H'0000	R/W R	These bits specify the horizontal image size in the memory area where the captured image is to be stored (4-byte units). The image data captured by the CEU is stored in the memory. If the right end of the captured image does not match the horizontal image size in the memory area as shown in Figure 36.34, some addresses must be skipped at the right end of the image when storing the captured image. Therefore, the horizontal image size in the memory area where the captured image is to be stored must be set in these bits. The maximum value to be set is 8188 bytes (8188 pixels). In data synchronous fetch mode, set as follows: CHDW = CAPWR.HWDTH

Figure 36.34 Captured Image and Memory Area Image

36.4.13 Capture Data Address Y Register (CDAYR)

CDAYR specifies the address where the luminance (Y) component of the captured data is to be stored in frame image capture or one-field image capture, the address where the luminance (Y) component of the captured top field is to be stored in both-field image capture, and the address where the fetched data is to be stored in data fetch. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. In frame image capture or one-field image capture, set the start address of the memory area where the Y (luminance) component of the captured data is to be stored by CDAYR. In both-field image capture, set the start address of the memory area where the Y (luminance) component of the captured top-field image is to be stored by CDAYR. In data fetch, set the start address of the memory area where data is to be stored by CDAYR.

Because the address must be specified in 32 bits, the address set by CDAYR must be in longword units. As the setting is in 4-pixel units for image capture and 4-byte units for data fetch, the lower two bits are always fixed to 0.

Bit	Bit Name	Initial Value	R/W	Description
31 to 2 1, 0	CAYR[31:2] CAYR[1:0]	H'0000 0000	R/W R	<ul style="list-style-type: none"> • Frame image capture: These bits set the address for storing the Y (luminance) component data of the captured data (4-pixel units). • One-field image capture: These bits set the address for storing the Y (luminance) component data of the captured data (4-pixel units). • Both-field image capture: These bits set the address for storing the Y (luminance) component data of the captured top-field data (4-pixel units). • Data fetch: These bits set the address for storing data (4-byte units). • Data enable fetch bundle write: These bits set the address for storing data (32-byte units).

Set the address of the starting point of the memory area where the fetched data is to be stored in this register, as shown in Figure 36.35.

- Frame image capture: Set the address of the starting point of the memory area where the Y component of the captured image is to be stored.
- One-field image capture: Set the address of the starting point of the memory area where the Y component of the captured image is to be stored.
- Both-field image capture: Set the address of the starting point of the memory area where the Y component of the captured top-field image is to be stored.
- Data fetch: Set the address of the starting point of the memory area where the fetched data is to be stored. In data fetch mode, the data is simply stuffed in order from the start address so the end address becomes as follows:

End address = CDAYR + number of fetched bytes

- Data enable fetch bundle write: Set the address in 32-byte units.

Figure 36.35 Relationship between Captured Image and Y Component Memory Area

36.4.14 Capture Data Address C Register (CDACR)

CDACR specifies the address where the chrominance (C) component of the captured data is to be stored in frame image capture or one-field image capture, and the address where the chrominance (C) component of the captured top field is to be stored in both-field image capture. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. In frame image capture or one-field image capture, set the start address of the memory area where the C (chrominance) component of the captured data is to be stored by CDACR. In both-field image capture, set the start address of the memory area where the C (chrominance) component of the captured top-field image is to be stored by CDACR. CDACR is not used in data fetch.

Because the address must be specified in 32 bits, the address set by CDACR must be in longword units. As the setting is in 4-pixel units, the lower two bits are always fixed to 0.

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	CACR[31:2]	H'0000 0000	R/W	• Frame image capture: These bits set the address for storing the C (chrominance) component data of the captured data (4-pixel units).
1, 0	CACR[1:0]		R	• One-field image capture: These bits set the address for storing the C (chrominance) component data of the captured data (4-pixel units). • Both-field image capture: These bits set the address for storing the C (chrominance) component data of the captured top-field data (4-pixel units).

Set the address of the starting point of the memory area where the C component of the captured image is to be stored in this register, as shown in Figure 36.36. The C component has an output data format like that in Figure 36.37, and is saved in the memory in this format.

- Frame image capture: Set the address of the starting point of the memory area where the C component of the captured image is to be stored.
- One-field image capture: Set the address of the starting point of the memory area where the C component of the captured image is to be stored.
- Both-field image capture: Set the address of the starting point of the memory area where the C component of the captured top-field image is to be stored.

Figure 36.36 Relationship between Captured Image and C Component Memory Area

Figure 36.37 Image of Storing C Components in Memory

36.4.15 Capture Data Bottom-Field Address Y Register (CDBYR)

CDBYR specifies the address where the luminance (Y) component of the captured bottom-field data is to be stored in both-field image capture. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. Set the start address of the memory area where the Y (luminance) component of the captured bottom-field image is to be stored by CDBYR. CDBYR is not used in frame image capture, one-field image capture, or data fetch.

Because the address must be specified in 32 bits, the address set by CDBYR must be in longword units. As the setting is in 4-pixel units, the lower two bits are always fixed to 0.

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	CDBYR[31:2]	H'0000 0000	R/W	These bits set the address for storing the Y (luminance) component data of the captured bottom-field data (4-pixel units).
1, 0	CDBYR[1:0]		R	

Set the address of the starting point of the memory area where the Y component of the captured bottom-field image is to be stored in this register, as shown in Figure 36.38.

Figure 36.38 Relationship between Captured Bottom-Field Image and Y Component Memory Area

36.4.16 Capture Data Bottom-Field Address C Register (CDBCR)

CDBCR specifies the address where the chrominance (C) component of the captured bottom-field data is to be stored in both-field image capture. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. Set the start address of the memory area where the C (chrominance) component of the captured bottom-field image is to be stored by CDBCR. CDBCR is not used in frame image capture, one-field image capture, or data fetch.

Because the address must be specified in 32 bits, the address set by CDBCR must be in longword units. As the setting is in 4-pixel units, the lower two bits are always fixed to 0.

1, 0	CBCR[1:0]		R	

Set the address of the starting point of the memory area where the C component of the captured bottom-field image is to be stored in this register, as shown in Figure 36.39. The C component has an output data format like that in Figure 36.40, and is saved in the memory in this format.

Figure 36.39 Relationship between Captured Bottom-Field Image and C Component Memory Area

Figure 36.40 Image of Storing C Components in Memory

36.4.17 Capture Bundle Destination Size Register (CBDSR)

CBDSR sets the size of output to memory in a bundle write. The number of output lines should be specified for image capture or data synchronous fetch. The number of bytes should be specified for data enable fetch.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	CBVS[22:16]

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CBVS[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 0	CBVS[22:3] CBVS[2:0]	H'000	R/W R	These bits select the number of lines or number of bytes for output to the memory in a bundle write. Image capture and data synchronous fetch: Number of lines for output to the memory in a bundle write. Unit: 8 lines, min.: 8 lines, max.: 1,920 lines (H'780) Data enable fetch: Number of bytes for output to the memory in a bundle write. Unit: 32 bytes, min.: 512 bytes, max.: 6291456 lines (H'600000)

(a) Image capture and data synchronous fetch

Set the number of lines of captured data to be written to the memory by a bundle write as a multiple of eight. This register is valid only when the CBE bit in CDOCR is 1. When the CBE bit in CDOCR is 1 and this register cleared to H'0, this module operates with the number of lines of captured data to be written to the memory as eight. The maximum number of lines that can be set is 1,920 (H'780). Only bits CBVS[11:3] are valid.

Figure 36.41 Image of Storing Captured Image in Memory by Bundle Write

(b) Data enable fetch

Set the number of bytes of captured data to be written to the memory by a bundle write as a multiple of 32. This register is valid only when the CBE bit in CDOCR is 1. The minimum settable size is 512 bytes. When a number smaller than 512 bytes is specified, operation is not guaranteed.

36.4.18 Capture Low-Pass Filter Control Register (CLFCR)

CLFCR specifies whether or not to operate the low-pass filter. In data fetch mode, clear the LPF bit to B'0.

The characteristic of the low-pass filter installed in the CEU causes the phase location of the image processed by the low-pass filter to be shifted right by one pixel compared to the raw image.

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	LPF	0	R/W	Enables or disables operation of the low-pass filter. The low-pass filter removes high-frequency components from the destination image in the horizontal direction. Clear this bit to 0 in data fetch mode. 0: Low-pass filter not used 1: Low-pass filter used (only in the horizontal direction)

36.4.19 Firewall Operation Control Register (CFWCR)

CFWCR specifies the upper limit of the write addresses in data enable fetch. When the VD input from an external module does not go low and end notification is not given, this register can prevent writing to memory from being out of control.

This register is enabled only in data enable fetch.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
16	CBE	0	R/W	<p>Controls the number of lines of captured data to be written to the memory.</p> <ul style="list-style-type: none"> • Image capture This bit controls the number of lines of captured data to be written to the memory. When bundle write is set by this register, captured data is written in line units specified by CBDSR to the addresses specified by CDAYR and CDACR, and CDAYR2 and CDACR2 (CDBYR and CDBCR, and CDBYR2 and CDBCR2 for the bottom field in both-field capture) alternately (Figure 36.42). When captured data has been written for the number of lines set by CBDSR, a write end interrupt corresponding to each address setting register occurs. However, after write for one-frame (one-field) capture ends, a bundle write end interrupt does not occur even when bundle write has finished. • Data synchronous fetch This bit controls the number of lines of captured data to be written to the memory. When bundle write is set by this register, captured data is written in line units specified by CBDSR to the addresses specified by CDAYR and CDAYR2 alternately. When captured data has been written for the number of lines set by CBDSR, a write end interrupt corresponding to each address setting register occurs. However, after write for one-frame capture ends, a bundle write end interrupt does not occur even when bundle write has finished. • Data enable fetch This bit controls the number of bytes of captured data to be written to the memory. When bundle write is set by this register, captured data is written in byte units specified by CBDSR to the addresses specified by CDAYR and CDAYR2 alternately. When captured data has been written for the number of bytes set by CBDSR, a write end interrupt corresponding to each address setting register occurs. Also, only in data enable fetch, a bundle write end interrupt occurs when bundle write has finished after write for one-frame capture ends. Table 36.9 shows the correspondence between address setting registers and write end interrupt sources. Figure 36.43 shows the timing of write end interrupts in image capture and data synchronous fetch. Figure 36.44 shows the timing of write end interrupts in data enable fetch. <p>0: Normal write 1: Bundle write</p>
15 to 5	—	All 0	R	<p>Reserved These bits are always read as 0. The write value should always be 0.</p>
4	CDS	0	R/W	<p>Sets the image format when outputting the image data captured in the YCbCr422 format to the memory. When 0 is written to this bit, only the luminance component (Y) is output and no chrominance components (Cb and Cr) are output for the odd-numbered lines. With an interlace source image, similarly only the luminance component (Y) is output and no chrominance components (Cb and Cr) are output for the odd-numbered lines of the field. In data fetch mode, set this bit to 1. 0: Converts the YCbCr422 format to the YCbCr420 format before outputting data to the memory 1: Outputs data in the YCbCr422 format to the memory without conversion</p>
3	—	0	R	<p>Reserved This bit is always read as 0. The write value should always be 0.</p>
2	COLS	0	R/W	<p>Controls swapping in 32-bit units for data output from the CEU. 0: Data is not swapped in 32-bit units 1: Data is swapped in 32-bit units</p>
1	COWS	0	R/W	<p>Controls swapping in 16-bit units for data output from the CEU. 0: Data is not swapped in 16-bit units 1: Data is swapped in 16-bit units</p>
0	COBS	0	R/W	<p>Controls swapping in 8-bit units for data output from the CEU. 0: Data is not swapped in 8-bit units 1: Data is swapped in 8-bit units</p>

CDBYR, CDBCR	CPBE3 bit in CETCR
CDBYR2, CDBCR2	CPBE4 bit in CETCR

Figure 36.43 Timing of Write End Interrupts (Image Capture, Data Synchronous Fetch)

Figure 36.44 Timing of Write End Interrupts (Data Enable Fetch)

For data output from the CEU, the COLS, COWS, and COBS bits control swapping in 32-bit, 16-bit, and 8-bit units, respectively. Set these bits when data is misaligned because of a difference in endian. The data swapping bits are shown below. These bits can be set similarly in data fetch mode.

Data can be swapped in 8-bit, 16-bit, 32-bit units, or in 32 bits, 16 bits and 8 bits, as shown in Figure 36.45. To enable data swapping, set the corresponding control bit to B'1.

36.4.22 Capture Event Flag Clear Register (CETCR)

CETCR notifies the CPU of the source of an interrupt that is generated in the CEU. The flags of CETCR can be used as interrupt signals. When the corresponding interrupt is enabled, an interrupt is generated. To clear the interrupt, clear the bit corresponding to the interrupt source to 0. After several cycles have passed after modifying the bit, the interrupt is cleared.

To clear the bit corresponding to the interrupt source to be cleared to 0 and retain that state, write 1 to that bit. For example, to clear only the CPE bit to 0, write H'FFFF FFFE to CETCR.

In CETCR, only bits to which 0 is written are cleared. Bits to which 1 is written retain their current values. To clear an interrupt source, write 0 only to the bit corresponding to the interrupt source to be cleared, and 1 to the other bits.

Note: Since the CETCR value becomes undefined in the following cases, clear all bits in CETCR to 0.

- VD and HD bits immediately after power-on reset or the deep-standby mode is entered
- All bits after the software standby or module standby mode is entered
- VD and HD bits after the polarities of the capture interface sync signals are changed

R/W:	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R	R	R	R/W	R	R	R/W	R/W

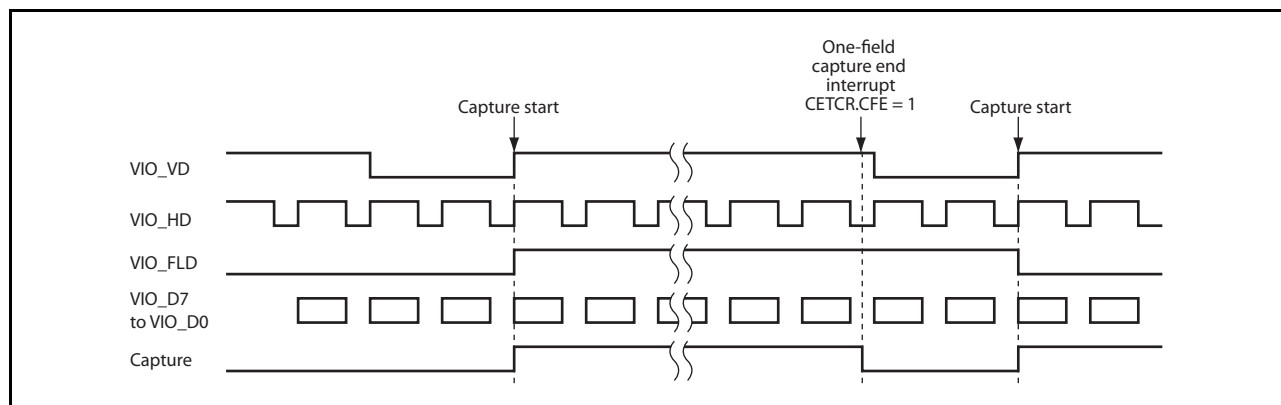

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25	NVD	0	R/W	This bit is used for an interrupt indicating that no VD was input. A non-VD interrupt occurs when the 14-bit internal counter becomes full. Accordingly, this bit is set to 1 when no VD has been input for at least 16,383 lines since the last VD was input.
24	NHD	0	R/W	This bit is used for an interrupt indicating that no HD was input. A non-HD interrupt occurs when the 11-bit internal counter that is incremented every eight cycles becomes full. Accordingly, this bit is set to 1 when no HD has been input for at least 16,376 cycles since the last HD was input. When connecting a camera whose HD is fixed low when VD is low, this bit may be set to 1. Ignore this interrupt during data enable fetch.

Bit	Bit Name	Initial Value	R/W	Description
23	FWF	0	R/W	The interrupt is generated when data is written to the address that exceeds the value specified with CFWCR.FMV. This bit is set to 1 when data is written to the address that exceeds the value specified with CFWCR.FMV while CFWCR.FWE = 1.
22, 21	—	0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	VBP	0	R/W	This bit is used for an interrupt indicating that VD has been input while the CEU holds data (insufficient vertical-sync front porch). The conditions for a VBP interrupt to occur are as follows: <ul style="list-style-type: none"> • Condition 1 VD is input when there is captured data within the CEU • Condition 2 The last transfer data cannot be internally detected due to a write buffer overflow or an illegal HD so that the end timing is unclear until the next VD (By generating a VBP interrupt at the VD input timing, capture fail can be announced.) When a VBP interrupt occurs, a capture end interrupt (CPE bit in CETCR) does not occur and the image of that frame is not captured correctly. Though a capture end interrupt (CPE bit) will occur on rare occasions, it should be ignored in this case. Capturing cannot be performed until the next VD (even if the CE bit (capture reservation signal) in CAPSR is 1, capturing does not start). In the case of condition 2, instead of waiting for a VBP interrupt to occur, execute a software reset (CPKIL bit in CAPSR) to stop capturing and then restart capturing. In this case, since capture operation is terminated without waiting for the next VD, a VBP interrupt does not occur and capturing can be performed from the next VD.
19	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
18	IGVS	0	R/W	This bit is used for an interrupt generated when the number of VD cycles set in CMCYR differ from the number of VD cycles input from an external module. This bit is set to 1 when there is an illegal VD input from an external module. This bit is set to 1 when the number of HD cycles for the VD input to the CEU differs from the value set in the VCYL bits in CMCYR. Note however that when the VCYL bits are cleared to 0, this interrupt does not occur.
17	IGHS	0	R/W	This bit is used for an interrupt generated when the number of HD cycles set in CMCYR differ from the number of HD cycles input from an external module. This bit is set to 1 when there is an illegal HD input from an external module. This bit is set to 1 when the number of clock cycles for the HD input to the CEU differs from the value set in the HCYL bits in CMCYR. Note however that when the HCYL bits are cleared to 0, this interrupt does not occur.
16	CDTOF	0	R/W	This bit is used for an interrupt indicating that data overflowed in the CRAM of the write buffer. Since data is input at realtime from an external module in capture operations, the frame image is overwritten unless the captured data is transferred from the CEU internal buffer to the memory at a certain or higher transfer rate. This bit is set to 1 when writing the data in the CRAM of the CEU internal write buffer to the bus is not performed within time and data has overflowed.
15	CPBE4	0	R/W	This bit is used for an interrupt indicating that writing to CDBYR2 and CDBCR2 in a bundle write has finished. This interrupt is output when the last captured data has been transferred and the end notification received, regardless of the next HD input. This bit is set to 1 when data for the number of lines set in CBDSR has been captured and the last data transfer to the bus has completed. However, this interrupt does not occur when the last captured data in a bundle write is the last captured data of a frame (field).
14	CPBE3	0	R/W	This bit is used for an interrupt indicating that writing to CDBYR and CDBCR in a bundle write has finished. This interrupt is output when the last captured data has been transferred and the end notification received, regardless of the next HD input. This bit is set to 1 when data for the number of lines set in CBDSR has been captured and the last data transfer to the bus has completed. However, this interrupt does not occur when the last captured data in a bundle write is the last captured data of a frame (field).

Bit	Bit Name	Initial Value	R/W	Description
13	CPBE2	0	R/W	<p>This bit is used for an interrupt indicating that writing to CDAYR2 and CDACR2 in a bundle write has finished.</p> <p>This interrupt is output when the last captured data has been transferred and the end notification received, regardless of the next HD input.</p> <p>This bit is set to 1 when data for the number of lines (number of bytes in data enable fetch) set in CBDSR has been captured and the last data transfer to the bus has completed.</p> <p>However, in image capture or data synchronous fetch, this interrupt does not occur when the last captured data in a bundle write is the last captured data of a frame (field).</p>
12	CPBE1	0	R/W	<p>This bit is used for an interrupt indicating that writing to CDAYR and CDACR in a bundle write has finished.</p> <p>This interrupt is output when the last captured data has been transferred and the end notification received, regardless of the next HD input.</p> <p>This bit is set to 1 when data for the number of lines (number of bytes in data enable fetch) set in CBDSR has been captured and the last data transfer to the bus has completed.</p> <p>However, in image capture or data synchronous fetch, this interrupt does not occur when the last captured data in a bundle write is the last captured data of a frame (field).</p>
11, 10	—	All 0	R	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>
9	VD	Undefined	R/W	<p>This bit is used for an interrupt indicating that VD (vertical sync signal) was input from an external module.</p> <p>In data enable fetch mode, this bit is set to 1 when a VD input from an external module is detected.</p> <p>In image capture mode and data synchronous fetch mode, this module generates a VD interrupt in response to the first detection of the active level of HD following detection of the active level of VD from an external module. Note that, when VD and HD are asserted and detected at the same time, this module generates a VD interrupt at that time. Immediately after the VDPOL bit in CAMCR is modified, a pseudo VD is input and this bit is set to 1. The VD interrupt after the VDPOL bit is modified should be ignored.</p>
8	HD	Undefined	R/W	<p>This bit is used for an interrupt indicating that HD (horizontal sync signal) was input from an external module.</p> <p>This bit is set to 1 when an HD input from an external module is detected.</p> <p>Immediately after the HDPOL bit in CAMCR is modified, a pseudo HD is input and this bit is set to 1. The HD interrupt after the HDPOL bit is modified should be ignored.</p>
7 to 5	—	All 0	R	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>
4	IGRW	0	R/W	<p>This bit is used for an interrupt indicating that during capturing, access was attempted to a register to which writing during operation is prohibited.</p> <p>Among the CEU registers, writing during capturing is prohibited for some registers. Table 36.10 shows which registers can/cannot be written to during capturing. This bit is set to 1 when a register to which writing during capturing is prohibited has been written to.</p>
3, 2	—	All 0	R	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>
1	CFE	0	R/W	<p>This bit is used for an interrupt indicating that capturing of one field from an external module has finished.</p> <p>This interrupt is output when the last captured data has been transferred and the end notification received, regardless of the next VD input (see Figure 36.46).</p> <p>This interrupt occurs only in both-field capture mode.</p>
0	CPE	0	R/W	<p>This bit is used for an interrupt indicating that capturing of one frame from an external module has finished.</p> <p>This interrupt is output when the last captured data has been transferred and the end notification received, regardless of the next VD input.</p> <p>This interrupt indicates that capturing of one frame has finished. This bit is set to 1 when the image of the size set in CAPWR is captured and the last data transfer to the bus finished (see Figure 36.47).</p>

Figure 36.47 CPE Generation Timing

36.4.23 Capture Status Register (CSTSR)

CSTSR indicates the internal status of the CEU. CSTSR differs from CETCR in that no interrupt is generated for the events indicated in CSTSR.

The CEU operating/halt state can be confirmed using CSTSR. To confirm the halt state of the CEU, make sure that the status bit (bit 0) indicating that the CEU is operating is cleared to 0 for sure.

31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	CRST	0	R	Indicates which register plane is currently used. 0: Plane A of the register is being used 1: Plane B of the register is being used
23 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	CPFLD	0	R	Indicates which field is being captured. 0: Bottom field is being captured 1: Top field is being captured
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	CPTON	0	R	Indicates that the CEU is operating. This bit retains 1 during the period that starts from the internal VD at capture start and ends when a one-frame capture end interrupt occurs. Figure 36.48 shows the CEU operating period.

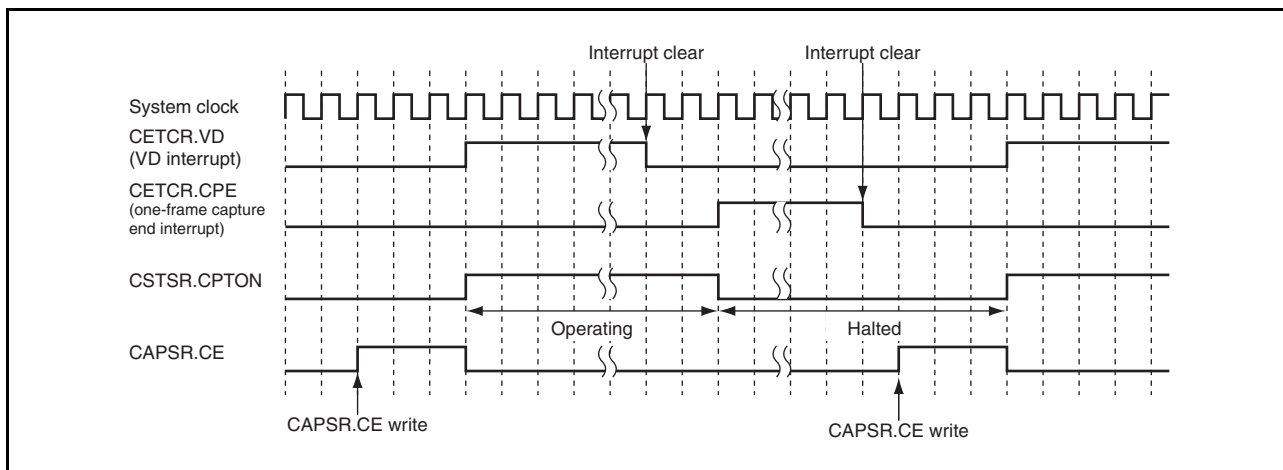

Figure 36.48 Operating Status during Capturing

36.4.24 Capture Data Size Register (CDSSR)

CDSSR indicates the size of data written to the memory in data enable fetch. As this register indicates a correct value at the end of capture, confirm this register when capture is completed.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CDSS[31:0]	H'0000 0000	R	<p>Indicate the size of data written to the memory in data enable fetch. In a bundle write, size of data written to the selected address at the end of one-frame capture is indicated. In a bundle write, as soon as the number of bytes specified by CBDSR is transferred to the bus, address to which data is written is switched.</p> <p>Therefore, if one-frame capture is completed at the same time as a bundle write is completed, this register indicates H'0000 0000. Figure 36.49 and Figure 36.50 show the overall timing of the CDSSR operation in a bundle write.</p>

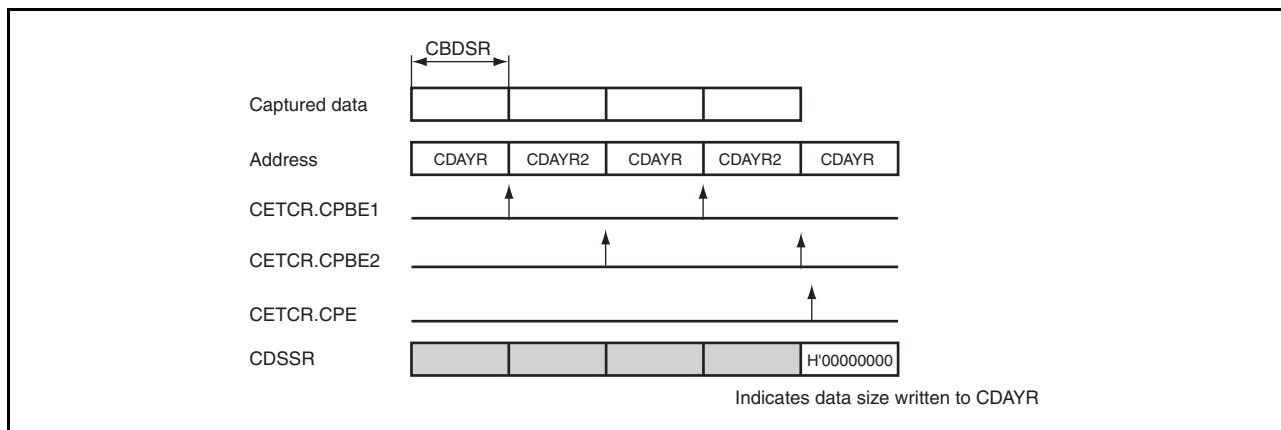

Figure 36.49 Overall Timing of CDSSR Operation in Bundle Write (When Bundle Write End and Capture End Coincide)

Figure 36.50 Overall Timing of CDSSR Operation in Bundle Write (When Bundle Write End and Capture End Do Not Coincide)

36.4.25 Capture Data Address Y Register 2 (CDAYR2)

CDAYR2 specifies the address for the luminance (Y) component used in a bundle write and the address for data storage in a bundle write in data fetch. CDAYR2 is used only in a bundle write.

CDAYR2 specifies the address where the Y component of the captured data is to be stored in frame image capture or one-field image capture, the address where the Y component of the captured top field is to be stored in both-field image capture, and the address where data is to be stored in data fetch. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. In frame image capture or one-field image capture, set the start address of the memory area where the Y component of the captured data is to be stored by CDAYR2. In both-field image capture, set the start address of the memory area where the Y component of the captured top-field image is to be stored by CDAYR2. In data fetch, set the start address of the memory area to be used for data storage.

The address specified by this register must be in 32-bit units. As the setting is in 4-pixel units, the lower two bits are always fixed to 0.

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	CAYR2[31:2]	H'0000 0000	R/W	<ul style="list-style-type: none"> • Frame image capture: These bits set the address for storing the Y component data of the captured data (4-pixel units). • One-field image capture: These bits set the address for storing the Y component data of the captured data (4-pixel units). • Both-field image capture: These bits set the address for storing the Y component data of the captured top-field data (4-pixel units). • Data synchronous fetch: These bits set the address for storing data (4-byte units). • Dana enable fetch: These bits set the address for storing data (32-byte units).
1, 0	CAYR2[1:0]		R	

Set the address of the starting point of the memory area where the Y component of the captured image is to be stored in this register, as shown in Figure 36.51.

- Frame image capture: Set the address of the starting point of the memory area where the Y component of the captured image is to be stored.
- One-field image capture: Set the address of the starting point of the memory area where the Y component of the captured image is to be stored.
- Both-field image capture: Set the address of the starting point of the memory area where the Y component of the captured top-field image is to be stored.

Figure 36.51 Relationship between Captured Image and Y Component Memory Area

36.4.26 Capture Data Address C Register 2 (CDACR2)

CDACR2 specifies the address for the chrominance (C) component used in a bundle write. CDACR2 is used only in a bundle write.

CDACR2 specifies the address where the C component of the captured data is to be stored in frame image capture or one-field image capture, and the address where the C component of the captured top field is to be stored in both-field image capture. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. In frame image capture or one-field image capture, set the start address of the memory area where the C component of the captured data is to be stored by CDACR2. In both-field image capture, set the start address of the memory area where the C component of the captured top-field image is to be stored by CDACR2. CDACR2 is not used in data fetch.

The address specified by this register must be in 32-bit units. As the setting is in 4-pixel units, the lower two bits are always fixed to 0.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CACR2[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	CACR2[31:2]	H'0000 0000	R/W	<ul style="list-style-type: none"> Frame image capture: These bits set the address for storing the C component data of the captured data (4-pixel units). One-field image capture: These bits set the address for storing the C component data of the captured data (4-pixel units). Both-field image capture: These bits set the address for storing the C component data of the captured top-field data (4-pixel units).
1, 0	CACR2[1:0]		R	

In this register, set the address of the starting point of the memory area where the captured data is to be stored in a bundle write, as shown in Figure 36.52. The C component has an output data format as shown in Figure 36.53, and is saved in the memory in this format.

- Frame image capture: Set the address of the starting point of the memory area where the C component of the captured image is to be stored.
- One-field image capture: Set the address of the starting point of the memory area where the C component of the captured image is to be stored.
- Both-field image capture: Set the address of the starting point of the memory area where the C component of the captured top-field image is to be stored.

The C component has an output data format as shown in Figure 36.52, and is saved in the memory in this format.

Figure 36.52 Relationship between Captured Image and C Component Memory Area

Figure 36.53 Image of Storing C Components in Memory

36.4.27 Capture Data Bottom-Field Address Y Register 2 (CDBYR2)

CDBYR2 specifies the address for the luminance (Y) component of the bottom field used in a bundle write. CDBYR2 is used only in a bundle write.

CDBYR2 specifies the address where the Y component of the captured bottom-field data is to be stored in both-field image capture. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. Set the start address of the memory area where the Y component of the bottom-field image captured in both-field image capture is to be stored by CDBYR2. CDBYR2 is not used in frame image capture, one-field image capture, or data fetch.

The address specified by this register must be in 32-bit units. As the setting is in 4-pixel units, the lower two bits are always fixed to 0.

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	CBYR2[31:2]	H'0000 0000	R/W	These bits set the address for storing the Y component data of the captured bottom-field data (4-pixel units).
1, 0	CBYR2[1:0]		R	

In this register, set the address of the starting point of the memory area where the Y component of the captured bottom-field image is to be stored in a bundle write, as shown in Figure 36.54.

Figure 36.54 Relationship between Captured Bottom-Field Image and Y Component Memory Area

36.4.28 Capture Data Bottom-Field Address C Register 2 (CDBCR2)

CDBCR2 specifies the address for the chrominance (C) component of the bottom field used in a bundle write. CDBCR2 is used only in a bundle write.

CDBCR2 specifies the address where the C component of the captured bottom-field data is to be stored in both-field image capture. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. Set the start address of the memory area where the C component of the bottom-field image captured in both-field image capture is to be stored by CDBCR2. CDBCR2 is not used in frame image capture, one-field image capture, or data fetch.

The address specified by this register must be in 32-bit units. As the setting is in 4-pixel units, the lower two bits are always fixed to 0.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	CBCR2[31:2]	H'0000 0000	R/W	These bits set the address for storing the C component data of the captured bottom-field data (4-pixel units).
1, 0	CBCR2[1:0]		R	

In this register, set the address of the starting point of the memory area where the C component of the captured bottom-field image is to be stored in a bundle write, as shown in Figure 36.55. The C component has an output data format as shown in Figure 36.56, and is saved in the memory in this format.

Figure 36.55 Relationship between Captured Bottom-Field Image and C Component Memory Area

Figure 36.56 Image of Storing C Components in Memory

36.5 Usage Notes for CEU

36.5.1 Conditions for Connection to an External Module

(1) Clock Frequency

The external input clock should have a frequency at most the same as the CEU operating clock frequency ($B\phi$), with jitter on both sides included.

$$\text{CEU operating clock frequency (B}\phi\text{)} \geq \text{External input clock frequency}$$

(2) Blanking Period

The period from the last valid pixel in each line to the next horizontal sync signal HD must be at least 20 cycles.

(3) Fixed Period of Field Identification Signal

The field identification signal FLD should be fixed for at least 1-HD period since a VD input.

36.5.2 Restrictions on Input/Output Functions

Table 36.11 lists the restrictions regarding the CEU input/output functions.

Table 36.11 Restrictions on CEU Input/Output Functions

Item	Restrictions
External module interface	The operating clock of the external module (VIO_CLK) should always have a frequency at most the same as that of the CEU operating clock (Bφ), with jitter on both sides included.
	Selecting the interface, or modifying the frequency of the external module operating clock or HD/VD polarity must be done when capture operations are halted for sure.
	Specify the capture horizontal size in image capture in 8-cycle units.
	Specify the capture horizontal size in data fetch in 4-cycle units.
	The capture vertical size must be specified in 4-line units.
	The maximum number of cycles in the horizontal sync signal period should be 16,375 cycles of external input clock.
	The maximum number of lines (HD count) in the vertical sync signal should be 16,382 lines.
	The minimum number of captured pixels should be sub-QCIF (128 × 96).
	The maximum number of captured pixels should be 5 megapixels (2,560 × 1,920).
	Captured size in data enable fetch Maximum: 6 Mbytes (2,048 × 1,536 × 2) Minimum: 16 bytes
Memory output	The output address must be specified in 32-bit units.
	The horizontal size of the destination image (memory) must be specified in 4-pixel units.
	The number of horizontal output pixels (= horizontal clipping size) must be specified in 4-pixel units.
	The number of vertical output lines (HD) (= vertical clipping size) must be specified in 4-line (HD) units.
	In data enable fetch bundle write, the output address must be specified in 32-byte units.
Internal processing	The filter clipping size must be specified as a value equal to or lower than the actual output size of the filter.

36.5.3 Cooperation with Video Display Controller 5

Since the input data are written to the memory separately as Y data and CbCr data in image capture mode, the captured data cannot be displayed in the video display controller 5.

36.5.4 Software Reset

For transitions to the software reset state by the CPKIL bit in the CAPSR register, see section 42.3.6, Software Reset. However, where the procedure refers to the SRST bit, read this as the CPKIL bit in the CAPSR register.

37. SCUX

The SCUX consists of sampling converters, digital volume units, and a mixer. It is connected to the SSIF module to have an interface with external modules.

37.1 Features

(1) [SRC] Sampling Rate Conversion

- Asynchronous or synchronous sampling rate conversion is possible*¹
- Sampling rate (synchronous mode)*²
Input [KHz]: 8, 11.025, 12, 16, 22.05, 24, 32, 44.1, 48, 64, 88.2, or 96 is selectable
Output [KHz]: 8, 16, 24, 32, 44.1, 48, or 96 is selectable
- Sampling rate (asynchronous mode)*²
Input/output [KHz]: 1 to 96
- Supported bit sizes are 16 bits and 24 bits
- Sound quality: -132 dB or less*³
- 1, 2, 4, 6, or 8 channels are supported*⁴
- DMA transfer with on-chip memory or external memory and direct transfer with the SSIF module are possible

Note 1. The synchronous mode can be selected only when the SCUX is connected to the FFD and FFU modules. For details, refer to section 37.4.5.

Note 2. The selectable sampling rates depend on the number of used channels and rate ratio. For details, refer to section 37.3.22 and section 37.4.7.

Note 3. The data format is a 24-bit value.

Note 4. The number of selectable channels depends on the sampling rate and route. For details, refer to section 37.4.7.

(2) [DVU] Digital Volume and Mute Functions

- Digital volume, volume ramp, and zero cross mute are provided as functions to adjust the volume
- The digital volume is set as a 24-bit fixed-point value within the range from a multiple of 0 to 8 (mute, -120 to 18 dB)
- Volume ramp can be used to perform soft mute, fade in, fade out, and volume change as desired
- The ramp time of volume ramp can be changed and set within the sampling range of 2^0 to 2^{23}
- Zero cross mute turns the sound mute at the zero cross point of audio data
- Direct transfer with the SSIF module and transfer with the mixer are possible

(3) [MIX] Mixer

- Data of two to four source systems can be mixed (added together) into one system
- The ratio to add the sources can be set
- The ratio can be changed dynamically
- Volume ramp enables mixing to be performed (ramp time is variable)
- Only direct transfer with the SSIF module is possible

Figure 37.1 shows a block diagram of the SCUX.

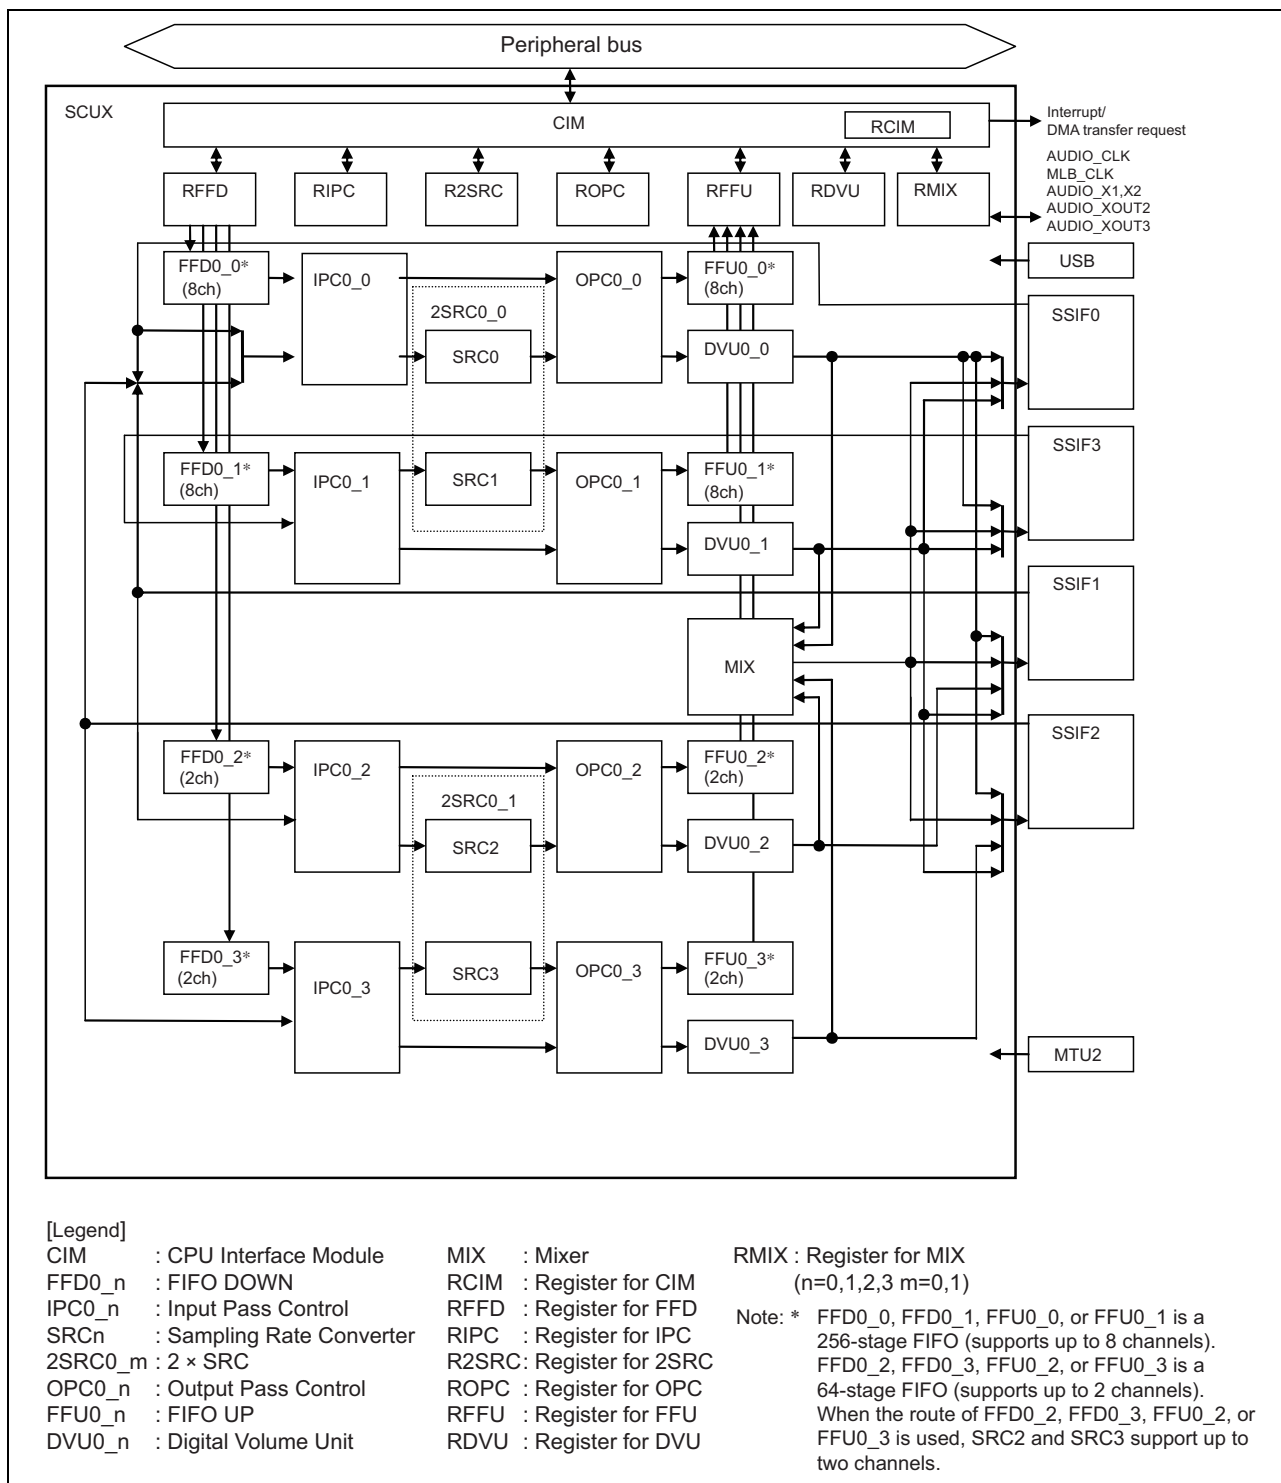

Figure 37.1 Block Diagram of SCUX

37.2 Input/Output Pins

Table 37.1 Pin Configuration

Name	I/O	Function
AUDIO_CLK	Input	External clock for audio Can be used in generating the sampling timing.
MLB_CLK*1	Input	External clock for MLB Can be used in generating the sampling timing.
AUDIO_X1	Input	Crystal resonator/external clock for audio Can be used in generating the sampling timing.
AUDIO_X2	Output	
AUDIO_XOUT2	Output	Output clock of AUDIO_X1 divided into two (Output is toggled once per cycle of the AUDIO_X1 clock.)
AUDIO_XOUT3	Output	Output clock of AUDIO_X1 divided into three (Output is toggled once every 1.5 cycles of the AUDIO_X1 clock.)

Note 1. Since the RZ/A1LU and RZ/A1LC do not have a MLB_CLK external pin, a fixed value (0) is input as the signal in this module.

37.3 Register Descriptions

Table 37.2 shows the register configuration.

Table 37.2 Register Configuration

Block Name	Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
IPC0_0	IPC0_0 initialization register	IPCIR_IPC0_0	R/W	H'00000001	H'E8208000	32
	IPC0_0 pass select register	IPSLR_IPC0_0	R/W	H'00000000	H'E8208004	32
IPC0_1	IPC0_1 initialization register	IPCIR_IPC0_1	R/W	H'00000001	H'E8208100	32

	MIX route select register	MIXRSEL_CIM	R/W	H'76543210	H'E8209774	32

Note 1. Only 0 can be written to clear the flag. Writing 0 is ignored.

Note 2. Address H'E8209708 can be accessed in only 16-bit or 32-bit units.

Note 3. Address H'E820970C can be accessed in only 16-bit or 32-bit units.

Note 4. Address H'E8209710 can be accessed in only 16-bit or 32-bit units.

Note 5. Address H'E8209714 can be accessed in only 16-bit or 32-bit units.

Note 6. Address H'E8209718 can be accessed in only 16-bit or 32-bit units.

Note 7. Address H'E820971C can be accessed in only 16-bit or 32-bit units.

Note 8. Address H'E8209720 can be accessed in only 16-bit or 32-bit units.

Note 9. Address H'E8209724 can be accessed in only 16-bit or 32-bit units.

37.3.1 IPC0_n Initialization Register (IPCIR_IPC0_n) (n = 0, 1, 2, 3)

IPCIR_IPC0_n is a 32-bit readable/writable register that initializes the IPC internal circuit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	INIT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INIT	1	R/W	Initialization When this bit is set to 1, the IPC internal circuit is initialized. To cancel the initialization, set this bit to 0 with it set to 1. 0: Processing State 1: Initialization (sets the initial setting of other registers)

37.3.2 IPC0_n Pass Select Register (IPSLR_IPC0_n) (n = 0, 1, 2, 3)

IPSLR_IPC0_n is a 32-bit readable/writable register that selects the input source and output destination of the input timing signal and audio data.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	IPC_PASS_SEL	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	IPC_PASS_SEL	0	R/W	IPC Pass Select These bits select the pass. 000: No operation 001: Input Timing Signal/Input Audio Data : EXTERNAL(SSIF) → IPC → SRC (Async mode) 010: Reserved 011: Input Timing Signal : EXTERNAL → IPC → FFD/SRC Input Audio Data : FFD → IPC → SRC (Async mode) 100: Input Timing Signal/Input Audio Data : FFD → IPC → SRC (Sync mode) 101 to 111: No operation

37.3.3 OPC0_n Initialization Register (OPCIR_OPC0_n) (n = 0, 1, 2, 3)

OPCIR_OPC0_n is a 32-bit readable/writable register that initializes the OPC internal circuit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	INIT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INIT	1	R/W	Initialization When this bit is set to 1, the OPC internal circuit is initialized. To cancel the initialization, set this bit to 0 with it set to 1. 0: Processing State 1: Initialization (sets the initial setting of other registers)

37.3.4 OPC0_n Pass Select Register (OPSLR_OPC0_n) (n = 0, 1, 2, 3)

OPSLR_OPC0_n is a 32-bit readable/writable register that selects the input source and output destination of the output timing signal and audio data.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	OPC_PASS_SEL	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	OPC_PASS_SEL	0	R/W	OPC Pass Select These bits select the pass. 000: No operation 001: Output Timing Signal : EXTERNAL → OPC → SRC/DVU Output Audio Data : SRC(Async mode) → OPC → DVU 010: Reserved 011: Output Timing Signal : EXTERNAL → OPC → FFU/SRC Output Audio Data : SRC(Async mode) → OPC → FFU 100: Output Timing Signal : FFU → OPC → SRC Output Audio Data : SRC(Sync mode) → OPC → FFU 101 to 111: No operation

37.3.5 FFD0_n FIFO Download Initialization Register (FFDIR_FFD0_n) (n = 0, 1, 2, 3)

FFDIR_FFD0_n is a 32-bit readable/writable register that initializes the FFD internal circuit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	INIT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INIT	1	R/W	Initialization When this bit is set to 1, the FFD internal circuit is initialized. To cancel the initialization, set this bit to 0 with it set to 1. 0: Processing State 1: Initialization (sets the initial setting of other registers)

37.3.6 FFD0_n FIFO Download Audio Information Register (FDAIR_FFD0_n) (n = 0, 1, 2, 3)

FDAIR_FFD0_n is a 32-bit readable/writable register that sets the number of FFD data channels.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	CHNUM			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	CHNUM	All 0	R/W	Number of Channels These bits set the number of channels. 0000: Zero (None) 0001: 1 channel 0010: 2 channels* 0011: Reserved 0100: 4 channels* 0101: Reserved 0110: 6 channels* 0111: Reserved 1000: 8 channels* 1001 to 1111: Reserved Note: * These bits are only settable for FFD0_0 and FFD0_1. Setting these bits in the registers for FFD0_2 and FFD0_3 is prohibited.

37.3.7 FFD0_n FIFO Download Request Size Register (DRQSR_FFD0_n) (n = 0, 1, 2, 3)

DRQSR_FFD0_n is a 32-bit readable/writable register that sets the request size of data transfer requests.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	SIZE			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	SIZE	All 0	R/W	Request Size These bits set the PCM data size per request. The size must be less than the FIFO size. 0000: 256 data. (FFD0_0,FFD0_1), 64 data. (FFD0_2,FFD0_3) * ¹ 0001: 128 data. (FFD0_0,FFD0_1), 32 data. (FFD0_2,FFD0_3) 0010: 64 data. (FFD0_0,FFD0_1), 16 data. (FFD0_2,FFD0_3) 0011: 32 data. (FFD0_0,FFD0_1), 8 data. (FFD0_2,FFD0_3) 0100: 16 data. (FFD0_0,FFD0_1), 4 data. (FFD0_2,FFD0_3) 0101: 8 data. (FFD0_0,FFD0_1), 2 data. (FFD0_2,FFD0_3) 0110: 4 data. (FFD0_0,FFD0_1), 1 data. (FFD0_2,FFD0_3) 0111: 2 data. (FFD0_0,FFD0_1)* ² 1000: 1 data. (FFD0_0,FFD0_1)* ² 1001 to 1111: Reserved. Notes: 1. If the request size equals the FIFO size, the request size must be a multiple of the number of channels so that the operation is correct. For example, the request size and FIFO size are 256, the number of channels can be set to 1, 2, 4, or 8. If the number of channels is not set to any of the numbers, FIFO overflow may occur. 2. These bits are only settable for FFD0_0 and FFD0_1. Setting these bits in the registers for FFD0_2 and FFD0_3 is prohibited.

37.3.8 FFD0_n FIFO Download Pass Register (FFDPR_FFD0_n) (n = 0, 1, 2, 3)

FFDPR_FFD0_n is a 32-bit readable/writable register that sets the input/output route of audio data.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	PASS
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	PASS	All 0	R/W	Data Pass Select These bits set the data pass of audio data. 00: No pass selected 01: CIM → FFD → IPC (Async Mode) *1 10: CIM → FFD → IPC (Sync Mode) *2 11: Reserved Notes: 1.- Async mode: The FFD use external timing. 2.- Sync mode: The FFD use the request which is generated by SRC module. Set Sync mode in SRC.

37.3.9 FFD0_n FIFO Download Boot Register (FFDBR_FFD0_n) (n = 0, 1, 2, 3)

FFDBR_FFD0_n is a 32-bit readable/writable register that controls the starting and stopping of data requests sent to RFFD.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	BOOT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	BOOT	0	R/W	Data Request Start/Stop This bit controls the start/stop of data request. This bit can be set when the PASS bits in the FFDPR register are set to B'01 or B'10. This bit should be set after setting all FFD registers. 0: Stops the data request. 1: Starts the data request.

37.3.10 FFD0_n FIFO Download Event Mask Register (DEVMR_FFD0_n) (n = 0, 1, 2, 3)

DEVMR_FFD0_n is a 32-bit readable/writable register that controls SCUFDIn interrupt requests.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DEV MUF	DEV MOF	DEV MOL	DEV MIUF	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DEV MRQ	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	DEV MUF	0	R/W	FFD Underflow Mask This bit sets whether to mask the interrupt request from the DEVCUF bit in the DEVCR register. 0: Disables interrupts. 1: Enables interrupts.
30	DEV MOF	0	R/W	FFD Overflow Mask This bit sets whether to mask the interrupt request from the DEVCOF bit in the DEVCR register. 0: Disables interrupts. 1: Enables interrupts.
29	DEV MOL	0	R/W	FFD Overlap Mask This bit sets whether to mask the interrupt request from the DEVCOL bit in the DEVCR register. 0: Disables interrupts. 1: Enables interrupts.
28	DEV MIUF	0	R/W	FFD Initialization Underflow Mask This bit sets whether to mask the interrupt request from the DEVCIUF bit in the DEVCR register. 0: Disables interrupts. 1: Enables interrupts.
27 to 16	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
15	DEV MRQ	0	R/W	FFD Request Packet Mask This bit sets whether to mask the interrupt request from the DEVCRQ bit in the DEVCR register. 0: Disables interrupts. 1: Enables interrupts.
14 to 0	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.

37.3.11 FFD0_n FIFO Download Event Clear Register (DEVCR_FFD0_n) (n = 0, 1, 2, 3)

DEVCR_FFD0_n is a 32-bit readable/writable register that clears SCUFDIn interrupt requests. When an interrupt event is generated, the relevant bit in this register is automatically set to 1 and 1 is retained until 0 is written to that bit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DEV CUF	DEV COF	DEV COL	DEV CIUF	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/(W)*1	R/(W)*1	R/(W)*1	R/(W)*1	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DEV CRQ	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/(W)*1	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	DEVCUF	0	R/(W)*1	FFD Underflow Clear This is an interrupt flag to indicate whether DPRAM underflow occurs. When it occurs and the first packet has already been written to DPRAM, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
30	DEVCOF	0	R/(W)*1	FFD Overflow Clear This is an interrupt flag to indicate whether DPRAM overflow occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
29	DEVCOL	0	R/(W)*1	FFD Overlap Clear This is an interrupt flag to indicate whether FFD overlap occurs. When the next read request occurs while FFD reads data from DPRAM upon the previous read request, the overflow occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Waiting.
28	DEVCIUF	0	R/(W)*1	FFD Initialization Underflow Clear This is an interrupt flag to indicate whether DPRAM initialization underflow occurs. When it occurs and the first packet has not been written to DPRAM, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
27 to 16	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
15	DEVCRQ	0	R/(W)*1	FFD Request Packet Clear This is an interrupt flag to send a request to write one packet in FFD, to the CPU. When the request occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
14 to 0	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.

Note 1. Readable/writable. When 0 is written, the bit is initialized. Writing 1 to the bit is ignored. Write 0 only to each bit corresponding to the interrupt source to be cleared; write 1 to other bits.

37.3.12 FFU0_n FIFO Upload Initialization Register (FFUIR_FFU0_n) (n = 0, 1, 2, 3)

FFUIR_FFU0_n is a 32-bit readable/writable register that initializes the FFU internal circuit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	INIT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INIT	1	R/W	Initialization When this bit is set to 1, the FFU internal circuit is initialized. To cancel the initialization, set this bit to 0 with it set to 1. 0: Processing State 1: Initialization (sets the initial setting of other registers)

37.3.13 FFU0_n FIFO Upload Audio Information Register (FUAIR_FFU0_n) (n = 0, 1, 2, 3)

FUAIR_FFU0_n is a 32-bit readable/writable register that sets the number of FFU data channels.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	CHNUM			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	CHNUM	All 0	R/W	Number of Channels These bits set the number of channels. For details, see below. 0000: Zero (None) 0001: 1 channel 0010: 2 channels* 0011: Reserved 0100: 4 channels* 0101: Reserved 0110: 6 channels* 0111: Reserved 1000: 8 channels* 1001 to 1111: Reserved Note: *These bits are only settable for FFU0_0 and FFU0_1. Setting these bits in the registers for FFU0_2 and FFU0_3 is prohibited.

37.3.14 FFU0_n FIFO Upload Request Size Register (URQSR_FFU0_n) (n = 0, 1, 2, 3)

URQSR_FFU0_n is a 32-bit readable/writable register that sets the request size of data transfer requests.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	SIZE				
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	SIZE	All 0	R/W	Request Size These bits set the PCM data size per request. The size must be less than the FIFO size. 0000: 256 data. (FFU0_0,FFU0_1), 64 data. (FFU0_2,FFU0_3)*1 0001: 128 data. (FFU0_0,FFU0_1), 32 data. (FFU0_2,FFU0_3) 0010: 64 data. (FFU0_0,FFU0_1), 16 data. (FFU0_2,FFU0_3) 0011: 32 data. (FFU0_0,FFU0_1), 8 data. (FFU0_2,FFU0_3) 0100: 16 data. (FFU0_0,FFU0_1), 4 data. (FFU0_2,FFU0_3) 0101: 8 data. (FFU0_0,FFU0_1), 2 data. (FFU0_2,FFU0_3) 0110: 4 data. (FFU0_0,FFU0_1), 1 data. (FFU0_2,FFU0_3) 0111: 2 data. (FFU0_0,FFU0_1)*2 1000: 1 data. (FFU0_0,FFU0_1)*2 1001 to 1111: Reserved. Note 1. If the request size equals the FIFO size, the request size must be a multiple of the number of channels so that the operation is correct. For example, the request size and FIFO size are 256, the number of channels can be set to 1, 2, 4, or 8. If the number of channels is not set to any of the numbers, FIFO overflow may occur. Note 2. These bits are only settable for FFU0_0 and FFU0_1. Setting these bits in the registers for FFU0_2 and FFU0_3 is prohibited.

37.3.15 FFU0_n FIFO Upload Pass Register (FFUPR_FFU0_n) (n = 0, 1, 2, 3)

FFUPR_FFU0_n is a 32-bit readable/writable register that sets the input/output route of audio data.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	PASS
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	PASS	All 0	R/W	Data Pass Select These bits set the data pass of audio data. 00: No pass selected 01: CIM ← FFU ← OPC (Async Mode) *1 10: CIM ← FFU ← OPC (Sync Mode) *2 11: Reserved Notes: 1. Async mode: The FFU use external timing. 2. Sync mode: The FFU use the request which is generated by SRC module. Set Sync mode in SRC.

37.3.16 FFU0_n FIFO Upload Event Mask Register (UEVMR_FFU0_n) (n = 0, 1, 2, 3)

UEVMR_FFU0_n is a 32-bit readable/writable register that controls SCUFUIn interrupt requests.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	UEV MUF	UEV MOF	UEV MOL	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	UEV MRQ	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	UEVMUF	0	R/W	FFU Underflow Mask This bit sets whether to mask the interrupt request from the UEVCUF bit in the UEVCR register. 0: Disables interrupts. 1: Enables interrupts.
30	UEVMOF	0	R/W	FFU Overflow Mask This bit sets whether to mask the interrupt request from the UEVCOF bit in the UEVCR register. 0: Disables interrupts. 1: Enables interrupts.
29	UEVMOL	0	R/W	FFU Overlap Mask This bit sets whether to mask the interrupt request from the UEVCOL bit in the UEVCR register. 0: Disables interrupts. 1: Enables interrupts.
28 to 16	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
15	UEVMRQ	0	R/W	FFU Request Packet Mask This bit sets whether to mask the interrupt request from the UEVCRQ bit in the UEVCR register. 0: Disables interrupts. 1: Enables interrupts.
14 to 0	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.

37.3.17 FFU0_n FIFO Upload Event Clear Register (UEVCR_FFU0_n) (n = 0, 1, 2, 3)

UEVCR_FFU0_n is a 32-bit readable/writable register that clears SCUFUIn interrupt requests. When an interrupt event is generated, the relevant bit in this register is automatically set to 1 and 1 is retained until 0 is written to that bit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	UEV CUF	UEV COF	UEV COL	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/(W)*1	R/(W)*1	R/(W)*1	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	UEV CRQ	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/(W)*1	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	UEVCUF	0	R/(W)*1	FFU Underflow Clear This is a flag to indicate whether DPRAM underflow occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
30	UEVCOF	0	R/(W)*1	FFU Overflow Clear This is a flag to indicate whether DPRAM overflow occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
29	UEVCOL	0	R/(W)*1	FFU Overlap Clear This is a flag to indicate whether DPRAM overlap occurs. When the next write request occurs while FFU writes data upon the previous write request, the overlap occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
28 to 16	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
15	UEVCRQ	0	R/(W)*1	FFU Request Packet Clear This is an interrupt flag to send a request to read one packet from FFU, to the CPU. When the request occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
14 to 0	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.

Note 1. Readable/writable. When 0 is written, the bit is initialized. Writing 1 to the bit is ignored. Write 0 only to each bit corresponding to the interrupt source to be cleared; write 1 to other bits.

37.3.18 2SRC0_m Initialization Register p (SRCIRp_2SRC0_m) (m = 0, 1; p = 0, 1)

SRCIRp_2SRC0_m is a 32-bit readable/writable register that initializes the SRC internal circuit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	INIT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INIT	1	R/W	Initialization When this bit is set to 1, the SRC internal circuit is initialized. To cancel the initialization, set this bit to 0 with it set to 1. 0: Processing State 1: Initialization (sets the initial setting of other registers)

37.3.19 2SRC0_m Audio Information Register p (SADIRp_2SRC0_m) (m = 0, 1; p = 0, 1)

SADIRp_2SRC0_m is a 32-bit readable/writable register that sets the bit length of data and the number of channels.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	OTBL				
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	CHNUM			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20 to 16	OTBL	All 0	R/W	Bit Length of Output Audio Data 00000: 24 bits 00001 to 00111: Reserved 01000: 16 bits 01001 to 11111: Reserved
15 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	CHNUM	All 0	R/W	Number of Channels These bits set the number of channels. 0000: Zero (None) 0001: 1 channel 0010: 2 channels 0011: Reserved 0100: 4 channels 0101: Reserved 0110: 6 channels 0111: Reserved 1000: 8 channels 1001 to 1111: Reserved

37.3.20 2SRC0_m Bypass Register p (SRCBRp_2SRC0_m) (m = 0, 1; p = 0, 1)

SRCBRp_2SRC0_m is a 32-bit readable/writable register that sets the bypass mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	BY PASS
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	BYPASS	0	R/W	Bypass Mode This bit controls the data pass of SRC. The bypass function is only used in asynchronous SRC mode. Therefore, this bit must be set to 0 when synchronous SRC mode is used (bit SRCMD0 in SRCCRp_2SRC0_m register is 1). 0: SRC function is used. Input data is processed by SRC and then the result data is connected to output data. 1: SRC function is not used. Input data is directly connected to output data.

37.3.21 2SRC0_m IFS Control Register p (IFSCRp_2SRC0_m) (m = 0, 1; p = 0, 1)

IFSCRp_2SRC0_m is a 32-bit readable/writable register that enables or disables usage of the initial value set by INTIFS.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	INT IFSEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INTIFSEN	0	R/W	INTIFS Value Enable This bit is enabled only in asynchronous SRC mode (bit SRCMD in SRCCRp_2SRC0_m register is 0). 0: Disables initial value setting in IFSVR register. 1: Enables initial value setting in IFSVR register.

37.3.22 2SRC0_m IFS Value Setting Register p (IFSVRp_2SRC0_m) (m = 0, 1; p = 0, 1)

IFSVRp_2SRC0_m is a 32-bit readable/writable register that sets the INTIFS value.

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27 to 0	INTIFS	All 0	R/W	Initial Value of FSI These bits set initial value of FSI. Set the input sampling rate and output sampling rate within the restricted range determined by the number of channels. Example: Fin = 32 kHz Fout = 44.1 kHz FSI = 2 ²² * 32000/44100 = 3043485 = 0x02E709D

When using the SRC in asynchronous mode, INTIFS is given as the initial value of FSI, which is the sampling conversion function. Therefore, after setting the INTIFSEN bit in IFSCRp_2SRC0_m to 1, set the INTIFS bits to the desired value. The SRC automatically detects the input sampling frequency and output sampling frequency. Based on this, the FSI value is calculated so that the following equation is satisfied.

$$\frac{F_{in}}{F_{out}} \approx \frac{FSI}{FSO}$$

[Legend]

Fin: Input sampling frequency

Fout: Output sampling frequency

FSI: Input sampling rate

FSO: Output sampling rate (fixed value: 2²² = 0x0400000)

When using the SRC in synchronous mode, the value set in INTIFS is used as the FSI value from beginning to end. The value set in INITFS is shown in Table 37.3 to Table 37.8.

Table 37.3 INITFS Setting (Delay Mode: Normal, Number of Channels: 1 or 2)

Input Sampling Rate [KHz]	Output Sampling Rate [KHz]

31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	WATMD	0	R/W	Wait Time Control of SRC 0: Disables wait time control. 1: Enables wait time control.
19 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	—	0	R/W	The write value should always be 1.
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	BUFMD	0	R/W	Low Delay Mode 0: Disables low delay mode. 1: Enables low delay mode.
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	—	0	R/W	The write value should always be 1.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	—	0	R/W	The write value should always be 1.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SRCMD	0	R/W	SRC Mode Select 0: Asynchronous SRC 1: Synchronous SRC

37.3.24 2SRC0_m Minimum FS Setting Register p (MNFSRp_2SRC0_m) (m = 0, 1; p = 0, 1)

MNFSRp_2SRC0_m is a 32-bit readable/writable register that sets the minimum value of FS.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	MINFS											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MINFS															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27 to 0	MINFS	All 0	R/W	Minimum Value of FS Ratio These bits set the FS ratio to start fading out the output data to mute under the situation that the input timing stops during SRC processing. This setting value should be less than the value of IFSVRp_2SRC0_m register. Example: Fin = 32kHz Fout = 44.1kHz FSI = $2^{22} * 32000/44100 = 3043485 = 0x02E709D$ MINFS = FSI * 98% = 2982615 = 0x02D82D7 Set the ratio which is out of the range of the jitter. (The recommended value is from 90 to 98 percent.)

37.3.25 2SRC0_m Buffer Size Setting Register p (BFSSRp_2SRC0_m) (m = 0, 1; p = 0, 1)

BFSSRp_2SRC0_m is a 32-bit readable/writable register that sets the buffer size. This register setting is valid only when SRCCRp_2SRC0_m.BUFMD = 1.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	BUFDATA

R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	BUFIN			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25 to 16	BUFDATA	All 0	R/W	Set the buffer size of 1 channel in DATA RAM. Sets 0x80 for low delay mode 1. Sets 0x40 for low delay mode 2.
15 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	BUFIN	All 0	R/W	Set the buffer size of 1 channel in INDATA RAM. Sets 0x5 for low delay mode.

37.3.26 2SRC0_m SCU2 Status Register p (SC2SRp_2SRC0_m) (m = 0, 1; p = 0, 1)

SC2SRp_2SRC0_m is a 32-bit read-only register that indicates the status of the SRC.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SRCWSTS		SC2MUTE		SC2STS		SC2FSI									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	SRCWSTS	0	R	Status of Wait Time Operation of SRC 0: Wait for count up to wait time 1: Reached to wait time
30	SC2MUTE	0	R	SRC Mute Status This bit is only used for debug. 0: SRC output data is not fixed and it should be muted. This happens when SRC cannot synchronize the input sampling rate and output sampling rate. 1: SRC output data is fixed.
29, 28	SC2STS	All 0	R	Status of SRC 00: SRC is reset. 01: SRC is initialized. 10: SRC is processing. 11: Reserved
27 to 0	SC2FSI	All 0	R	Latest value of FSI which is calculated by SRC

37.3.27 2SRC0_m Wait Time Setting Register p (WATSRp_2SRC0_m) (m = 0, 1; p = 0, 1)

WATSRp_2SRC0_m is a 32-bit readable/writable register that sets the wait time for data input to the SRC.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	WTIME							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	WTIME															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 0	WTIME	All 0	R/W	These bits set the wait time when WATMD bit of SRCCRp_2SRC0_m register is 1. After the INIT bit of SRCIRp_2SRC0_m register is set to 0, 0 data is stored into the SRC until the number of input data reaches to the setting value of these bits. The data input before the INIT bit is set to 0 is discarded. After the number of input data reaches to the setting value, input data is stored into the SRC.

37.3.28 2SRC0_m Event Mask Register p (SEVMRp_2SRC0_m) (m = 0, 1; p = 0, 1)

SEVMRp_2SRC0_m is a 32-bit readable/writable register that enables or disables SCUAI_m interrupt requests. The name of the interrupt source corresponding to the interrupt request from SEVMRp_2SRC0_0 is SCUAI0 and that corresponding to the interrupt request from SEVMRp_2SRC0_1 is SCUAI1.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	EVMUF	EVMOF	-	-	-	-	-	-	-	-	-	-	-	-	-	-

R/W:	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	EVMWAIT	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	EVMUF	0	R/W	SRC Underflow Mask This bit sets whether to mask the interrupt request from the EVCUF bit in the SEVCRp_2SRC0_m register. 0: Disables interrupts. 1: Enables interrupts.
30	EVMOF	0	R/W	SRC Overflow Mask This bit sets whether to mask the EVCOF bit in the SEVCRp_2SRC0_m register. 0: Disables interrupts. 1: Enables interrupts.
29 to 15	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
14	EVMWAIT	0	R/W	SRC Wait Time Mask This bit sets whether to mask the interrupt request from the EVCWAIT bit of SEVCRp_2SRC0_m register. 0: Disables interrupts. 1: Enables interrupts.
13 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

37.3.29 2SRC0_m Event Clear Register p (SEVCRp_2SRC0_m) (m = 0, 1; p = 0, 1)

SEVCRp_2SRC0_m is a 32-bit readable/writable register that clears SCUAI_m interrupt requests. When an interrupt event is generated, the relevant bit in this register is automatically set to 1 and 1 is retained until 0 is written to that bit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	EVCUF	EVCOF	-	-	-	-	-	-	-	-	-	-	-	-	-	-

R/W:	R/(W) ^{*1}	R/(W) ^{*1}	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	EVCWAIT	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/(W) ^{*1}	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	EVCUF	0	R/(W) ^{*1}	SRC Underflow Clear This is an interrupt flag to indicate whether INDATA RAM underflow occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
30	EVCOF	0	R/(W) ^{*1}	SRC Overflow Clear This is an interrupt flag to indicate whether INDATA RAM overflow occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
29 to 15	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
14	EVCWAIT	0	R/(W) ^{*1}	SRC Wait Time Clear This is an interrupt flag to indicate whether SRC has started processing after the wait time. 0: Clears the flag. 1: Retains the flag.
13 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note 1. Readable/writable. When 0 is written, the bit is initialized. Writing 1 to the bit is ignored. Write 0 only to each bit corresponding to the interrupt source to be cleared; write 1 to other bits.

37.3.30 2SRC0_m Initialization Register RIF (SRCIRR_2SRC0_m) (m = 0, 1)

SRCIRR_2SRC0_m is a 32-bit readable/writable register that initializes COEF-ROMIF which is mounted on 2SRC0_m.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	INIT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INIT	1	R/W	Initialization When this bit is set to 1, the COEF-ROMIF internal circuit is initialized. To cancel the initialization, set this bit to 0 with it set to 1. 0: Processing State 1: Initialization (sets the initial setting of other registers)

37.3.31 DVU0_n Initialization Register (DVUIR_DVU0_n) (n = 0, 1, 2, 3)

DVUIR_DVU0_n is a 32-bit readable/writable register that initializes the DVU internal circuit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	INIT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INIT	1	R/W	Initialization When this bit is set to 1, the DVU internal circuit is initialized. To cancel the initialization, set this bit to 0 with it set to 1. 0: Processing State 1: Initialization (sets the initial setting of other registers)

37.3.32 DVU0_n Audio Information Register (VADIR_DVU0_n) (n = 0, 1, 2, 3)

VADIR_DVU0_n is a 32-bit readable/writable register that sets the bit length of data and the number of channels.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	OTBL				
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	CHNUM			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20 to 16	OTBL	All 0	R/W	Bit Length of Output Audio Data. 00000: 24 bits 00001 to 00111: Reserved 01000: 16 bits 01001 to 11111: Reserved
15 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	CHNUM	All 0	R/W	Number of Channels These bits set the number of channels. 0000: Zero (None) 0001: 1 channel 0010: 2 channels 0011: Reserved 0100: 4 channels 0101: Reserved 0110: 6 channels 0111: Reserved 1000: 8 channels 1001 to 1111: Reserved

37.3.33 DVU0_n Bypass Register (DVUBR_DVU0_n) (n = 0, 1, 2, 3)

DVUBR_DVU0_n is a 32-bit readable/writable register that sets the bypass mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	BY PASS
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	BYPASS	0	R/W	Bypass Mode This bit controls the data pass of DVU. 0: DVU function is used. Input data is processed by DVU and then the result data is connected to output data. 1: DVU function is not used. Input data is directly connected to output data.

37.3.34 DVU0_n Control Register (DVUCR_DVU0_n) (n = 0, 1, 2, 3)

DVUCR_DVU0_n is a 32-bit readable/writable register that selects the DVU mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	VVMD	-	-	-	VRMD	-	-	-	ZCMD
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	VVMD	0	R/W	Digital Volume Mode Select This bit selects the digital volume function. 0: Disables the digital volume function. 1: Enables the digital volume function.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	VRMD	0	R/W	Volume Ramp Mode Select This bit selects the volume ramp function. 0: Disables the volume ramp function. 1: Enables the volume ramp function.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	ZCMD	0	R/W	Zero Cross Mute Mode Select This bit selects the zero cross mute function. 0: Disables the zero cross mute function. 1: Enables the zero cross mute function.

37.3.35 DVU0_n Zero Cross Mute Control Register (ZCMCR_DVU0_n) (n = 0, 1, 2, 3)

ZCMCR_DVU0_n is a 32-bit readable/writable register that controls operation of the zero cross mute function for each channel.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	ZCEN7	ZCEN6	ZCEN5	ZCEN4	ZCEN3	ZCEN2	ZCEN1	ZCEN0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	ZCEN7	0	R/W	Zero Cross Mute Enable for Channel 7 This bit controls the operation of the zero cross mute function for channel 7. 0: Disables the operation of the zero cross mute function. 1: Enables the operation the zero cross mute function.
6	ZCEN6	0	R/W	Zero Cross Mute Enable for Channel 6 This bit controls the operation of the zero cross mute function for channel 6. 0: Disables the operation of the zero cross mute function. 1: Enables the operation the zero cross mute function.
5	ZCEN5	0	R/W	Zero Cross Mute Enable for Channel 5 This bit controls the operation of the zero cross mute function for channel 5. 0: Disables the operation of the zero cross mute function. 1: Enables the operation the zero cross mute function.
4	ZCEN4	0	R/W	Zero Cross Mute Enable for Channel 4 This bit controls the operation of the zero cross mute function for channel 4. 0: Disables the operation of the zero cross mute function. 1: Enables the operation the zero cross mute function.
3	ZCEN3	0	R/W	Zero Cross Mute Enable for Channel 3 This bit controls the operation of the zero cross mute function for channel 3. 0: Disables the operation of the zero cross mute function. 1: Enables the operation the zero cross mute function.
2	ZCEN2	0	R/W	Zero Cross Mute Enable for Channel 2 This bit controls the operation of the zero cross mute function for channel 2. 0: Disables the operation of the zero cross mute function. 1: Enables the operation the zero cross mute function.
1	ZCEN1	0	R/W	Zero Cross Mute Enable for Channel 1 This bit controls the operation of the zero cross mute function for channel 1. 0: Disables the operation of the zero cross mute function. 1: Enables the operation the zero cross mute function.
0	ZCEN0	0	R/W	Zero Cross Mute Enable for Channel 0 This bit controls the operation of the zero cross mute function for channel 0. 0: Disables the operation of the zero cross mute function. 1: Enables the operation the zero cross mute function.

37.3.36 DVU0_n Volume Ramp Control Register (VRCTR_DVU0_n) (n = 0, 1, 2, 3)

VRCTR_DVU0_n is a 32-bit readable/writable register that controls operation of the volume ramp function.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	VREN7	VREN6	VREN5	VREN4	VREN3	VREN2	VREN1	VREN0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	VREN7	0	R/W	Volume Ramp Enable for Channel 7 This bit controls the operation of the volume ramp function for channel 7. 0: Disables the operation of the volume ramp function. 1: Enables the operation of the volume ramp function.
6	VREN6	0	R/W	Volume Ramp Enable for Channel 6 This bit controls the operation of the volume ramp function for channel 6. 0: Disables the operation of the volume ramp function. 1: Enables the operation of the volume ramp function.
5	VREN5	0	R/W	Volume Ramp Enable for Channel 5 This bit controls the operation of the volume ramp function for channel 5. 0: Disables the operation of the volume ramp function. 1: Enables the operation of the volume ramp function.
4	VREN4	0	R/W	Volume Ramp Enable for Channel 4 This bit controls the operation of the volume ramp function for channel 4. 0: Disables the operation of the volume ramp function. 1: Enables the operation of the volume ramp function.
3	VREN3	0	R/W	Volume Ramp Enable for Channel 3 This bit controls the operation of the volume ramp function for channel 3. 0: Disables the operation of the volume ramp function. 1: Enables the operation of the volume ramp function.
2	VREN2	0	R/W	Volume Ramp Enable for Channel 2 This bit controls the operation of the volume ramp function for channel 2. 0: Disables the operation of the volume ramp function. 1: Enables the operation of the volume ramp function.
1	VREN1	0	R/W	Volume Ramp Enable for Channel 1 This bit controls the operation of the volume ramp function for channel 1. 0: Disables the operation of the volume ramp function. 1: Enables the operation of the volume ramp function.
0	VREN0	0	R/W	Volume Ramp Enable for Channel 0 This bit controls the operation of the volume ramp function for channel 0. 0: Disables the operation of the volume ramp function. 1: Enables the operation of the volume ramp function.

37.3.37 DVU0_n Volume Ramp Period Register (VRPDR_DVU0_n) (n = 0, 1, 2, 3)

VRPDR_DVU0_n is a 32-bit readable/writable register that sets the ramp time of volume ramp.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 8	VRPDUP	All 0	R/W	Volume Ramp Period for Volume Up 00000: 1 [sample] (128 dB/1 step) 00001: 2 [sample] (64 dB/1 step) 00010: 4 [sample] (32 dB/1 step) 00011: 8 [sample] (16 dB/1 step) 00100: 16 [sample] (8 dB/1 step) 00101: 32 [sample] (4 dB/1 step) 00110: 64 [sample] (2 dB/1 step) 00111: 128 [sample] (1 dB/1 step) 01000: 256 [sample] (0.5 dB/1 step) 01001: 512 [sample] (0.25 dB/1 step) 01010: 1024 [sample] (0.125 dB/1 step) 01011: 2048 [sample] (0.125 dB/2 steps) 01100: 4096 [sample] (0.125 dB/4 steps) 01101: 8192 [sample] (0.125 dB/8 steps) 01110: 16384 [sample] (0.125 dB/16 steps) 01111: 32768 [sample] (0.125 dB/32 steps) 10000: 65536 [sample] (0.125 dB/64 steps) 10001: 131072 [sample] (0.125 dB/128 steps) 10010: 262144 [sample] (0.125 dB/256 steps) 10011: 524288 [sample] (0.125 dB/512 steps) 10100: 1048576 [sample] (0.125 dB/1024 steps) 10101: 2097152 [sample] (0.125 dB/2048 steps) 10110: 4194304 [sample] (0.125 dB/4096 steps) 10111: 8388608 [sample] (0.125 dB/8192 steps) 11000 to 11111: Reserved
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
4 to 0	VRPDDW	0	R/W	Volume Ramp Period for Volume Down 00000: 1 [sample] (-128 dB/1 step) 00001: 2 [sample] (-64 dB/1 step) 00010: 4 [sample] (-32 dB/1 step) 00011: 8 [sample] (-16 dB/1 step) 00100: 16 [sample] (-8 dB/1 step) 00101: 32 [sample] (-4 dB/1 step) 00110: 64 [sample] (-2 dB/1 step) 00111: 128 [sample] (-1 dB/1 step) 01000: 256 [sample] (-0.5 dB/1 step) 01001: 512 [sample] (-0.25 dB/1 step) 01010: 1024 [sample] (-0.125 dB/1 step) 01011: 2048 [sample] (-0.125 dB/2 steps) 01100: 4096 [sample] (-0.125 dB/4 steps) 01101: 8192 [sample] (-0.125 dB/8 steps) 01110: 16384 [sample] (-0.125 dB/16 steps) 01111: 32768 [sample] (-0.125 dB/32 steps) 10000: 65536 [sample] (-0.125 dB/64 steps) 10001: 131072 [sample] (-0.125 dB/128 steps) 10010: 262144 [sample] (-0.125 dB/256 steps) 10011: 524288 [sample] (-0.125 dB/512 steps) 10100: 1048576 [sample] (-0.125 dB/1024 steps) 10101: 2097152 [sample] (-0.125 dB/2048 steps) 10110: 4194304 [sample] (-0.125 dB/4096 steps) 10111: 8388608 [sample] (-0.125 dB/8192 steps) 11000 to 11111: Reserved

37.3.38 DVU0_n Volume Ramp Decibel Register (VRDBR_DVU0_n) (n = 0, 1, 2, 3)

VRDBR_DVU0_n is a 32-bit readable/writable register that sets the gain level (decibel units) of volume ramp.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16			
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

37.3.39 DVU0_n Volume Ramp Wait Time Register (VRWTR_DVU0_n) (n = 0, 1, 2, 3)

VRWTR_DVU0_n is a 32-bit readable/writable register that sets the wait time before executing the volume ramp function.

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 0	VRWT	All 0	R/W	Volume Ramp Wait Time These bits set the wait time before starting the volume ramp function when the setting of VRDBR register is changed. If the internal counter of the DVU logic reached to the value of these bits, the volume ramp function starts operating to change the volume to the value changed in the VRDBR register as a target.

37.3.40 DVU0_n Volume Value Setting 0 Register (VOL0R_DVU0_n) (n = 0, 1, 2, 3)

VOL0R_DVU0_n is a 32-bit readable/writable register that sets the digital volume value of channel 0.

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 0	VOLVAL0	All 0	R/W	Digital Volume Value for Channel 0 These bits set the digital volume of channel 0. The maximum value is octupled gain (18 dB) and the minimum value is 0 (-∞ dB). VOLVAL0[23] : Sign bit VOLVAL0[22:20] : Integer bits VOLVAL0[19:0] : Decimal bits

Setting Value	Time	Gain[dB]	Setting Value	Time	Gain[dB]

...
0x10_0000	1	0	0x00_0001	9.5x10 ⁻⁷	-120
...	0x00_0000	0	-∞

37.3.41 DVU0_n Volume Value Setting 1 Register (VOL1R_DVU0_n) (n = 0, 1, 2, 3)

VOL1R_DVU0_n is a 32-bit readable/writable register that sets the digital volume value of channel 1.

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 0	VOLVAL1	All 0	R/W	Digital Volume Value for Channel 1 These bits set the digital volume of channel 1. The maximum value is octupled gain (18 dB) and the minimum value is 0 (-∞ dB). VOLVAL1[23] : Sign bit VOLVAL1[22:20] : Integer bits VOLVAL1[19:0] : Decimal bits

Setting Value	Time	Gain[dB]	Setting Value	Time	Gain[dB]

37.3.48 DVU0_n Enable Register (DVUER_DVU0_n) (n = 0, 1, 2, 3)

DVUER_DVU0_n is a 32-bit readable/writable register that enables or disables the DVU register settings.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	DVUEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	DVUEN	0	R/W	DVU Register Setting Enable This bit controls the setting of DVU registers (ZCMCR, VRCTR, VRPDR, VRDBR, VOL0R, VOL1R, VOL2R, VOL3R, VOL4R, VOL5R, VOL6R, and VOL7R). 0: Disables the setting of DVU registers. 1: Enables the setting of DVU registers.

37.3.49 DVU0_n Status Register (DVUSR_DVU0_n) (n = 0, 1, 2, 3)

DVUSR_DVU0_n is a 32-bit read-only register that indicates the status of zero cross mute and volume ramp.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	ZSTS7	ZSTS6	ZSTS5	ZSTS4	ZSTS3	ZSTS2	ZSTS1	ZSTS0

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23	ZSTS7	0	R	Zero Cross Mute Status of Channel 7 This bit indicates the zero cross mute status of channel 7. 0: Not in mute status 1: Mute status
22	ZSTS6	0	R	Zero Cross Mute Status of Channel 6 This bit indicates the zero cross mute status of channel 6. 0: Not in mute status 1: Mute status
21	ZSTS5	0	R	Zero Cross Mute Status of Channel 5 This bit indicates the zero cross mute status of channel 5. 0: Not in mute status 1: Mute status
20	ZSTS4	0	R	Zero Cross Mute Status of Channel 4 This bit indicates the zero cross mute status of channel 4. 0: Not in mute status 1: Mute status
19	ZSTS3	0	R	Zero Cross Mute Status of Channel 3 This bit indicates the zero cross mute status of channel 3. 0: Not in mute status 1: Mute status
18	ZSTS2	0	R	Zero Cross Mute Status of Channel 2 This bit indicates the zero cross mute status of channel 2. 0: Not in mute status 1: Mute status
17	ZSTS1	0	R	Zero Cross Mute Status of Channel 1 This bit indicates the zero cross mute status of channel 1. 0: Not in mute status 1: Mute status
16	ZSTS0	0	R	Zero Cross Mute Status of Channel 0 This bit indicates the zero cross mute status of channel 0. 0: Not in mute status 1: Mute status
15 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	VRSTS	All 0	R	Volume Ramp Status These bits indicate the volume ramp status. 000: Mute status 001: Volume ramp down 010: Volume ramp up 011: Level of volume ramp is in the state of the value of VRDBR register 100: Volume of input data is maintained (Volume is not multiplied). 101 to 111: Reserved

37.3.50 DVU0_n Event Mask Register (VEVMR_DVU0_n) (n = 0, 1, 2, 3)

VEVMR_DVU0_n is a 32-bit readable/writable register that enables or disables SCUDVIn interrupt requests.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	VEVMZCM7	VEVMZCM6	VEVMZCM5	VEVMZCM4	VEVMZCM3	VEVMZCM2	VEVMZCM1	VEVMZCM0	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/(W) ¹	R/(W) ¹	R/(W) ¹	R/(W) ¹	R/(W) ¹	R/(W) ¹	R/(W) ¹	R/(W) ¹	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VEVMVR	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/(W) ¹	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	VEVMZCM7	0	R/W	Zero Cross Mute Status Change Mask of Channel 7 This bit sets whether to mask the interrupt request from the VEVCZCM7 bit in the VEVCVCR_DVU0_n register. 0: Disables interrupts. 1: Enables interrupts.
30	VEVMZCM6	0	R/W	Zero Cross Mute Status Change Mask of Channel 6 This bit sets whether to mask the interrupt request from the VEVCZCM6 bit in the VEVCVCR_DVU0_n register. 0: Disables interrupts. 1: Enables interrupts.
29	VEVMZCM5	0	R/W	Zero Cross Mute Status Change Mask of Channel 5 This bit sets whether to mask the interrupt request from the VEVCZCM5 bit in the VEVCVCR_DVU0_n register. 0: Disables interrupts. 1: Enables interrupts.
28	VEVMZCM4	0	R/W	Zero Cross Mute Status Change Mask of Channel 4 This bit sets whether to mask the interrupt request from the VEVCZCM4 bit in the VEVCVCR_DVU0_n register. 0: Disables interrupts. 1: Enables interrupts.
27	VEVMZCM3	0	R/W	Zero Cross Mute Status Change Mask of Channel 3 This bit sets whether to mask the interrupt request from the VEVCZCM3 bit in the VEVCVCR_DVU0_n register. 0: Disables interrupts. 1: Enables interrupts.
26	VEVMZCM2	0	R/W	Zero Cross Mute Status Change Mask of Channel 2 This bit sets whether to mask the interrupt request from the VEVCZCM2 bit in the VEVCVCR_DVU0_n register. 0: Disables interrupts. 1: Enables interrupts.
25	VEVMZCM1	0	R/W	Zero Cross Mute Status Change Mask of Channel 1 This bit sets whether to mask the interrupt request from the VEVCZCM1 bit in the VEVCVCR_DVU0_n register. 0: Disables interrupts. 1: Enables interrupts.
24	VEVMZCM0	0	R/W	Zero Cross Mute Status Change Mask of Channel 0 This bit sets whether to mask the interrupt request from the VEVCZCM0 bit in the VEVCVCR_DVU0_n register. 0: Disables interrupts. 1: Enables interrupts.
23 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	VEVMVR	0	R/W	Volume Ramp Status Change This bit sets whether to mask the interrupt request from the VEVCVCR bit in the VEVCVCR_DVU0_n register. 0: Disables interrupts. 1: Enables interrupts.

Bit	Bit Name	Initial Value	R/W	Description
14 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

37.3.51 DVU0_n Event Clear Register (VEVCR_DVU0_n) (n = 0, 1, 2, 3)

VEVCR_DVU0_n is a 32-bit readable/writable register that clears SCUDVIn interrupt requests. When an interrupt event is generated, the relevant bit in this register is automatically set to 1 and 1 is retained until 0 is written to that bit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	VEVC ZCM7	VEVC ZCM6	VEVC ZCM5	VEVC ZCM4	VEVC ZCM3	VEVC ZCM2	VEVC ZCM1	VEVC ZCM0	-	-	-	-	-	-	-	-

R/W:	R/(W) ^{*1}	R/(W) ^{*1}	R/(W) ^{*1}	R/(W) ^{*1}	R/(W) ^{*1}	R/(W) ^{*1}	R/(W) ^{*1}	R/(W) ^{*1}	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VEV CVR	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/(W) ^{*1}	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	VEVCZCM7	0	R/(W) ^{*1}	Zero Cross Mute Status Change Clear of Channel 7 This is an interrupt flag to indicate whether the zero cross mute status change of channel 7 occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
30	VEVCZCM6	0	R/(W) ^{*1}	Zero Cross Mute Status Change Clear of Channel 6 This is an interrupt flag to indicate whether the zero cross mute status change of channel 6 occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
29	VEVCZCM5	0	R/(W) ^{*1}	Zero Cross Mute Status Change Clear of Channel 5 This is an interrupt flag to indicate whether the zero cross mute status change of channel 5 occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
28	VEVCZCM4	0	R/(W) ^{*1}	Zero Cross Mute Status Change Clear of Channel 4 This is an interrupt flag to indicate whether the zero cross mute status change of channel 4 occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
27	VEVCZCM3	0	R/(W) ^{*1}	Zero Cross Mute Status Change Clear of Channel 3 This is an interrupt flag to indicate whether the zero cross mute status change of channel 3 occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
26	VEVCZCM2	0	R/(W) ^{*1}	Zero Cross Mute Status Change Clear of Channel 2 This is an interrupt flag to indicate whether the zero cross mute status change of channel 2 occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
25	VEVCZCM1	0	R/(W) ^{*1}	Zero Cross Mute Status Change Clear of Channel 1 This is an interrupt flag to indicate whether the zero cross mute status change of channel 1 occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
24	VEVCZCM0	0	R/(W) ^{*1}	Zero Cross Mute Status Change Clear of Channel 0 This is an interrupt flag to indicate whether the zero cross mute status change of channel 0 occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
23 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
15	VEVCVR	0	R/(W)*1	Volume Ramp Status Change Clear This is an interrupt flag to judge volume ramp mute occurs or not. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
14 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note 1. Readable/writable. When 0 is written, the bit is initialized. Writing 1 to the bit is ignored. Write 0 only to each bit corresponding to the interrupt source to be cleared; write 1 to other bits.

37.3.52 MIX0_0 Initialization Register (MIXIR_MIX0_0)

MIXIR_MIX0_0 is a 32-bit readable/writable register that initializes the MIX internal circuit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	INIT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INIT	1	R/W	Initialization When this bit is set to 1, the MIX internal circuit is initialized. To cancel the initialization, set this bit to 0 with it set to 1. 0: Processing State 1: Initialization (sets the initial setting of other registers)

37.3.53 MIX0_0 Audio Information Register (MADIR_MIX0_0)

MADIR_MIX0_0 is a 32-bit readable/writable register that sets the number of channels.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	CHNUM			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	CHNUM	All 0	R/W	Number of Channels These bits set the number of channels. 0000: Zero (None) 0001: 1 channel 0010: 2 channels 0011: Reserved 0100: 4 channels 0101: Reserved 0110: 6 channels 0111: Reserved 1000: 8 channels 1001 to 1111: Reserved

37.3.54 MIX0_0 Bypass Register (MIXBR_MIX0_0)

MIXBR_MIX0_0 is a 32-bit readable/writable register that sets the bypass mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	BPSYS
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	BY PASS
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
17, 16	BPSYS	All 0	R/W	Bypass System Select This bit selects the input data output from the MIX module when the BYPASS bit is set to 1. 00: Input data of system A 01: Input data of system B 10: Input data of system C 11: Input data of system D
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	BYPASS	0	R/W	Bypass Mode This bit controls the data pass of MIX function. 0: MIX function is used. Input data is processed by MIX and then the result data is connected to output data. 1: SRC function is not used. Input data is connected to output data according to the BPSYS bits.

37.3.55 MIX0_0 Mode Register (MIXMR_MIX0_0)

MIXMR_MIX0_0 is a 32-bit readable/writable register that selects the MIX mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	MIX MODE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	MIXMODE	0	R/W	MIX mode This bit sets the mix mode. 0: Selects volume step mixer. 1: Selects volume ramp mixer.

37.3.56 MIX0_0 Volume Period Register (MVPDR_MIX0_0)

MVPDR_MIX0_0 is a 32-bit readable/writable register that sets the ramp time of volume ramp.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	MXPDPUP				-	-	-	-	MXPDDW			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 8	MXPDPUP	0	R/W	Volume Up Period These bits set the decibel which changes per sample during volume up. This setting is used when the MIXMODE bit in the MIXMR register is set to 1. 0000: 128 dB/1 sample 0001: 64 dB/1 sample 0010: 32 dB/1 sample 0011: 16 dB/1 sample 0100: 8 dB/1 sample 0101: 4 dB/1 sample 0110: 2 dB/1 sample 0111: 1 dB/1 sample 1000: 0.5 dB/1 sample 1001: 0.25 dB/1 sample 1010: 0.125 dB/1 sample 1011 to 1111: Reserved
7 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	MXPDDW	0	R/W	Volume Down Period These bits set the decibel which changes per sample during volume down. This setting is used when the MIXMODE bit in the MIXMR register is set to 1. 0000: -128 dB/1 sample 0001: -64 dB/1 sample 0010: -32 dB/1 sample 0011: -16 dB/1 sample 0100: -8 dB/1 sample 0101: -4 dB/1 sample 0110: -2 dB/1 sample 0111: -1 dB/1 sample 1000: -0.5 dB/1 sample 1001: -0.25 dB/1 sample 1010: -0.125 dB/1 sample 1011 to 1111: Reserved

37.3.57 MIX0_0 Decibel A Register (MDBAR_MIX0_0)

MDBAR_MIX0_0 is a 32-bit readable/writable register that sets the gain level (decibel units) of system A.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	MIXDBA									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	MIXDBA	All 0	R/W	dDecibel of System A These bits set the decibel (gain level) of volume ramp. The value can be selected from 1024 points in the range of 0 dB to -∞ dB at intervals of 0.125 dB.

Setting Value	Time	Gain[dB]	Setting Value	Time	Gain[dB]

37.3.61 MIX0_0 Decibel Enable Register (MDBER_MIX0_0)

MDBER_MIX0_0 is a 32-bit readable/writable register that enable or disables the MIX decibel register settings.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	MIXDB EN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	MIXDBEN	0	R/W	MIX Decibel Enable This bit controls the decibel dB set in MDBAR, MDBBR, MDBCR and MDBDR registers. 0: Disables the setting of decibel. 1: Enables the setting of decibel.

37.3.62 MIX0_0 Status Register (MIXSR_MIX0_0)

MIXSR_MIX0_0 is a 32-bit read-only register that indicates the status of the MIX.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	MIXSTS
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	MIXSTS	All 0	R	MIX Status This bit specifies the status of ramp process. 00: Ramp process is unchanged. 01: Ramp down 10: Ramp up

37.3.63 Software Reset Register (SWRSR_CIM)

SWRSR_CIM is a 32-bit readable/writable register that initializes the SCUX internal circuit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	SWRST
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SWRST	1	R/W	While this bit is set to 0, the SCUX internal circuit is reset. Registers except this register are reset. Therefore, they should be set again after the reset is canceled. 0: The SCUX is reset. 1: The SCUX is operating.

37.3.64 DMA Control Register (DMACR_CIM)

DMACR_CIM is a 32-bit readable/writable register that controls DMA execution.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	DMAM DFFU3	DMAM DFFU2	DMAM DFFU1	DMAM DFFU0	DMAM DFFD3	DMAM DFFD2	DMAM DFFD1	DMAM DFFD0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	—	All 0	R/W	Reserved The write value should always be 0.
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	DMAMDFFU3	0	R/W	FFU0_3 DMA Mode 0: Disables DMA transfer to DMATD3_CIM. 1: Enables DMA transfer to DMATD3_CIM. Note: When DMA transfer is enabled, disable packet requests sent to the interrupt controller. (Set the UEVMR_FFU0_3.UEVMRQ bit to 0.)
6	DMAMDFFU2	0	R/W	FFU0_2 DMA Mode 0: Disables DMA transfer to DMATD2_CIM. 1: Enables DMA transfer to DMATD2_CIM. Note: When DMA transfer is enabled, disable packet requests sent to the interrupt controller. (Set the UEVMR_FFU0_2.UEVMRQ bit to 0.)
5	DMAMDFFU1	0	R/W	FFU0_1 DMA Mode 0: Disables DMA transfer to DMATD1_CIM. 1: Enables DMA transfer to DMATD1_CIM. Note: When DMA transfer is enabled, disable packet requests sent to the interrupt controller. (Set the UEVMR_FFU0_1.UEVMRQ bit to 0.)
4	DMAMDFFU0	0	R/W	FFU0_0 DMA Mode 0: Disables DMA transfer to DMATD0_CIM. 1: Enables DMA transfer to DMATD0_CIM. Note: When DMA transfer is enabled, disable packet requests sent to the interrupt controller. (Set the UEVMR_FFU0_0.UEVMRQ bit to 0.)
3	DMAMDFFD3	0	R/W	FFD0_3 DMA Mode 0: Disables DMA transfer to DMATD3_CIM. 1: Enables DMA transfer to DMATD3_CIM. Note: When DMA transfer is enabled, disable packet requests sent to the interrupt controller. (Set the DEVMR_FFD0_3.DEVMRQ bit to 0.)
2	DMAMDFFD2	0	R/W	FFD0_2 DMA Mode 0: Disables DMA transfer to DMATD2_CIM. 1: Enables DMA transfer to DMATD2_CIM. Note: When DMA transfer is enabled, disable packet requests sent to the interrupt controller. (Set the DEVMR_FFD0_2.DEVMRQ bit to 0.)
1	DMAMDFFD1	0	R/W	FFD0_1 DMA Mode 0: Disables DMA transfer to DMATD1_CIM. 1: Enables DMA transfer to DMATD1_CIM. Note: When DMA transfer is enabled, disable packet requests sent to the interrupt controller. (Set the DEVMR_FFD0_1.DEVMRQ bit to 0.)
0	DMAMDFFD0	0	R/W	FFD0_0 DMA Mode 0: Disables DMA transfer to DMATD0_CIM. 1: Enables DMA transfer to DMATD0_CIM. Note: When DMA transfer is enabled, disable packet requests sent to the interrupt controller. (Set the DEVMR_FFD0_0.DEVMRQ bit to 0.)

37.3.65 DMA Transfer Register for FFD0_n (DMATDn_CIM) (n = 0, 1, 2, 3)

DMATDn_CIM is a 32-bit register that stores the data to be transmitted to FFD0_n. The data written to DMATDn_CIM is automatically stored in FFD0_n. When the number of idle data bytes in FFD0_n becomes equal to or greater than the value set in DRQSR_FFD0_n.SIZE, a data transfer request is issued. When the DMA controller is used (DMACR_CIM.DMAMDFFDn = 1), a transfer request for the number of counts set in DRQSR_FFD0_n.SIZE is sent to the DMA controller. When the interrupt controller is used (DEVMR_FFD0_n.DEVMRQ = 1), data is written in this register for the number of counts set in DRQSR_FFD0_n.SIZE.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W:	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W:	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

In the SCUX internal block, audio data is handled in the 24-bit big endian format. When this register is accessed in 32-bit units, the lower eight bits are not used and only the upper 24 bits are used, as shown in Figure 37.2. When the SCUX is used in 16-bit mode, the valid data needs to be located at the MSB of audio data. Therefore, when this register is accessed in 16-bit units, the written data is located in the upper 16 bits of audio data and the lower eight bits are fixed to 0 in the CIM block. When the SCUX is used in 16-bit mode and this register is accessed in 32-bit units, since bits [15:8] of the data to be written is passed to the FFD block without change, 0 should be written to bits [15:8].

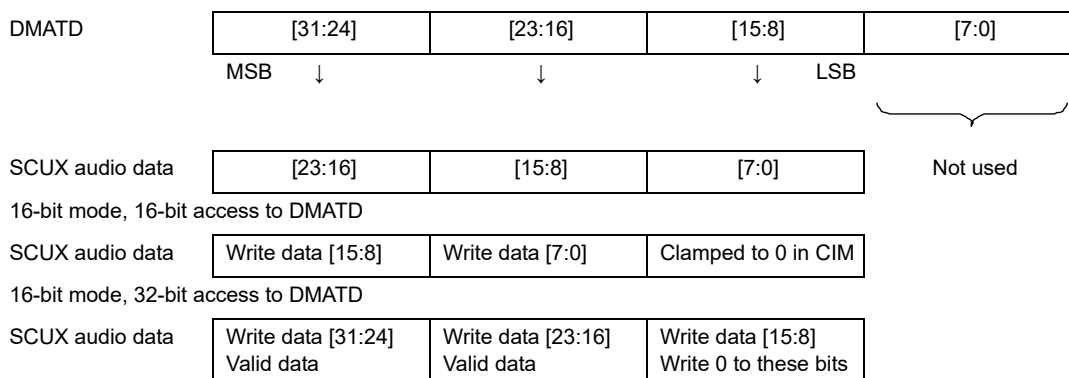

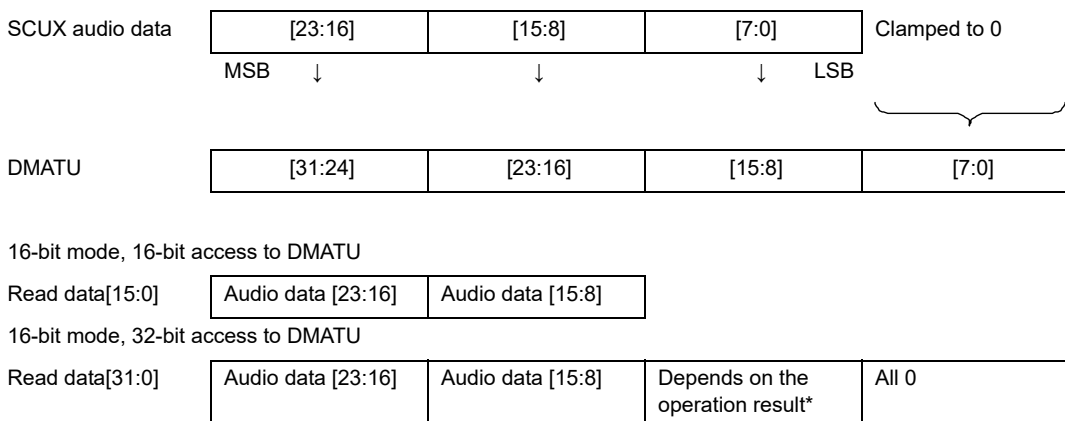

Figure 37.2 Data Alignment of DMATDn_CIM

37.3.66 DMA Transfer Register for FFU0_n (DMATUn_CIM) (n = 0, 1, 2, 3)

DMATUn_CIM is a 32-bit register that stores the data received from FFU0_n. When data is read from DMATUn_CIM, the next data is automatically transferred from FFU0_n. When the number of data bytes in FFU0_n becomes equal to or greater than the value set in URQSR_FFU0_n.SIZE, a data transfer request is issued. When the DMA controller is used (DMACR_CIM.DMAMDFFU_n = 1), a transfer request for the number of counts set in URQSR_FFU0_n.SIZE is sent to the DMA controller. When the interrupt controller is used (UEVMR_FFU0_n.UEVMRQ = 1), data is read from this register for the number of counts set in URQSR_FFU0_n.SIZE.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

When this register is accessed in 32-bit units, audio data is located in the upper 24 bits and the lower eight bits are always read as 0, as shown in Figure 37.3. When this register is accessed in 16-bit units, the upper 16 bits of audio data are read as valid data. When the SCUX is used in 16-bit mode and this register is accessed in 32-bit units, the lower eight bits are always read as 0 and bits [15:8] of the read data are read as a value dependent on the internal operation result in the SRC.

Note: * All 1 when the internal operation result of the SRC is 0x7FFFFFFF; otherwise, all 0.
Even when used in 16-bit mode, operation is performed in 24-bit units.

Figure 37.3 Data Alignment of DMATUn_CIM

37.3.67 SSI Route Select Register (SSIRSEL_CIM)

SSIRSEL_CIM is a 32-bit readable/writable register that selects the SSIF channel to be connected to each SRC during direct transfer with the SSIF module. This register setting has no meaning when a route between the FFD or FFU module is selected. The IPSLR_IPC0_n and OPSLR_OPC0_n registers are used to select connection between the SSIF or FFD/FFU module. The DVUBR_DVU0_n register is used to specify whether the DVU is used or not.

37.3.68 FFD0_n Timing Select Register (FDTSELn_CIM) (n = 0, 1, 2, 3)

FDTSELn_CIM is a 32-bit readable/writable register that selects the input timing signal to be used in SRCn (n = 0, 1, 2, 3) when asynchronous mode is selected. This register setting is used only when the route with the FFD module is selected.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SCKDIV	All 0	R/W	Division Ratio These bits specify the ratio for dividing the input clock specified in the SCKSEL bits to generate the timing signal. Note: Always write 0 to bit 16. (Writing 1 to bit 16 is ignored.) When all of these bits are set to 0, the division ratio is 1. Only the input clock selected by SCKSEL[3] = 0 will be divided. The WS signal selected by SCKSEL[3] = 1 will not be divided. The DIVEN bit must be set to 0 before changing these bits.
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	DIVEN	0	R/W	Division Enable Frequency division starts the moment 1 is written to this bit. 1: Starts frequency division. 0: Outputs 0.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	MTUSEL	0	R/W	MTU Select This bit selects the clock signal specified by setting the SCKSEL bits to 0101 from the multi-function timer pulse unit 2. 0: Uses TIOC3A. 1: Uses TIOC4A
3 to 0	SCKSEL	All 0	R/W	Clock Select These bits select the clock that is used in generating the timing signal. 0000: Uses AUDIO_CLK. 0001: Uses the AUDIO_X1 input. 0010: Uses MLB_CLK. 0011: Uses USB_X1. 0100: Uses the peripheral clock 1 (P1 ϕ) divided into 2. 0101: Uses the signal specified by the MTUSEL bit. 0110 and 0111: Setting prohibited 1000: Uses the WS signal of SSIF0. 1001: Uses the WS signal of SSIF1. 1010: Uses the WS signal of SSIF2. 1011: Uses the WS signal of SSIF3. 1100 to 1111: Setting prohibited Note: The DIVEN bit must be set to 0 before changing these bits.

The input timing signal selector has the configuration shown in Figure 37.4.

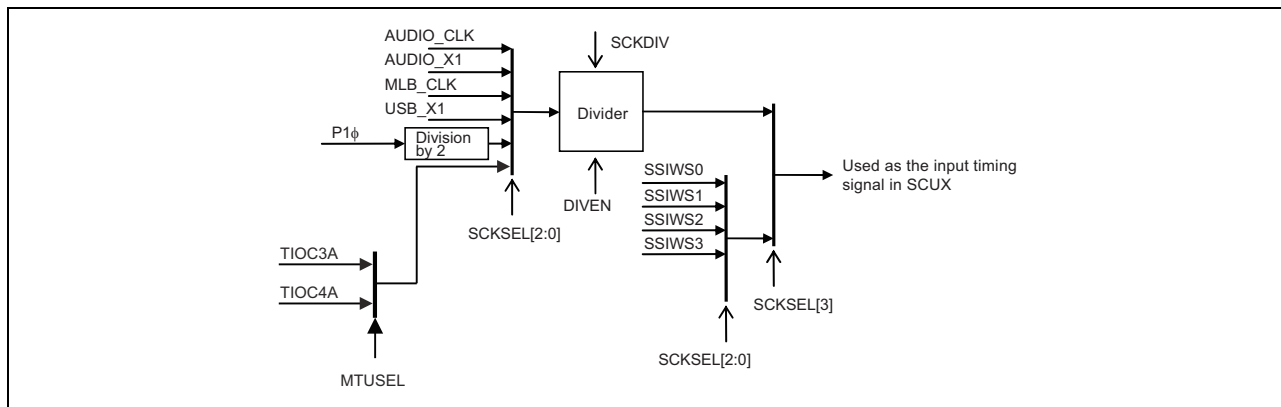

Figure 37.4 Configuration Diagram of Input Timing Signal Selector

37.3.69 FFU0_n Timing Select Register (FDTSELn_CIM) (n = 0, 1, 2, 3)

FDTSELn_CIM is a 32-bit writable register that selects the output timing signal to be used in SRCn (n = 0, 1, 2, 3) when asynchronous mode is selected. This register setting is used when the route with the FFU module is selected or when output to the MIX is selected.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	-	-	-	-	-	-	-	W	-	-	-	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	—	Reserved The write value should always be 0.
26 to 16	SCKDIV	All 0	W	Division Ratio These bits specify the ratio for dividing the input clock specified in the SCKSEL bits to generate the timing signal. Note: Always write 0 in bit 16. (Writing 1 to bit 16 is ignored.) When all of these bits are set to 0, the division ratio is 1. Only the input clock selected by SCKSEL[3] = 0 will be divided. The WS signal selected by SCKSEL[3] = 1 will not be divided. The DIVEN bit must be set to 0 before changing these bits.
15 to 9	—	All 0	—	Reserved The write value should always be 0.
8	DIVEN	0	W	Division Enable Frequency division starts the moment 1 is written to this bit. 1: Starts frequency division. 0: Outputs 0.
7 to 5	—	All 0	—	Reserved The write value should always be 0.
4	MTUSEL	0	W	MTU Select This bit selects the clock signal specified by setting the SCKSEL bits to 0101 from the multi-function timer pulse unit 2. 0: Uses TIOC3A. 1: Uses TIOC4A.
3 to 0	SCKSEL	All 0	W	Clock Select These bits select the clock that is used in generating the timing signal. 0000: Uses AUDIO_CLK. 0001: Uses AUDIO_X1 input. 0010: Uses MLB_CLK. 0011: Uses USB_X1. 0100: Uses the peripheral clock 1 (P1 ϕ) divided into 2. 0101: Uses the signal specified by the MTUSEL bit. 0110 and 0111: Setting prohibited 1000: Uses the WS signal of SSIF0. 1001: Uses the WS signal of SSIF1. 1010: Uses the WS signal of SSIF2. 1011: Uses the WS signal of SSIF3. 1100 to 1111: Setting prohibited Note: The DIVEN bit must be set to 0 before changing these bits.

The output timing signal selector has the configuration shown in Figure 37.5.

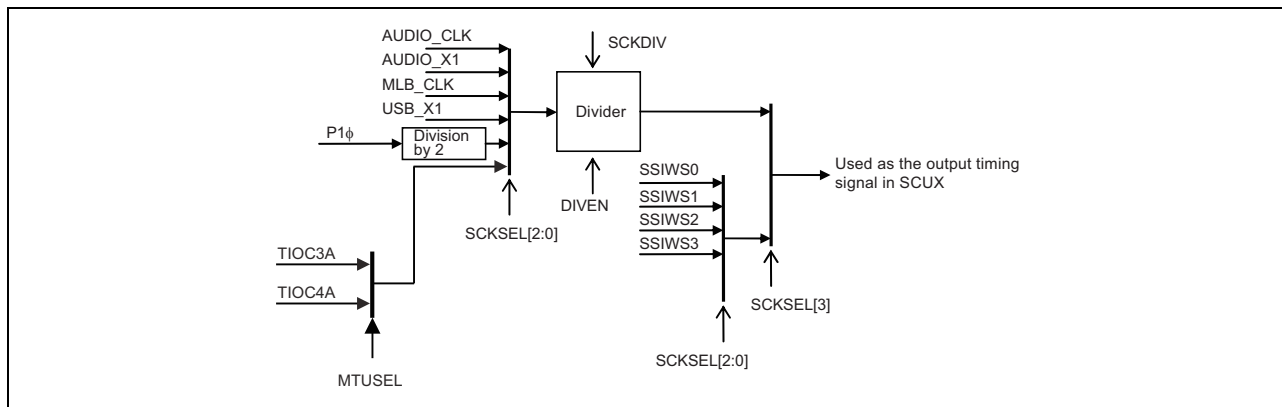

Figure 37.5 Configuration Diagram of Output Timing Signal Selector

37.3.70 SSI Pin Mode Register (SSIPMD_CIM)

SSIPMD_CIM is a 32-bit readable/writable register that sets the pin mode of the SSIF.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	SSI3 CKS	SSI2 CKS	SSI1 CKS	SSI0 CKS

R/W:	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 22	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
21, 20	—	All 0	R/W	Reserved The write value should always be 0.
19	SSI3CKS	0	R/W	SSIF3 Clock Select This bit selects the clock to be connected to the AUDIO_CLK pin of the SSIF3 module. 0: Selects the AUDIO_CLK input. 1: Selects the MLB_CLK input. Note: When selecting AUDIO_CLK or MLB_CLK as the oversampling clock of the SSIF3 module, SSICR3.CKS = 1 must also be set in the SSIF3 module.
18	SSI2CKS	0	R/W	SSIF2 Clock Select This bit selects the clock to be connected to the AUDIO_CLK pin of the SSIF2 module. 0: Selects the AUDIO_CLK input. 1: Selects the MLB_CLK input. Note: When selecting AUDIO_CLK or MLB_CLK as the oversampling clock of the SSIF2 module, SSICR2.CKS = 1 must also be set in the SSIF2 module.
17	SSI1CKS	0	R/W	SSIF1 Clock Select This bit selects the clock to be connected to the AUDIO_CLK pin of the SSIF1 module. 0: Selects the AUDIO_CLK input. 1: Selects the MLB_CLK input. Note: When selecting AUDIO_CLK or MLB_CLK as the oversampling clock of the SSIF1 module, SSICR1.CKS = 1 must also be set in the SSIF1 module.
16	SSIOCKS	0	R/W	SSIF0 Clock Select This bit selects the clock to be connected to the AUDIO_CLK pin of the SSIF0 module. 0: Selects the AUDIO_CLK input. 1: Selects the MLB_CLK input. Note: When selecting AUDIO_CLK or MLB_CLK as the oversampling clock of the SSIF0 module, SSICR0.CKS = 1 must also be set in the SSIF0 module.
15, 14	SSI3PMD	00	R/W	SSIF3 Pin Mode These bits select connection of the SSISCK3 and SSIWS3 pins. 00: The pins are used independently. 01: The SSIF0 pins are used in common. Both SSIF0 and SSIF3 are slaves. 10: The SSIF0 pins are used in common. SSIF0 is the master and SSIF3 is the slave. 11: Setting prohibited
13	—	All 0	R/W	Reserved This bits is always read as 0. The write value should always be 0.
12 to 8	—	All 0	R/W	Reserved The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SSI012EN	0	R/W	SSI012 Enable This bit selects whether the three modules SSIF0, SSIF1, and SSIF2 are used to provide six channels at transmission. 0: Not handled as six channels. 1: Handled as six channels. Note: This bit can be set to 1 only when the SSI1PMD and SSI2PMD bits of this register are both set to 01 or 10. Usage of six channels at reception can be specified by SSIRSEL_CIM.SISEL0.
3, 2	SSI2PMD	00	R/W	SSI2 Pin Mode These bits select connection of the SSISCK2 and SSIWS2 pins. 00: The pins are used independently. 01: The SSIF0 pins are used in common. Both SSIF0 and SSIF2 are slaves. 10: The SSIF0 pins are used in common. SSIF0 is the master and SSIF2 is the slave. 11: Setting prohibited
1, 0	SSI1PMD	00	R/W	SSI1 Pin Mode These bits select connection of the SSISCK1 and SSIWS1 pins. 00: The pins are used independently. 01: The SSIF0 pins are used in common. Both SSIF0 and SSIF1 are slaves. 10: The SSIF0 pins are used in common. SSIF0 is the master and SSIF1 is the slave. 11: Setting prohibited

37.3.71 SSI Control Register (SSICTRL_CIM)

SSIPCTRL_CIM is a 32-bit readable/writable register that controls connection with the SSIF module and starting and stopping of the module.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

8	SSI2RX	0	W	SSIF2 Direct Reception 0: Disables direct reception from SSIF2. 1: Enables direct reception from SSIF2.
7 to 2	—	All 0	—	Reserved The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
1	SSI012TEN	0	W	<p>SSIF012 Transmission Enable</p> <p>This bit specifies transmission in three modules SSIF0, SSIF1, and SSIF2 to be started or stopped simultaneously.</p> <p>0: Stops transmission in SSIF0, SSIF1, and SSIF2.</p> <p>1: Starts transmission in SSIF0, SSIF1, and SSIF2.</p> <p>Note: This function can be used only when SSIPMD_CIM.SSI012EN = 1.</p> <p>When SSIPMD_CIM.SSI012EN = 0, SSIF modules should be controlled using SSICRn.TEN.</p> <p>This bit must be set to 0 when performing direct transmission to SSIF0, SSIF1, or SSIF2.</p>
0	SSI012REN	0	W	<p>SSIF012 Reception Enable</p> <p>This bit specifies reception in three modules SSIF0, SSIF1, and SSIF2 to be started or stopped simultaneously.</p> <p>0: Stops reception in SSIF0, SSIF1, and SSIF2.</p> <p>1: Starts reception in SSIF0, SSIF1, and SSIF2.</p> <p>Note: This function can be used only when SSIRSEL_CIM.SISEL0 = 01.</p> <p>When SSIRSEL_CIM.SISEL0 = 00, SSIF modules should be controlled using SSICRn.REN.</p> <p>This bit must be set to 0 when performing direct reception from SSIF0, SSIF1, or SSIF2.</p>

37.3.72 SRCn Route Select Register (SRCRSELn_CIM) (n = 0, 1, 2, 3)

SRCRSEL_CIM is a 32-bit readable/writable register that sets the route for the data that is input to the SRC.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	PLACE7			-	PLACE6			-	PLACE5			-	PLACE4		
Initial value:	0	1	1	1	0	1	1	0	0	1	0	1	0	1	0	0
R/W:	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	PLACE3			-	PLACE2			-	PLACE1			-	PLACE0		
Initial value:	0	0	1	1	0	0	1	0	0	0	0	1	0	0	0	0
R/W:	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 28	PLACE7	111	R/W	Place 7 Stream data is rearranged before it is input to the SRC. These bits select data on the input side to be output to place 7 on the output side. 000: Data at place 0 on the input side is output to place 7 on the output side. 001: Data at place 1 on the input side is output to place 7 on the output side. 010: Data at place 2 on the input side is output to place 7 on the output side. 011: Data at place 3 on the input side is output to place 7 on the output side. 100: Data at place 4 on the input side is output to place 7 on the output side. 101: Data at place 5 on the input side is output to place 7 on the output side. 110: Data at place 6 on the input side is output to place 7 on the output side. 111: Data at place 7 on the input side is output to place 7 on the output side. Note: This bit setting is used when eight channels are set. When six or less channels are set, set these bits to the same value as the initial value.
27	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
26 to 24	PLACE6	110	R/W	Place 6 Stream data is rearranged before it is input to the SRC. These bits select data on the input side to be output to place 6 on the output side. 000: Data at place 0 on the input side is output to place 6 on the output side. 001: Data at place 1 on the input side is output to place 6 on the output side. 010: Data at place 2 on the input side is output to place 6 on the output side. 011: Data at place 3 on the input side is output to place 6 on the output side. 100: Data at place 4 on the input side is output to place 6 on the output side. 101: Data at place 5 on the input side is output to place 6 on the output side. 110: Data at place 6 on the input side is output to place 6 on the output side. 111: Data at place 7 on the input side is output to place 6 on the output side. Note: This bit setting is used when eight channels are set. When six or less channels are set, set these bits to the same value as the initial value.

Bit	Bit Name	Initial Value	R/W	Description
23	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
22 to 20	PLACE5	101	R/W	Place 5 Stream data is rearranged before it is input to the SRC. These bits select data on the input side to be output to place 5 on the output side. 000: Data at place 0 on the input side is output to place 5 on the output side. 001: Data at place 1 on the input side is output to place 5 on the output side. 010: Data at place 2 on the input side is output to place 5 on the output side. 011: Data at place 3 on the input side is output to place 5 on the output side. 100: Data at place 4 on the input side is output to place 5 on the output side. 101: Data at place 5 on the input side is output to place 5 on the output side. 110: Data at place 6 on the input side is output to place 5 on the output side. 111: Data at place 7 on the input side is output to place 5 on the output side. Note: This bit setting is used when six or more channels are set. When four or less channels are set, set these bits to the same value as the initial value.
19	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
18 to 16	PLACE4	100	R/W	Place 4 Stream data is rearranged before it is input to the SRC. These bits select data on the input side to be output to place 4 on the output side. 000: Data at place 0 on the input side is output to place 4 on the output side. 001: Data at place 1 on the input side is output to place 4 on the output side. 010: Data at place 2 on the input side is output to place 4 on the output side. 011: Data at place 3 on the input side is output to place 4 on the output side. 100: Data at place 4 on the input side is output to place 4 on the output side. 101: Data at place 5 on the input side is output to place 4 on the output side. 110: Data at place 6 on the input side is output to place 4 on the output side. 111: Data at place 7 on the input side is output to place 4 on the output side. Note: This bit setting is used when six or more channels are set. When four or less channels are set, set these bits to the same value as the initial value.
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
14 to 12	PLACE3	011	R/W	<p>Place 3</p> <p>Stream data is rearranged before it is input to the SRC. These bits select data on the input side to be output to place 3 on the output side.</p> <p>000: Data at place 0 on the input side is output to place 3 on the output side.</p> <p>001: Data at place 1 on the input side is output to place 3 on the output side.</p> <p>010: Data at place 2 on the input side is output to place 3 on the output side.</p> <p>011: Data at place 3 on the input side is output to place 3 on the output side.</p> <p>100: Data at place 4 on the input side is output to place 3 on the output side.</p> <p>101: Data at place 5 on the input side is output to place 3 on the output side.</p> <p>110: Data at place 6 on the input side is output to place 3 on the output side.</p> <p>111: Data at place 7 on the input side is output to place 3 on the output side.</p> <p>Note: This bit setting is used when four or more channels are set. When two or less channels are set, set these bits to the same value as the initial value.</p>
11	—	0	R	<p>Reserved</p> <p>This bit is always read as 0. The write value should always be 0.</p>
10 to 8	PLACE2	010	R/W	<p>Place 2</p> <p>Stream data is rearranged before it is input to the SRC. These bits select data on the input side to be output to place 2 on the output side.</p> <p>000: Data at place 0 on the input side is output to place 2 on the output side.</p> <p>001: Data at place 1 on the input side is output to place 2 on the output side.</p> <p>010: Data at place 2 on the input side is output to place 2 on the output side.</p> <p>011: Data at place 3 on the input side is output to place 2 on the output side.</p> <p>100: Data at place 4 on the input side is output to place 2 on the output side.</p> <p>101: Data at place 5 on the input side is output to place 2 on the output side.</p> <p>110: Data at place 6 on the input side is output to place 2 on the output side.</p> <p>111: Data at place 7 on the input side is output to place 2 on the output side.</p> <p>Note: This bit setting is used when four or more channels are set. When two or less channels are set, set these bits to the same value as the initial value.</p>
7	—	0	R	<p>Reserved</p> <p>This bit is always read as 0. The write value should always be 0.</p>

Bit	Bit Name	Initial Value	R/W	Description
6 to 4	PLACE1	001	R/W	<p>Place 1</p> <p>Stream data is rearranged before it is input to the SRC. These bits select data on the input side to be output to place 1 on the output side.</p> <p>000: Data at place 0 on the input side is output to place 1 on the output side.</p> <p>001: Data at place 1 on the input side is output to place 1 on the output side.</p> <p>010: Data at place 2 on the input side is output to place 1 on the output side.</p> <p>011: Data at place 3 on the input side is output to place 1 on the output side.</p> <p>100: Data at place 4 on the input side is output to place 1 on the output side.</p> <p>101: Data at place 5 on the input side is output to place 1 on the output side.</p> <p>110: Data at place 6 on the input side is output to place 1 on the output side.</p> <p>111: Data at place 7 on the input side is output to place 1 on the output side.</p>
3	—	0	R	<p>Reserved</p> <p>This bit is always read as 0. The write value should always be 0.</p>
2 to 0	PLACE0	000	R/W	<p>Place 0</p> <p>Stream data is rearranged before it is input to the SRC. These bits select data on the input side to be output to place 0 on the output side.</p> <p>000: Data at place 0 on the input side is output to place 0 on the output side.</p> <p>001: Data at place 1 on the input side is output to place 0 on the output side.</p> <p>010: Data at place 2 on the input side is output to place 0 on the output side.</p> <p>011: Data at place 3 on the input side is output to place 0 on the output side.</p> <p>100: Data at place 4 on the input side is output to place 0 on the output side.</p> <p>101: Data at place 5 on the input side is output to place 0 on the output side.</p> <p>110: Data at place 6 on the input side is output to place 0 on the output side.</p> <p>111: Data at place 7 on the input side is output to place 0 on the output side.</p>

37.3.73 MIX Route Select Register (MIXRSEL_CIM)

MIXRSEL_CIM is a 32-bit readable/writable register that sets the route for the data that is output from the MIX.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	PLACE7			-	PLACE6			-	PLACE5			-	PLACE4		
Initial value:	0	1	1	1	0	1	1	0	0	1	0	1	0	1	0	0
R/W:	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	PLACE3			-	PLACE2			-	PLACE1			-	PLACE0		
Initial value:	0	0	1	1	0	0	1	0	0	0	0	1	0	0	0	0
R/W:	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 28	PLACE7	111	R/W	Place 7 Stream data is rearranged after it is output from the MIX. These bits select data on the input side to be output to place 7 on the output side. 000: Data at place 0 on the input side is output to place 7 on the output side. 001: Data at place 1 on the input side is output to place 7 on the output side. 010: Data at place 2 on the input side is output to place 7 on the output side. 011: Data at place 3 on the input side is output to place 7 on the output side. 100: Data at place 4 on the input side is output to place 7 on the output side. 101: Data at place 5 on the input side is output to place 7 on the output side. 110: Data at place 6 on the input side is output to place 7 on the output side. 111: Data at place 7 on the input side is output to place 7 on the output side. Note: This bit setting is used when eight channels are set. When six or less channels are set, set these bits to the same value as the initial value.
27	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
26 to 24	PLACE6	110	R/W	Place 6 Stream data is rearranged after it is output from the MIX. These bits select data on the input side to be output to place 6 on the output side. 000: Data at place 0 on the input side is output to place 6 on the output side. 001: Data at place 1 on the input side is output to place 6 on the output side. 010: Data at place 2 on the input side is output to place 6 on the output side. 011: Data at place 3 on the input side is output to place 6 on the output side. 100: Data at place 4 on the input side is output to place 6 on the output side. 101: Data at place 5 on the input side is output to place 6 on the output side. 110: Data at place 6 on the input side is output to place 6 on the output side. 111: Data at place 7 on the input side is output to place 6 on the output side. Note: This bit setting is used when eight channels are set. When six or less channels are set, set these bits to the same value as the initial value.

Bit	Bit Name	Initial Value	R/W	Description
23	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
22 to 20	PLACE5	101	R/W	Place 5 Stream data is rearranged after it is output from the MIX. These bits select data on the input side to be output to place 5 on the output side. 000: Data at place 0 on the input side is output to place 5 on the output side. 001: Data at place 1 on the input side is output to place 5 on the output side. 010: Data at place 2 on the input side is output to place 5 on the output side. 011: Data at place 3 on the input side is output to place 5 on the output side. 100: Data at place 4 on the input side is output to place 5 on the output side. 101: Data at place 5 on the input side is output to place 5 on the output side. 110: Data at place 6 on the input side is output to place 5 on the output side. 111: Data at place 7 on the input side is output to place 5 on the output side. Note: This bit setting is used when six or more channels are set. When four or less channels are set, set these bits to the same value as the initial value.
19	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
18 to 16	PLACE4	100	R/W	Place 4 Stream data is rearranged after it is output from the MIX. These bits select data on the input side to be output to place 4 on the output side. 000: Data at place 0 on the input side is output to place 4 on the output side. 001: Data at place 1 on the input side is output to place 4 on the output side. 010: Data at place 2 on the input side is output to place 4 on the output side. 011: Data at place 3 on the input side is output to place 4 on the output side. 100: Data at place 4 on the input side is output to place 4 on the output side. 101: Data at place 5 on the input side is output to place 4 on the output side. 110: Data at place 6 on the input side is output to place 4 on the output side. 111: Data at place 7 on the input side is output to place 4 on the output side. Note: This bit setting is used when six or more channels are set. When four or less channels are set, set these bits to the same value as the initial value.
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
14 to 12	PLACE3	011	R/W	<p>Place 3</p> <p>Stream data is rearranged after it is output from the MIX. These bits select data on the input side to be output to place 3 on the output side.</p> <p>000: Data at place 0 on the input side is output to place 3 on the output side.</p> <p>001: Data at place 1 on the input side is output to place 3 on the output side.</p> <p>010: Data at place 2 on the input side is output to place 3 on the output side.</p> <p>011: Data at place 3 on the input side is output to place 3 on the output side.</p> <p>100: Data at place 4 on the input side is output to place 3 on the output side.</p> <p>101: Data at place 5 on the input side is output to place 3 on the output side.</p> <p>110: Data at place 6 on the input side is output to place 3 on the output side.</p> <p>111: Data at place 7 on the input side is output to place 3 on the output side.</p> <p>Note: This bit setting is used when four or more channels are set. When two or less channels are set, set these bits to the same value as the initial value.</p>
11	—	0	R	<p>Reserved</p> <p>This bit is always read as 0. The write value should always be 0.</p>
10 to 8	PLACE2	010	R/W	<p>Place 2</p> <p>Stream data is rearranged after it is output from the MIX. These bits select data on the input side to be output to place 2 on the output side.</p> <p>000: Data at place 0 on the input side is output to place 2 on the output side.</p> <p>001: Data at place 1 on the input side is output to place 2 on the output side.</p> <p>010: Data at place 2 on the input side is output to place 2 on the output side.</p> <p>011: Data at place 3 on the input side is output to place 2 on the output side.</p> <p>100: Data at place 4 on the input side is output to place 2 on the output side.</p> <p>101: Data at place 5 on the input side is output to place 2 on the output side.</p> <p>110: Data at place 6 on the input side is output to place 2 on the output side.</p> <p>111: Data at place 7 on the input side is output to place 2 on the output side.</p> <p>Note: This bit setting is used when four or more channels are set. When two or less channels are set, set these bits to the same value as the initial value.</p>
7	—	0	R	<p>Reserved</p> <p>This bit is always read as 0. The write value should always be 0.</p>

Bit	Bit Name	Initial Value	R/W	Description
6 to 4	PLACE1	001	R/W	<p>Place 1</p> <p>Stream data is rearranged after it is output from the MIX. These bits select data on the input side to be output to place 1 on the output side.</p> <p>000: Data at place 0 on the input side is output to place 1 on the output side.</p> <p>001: Data at place 1 on the input side is output to place 1 on the output side.</p> <p>010: Data at place 2 on the input side is output to place 1 on the output side.</p> <p>011: Data at place 3 on the input side is output to place 1 on the output side.</p> <p>100: Data at place 4 on the input side is output to place 1 on the output side.</p> <p>101: Data at place 5 on the input side is output to place 1 on the output side.</p> <p>110: Data at place 6 on the input side is output to place 1 on the output side.</p> <p>111: Data at place 7 on the input side is output to place 1 on the output side.</p>
3	—	0	R	<p>Reserved</p> <p>This bit is always read as 0. The write value should always be 0.</p>
2 to 0	PLACE0	000	R/W	<p>Place 0</p> <p>Stream data is rearranged after it is output from the MIX. These bits select data on the input side to be output to place 0 on the output side.</p> <p>000: Data at place 0 on the input side is output to place 0 on the output side.</p> <p>001: Data at place 1 on the input side is output to place 0 on the output side.</p> <p>010: Data at place 2 on the input side is output to place 0 on the output side.</p> <p>011: Data at place 3 on the input side is output to place 0 on the output side.</p> <p>100: Data at place 4 on the input side is output to place 0 on the output side.</p> <p>101: Data at place 5 on the input side is output to place 0 on the output side.</p> <p>110: Data at place 6 on the input side is output to place 0 on the output side.</p> <p>111: Data at place 7 on the input side is output to place 0 on the output side.</p>

37.4 Operation

37.4.1 Initial Setting Procedure

Figure 37.6 to Figure 37.8 show the initial setting procedure of the SCUX. For details on register setting, refer to section 37.3, Register Descriptions.

37.4.2 Transfer Start Procedure and Stop Procedure

Figure 37.9 to Figure 37.11 show the transfer start procedure and stop procedure of the SCUX. For details on register setting, refer to section 37.3, Register Descriptions.

37.4.3 Data Rearrangement for Each Channel

Data can be rearranged independently for each channel in the SCUX. Data rearrangement can be performed immediately before input to the SRC and immediately after output from the MIX. Table 37.9 to Table 37.11 show definition of data places. Data rearrangement immediately before the SRC is performed as described in section 37.3.72, SRCn Route Select Register (SRCRSELn_CIM) (n = 0, 1, 2, 3). Data rearrangement immediately after the MIX is performed as described in section 37.3.73, MIX Route Select Register (MIXRSEL_CIM).

37.4.4 Pin Connection Specifications of SSIF

SSIF0 to SSIF3 can be operated in synchronization with the same SSISCK and SSIWS signals. The AUDIO_CLK input to the SSIF can be selected between external pins AUDIO_CLK and MLB_CLK. These settings are made as described in section 37.3.70, SSI Pin Mode Register (SSIPMD_CIM). Figure 37.12 shows the pin connection specifications of each SSIF module.

Figure 37.12 Pin Connection Specifications of SSIF

37.4.5 Data Transfer Route

Table 37.12 to Table 37.14 list the data transfer routes that can be selected by the SCUX.

Table 37.15 to Table 37.17 show the necessary register settings for selecting each transfer route.

The 2SRC0_m bypass register p and DVU0_n bypass register should be set appropriately to bypass the SRC and DVU, respectively.

Table 37.12 Data Transfer Routes (1)

37.4.6 Input Timing Signal and Output Timing Signal

The input timing signal and output timing signal need to be set when using the SRC or MIX. Table 37.18 to Table 37.20 show the input/output timing setting necessary for each transfer route in Table 37.12 to Table 37.14. When direct connection between the SRC and SSIF is selected, the WS signal of the relevant SSIF is automatically selected regardless of the setting of the FFD0_n/FFU0_n timing select register. When direct connection between the MIX and SSIF is selected, set the prescribed value in the FFU0_n timing select register. When connection between the FFD and SRC or connection between the SRC and FFU is selected, a desired value can be set in the FFD0_n/FFU0_n timing select register and timing signals corresponding to the setting are used.

Table 37.18 Input/Output Timing Setting (1)

Route	No.	Input Timing Setting					Output Timing Setting						
		SSICTRL_CIM				FDTSELn_CIM	Input Timing Signal	SSICTRL_CIM				FUTSELn_CIM	Output Timing Signal

Note 1. Automatically selected regardless of the FDTSELn_CIM and FUTSELn_CIM settings.

Note 2. When connection to an SRCm for a given route is not being selected by the SOSELn bits of register SSIRSEL_CIM, SSInTX may be set to 1 (m = 0 to 3; n = 0 to 3).

Note 3. When connection to SRCm and MIX for a given route is not being selected by the SOSELn bits of register SSIRSEL_CIM, SSInTX may be set to 1 (m = 0 to 3; n = 0, 3).

Note 4. When connection to a MIX for a given route is not being selected by the SOSELn bits of register SSIRSEL_CIM, SSInTX may be set to 1 (n = 0, 3).

37.4.7 2SRC (SRC) Block

The 2SRC block consists of two SRCs (Sampling Rate Converters) which implement the sampling rate conversion function. Each SRC has two modes allowing either synchronous or asynchronous sampling rate conversion to be performed.

- Asynchronous or synchronous sampling rate conversion is possible*¹
- Sampling rate (synchronous mode)*²
Input [KHz]: 8, 11.025, 12, 16, 22.05, 24, 32, 44.1, 48, 64, 88.2, or 96 is selectable
Output [KHz]: 8, 16, 24, 32, 44.1, 48, or 96 is selectable
- Sampling rate (asynchronous mode)*²
Input/output [KHz]: 1 to 96
- The supported number of bits is 16 bits and 24 bits
- Sound quality: -132 dB or less*³
- Supports 1, 2, 4, 6, or 8 channels*⁴
- DMA transfer with on-chip memory or external memory and direct transfer with the SSIF module are possible

Note 1. The synchronous mode can be selected only when the SCUX is connected to the FFD and FFU modules.

Note 2. The selectable sampling rates depend on the number of used channels and rate ratio.

Note 3. The data format is a 24-bit value.

Note 4. The number of selectable channels depends on the sampling rate and route.

Figure 37.13 shows a block diagram of the 2SRC (SRC) block. Input audio data indicates the data before executing the SRC function and output audio data indicates the data after executing the SRC function.

In synchronous SRC mode, the 2SRC (SRC) block outputs the input request signal to the FFD block and outputs the output request signal to the FFU block. In asynchronous SRC mode, the 2SRC (SRC) block receives the input timing signal and output timing signal from an external module and automatically detects the input sampling rate and output sampling rate from these timing signals.

Each SRC in the 2SRC (SRC) block can simultaneously process audio data for a maximum of eight channels. However, the maximum sampling rate that can be handled depends on the number of channels used. When SRC2 or SRC3 is used by the route from the FFD or the route to the FFU, the maximum number of processable channels is two. The number of channels is set by `SADIRp_2SRC0_m.CHNUM`. When not in bypass mode (`SRCBRp_2SRC0_m.BYPASS = 0`), unused channels always output 0 after initialization (`SRCIRp_2SRC0_m.INIT = 1`) unless the `CHNUM` setting is changed. In bypass mode, the input audio data is output one cycle later in all channels regardless of the `CHNUM` setting.

The bit width of output audio data can be set to 16 bits or 24 bits by `SADIRp_2SRC0_m.OTBL`. For input audio data, audio data with the same bit width as the `OTBL` bit setting in Table 37.21 should be input.

Figure 37.13 Block Diagram of 2SRC Block

Table 37.21 Combinations of Bit Width of Input/Output Audio Data

SADIRp_2SRC0_m.OTBL	Bit Width of Input Audio Data	Bit Width of Output Audio Data
00000 = 24 bits	24 bits	24 bits
01000 = 16 bits	16 bits	16 bits

Table 37.22 shows the functions of the 2SRC (SRC) block.

Table 37.22 2SRC (SRC) Block Functions

Item	Performance					
Type of SRC	Asynchronous SRC/synchronous SRC					
Operation frequency	66 MHz					
Delay mode	Normal				Low delay 1	Low delay 2
Channel number	1 or 2	4	6	8	1 or 2	1 or 2
Sampling rate of input source	8k to 96k [Hz]	8k to 96k [Hz]	8k to 66k [Hz]	8k to 49k [Hz]	8k to 96k [Hz]	8k to 96k [Hz]
Sampling rate of output source	8k to 96k [Hz]	8k to 96k [Hz]	8k to 66k [Hz]	8k to 49k [Hz]	8k to 96k [Hz]	8k to 96k [Hz]
Ratio of input and output sampling rate (FSO/FSI)	16 to 0.125 [time]	16 to 0.25 [time]	16 to 0.375 [time]	16 to 0.5 [time]	16 to 0.5 [time]	16 to 1 [time]
Sound quality	-132 dB					

Table 37.23 shows the latency of the 2SRC (SRC) block.

Table 37.23 2SRC (SRC) Block Latency

Item	Bypass	Normal					Low Delay 1		Low Delay 2	
		1	2	4	6	8	1	2	1	2
Channel number	Any	1	2	4	6	8	1	2	1	2
Processing delay	0	641	321	161	102	81	81	81	49	49
Logic delay	1	3	3	3	3	3	3	3	3	3
Output delay	Output delay [sample] = (Processing delay) * (FSO/FSI ratio) + (Logic delay)									

37.4.8 DVU Block

The DVU block is used to control volume and mute. This block can simultaneously process data for a maximum of eight channels.

- Digital volume, volume ramp, and zero cross mute are provided as functions to adjust the volume
- The digital volume is set as a 24-bit fixed-point value within the range from a multiple of 0 to 8 (mute, -120 to 18 dB)
- Volume ramp can be used to perform soft mute, fade in, fade out, and volume change as desired
- The ramp time of volume ramp can be changed and set within the sampling range of 2⁰ to 2²³
- Zero cross mute turns the sound mute at the zero cross point of audio data
- Direct transfer with the SSIF module and transfer with the mixer are possible

The number of channels is set by VADIR_DVU0_n.CHNUM. For unused channels, the input data that is input to the corresponding channels is output one cycle later. In bypass mode, the input data is output one cycle later in all channels regardless of the CHNUM setting.

Figure 37.14 shows the processing image of the DVU block.

Figure 37.14 Processing Image of DVU Block

Table 37.24 shows the functions of the DVU block.

Table 37.24 DVU Block Functions

Item	Performance
Digital volume	Range: -120 dB to 18 dB (9.5×10^{-7} -time to 8-time)
Volume ramp	Volume ramp use for many kinds of operation (soft mute, fade in, fade out, volume change by ramp) Ramp time: $2^0/fso$ to $2^{23}/fso$ Example: (1/fso: -128 dB/1 step) (2/fso: -64 dB/1 step) (4/fso: -32 dB/1 step) (128/fso: -1 dB/1 step) (256/fso: -0.5 dB/1 step) (512/fso: -0.25 dB/1 step) (1024/fso: -0.125 dB/1 step) (2048/fso: -0.125 dB/2 steps) (4096/fso: -0.125 dB/4 steps) (8388608/fso: -0.125 dB/8192 steps)
Zero cross mute	Mute the signal at zero cross point

Figure 37.15 shows the image of digital volume operation.

DVUBR_DVU0_n.BYPASS = 0
 DVUCR_DVU0_n.VVMD = 1 (digital volume mode)
 VOLOR_DVU0_n.VOLVALm (m = arbitrary value from 0 to 7): 24'H10_0000 (0 dB) → 24'H05_0F45 (-10 dB)

Figure 37.15 Digital Volume Operation

Operation

- (1) In the initialized state ($DVUIR_DVU0_n.INIT = 1$), set the $VVMD$ bit in $DVUCR_DVU0_n$ to 1 (digital volume mode) and the $VOLVALm$ bit in $VOL0R_DVU0_n$ to $24'H10_0000$ (0 dB). Until the initialized state is cleared, the DVU does not start operation and its output data is 0.
- (2) When the initialized state is cleared ($DVUIR_DVU0_n.INIT = 0$), the DVU starts operation. Since the $VOLVALm$ bit is set to 0 dB, the output data is the same size as the input data.
- (3) Set the $DVUEN$ bit in $DVUER_DVU0_n$ to 0 and the $VOLVAL0$ bit in $VOL0R_DVU0_n$ to $24'H05_0F45$ (-10 dB).
- (4) The setting to the $VOLVAL0$ bit in (3) is enabled by setting the $DVUEN$ bit in $DVUER_DVU0_n$ to 1. The output data is the value obtained by attenuating the input data by -10 dB.

Figure 37.16 shows the image of volume ramp operation.

Figure 37.16 Volume Ramp Operation

Operation

- (1) In the initialized state ($DVUIR_DVU0_n.INIT = 1$), set the VRMD bit in $DVUCR_DVU0_n$ to 1 (volume ramp mode) and the VREN_m (m: arbitrary value from 0 to 7) bit in $VRCTR_DVU0_n$ to 1. Until the initialized state is cleared, the DVU does not start operation and its output data is 0.
- (2) When the initialized state is cleared ($DVUIR_DVU0_n.INIT = 0$), the DVU starts operation.
 Note: Changes to the settings of the VRDB bit of the $VRDBR_DVU0_n$ register made in the INIT state rapidly become applicable on release from the INIT state (independently of the setting of $VRWTR_DVU0_n$ and $VRPDR_DVU0_n$).
- (3) Set the DVUEN bit in $DVUER_DVU0_n$ to 0, the VRPDDW bit in $VRPDR_DVU0_n$ to 5'H0F (0.125 dB/32 steps), the VRDB bit in $VRDBR_DVU0_n$ to 10'H064 (-12.5 dB), and the VRWT bit in $VRWTR_DVU0_n$ to 24'H00_113A (4410 samples).
- (4) The setting in (3) is enabled by setting the DVUEN bit in $DVUER_DVU0_n$ to 1.
- (5) The VDU waits to start the volume ramp operation for $4410/44100 = 0.1$ second because the sampling rate is set to 44.1 kHz with $VRWTR_DVU0_n.VRWT = 24'H00_113A$ (4410 samples).
- (6) The VDU starts volume ramp operation after the wait time in (5).
 The output data is the value obtained by attenuating the input data by -12.5 dB after $12.5 \times 32/0.125 = 3200$ steps because the VRPDDW bit in $VRPDR_DVU0_n$ is set to 5'H0F (0.125 dB/32 steps) according to 0 dB to -12.5 dB ramp down.
- (7) Set the DVUEN bit in $DVUER_DVU0_n$ to 0, the VRPDUP bit in $VRPDR_DVU0_n$ to 5'H0C (0.125 dB/4 steps), the VRDB bit in $VRDBR_DVU0_n$ to 10'H000 (0 dB), and the VRWT bit in $VRWTR_DVU0_n$ to 24'H00_0000 (0 sample).
- (8) The setting in (7) is enabled by setting the DVUEN bit in $DVUER_DVU0_n$ to 1.
- (9) The VDU starts volume ramp operation without delay because the VRWT bit in $VRWTR_DVU0_n$ is set to 24'H00_0000 (0 sample).
 The output data is the same size as the input data after $12.5 \times 4/0.125 = 400$ steps because the VRPDUP bit in $VRPDR_DVU0_n$ is set to 5'H0C (0.125 dB/4 steps) according to -12.5 dB to 0 dB ramp up.

Table 37.25 shows the latency of the DVU block.

Table 37.25 DVU Block Latency

Item	Bypass	DVU Operation
Output delay	1	2

37.4.9 MIX Block

The MIX block is used to mix (add together) the input audio data from a maximum of four systems into one system. Each system can simultaneously process data for a maximum of eight channels.

- Data of two to four source systems can be mixed (added together) into one system
- The ratio to add the sources can be set
- The ratio can be changed dynamically
- Volume ramp enables mixing to be performed (ramp time is variable)
- Only direct transfer with the SSIF module is possible

The number of channels is set by MADIR_MIX0_0.CHNUM. When not in bypass mode (MIXBR_MIX0_0.BYPASS = 0), unused channels always output 0 after initialization (MIXIR_MIX0_0.INIT = 1) unless the CHNUM setting is changed. In bypass mode, the input data is output one cycle later in all channels regardless of the CHNUM setting. Figure 37.17 shows a block diagram of the MIX block.

Figure 37.17 Block Diagram of MIX Block

Table 37.26 shows the functions of the MIX block.

Table 37.26 MIX Block Functions

Item	Performance
Volume step mixer	Mix the data of four systems into one system. The volume of each system can be adjusted by step change.
Volume ramp mixer	Mix the data of four systems into one system. The volume of each system can be adjusted by ramp.

Figure 37.18 shows the image of volume step operation for 1-system data. This figure explains about the operation when the volume is changed from 0 dB to $-\infty$ dB. The volume can change the target dB for one step each. In the case of the volume step mixer, the volume of four systems can be adjusted at each step change (one sample).

Figure 37.19 shows the image of volume ramp operation for 1-system data. This figure explains about the operation when the volume is changed from 0 dB to $-\infty$ dB. The volume can be changed by 0.125-dB/step each and it takes 1024 samples to reach $-\infty$ dB in the maximum case for each system. In the case of the volume ramp mixer, the volume of four

systems can be adjusted at each ramp. In addition, the volume ramp mixer has a mechanism to reduce the noise. If the direction of volume is different among the four systems, it operates from the volume-down systems and after that operates on the volume-up systems automatically. In the case of the same direction, it changes the volume at the same timing.

Figure 37.18 Volume Step Operation

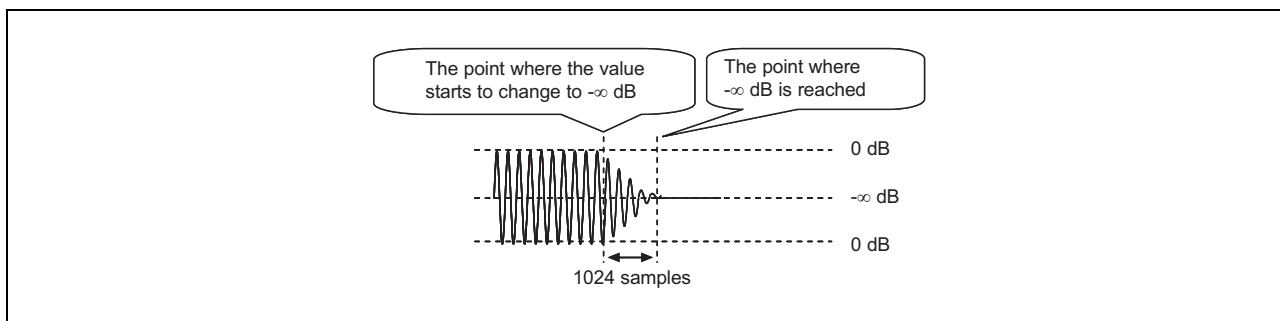

Figure 37.19 Volume Ramp Operation

Figure 37.20 shows the image of volume ramp operation for 4-system data.

Figure 37.20 Volume Ramp Operation for 4-System Data

Operation

- (1) In the initialized state (MIXIR_MIX0_0.INIT = 1), set the MIXMODE bit in MIXMR_MIX0_0 to 1 (volume ramp mode) and the MXPDDW bit in MVPDR_MIX0_0 to 4'HA (0.125 dB/1 sample).
Until the initialized state is cleared, the MIX does not start operation and its output data is 0.
- (2) When the initialized state is cleared (MIXIR_MIX0_0.INIT = 0), the MIX starts operation.
Note: Changes to the settings of the MIXDBA bits of the MDBAR_MIX0_0 register, MIXDBB bits of the MDBBR_MIX0_0 register, MIXDBC bits of the MDBCR_MIX0_0 register, and MIXDBD bits of the MDBDR_MIX0_0 register made in the INIT state rapidly become applicable on release from the INIT state (independently of the setting of MVPDR_MIX0_0).
- (3) Set as follows:
 MDBER_MIX0_0.MIXDBEN = 0
 MDBAR_MIX0_0.MIXDBA = 10'H0C8 (-25 dB)
 MDBBR_MIX0_0.MIXDBB = 10'H0C8 (-25 dB)
 MDBCR_MIX0_0.MIXDBC = 10'H0C8 (-25 dB)
 MDBDR_MIX0_0.MIXDBD = 10'H0C8 (-25 dB)
- (4) The setting in (3) is enabled by setting the MIXDBEN bit in MDBER_MIX0_0 to 1.
- (5) The output data is the value obtained by attenuating and mixing the input data of each system by -25 dB after 25/0.125 = 200 steps because the MXPDDW bit in MVPDR_MIX0_0 is set to 4'HA (0.125 dB/1 sample) according to 0 dB to -25 dB ramp down for each system.
- (6) Set as follows:
 MDBER_MIX0_0.MIXDBEN = 0
 MDBAR_MIX0_0.MIXDBA = 10'H000 (0 dB)
 MDBBR_MIX0_0.MIXDBB = 10'H000 (0 dB)
 MDBCR_MIX0_0.MIXDBC = 10'H000 (0 dB)
 MDBDR_MIX0_0.MIXDBD = 10'H000 (0 dB)
- (7) The setting in (6) is enabled by setting the MIXDBEN bit in MDBER_MIX0_0 to 1.
- (8) The output data is the value obtained by boosting and mixing the input data of each system by 25 dB after 25/0.125 = 200 steps because the MXPDDUP bit in MVPDR_MIX0_0 is set to 4'HA (0.125 dB/1 sample) according to -25 dB to 0 dB ramp up for each system.

Table 37.27 shows the latency of the MIX block.

Table 37.27 MIX Block Latency

Item	Bypass	MIX Operation
Output delay	1	2

37.5 Usage Note

37.5.1 Software Reset

When initializing the internal circuits of this module by clearing the SWRST bit in the SWRSR_CIM register or setting the INIT bit in the IPCIR_IPC0_n, OPCIR_OPC0_n, FFDIR_FFD0_n, FFUIR_FFU0_n, SRCIRp_2SRC0_m, SRCIRR_2SRC0_m, DVUIR_DVU0_n, or MIXIR_MIX0_0 register, be sure to follow the procedures specified in section 37.4.1, Initial Setting Procedure or section 37.4.2, Transfer Start Procedure and Stop Procedure.

38. SD Host Interface

Note: • SD Host/Ancillary Product License Agreement (SD HALA) is required to develop SD host-related products.

38.1 Overview

38.1.1 Features

- SD memory/IO card interface (1-bit/4-bit SD bus)
- SD memory card: SD, SDHC, SDXC
- Transfer mode: Default mode, High-Speed mode
- SD clock (SD_CLK) frequency = $1/2^n$ P1 ϕ (Peripheral clock 1) frequency (n = 1 to 9)
- Error check function: CRC7 (for command/response), CRC16 (for data)
- Three interrupt requests
- DMA transfer request: SD_BUF read/write
- Card detect function
- Write protect support

38.1.2 Block Diagram

Figure 38.1 shows a block diagram of the SD host interface.

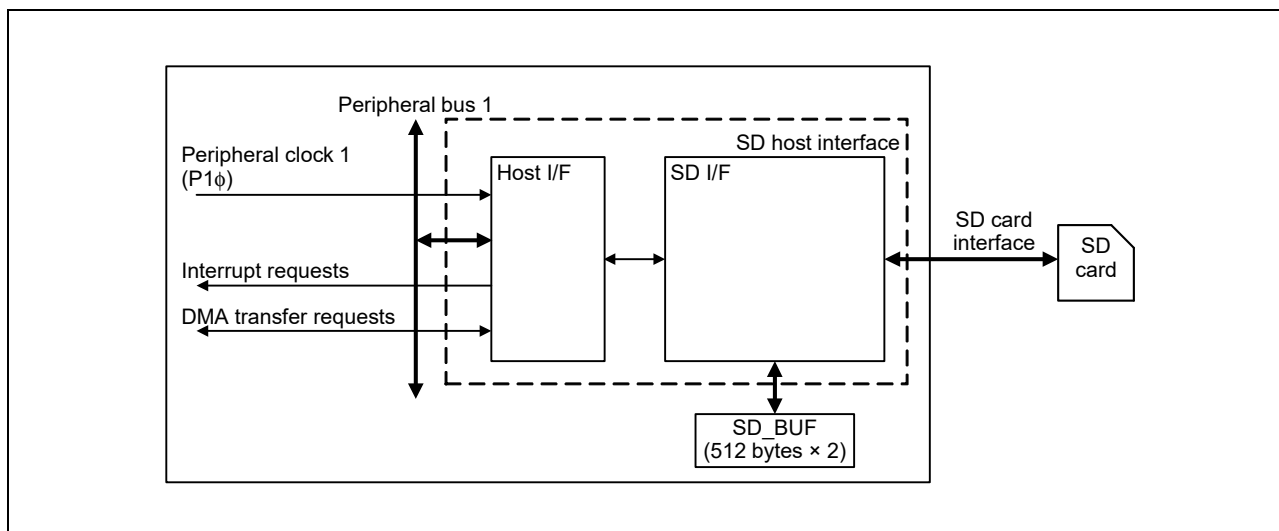

Figure 38.1 Block Diagram of SD Host Interface

38.1.3 Input/Output Pins

Table 38.1 lists the input and output pins used by the SD host interface.

Table 38.1 Pin Configuration

Pin Name	Signal Name	I/O	Function
SD_CLK[1:0]*1	SDCLK	Output	SD clock
SD_CMD[1:0]*1	SDCMD	I/O	Command/response
SD_D0[1:0]*1	SDDAT0	I/O	Data[bit 0]
SD_D1[1:0]*1	SDDAT1	I/O	Data[bit 1]/SDIO interrupt
SD_D2[1:0]*1	SDDAT2	I/O	Data[bit 2]/Read wait
SD_D3[1:0]*1	SDDAT3	I/O	Data[bit 3]
SD_CD[1:0]*1	ISDCD	Input	Card detect*2
SD_WP[1:0]*1	ISDWP	Input	Write protect*2

Note 1. [1:0] indicates the SD Host Interface channel number.

Note 2. When a pin is not in use, fix the corresponding signal to 1.

38.2 Register Descriptions

Table 38.2 summarizes the registers of the SD host interface.

	Swap control register	EXT_SWAP	H'E804E8F0	16

38.2.1 Command Type Register (SD_CMD)

The command type register (SD_CMD) selects the command type and response type. The command sequence is started by writing to SD_CMD. For details on the SD_CMD setting, refer to section 38.4.10, Example of SD_CMD Register Setting.

Do not write to SD_CMD while the SCLKDIVEN bit in SD_INFO2 is set to 0.

Bit	Bit Name	Initial Value	R/W	Description
15	MD7	0	R/W	Multiple Block Transfer Mode (enabled at multiple block transfer) 00: CMD12 is automatically issued at multiple block transfer. 01: CMD12 is not automatically issued at multiple block transfer. 10: Setting prohibited 11: Setting prohibited
14	MD6	0	R/W	
13	MD5	0	R/W	Single/Multiple Block Transfer (enabled when the command with data is handled) 0: Single block transfer 1: Multiple block transfer
12	MD4	0	R/W	Write/Read Mode (enabled when the command with data is handled) 0: Write (SD host interface → SD card) 1: Read (SD host interface ← SD card)
11	MD3	0	R/W	Data Mode (Command Type) 0: Command without data transfer (bc, bcr, ac) 1: Command with data transfer (adtc)
10	MD2	0	R/W	Mode/Response Type 000: Normal mode The response type and the transfer mode are selected by SD_CMD[7:0], and the SD_CMD[15:11] setting is disabled. 001: Setting prohibited 010: Setting prohibited 011: Extended mode/No response 100: Extended mode/SD card R1, R5, R6, R7 response 101: Extended mode/SD card R1b response 110: Extended mode/SD card R2 response 111: Extended mode/SD card R3, R4 response As some commands cannot be used in normal mode, see section 38.4.10, Example of SD_CMD Register Setting to select mode/response type.
9	MD1	0	R/W	
8	MD0	0	R/W	
7	C1	0	R/W	00: CMD
6	C0	0	R/W	01: ACMD 10: Setting prohibited 11: Setting prohibited
5	CF45	0	R/W	Command Index
4	CF44	0	R/W	These bits specify Command Format[45:40] (command index). [Examples]
3	CF43	0	R/W	CMD6: SD_CMD[7:0] = 8'b00_000110
2	CF42	0	R/W	CMD18: SD_CMD[7:0] = 8'b00_010010
1	CF41	0	R/W	ACMD13: SD_CMD[7:0] = 8'b01_001101
0	CF40	0	R/W	

Note: • SD_CMD cannot be written to when the CBSY bit in SD_INFO2 is 1.

38.2.2 SD Command Argument Registers (SD_ARG)

The SD command argument registers (SD_ARG) set the command argument of SD card. Set the command argument before writing to SD_CMD.

- SD_ARG0

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	CF23 to CF8	All 0	R/W	Set command format[23:8] (argument)

- SD_ARG1

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	CF39 to CF24	All 0	R/W	Set command format[39:24] (argument)

38.2.3 Data STOP Register (SD_STOP)

The data stop register (SD_STOP) is used to enable or disable block counting at multiple block transfer, and to control the issuing of CMD12 within command sequences.

Bit	Bit Name	Initial Value	R/W	Description
15 to 9	—	All 0	R	Fixed 0
8	SEC	0*1	R/W	<p>Block Count Enable*2</p> <p>0: Disables SD_SECCNT setting value. 1: Enables SD_SECCNT setting value. Set SEC to 1 at multiple block transfer. When SD_CMD is set as follows to start the command sequence while SEC is set to 1, CMD12 is automatically issued.</p> <p>1. CMD18 or CMD25 in normal mode (SD_CMD[10:8] = 000) 2. SD_CMD[15:13] = 001 in extended mode (CMD12 is automatically issued, multiple block transfer)</p> <p>When the command sequence is halted because of a communications error or timeout, CMD12 is not automatically issued.</p>
7 to 1	—	All 0	R	Fixed 0
0	STP	0*1	R/W	<p>Stop*3</p> <ul style="list-style-type: none"> When STP is set to 1 during multiple block transfer, CMD12 is issued to halt the transfer through the SD host interface. <p>However, if a command sequence is halted because of a communications error or timeout, CMD12 is not issued. Although continued buffer access is possible even after STP has been set to 1, the buffer access error bit (ERR5 or ERR4) in SD_INFO2 will be set accordingly.</p> <ul style="list-style-type: none"> When STP has been set to 1 during transfer for single block write, the access end flag is set when SD_BUF becomes empty, and CMD12 is not issued. If SD_BUF does contain data, the access end flag is set on completion of reception of the busy state without CMD12 having been issued. When STP has been set to 1 during transfer for single block read, the access end flag is set immediately after setting of the STP bit and CMD12 is not issued. When STP is set to 1 during reception of the busy state after an R1b response, the access end flag is set on completion of reception of the busy state without CMD12 having been issued. When STP is set to 1 after a command sequence has been completed, CMD12 is not issued and the access end flag is not set.

Note 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

Note 2. Do not change the value of this bit when the SCLKDIVEN bit in SD_INFO2 is set to 0.

Note 3. Do not change the value of this bit from 1 to 0 when the SCLKDIVEN bit in SD_INFO2 is set to 0.

38.2.4 Block Count Register (SD_SECCNT)

The block count register (SD_SECCNT) specifies the number of transfer blocks at multiple block transfer.

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	CNT15 to CNT0	All 0	R/W	Number of Transfer Blocks*1 When 0x0001 is set, the number of transfer blocks is 1. : When 0xFFFF is set, the number of transfer blocks is 65535. However, when 0x0000 is set, the number of transfer blocks is 65536.

Note 1. Do not change the value of this bit when the SCLKDIVEN bit in SD_INFO2 is set to 0.

38.2.5 SD Card Response Registers (SD_RSP)

The SD card response registers (SD_RSP) store the response from the SD card.

- SD_RSP00

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	R23 to R8	All 0	R	Store the response from the SD card

- SD_RSP01

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	R39 to R24	All 0	R	Store the response from the SD card

- SD_RSP02

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	R55 to R40	All 0	R	Store the response from the SD card

- SD_RSP03

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	R71 to R56	All 0	R	Store the response from the SD card

- SD_RSP04

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	R87 to R72	All 0	R	Store the response from the SD card

- SD_RSP05

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	R103 to R88	All 0	R	Store the response from the SD card

- SD_RSP06

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	R119 to R104	All 0	R	Store the response from the SD card

- SD_RSP07

Bit	Bit Name	Initial Value	R/W	Description
15 to 8	—	All 0	R	Fixed 0
7 to 0	R127 to R120	All 0	R	Store the response from the SD card

Table 38.3 lists the response types and corresponding SD_RSP registers.

Table 38.3 Response Types and Corresponding SD_RSP Registers

Response Types	SD_RSP Registers
R1, R1b[39:8]	SD_RSP01 and SD_RSP00
R2[127:8]	SD_RSP07 to SD_RSP00
R3[39:8]	SD_RSP01 and SD_RSP00
R4[39:8]	SD_RSP01 and SD_RSP00
R5[39:8]	SD_RSP01 and SD_RSP00
R6[39:8]	SD_RSP01 and SD_RSP00
R7[39:8]	SD_RSP01 and SD_RSP00

38.2.6 SD Card Interrupt Flag Register 1 (SD_INFO1)

The SD card interrupt flag register 1 (SD_INFO1) indicates the response end and access end in the command sequence. This register also indicates the card detect/write protect state.

For CMD12 and CMD52 (SDIO abort) at multiple block transfer, INFO0 is not set but only INFO2 is set.

Even if the command sequence is halted because of a communications error or timeout, INFO0 or INFO2 is set.

INFO10, INFO9, and INFO8 change depending on the SD_D3 state after a reset is released and continue to change in 4-bit transfer mode.

To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

Bit	Bit Name	Initial Value	R/W	Description
15 to 11	—	All 0	R	Fixed 0
10	INFO10	Unknown	R	Indicates the SD_D3 state. 1: SD_D3 is set to 1. 0: SD_D3 is set to 0.
9	INFO9	0	R/W*1	SD_D3 set [Setting condition] After change in SD_D3 from 0 to 1, two cycles of P1φ has elapsed with SD_D3 held 1. [Clearing condition] When 0 is written to INFO9
8	INFO8	0	R/W*1	SD_D3 clear [Setting condition] After change in SD_D3 from 1 to 0, two cycles of P1φ has elapsed with SD_D3 held 0. [Clearing condition] When 0 is written to INFO8
7	INFO7	Unknown	R	Write Protect Indicates the SD_WP state. 1: SD_WP is set to 0. 0: SD_WP is set to 1.
6	—	0	R	Fixed 0
5	INFO5	Unknown	R	Indicates the SD_CD state. 1: Indicates that Ncycle has elapsed with SD_CD held 0. 0: Indicates that Ncycle has elapsed with SD_CD held 1. Ncycle is set by bits 3 to 0 in SD_OPTION.
4	INFO4	0	R/W*1	SD_CD Card Insertion [Setting condition] After change in SD_CD from 1 to 0, Ncycle has elapsed with SD_CD held 0. [Clearing condition] When 0 is written to INFO4 Ncycle is set by bits 3 to 0 in SD_OPTION.
3	INFO3	0	R/W*1	SD_CD Card Removal [Setting condition] After change in SD_CD from 0 to 1, Ncycle has elapsed with SD_CD held 1. [Clearing condition] When 0 is written to INFO3 Ncycle is set by bits 3 to 0 in SD_OPTION.

Bit	Bit Name	Initial Value	R/W	Description
2	INFO2	0*2	R/W*1	<p>Access End [Setting conditions]</p> <ul style="list-style-type: none"> • When read access to the buffer is completed in the case of transfer for single block read • When read access to the buffer for the last block of data is completed in the case of transfer for multiple block read • When read access to the buffer and reception of the response to CMD12 are completed in the case of transfer for multiple block read with automatic issuing of CMD12 • When reception of the busy state after reception of the CRC status is completed in the case of transfer for single block write • When reception of the busy state after reception of the CRC status of the last block of data is completed in the case of transfer for multiple block write • When reception of the response busy state for CMD12 is completed in the case of transfer for multiple block write with automatic issuing of CMD12 • When reception of the response to CMD12 that was issued by setting the STP bit to 1 is completed in the case of transfer for multiple block read • When reception of the response busy state for CMD12 that was issued by setting the STP bit to 1 is completed in the case of transfer for multiple block write • When reception of the response to CMD52 that was issued by setting the IOABT bit to 1 is completed in the case of transfer for multiple block read • When reception of the response to CMD52 that was issued by setting the IOABT bit to 1 is completed in the case of transfer for multiple block write <p>In addition to the above conditions, this bit is set when a command sequence is halted because of a communications error or timeout. [Clearing condition] When 0 is written to INFO2</p>
1	—	0	R	Fixed 0
0	INFO0	0*2	R/W*1	<p>Response End [Setting conditions]</p> <ul style="list-style-type: none"> • When reception of the response is completed • When transmission of a command without response is completed • When reception of the busy state after R1b response is completed • When reception of the response to CMD52 that was issued by setting the C52PUB bit to 1 is completed in the case of transfer for multiple block read • When reception of the response to CMD52 that was issued by setting the C52PUB bit to 1 is completed in the case of transfer for multiple block write <p>In addition to the above conditions, this bit is set when a command sequence is halted because of a communications error or timeout. [Clearing condition] When 0 is written to INFO0</p>

Note 1. It is effective only if 0 is written.

Note 2. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

38.2.7 SD Card Interrupt Flag Register 2 (SD_INFO2)

The SD card interrupt flag register 2 (SD_INFO2) indicates the access status of the SD buffer (SD_BUF) and SD card. To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

Bit	Bit Name	Initial Value	R/W	Description
15	ILA	0*2	R/W*1	Illegal Access Error [Setting conditions] <ul style="list-style-type: none"> When data is written to SD_CMD within a command sequence When SD_CMD[10:8] = 3'b011 (no response) and SD_CMD[11] = 1'b1 (command with data transfer) are set in SD_CMD When SD_CMD[11] = 1'b1 (command with data transfer) and SD_CMD[7:0] = 8'b00001100 (CMD12) are set in SD_CMD [Clearing condition] When 0 is written to ILA
14	CBSY	0*2	R	Command Type Register Busy 1: The command sequence is being executed. 0: The command sequence is ended.
13	SCLKDIVEN	1*2	R	SD Bus Busy 1: SD buses (CMD and DAT) are not busy. 0: SD buses (CMD and DAT) are busy. When a command sequence is started by writing to SD_CMD, CBSY is set to 1. At the same time, SCLKDIVEN is set to 0. After CBSY has been set to 0 at the end of the command sequence, SCLKDIVEN is set to 1 when 8 cycles of SD_CLK elapses.
12	—	0	R	Fixed 0
11	—	0*2	R/W*1	Reserved. The write value should always be 1.
10	—	0	R	Fixed 0
9	BWE	0*2	R/W*1	SD_BUF Write Enable 1: Data can be written in SD_BUF0. 0: Data cannot be written in SD_BUF0. [Setting conditions] <ul style="list-style-type: none"> When SD_BUF is empty at single block transfer When either bank 1 or bank 2 of SD_BUF is empty at multiple block transfer [Clearing condition] <ul style="list-style-type: none"> When 0 is written to BWE When data is written to SD_BUF0 by the CPU, clear BWE and then write amount of data specified by SD_SIZE*3. Note that this bit is not set when the SD_BUF read/write DMA transfer is enabled by setting the DMASDRW bit in CC_EXT_MODE to 1.
8	BRE	0*2	R/W*1	SD_BUF Read Enable 1: Data can be read from SD_BUF0. 0: Data cannot be read from SD_BUF0. [Setting conditions] <ul style="list-style-type: none"> When data set in SD_SIZE is stored in SD_BUF at single block transfer When data set in SD_SIZE is stored in either bank 1 or bank 2 of SD_BUF at multiple block transfer [Clearing condition] <ul style="list-style-type: none"> When 0 is written to BRE When data is read from SD_BUF0 by the CPU, clear BRE and then read amount of data specified by SD_SIZE*3. Note that this bit is not set when the SD_BUF read/write DMA transfer is enabled by setting the DMASDRW bit in CC_EXT_MODE to 1. Even if a CRC error or an END error occurs while block data is read, data is stored in SD_BUF and BRE is set.

Bit	Bit Name	Initial Value	R/W	Description
7	DAT0	Unknown	R	<p>SD_D0</p> <p>Indicates the SD_D0 state</p> <p>1: SD_D0 is set to 1.</p> <p>0: SD_D0 is set to 0.</p> <p>If the data timeout (ERR3) is set but the response timeout (ERR6) is not set after the Erase command has been issued, the end of the Erase sequence (DAT0 = 1) is confirmed by polling DAT0.</p> <p>If a communications error or timeout occurs during a write sequence, the DAT0 bit may retain the value 0.</p>
6	ERR6	0*2	R/W*1	<p>Response Timeout</p> <p>[Setting condition]</p> <p>When a response is not received though a longer time than 640 cycles of SD_CLK has elapsed</p> <p>[Clearing condition]</p> <p>When 0 is written to ERR6</p> <p>The command sequence is halted by the response timeout.*4</p>
5	ERR5	0*2	R/W*1	<p>SD_BUF Illegal Read Access</p> <p>[Setting conditions]</p> <ul style="list-style-type: none"> • When SD_BUF is empty while SD_BUF0 is read • When data with a CRC error or END error is read from SD_BUF0 <p>[Clearing condition]</p> <p>When 0 is written to ERR5</p>
4	ERR4	0*2	R/W*1	<p>SD_BUF Illegal Write Access</p> <p>[Setting conditions]</p> <ul style="list-style-type: none"> • When data is written to SD_BUF0 while it is not in the data read/write command state • When data is written to SD_BUF0 while SD_BUF is full. • When data is written to SD_BUF0 while an error occurs in the CRC status or CRC status length. • When data is written to SD_BUF0 while a busy state after the CRC status continues for longer than Ncycle <p>[Clearing condition]</p> <p>When 0 is written to ERR4</p> <p>Ncycle is set by bits 7 to 4 in SD_OPTION.</p>
3	ERR3	0*2	R/W*1	<p>Data Timeout (except response timeout)</p> <p>[Setting conditions]</p> <ul style="list-style-type: none"> • After R1b response, the busy state (SD_D0 = 0) continues for longer than Ncycle. • After CRC status, the busy state (SD_D0 = 0) continues for longer than Ncycle. • After write data, the CRC status is not received though Ncycle has elapsed. • After read command, read data is not received though a longer time than Ncycle has elapsed. • After CMD12 has been issued within a command sequence, the busy state (SD_D0 = 0) for longer than Ncycle continues. • After the reception of read data, read data for the next block are not received though a longer time than Ncycle has elapsed. • After release of the read wait state, read data for the next block are not received though a longer time than Ncycle has elapsed. <p>[Clearing condition]</p> <ul style="list-style-type: none"> • When 0 is written to ERR3 <p>Ncycle is set by bits 7 to 4 in SD_OPTION.</p> <p>The command sequence is halted by the data timeout.</p>

Bit	Bit Name	Initial Value	R/W	Description
2	ERR2	0*2	R/W*1	END Error [Setting conditions] <ul style="list-style-type: none"> When an error occurs in the response length (and the end bit has not been detected) When an error occurs in the read data length (and the end bit has not been detected among the valid bits) When an error occurs in the CRC status length (and the end bit has not been detected) [Clearing condition] When 0 is written to ERR2 The command sequence is halted by the End error.*4
1	ERR1	0*2	R/W*1	CRC Error [Setting conditions] <ul style="list-style-type: none"> When an error occurs in the CRC status When a CRC error occurs in the read data When a CRC error occurs in the response [Clearing condition] When 0 is written to ERR1 The command sequence is halted by the CRC error.*4
0	ERR0	0*2	R/W*1	CMD Error [Setting condition] When the command index of the transmitted command differed from the command index of the received response [Clearing condition] When 0 is written to ERR0 The command sequence is halted by the CMD error.*4

Note 1. It is effective only if 0 is written.

Note 2. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

Note 3. The single byte or three bytes from the fraction of a full 32-bit unit are regarded as excess data due to an odd value for the number of bytes setting in SD_SIZE, or the two bytes from the fraction of a full 32-bit unit are regarded as excess data due if the value for the number of bytes setting in SD_SIZE is even but is not on a four-byte boundary.

Note 4. After the C52PUB bit in SDIO_MODE has been set to 1, if a communications error or timeout for response occurs in response to the CMD52 that is issued, since the command sequence has not been completed, complete the sequence with error processing as in usage examples in Figure 38.17 under section 38.4.7, IO_RW_EXTENDED Command (CMD53/Multiple Block Read) or in Figure 38.20 under section 38.4.8, IO_RW_EXTENDED Command (CMD53/Multiple Block Write).

38.2.8 SD_INFO1 Interrupt Mask Register (SD_INFO1_MASK)

The SD_INFO1 interrupt mask register (SD_INFO1_MASK) enables or disables the SD_INFO1 interrupt. When 0 is set in SD_INFO1_MASK while the corresponding flag in SD_INFO1 is set, an interrupt occurs.

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R	Fixed 0
9	IMASK9	1	R/W	INFO9 interrupt masked
8	IMASK8	1	R/W	INFO8 interrupt masked
7 to 5	—	All 0	R	Fixed 0
4	IMASK4	1	R/W	INFO4 interrupt masked
3	IMASK3	1	R/W	INFO3 interrupt masked
2	IMASK2	1	R/W	INFO2 interrupt masked
1	—	0	R	Fixed 0
0	IMASK0	1	R/W	INFO0 interrupt masked

38.2.9 SD_INFO2 Interrupt Mask Register (SD_INFO2_MASK)

The SD_INFO2 interrupt mask register (SD_INFO2_MASK) enables or disables the SD_INFO2 interrupt. When 0 is set in SD_INFO2_MASK while the corresponding flag in SD_INFO2 is set, an interrupt occurs.

Bit	Bit Name	Initial Value	R/W	Description
15	IMASK	1	R/W	ILA interrupt masked
14 to 12	—	All 0	R	Fixed 0
11	—	1	R/W	Reserved. The write value should always be 1.
10	—	0	R	Fixed 0
9	BMASK1	1	R/W	BWE interrupt masked
8	BMASK0	1	R/W	BRE interrupt masked
7	—	0	R	Fixed 0
6	EMASK6	1	R/W	ERR6 interrupt masked
5	EMASK5	1	R/W	ERR5 interrupt masked
4	EMASK4	1	R/W	ERR4 interrupt masked
3	EMASK3	1	R/W	ERR3 interrupt masked
2	EMASK2	1	R/W	ERR2 interrupt masked
1	EMASK1	1	R/W	ERR1 interrupt masked
0	EMASK0	1	R/W	ERR0 interrupt masked

38.2.10 SD Clock Control Register (SD_CLK_CTRL)

The SD clock control register (SD_CLK_CTRL) controls the SD clock (SD_CLK) output and sets the frequency. Set SCLKEN to 1 before writing to SD_CMD to issue a command.

Do not write to SD_CLK_CTRL while the SCLKDIVEN bit in SD_INFO2 is set to 0.

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R	Fixed 0
9	SDCLKOFFEN	0	R/W	SD Clock (SD_CLK) Output Automatic Control Enable 0: Automatic control for SD clock (SD_CLK) output is disabled. 1: Automatic control for SD clock (SD_CLK) output is enabled. This function of automatic control for SD clock (SD_CLK) output causes SD_CLK output only within a command sequence. The timing with which SD_CLK output starts and stops is as follows. SD_CLK output starts after writing to SD_CMD. SD_CLK output stops when 8 cycles of SD_CLK have elapsed after the end of the command sequence. In addition, automatic control for SD clock (SD_CLK) output is enabled when SCLKEN in SD_CLK_CTRL is 1.
8	SCLKEN	0*1	R/W*2	SD Clock (SD_CLK) Output Control Enable 0: SD clock (SD_CLK) output is disabled. The SD_CLK signal is fixed 0. 1: SD clock (SD_CLK) output is enabled.
7	DIV7	0	R/W*2	SD Clock (SD_CLK)
6	DIV6	0	R/W*2	10000000: P1φ/512 01000000: P1φ/256
5	DIV5	1	R/W*2	00100000: P1φ/128 00010000: P1φ/64
4	DIV4	0	R/W*2	00001000: P1φ/32
3	DIV3	0	R/W*2	00000100: P1φ/16
2	DIV2	0	R/W*2	00000010: P1φ/8 00000001: P1φ/4
1	DIV1	0	R/W*2	00000000: P1φ/2
0	DIV0	0	R/W*2	Other settings are prohibited.

Note 1. This initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

Note 2. Writing is impossible when the CBSY bit in SD_INFO2 is 1.

38.2.11 Transfer Data Length Register (SD_SIZE)

The transfer data length register (SD_SIZE) specifies the transfer data size.

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	—	All 0	R	Fixed 0
11, 10	—	All 0	R	Reserved
9 to 0	LEN9 to LEN0	1000000000	R/W	Transfer Data Size*1 These bits specify a size between 1 and 512 bytes for the transfer of single blocks. In cases of multiple block transfer with automatic issuing of CMD12 (CMD18 and CMD25), the only specifiable transfer data size is 512 bytes. Furthermore, in cases of multiple block transfer without automatic issuing of CMD12, as well as 512 bytes, 32, 64, 128, and 256 bytes are specifiable. However, in the reading of 32, 64, 128, and 256 bytes for the transfer of multiple blocks, this is restricted to cases of multiple block transfer by CMD53. Additionally, if a command accompanies data transfer, do not set these bits to 0.

Note 1. Do not change the values of these bits when the SCLKDIVEN bit in SD_INFO2 is 0.

38.2.12 SD Card Access Control Option Register (SD_OPTION)

The SD card access control option register (SD_OPTION) sets the bus width and timeout counter.

Bit	Bit Name	Initial Value	R/W	Description
15	WIDTH	0*1	R/W	Bus Width*2 0: 4-bit width 1: 1-bit width
14	—	1	R	Fixed 1
13 to 8	—	All 0	R	Fixed 0
7	TOP27	1*1	R/W	Timeout Counter*2
6	TOP26	1*1	R/W	1111: Setting prohibited 1110: $SD_CLK \times 2^{27}$
5	TOP25	1*1	R/W	1101: $SD_CLK \times 2^{26}$
4	TOP24	0*1	R/W	: 0001: $SD_CLK \times 2^{14}$ 0000: $SD_CLK \times 2^{13}$
3	CTOP24	1*1	R/W	Card Detect Time Counter
2	CTOP23	1*1	R/W	1111: Setting prohibited 1110: $P1\phi \times 2^{24}$
1	CTOP22	1*1	R/W	1101: $P1\phi \times 2^{23}$
0	CTOP21	0*1	R/W	: 0001: $P1\phi \times 2^{11}$ 0000: $P1\phi \times 2^{10}$

Note 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

Note 2. Do not change the values of these bits when the SCLKDIVEN bit in SD_INFO2 is 0.

38.2.13 SD Error Status Register 1 (SD_ERR_STS1)

The SD error status register 1 (SD_ERR_STS1) indicates the CRC status, CRC error, End error, and CMD error.

Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R	Fixed 0
14	E14	0*1	R	These bits store the CRC status. (normal: 010)
13	E13	1*1	R	
12	E12	0*1	R	
11	E11	0*1	R	Set to 1 when an error occurs in the CRC status
10	E10	0*1	R	Set to 1 when a CRC error occurs in the read data
9	E9	0*1	R	Set to 1 when a CRC error occurs in the response to a command*2 issued within a command sequence. In cases where CMD12 is issued by setting a command index in SD_CMD, this is indicated in E8.
8	E8	0*1	R	Set to 1 when a CRC error occurs in a response (other than a response to a command*2 issued within a command sequence)
7, 6	—	All 0	R	Fixed 0
5	E5	0*1	R	Set to 1 when an error occurs in the CRC status length (and the end bit has not been detected)
4	E4	0*1	R	Set to 1 when an error occurs in the read data length (and the end bit has not been detected among the valid bits)
3	E3	0*1	R	Set to 1 when an error occurs in the response length to a command*2 issued within a command sequence. In cases where CMD12 is issued by setting a command index in SD_CMD, this is indicated in E2.
2	E2	0*1	R	Set to 1 when an error occurs in the response length (other than a response to a command*2 issued within a command sequence)
1	E1	0*1	R	Set to 1 when an error occurs in the command index of the response to a command*2 issued within a command sequence. In cases where CMD12 is issued by setting a command index in SD_CMD, this is indicated in E0.
0	E0	0*1	R	Set to 1 when an error occurs in the command index of a response (other than a response to a command*2 issued within a command sequence).

Note 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

Note 2. "Command issued within a command sequence" refers to CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD_CMD, CMD12 when the STP bit in SD_STOP is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO_MODE is set to 1.

38.2.14 SD Error Status Register 2 (SD_ERR_STS2)

The SD error status register 2 (SD_ERR_STS2) indicates the timeout state. Ncycle is set by bits 7 to 4 in SD_OPTION.

Bit	Bit Name	Initial Value	R/W	Description
15 to 7	—	All 0	R	Fixed 0
6	E6	0*1	R	Set to 1 when the busy state continues for longer than Ncycle after the CRC status
5	E5	0*1	R	Set to 1 when the CRC status is not received though a longer time than Ncycle has elapsed after data writing
4	E4	0*1	R	Set to 1 when read data is not received though a longer time than Ncycle has elapsed after read command. Set to 1 when read data for the next block are not received though a longer time than Ncycle has elapsed after the reception of read data. Set to 1 when read data for the next block are not received though a longer time than Ncycle has elapsed after release of the read wait state.
3	E3	0*1	R	Set to 1 when the busy state for longer than Ncycle continues after CMD12 has been issued within a command sequence. In cases where CMD12 is issued by setting a command index in SD_CMD, this is indicated in E2.
2	E2	0*1	R	Set to 1 when the busy state for longer than Ncycle continues after R1b response
1	E1	0*1	R	Set to 1 when the response to a command*2 issued within a command sequence is not received though a longer time than 640 cycles of SD_CLK has elapsed. In cases where CMD12 is issued by setting a command index in SD_CMD, this is indicated in E0.
0	E0	0*1	R	Set to 1 when the response (other than a response to a command*2 issued within a command sequence) is not received though a longer time than 640 cycles of SD_CLK has elapsed.

Note 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

Note 2. "Command issued within a command sequence" refers to CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD_CMD, CMD12 when the STP bit in SD_STOP is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO_MODE is set to 1.

38.2.15 SD Buffer Read/Write Register (SD_BUF0)

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	BUF31 to BUF0	Unknown	R/W	When writing to the SD card, the write data is written to this register. When reading from the SD card, the read data is read from this register. This register is internally connected to two 512-byte (128-word) buffers.

38.2.16 SDIO Mode Control Register (SDIO_MODE)

The SDIO mode control register (SDIO_MODE) controls the CMD52 issuance and the read wait state at multiple block transfer, and the reception of SDIO interrupt. C52PUB and IOABT should not be set to 1 simultaneously.

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R	Fixed 0
9	C52PUB	0	R/W	SDIO None Abort*2 <ul style="list-style-type: none"> • When C52PUB is set to 1 in the CMD53 (multiple block) write sequence, CMD52 is automatically issued if SD_BUF becomes empty and between the current one-block and next-block. C52PUB is automatically cleared to 0 after reception of the response to CMD52 is completed. Additionally, if C52PUB is set to 1 while the last block is being transferred, CMD52 is not issued. In this case, C52PUB is automatically cleared to 0 after the access end flag has been set to 1. • When C52PUB and RWREQ are set to 1 in the CMD53 (multiple block) read sequence, the block transfer enters the read wait state between the current one-block and next-block and CMD52 is automatically issued. C52PUB is automatically cleared to 0 after reception of the response to CMD52 is completed. Additionally, if C52PUB is set to 1 while the last block is being transferred, CMD52 is not issued. In this case, C52PUB is automatically cleared to 0 after the access end flag has been set to 1. • If C52PUB is set to 1 in the CMD53 (multiple block) read sequence, be sure to set RWREQ to 1 as well as C52PUB. • Set SD_ARG before setting C52PUB to 1.
8	IOABT	0	R/W	SDIO Abort*2 <ul style="list-style-type: none"> • When IOABT is set to 1 in the CMD53 (multiple block) sequence, the CMD53 sequence is halted and CMD52 is issued. <p>However, if a command sequence is halted because of a communications error or timeout, CMD52 is not issued. Although continued buffer access is possible even after IOABT has been set to 1, the buffer access error bit (ERR5 or ERR4) in SD_INFO2 will be set accordingly. Set SD_ARG before setting IOABT to 1.</p> <ul style="list-style-type: none"> • When IOABT has been set to 1 during transfer for single block write, the access end flag is set when SD_BUF becomes empty, and CMD52 is not issued. If SD_BUF does contain data, the access end flag is set on completion of reception of the busy state without CMD52 having been issued. • When IOABT has been set to 1 during transfer for single block read, the access end flag is set immediately after setting of IOABT and CMD52 is not issued. • When IOABT is set to 1 during reception of the busy state after an R1b response, the access end flag is set on completion of reception of the busy state without CMD52 having been issued. • When IOABT is set to 1 after a command sequence has been completed, CMD52 is not issued and the access end flag is not set.
7 to 3	—	All 0	R	Fixed 0

Bit	Bit Name	Initial Value	R/W	Description
2	RWREQ	0	R/W	<p>Read Wait Request</p> <p>When RWREQ is set to 1 in the CMD53 (multiple block) read sequence, the block transfer enters the read wait state (SD_D2 changes from 1 to 0) between the current one-block and next-block.</p> <p>[Read wait state releasing]</p> <ul style="list-style-type: none"> The read wait state is released, when RWREQ is cleared to 0 in the read wait state.*3 When IOABT is set to 1 in the read wait state, RWREQ is automatically cleared to 0 after CMD52 has been issued, and then the read wait state is released. When C52PUB and RWREQ are set to 1 simultaneously in the CMD53 (multiple block) read sequence, the read wait state is not automatically released. Therefore, after the CMD52 response is received, clear RWREQ. (Be sure to set RWREQ and C52PUB simultaneously.) <p>When RWREQ is set to 1 while the last block in the CMD53 (multiple block) read sequence is transferred, the read wait state is not entered and RWREQ is automatically cleared to 0 by setting access end.</p>
1	—	0	R	Fixed 0
0	IOMOD	0	R/W	<p>SDIO Mode*1</p> <p>1: Enables the SD host interface to receive SDIO interrupt from the SDIO card.</p> <p>0: Disables the SD host interface to receive SDIO interrupt from the SDIO card.</p>

Note 1. Do not change the value of this bit when the SCLKDIVEN bit in SD_INFO2 is set to 0.

Note 2. Do not change the values of these bits from 1 to 0 when the SCLKDIVEN bit in SD_INFO2 is set to 0.

Note 3. Clear this bit after reception of the response to CMD52 is completed.

38.2.17 SDIO Interrupt Flag Register (SDIO_INFO1)

The SDIO interrupt flag register (SDIO_INFO1) indicates the status regarding to the SDIO card access. To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

Bit	Bit Name	Initial Value	R/W	Description
15	EXWT	0*2	R/W*1	[Setting condition] While the last block in the CMD53 (multiple block) read sequence is transferred, RWREQ in SDIO_MODE is set to 1. [Clearing condition] When 0 is written to EXWT
14	EXPUB52	0*2	R/W*1	[Setting conditions] <ul style="list-style-type: none"> • While the last block in the CMD53 (multiple block) sequence is transferred, C52PUB in SDIO_MODE is set to 1. • While C52PUB is set to 1 in the CMD53 (multiple block) write sequence, the last block is transferred. [Clearing condition] When 0 is written to EXPUB52
13 to 3	—	All 0	R	Fixed 0
2, 1	—	0*2	R/W*1	Reserved The write value should always be 1.
0	IOIRQ	0*2	R/W*1	SD IO Interrupt [Setting condition] When SDIO interrupt from an SDIO card is received while IOMOD in SDIO_MODE is set to 1 [Clearing condition] When 0 is written to IOIRQ*3

Note 1. It is effective only if 0 is written.

Note 2. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

Note 3. Before clearing this bit, access the SDIO card to negate the SDIO interrupt signal from the SDIO card (after CMD25 has been issued and the response received). If the interrupt signal is not negated, this bit may be set again.

38.2.18 SDIO_INFO1 Interrupt Mask Register (SDIO_INFO1_MASK)

The SDIO_INFO1 interrupt mask register (SDIO_INFO1_MASK) enables or disables the SD_INFO1 interrupt. When 0 is set in SDIO_INFO1_MASK while the corresponding flag in SD_INFO1 is set, an interrupt occurs.

Bit	Bit Name	Initial Value	R/W	Description
15	MEXWT	1	R/W	EXWT interrupt masked
14	MEXPUB52	1	R/W	EXPUB52 interrupt masked
13 to 3	—	All 0	R	Fixed 0
2, 1	—	All 1	R/W	Reserved The write value should always be 1.
0	IOMSK	1	R/W	IOIRQ interrupt masked

38.2.19 DMA Mode Enable Register (CC_EXT_MODE)

The DMA mode enable register (CC_EXT_MODE) enables the DMA transfer.

Bit	Bit Name	Initial Value	R/W	Description
15 to 13	—	All 0	R	Fixed 0
12	—	1	R	Reserved
11, 10	—	All 0	R	Fixed 0
9, 8	—	All 0	R	Reserved
7 to 5	—	All 0	R	Fixed 0
4	—	1	R	Reserved
3, 2	—	All 0	R	Reserved
1	DMASDRW	0	R/W	SD_BUF Read/Write DMA Transfer*1 1: The SD_BUF read/write DMA transfer is enabled. 0: The SD_BUF read/write DMA transfer is disabled. At the SD_BUF read/write DMA transfer, set DMASDRW to 1 before setting SD_CMD.
0	—	0	R	Reserved

Note 1. Do not change the values of these bits when the SCLKDIVEN bit in SD_INFO2 is set to 0.

38.2.20 Software Reset Register (SOFT_RST)

The software reset register (SOFT_RST) sets a software reset. Make sure to release the reset before using the SD host interface.

Bit	Bit Name	Initial Value	R/W	Description
15 to 3	—	All 0	R	Fixed 0
2	—	1	R	Reserved
1	—	1	R	Reserved
0	SDRST	0	R/W	Software Reset of SD I/F Unit 0: Reset 1: Reset released

38.2.21 Version Register (VERSION)

The version register (VERSION) indicates the version of the SD host interface.

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	—	1000	R	Reserved
11 to 8	UR3 to UR0	4'h2	R	Version of Renesas IP
7 to 0	IP7 to IP0	8'h0B	R	Version of adopted IP

38.2.22 Swap Control Register (EXT_SWAP)

The swap control register (EXT_SWAP) can replace data when SD_BUF0 is accessed.

Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R/W	Reserved The write value should always be 0.
14, 13	—	All 0	R	Reserved
12, 11	—	All 0	R/W	Reserved The write value should always be 0.
10, 9	—	All 0	R	Fixed 0
8	DMASEL	0	R/W	DMA Transfer Size Select Selects the transfer unit for SD_BUF read/write DMA transfer. Set this bit in combination with the transfer size set in the DMA Channel Configuration register. 0: 4-byte (longword) unit 1: 64-byte (longword × 16) unit Note: • For DMA transfer in 64-byte units, set address H'E804E000 (channel 0) / H'E804E800 (channel 1) as the destination or source of DMA transfer instead of the SD buffer read/write register (SD_BUF0). Moreover, if a communications error or timeout occurs during the 64-byte unit DMA transfer, this bit should be set to 0 and re-setting again before using DMA transfer. If a software reset occurs during the 64-byte unit DMA transfer, this bit should be set to 0 and re-setting again before using DMA transfer.
7	SDBRSWAP	0	R/W	SD_BUF0 Swap Read*1 When reading from SD_BUF0, data stored in SD_BUF0 can be replaced and then read.*2 0: The current data is read without replacement. 1: Data replacement for reading proceeds in bytes.
6	SDBWSWAP	0	R/W	SD_BUF0 Swap Write*1 When writing to SD_BUF0, data to be written can be replaced and then stored in SD_BUF0.*2 0: The current data is written without replacement. 1: Data replacement for writing proceeds in bytes.
5	—	0	R	Fixed 0
4, 3	—	All 0	R/W	Reserved The write value should always be 0.
2	—	0	R	Fixed 0
1	—	0	R/W	Reserved The write value should always be 0.
0	—	0	R	Fixed 0

Note 1. Do not change the values of these bits when the SCLKDIVEN bit in SD_INFO2 is set to 0.

Note 2. Details on SD_BUF0 access with data replacement or non-replacement are indicated in (1) SD Data Format in section 38.3.1, SD I/F.

38.3 Operation

38.3.1 SD I/F

(1) SD Data Format

When data is read from the SD card, the procedure is as follows.

1. The SD host interface receives data from the SD card via the SD_D signal. (SD_D signal: see Figure 38.2 and Figure 38.3.)
2. The receive data is stored in SD_BUF of the SD host interface. (SD_BUF store data: see Figure 38.4)
3. The data stored in SD_BUF is read by SD_BUF0. (Reading from SD_BUF0: see Figure 38.5)

When data is written to the SD card, the above procedure will be reversed.

When accessing SD_BUF0, caution should be taken for the transfer order in SD_D and the store order in SD_BUF. In addition, data stored in SD_BUF0 can be replaced in bytes with the EXT_SWAP. (See Figure 38.5)

Figure 38.2 SD_D0 in 1-Bit Width Mode

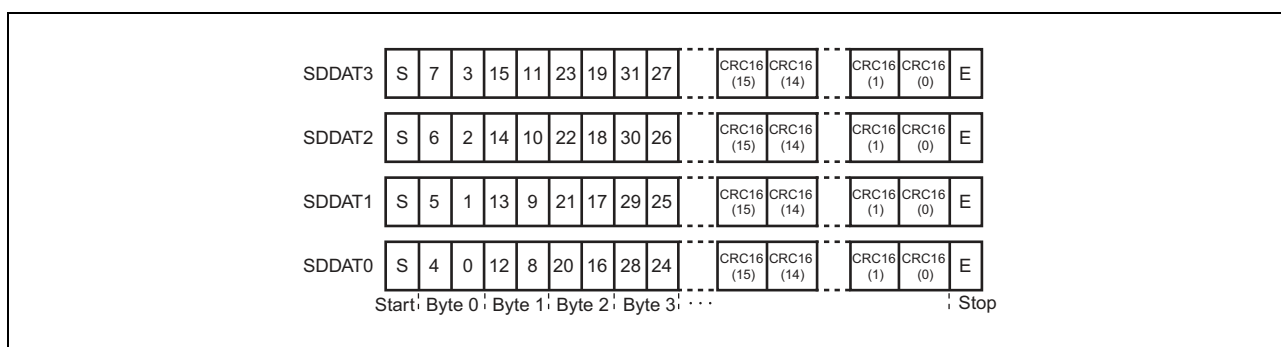

Figure 38.3 SD_D3 to SD_D0 in 4-Bit Width Mode

Figure 38.4 SD_BUF Store Data

Figure 38.5 Reading from SD_BUF0

38.3.2 Card Detect/Write Protect

(1) Card Detect

The SD host interface has two types of card detect functions as described in the following.

- Card detect with SD_CD

Figure 38.6 shows the timing chart of card detect using SD_CD. SD_CD is connected to the card socket and pulled up on the host device. The resistance of the pull-up resistor is decided by the specification of the SD host device.

[Card insertion]

SD_CD is pulled down when a card is inserted. At this time, if SD_CD has been pulled down for the Ncycle period (set in SD_OPTION), INFO4 in SD_INFO1 is set to 1. (It is cleared to by writing 0.)

[Card removal]

SD_CD is pulled up when a card is removed. At this time, if SD_CD has been pulled up for the Ncycle period (set in SD_OPTION), INFO3 in SD_INFO1 is set to 1. (It is cleared to by writing 0.)

Figure 38.6 Example of Card Detect with SD_CD

- SD card detect with SD_D3

Figure 38.7 shows the timing chart when the SD card is detected with SD_D3. In addition, SD_D3 is pulled down by the host device, and the resistance value for pulling down is decided by the specification of SD host device.

[Card insertion]

When an SD card is inserted, SD_D3 is pulled up. Accordingly, INFO9 in SD_INFO1 is set to 1. (It is cleared to by writing 0.)

[Card removal]

When an SD card is removed, SD_D3 is pulled down. Accordingly, INFO8 in SD_INFO1 is set to 1. (It is cleared to by writing 0.)

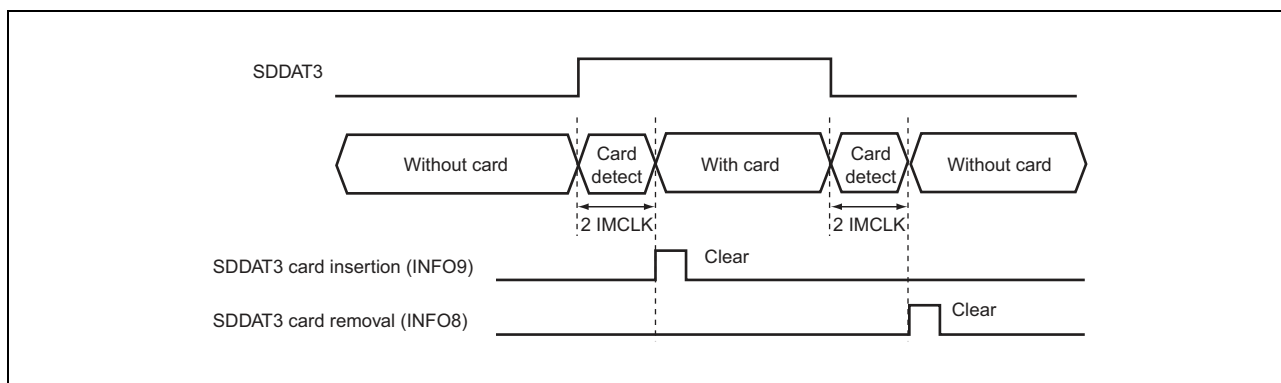

Figure 38.7 SD Card Detect with SD_D3

- Power-Down mode at Card removal

SD Host Interface module is halted by the MSTP123 bit to MSTP120 bit in Standby Control Register 12 (STBCR12). If these bits of each channel in STBCR12 are set to 10, low power consumption is achieved at Card removal. See section 42, Power-Down Modes.

Bit	Bit Name	Initial Value	R/W	Description
3	MSTP123	1	R/W	SD Host Interface 0 Module Stop
2	MSTP122	1		00: SD Host Interface 0 Module runs. 01: Setting prohibited 10: Only card detect block in SD Host Interface 0 Module runs. 11: Clock supply to SD Host Interface 0 Module is halted.
1	MSTP121	1	R/W	SD Host Interface 1 Module Stop
0	MSTP120	1		00: SD Host Interface 1 Module runs. 01: Setting prohibited 10: Only card detect block in SD Host Interface 1 Module runs. 11: Clock supply to SD Host Interface 1 Module is halted.

(2) Write Protect

The SD host interface has two types of write protect functions.

- Write protect with SD_WP

SD_WP is connected to the card socket, and pulled up or pulled down by the card insertion. The selection of pulling up or pulling down and the resistance value is decided by the specification of SD host device. As the SD_WP state is reflected to INFO7 in SD_INFO1, the write protect is decided after the SD card is inserted.

- Write protect with command

The card's internal write protection and the card lock/unlock operation are realized by the command.

38.3.3 Interrupt Request and DMA Transfer Request

(1) Interrupt Request

The SD host interface has three interrupt requests. Table 38.4 shows the relationship between the interrupt flag registers and the interrupt mask registers. When a bit in an interrupt mask register is set to 0, an interrupt occurs by setting the corresponding bit in the interrupt flag register to 1.

To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

Table 38.4 Interrupt Request

Interrupt Request	Interrupt Flag Register		Interrupt Mask Register	
	Register Name	Bit Name	Register Name	Bit Name
Card access interrupt (SDHI0)	SD_INFO1	INFO2	SD_INFO1_MASK	IMASK2
		INFO0		IMASK0
	SD_INFO2	ILA	SD_INFO2_MASK	IMASK
		BWE		BMASK1
		BRE		BMASK0
		ERR6		EMASK6
		ERR5		EMASK5
		ERR4		EMASK4
		ERR3		EMASK3
		ERR2		EMASK2
		ERR1		EMASK1
ERR0	EMASK0			
SDIO access interrupt (SDHI1)	SDIO_INFO1	EXWT	SDIO_INFO1_MASK	MEXWT
		EXPUB52		MEXPUB52
		IOIRQ		IOMSK
Card detect interrupt (SDHI3)	SD_INFO1	INFO9	SD_INFO1_MASK	IMASK9
		INFO8		IMASK8
		INFO4		IMASK4
		INFO3		IMASK3

(2) DMA Transfer Request

The SD host interface has two types of DMA transfer requests. The DMA transfer requests are described in the following passages.

- SD_BUF write DMA transfer request
 - When the buffer is empty while the DMASDRW bit in CC_EXT_MODE is set to 1, the SD_BUF write DMA transfer request is asserted.
 - The SD_BUF write DMA transfer request is negated when the last data in one block (= the transfer data size set in SD_SIZE) is transferred. The SD_BUF write DMA transfer request is also negated by clearing the SDRST bit in SOFT_RST to 0 or setting the STP bit in SD_STOP to 1. Note that if a communications error or timeout occurs at the DMA transfer, the SD_BUF write DMA transfer request is not negated.
 - The number of DMA transfers should be n x one block. (n = integer, one block = the transfer data size set in SD_SIZE)
 - When the IOABT bit in SDIO_MODE is set to 1, the SD_BUF write DMA transfer request is negated.
 - The DMA transfer request is also negated by clearing the DMASDRW bit to 0. However, note that the DMA transfer request is asserted again when the DMASDRW bit is set to 1 before writing to SD_CMD.
- SD_BUF read DMA transfer request
 - When the buffer is full while the DMASDRW bit in CC_EXT_MODE is set to 1, the SD_BUF read DMA transfer request is asserted.
 - The SD_BUF read DMA transfer request is negated when the last data in one block (= the transfer data size set in SD_SIZE) is transferred. The SD_BUF read DMA transfer request is also negated by clearing the SDRST bit in SOFT_RST to 0 or setting the STP bit in SD_STOP to 1. Note that if a communications error or timeout occurs at the DMA transfer, the SD_BUF read DMA transfer request is not negated.
 - The number of DMA transfers should be n x one block. (n = integer, one block = the transfer data size set in SD_SIZE)
 - When the IOABT bit in SDIO_MODE is set to 1, the SD_BUF read DMA transfer request is negated.
 - The DMA transfer request is also negated by clearing the DMASDRW bit to 0. However, note that the DMA transfer request is asserted again when the DMASDRW bit is set to 1 before writing to SD_CMD.
 - The number of cycles at one DMA transfer will be more than $P1\phi \times 10$. If SD_CLK is high frequency and SD_BUF is not empty, SD_CLK is stopped until SD_BUF is empty.

38.3.4 Communications Errors and Timeouts

- Communications Errors and Timeouts

Table 38.5 and Table 38.6 show the relationships between the SD card interrupt flag register and SD error status register for communications errors and timeouts, respectively. When a bit in the SD card interrupt flag register is set to 1, the corresponding bit in the SD error status register is set to 1. The values of the SD error status register are cleared by writing to SD_CMD or writing 0 to the SDRST bit in SOFT_RST.

Table 38.5 Communications Errors

Communication Error	SD Card Interrupt Flag Register		SD Error Status Register		Description
	Register Name	Bit Name	Register Name	Bit Name	
END error	SD_INFO2	ERR2	SD_ERR_STS1	E5	When an error occurs in the CRC status length
				E4	When an error occurs in read data length
				E3	When an error occurs in the response length to a command issued within a command sequence
				E2	When an error occurs in the response length (other than a response to a command issued within a command sequence)
CRC error		ERR1		E11	When an error occurs in the CRC status
				E10	When a CRC error occurs in the read data
				E9	When a CRC error occurs in the response to a command issued within a command sequence
				E8	When a CRC error occurs in the response (other than a response to a command issued within a command sequence)
CMD error		ERR0		E1	The command index of the transmitted command differed from the command index of the received response (for a command issued within a command sequence).
				E0	The command index of the transmitted command differed from the command index of the received response (for a command issued other than within a command sequence)

Table 38.6 Timeouts

Timeout	SD Card Interrupt Flag Register		SD Error Status Register		Description
	Register Name	Bit Name	Register Name	Bit Name	
Response timeout	SD_INFO2	ERR6	SD_ERR_STS2	E1	When the response to a command issued within a command sequence is not received though a longer time than 640 cycles of SD_CLK has elapsed
				E0	When the response (other than a response to a command issued within a command sequence) is not received though a longer time than 640 cycles of SD_CLK has elapsed
Data timeout (other than response timeout)		ERR3		E6	When the busy state (SD_D0 = 0) continues for longer than Ncycle after the CRC status
				E5	When the CRC status is not received though a longer time than Ncycle has elapsed after data writing
				E4	When read data is not received though a longer time than Ncycle has elapsed after read command
					When read data for the next block are not received though a longer time than Ncycle has elapsed after the reception of read data
					When read data for the next block are not received though a longer time than Ncycle has elapsed after release of the read wait state
				E3	When the busy state (SD_D0 = 0) for longer than Ncycle continues after CMD12 has been issued within a command sequence.
E2	When the busy state (SD_D0 = 0) for longer than Ncycle continues after R1b response				

38.4 Usage Example

38.4.1 Command without Data Transfer

(1) Flowchart

Figure 38.8 and Figure 38.9 show flowchart examples.

Figure 38.8 Flow Example of Command Without Response and Data

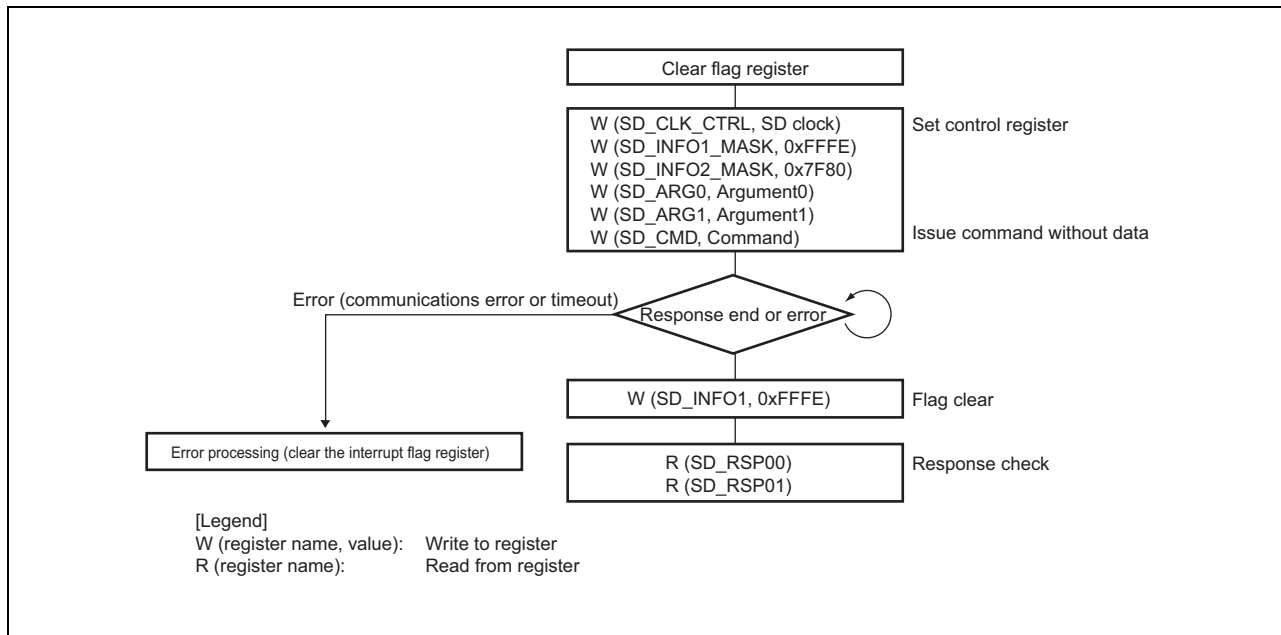

Figure 38.9 Flow Example of Command Without Data

(2) Operation for Command without Data Transfer: The operation of the command without data transfer is described in the following.

- Command without response and data
 - Flag register clear
First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
 - Control register set
Set the SD clock (SD_CLK), interrupt mask, and so on. (SD_CLK_CTRL, SD_INFO1_MASK, and SD_INFO2_MASK)
 - Command issue
Set CMD Argument in SD_ARG0 and SD_ARG1 and write to SD_CMD.
Accordingly, CMD is issued, and the operation is started.
 - Flag clear
When transmission of a command is completed, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0.

- Command without data
 - Flag register clear
First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
 - Control register set
Set the SD clock (SD_CLK), interrupt mask, and so on. (SD_CLK_CTRL, SD_INFO1_MASK, and SD_INFO2_MASK)
 - Command issue
Set CMD Argument in SD_ARG0 and SD_ARG1 and write to the SD_CMD.
Accordingly, CMD is issued, and the operation is started.
 - Flag clear
When a response is received, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0.
 - Read a response from SD_RSP00 and SD_RSP01.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

38.4.2 Single Block Read

(1) Flowchart

Figure 38.10 Single Block Read Flowchart Example

- (2) Operation for Single Block Read: The operation of the single block read is described in the following.
- Flag register clear
First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
 - Control register set
Set the SD clock (SD_CLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
 - Command issue (CMD17)
Set CMD17 Argument in SD_ARG0 and SD_ARG1 and write 0x0011 to SD_CMD.
Accordingly, CMD17 is issued, and the single block read operation is started.
 - Response check
On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP00 and SD_RSP01.
If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP or the IOABT bit in SDIO_MODE to 1. Furthermore, this causes CMD12 and CMD52 to not be issued.
If the INFO2 bit (access end) in SD_INFO has been set, halting the command sequence will also lead to the generation of an interrupt.
 - Data receive from SD card and data read
Write 0xFFFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write 0x7E80 to SD_INFO2_MASK to enable the BRE interrupt. When the data receive from the SD card is completed, the BRE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BRE bit to 0 and read the amount of data specified by SD_SIZE from SD_BUF0.
However, a communications error or timeout may be generated if data are being received while reading of SD_BUF0 is in progress.
 - Operation complete
When the data read from SD_BUF0 is completed, INFO2 (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO2 to 0 to end the single block read operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

38.4.3 Single Block Write

(1) Flowchart

Figure 38.11 Single Block Write Flowchart Example

(2) Operation for Single Block Write: The operation of the single block write is described in the following.

- Flag register clear
First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
- Control register set
Set the SD clock (SD_CLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
- Command issue (CMD24)
Set CMD24 Argument in SD_ARG0 and SD_ARG1 and write 0x0018 to SD_CMD.
Accordingly, CMD24 is issued, and the single block write operation is started.
- Response check
On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP00 and SD_RSP01.
If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP or the IOABT bit in SDIO_MODE to 1. Furthermore, this causes CMD12 and CMD52 to not be issued.
If the INFO2 bit (access end) in SD_INFO has been set, halting the command sequence will also lead to the generation of an interrupt.
- Data write and data transmit to SD card
Write 0xFFFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write 0x7D80 to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card. Then, the CRC status and busy state are received from the SD card.
However, a communications error or timeout may be generated if data are being transmitted after writing to SD_BUF0.
- Operation complete
When the CRC status and busy state are received from the SD card, INFO2 (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear the INFO2 bit to 0 to end the single block write operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

38.4.4 Multiple Block Read

(1) Flowchart

Figure 38.12 Multiple Block Read Flowchart Example

- (2) Operation for Multiple Block Read: The operation of the multiple block read is described in the following.
- Flag register clear
First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
 - Control register set
Set the SD clock (SD_CLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
Set SEC in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.
 - Command issue (CMD18)
Set CMD18 Argument in SD_ARG0 and SD_ARG1 and write 0x0012 to SD_CMD.
Accordingly, CMD18 is issued, and the multiple block read operation is started.
 - Response check
On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP00 and SD_RSP01.
If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. When this happens, the arguments for the CMD12 command are set in SD_ARG0 and SD_ARG1. If the command sequence is halted because the access end interrupt has been enabled, an interrupt will be generated by setting of the INFO2 bit (access end) bit in SD_INFO1 to 1 when reception of the response has been completed.
Clear the INFO2 bit to 0 and read the response.
 - Data receive from SD card and data read
Write 0xFFFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write 0x7E80 to SD_INFO2_MASK to enable the BRE interrupt. When one-block data receive from the SD card is completed, the BRE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BRE bit to 0 and read the amount of data specified by SD_SIZE from SD_BUF0. Doing this repeats transfer of the number of blocks set in SD_SECCNT. However, a communications error or timeout may be generated if data are being received while reading of SD_BUF0 is in progress. When reception of the last block of data is completed, CMD12 is automatically issued and the response is received.
At this point, the arguments of CMD12 are reflected as the arguments of CMD18.
 - Operation complete
When all-block data read and the CMD12 response receive are completed, INFO2 (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO2 to 0 to read the response. This is the end of multiple block read operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

38.4.5 Multiple Block Write

(1) Flowchart

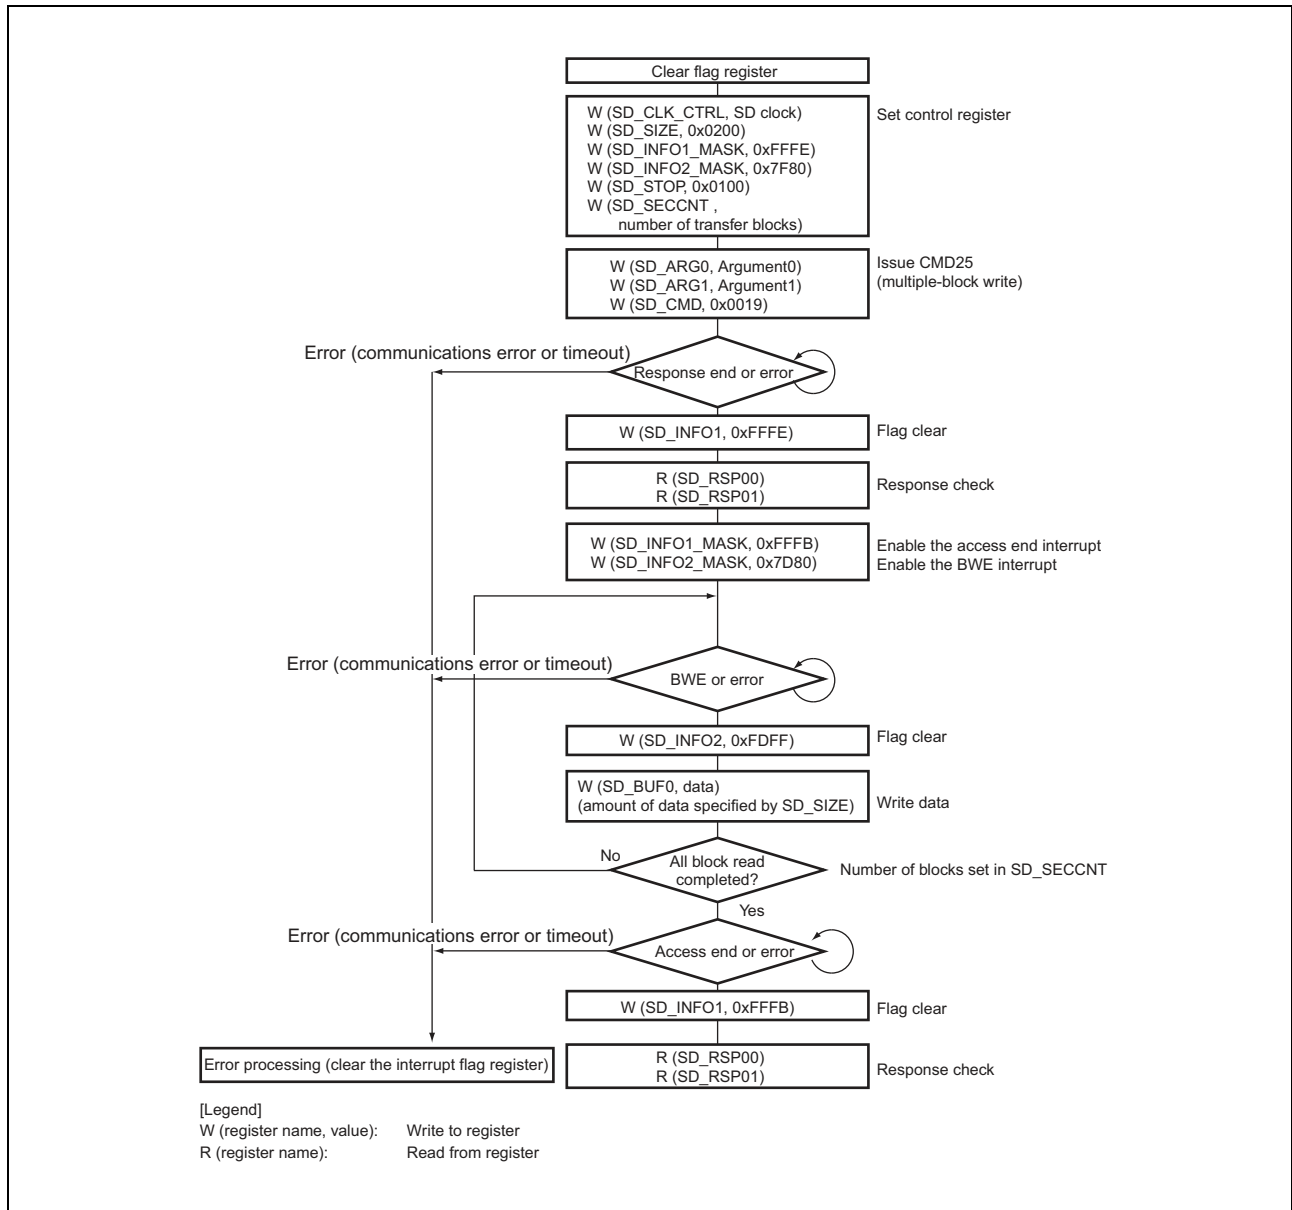

Figure 38.13 Multiple Block Write Flowchart Example

(2) Operation for Multiple Block Write: The operation of the multiple block write is described in the following.

- Flag register clear
First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
- Control register set
Set the SD clock (SD_CLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.
- Command issue (CMD25)
Set CMD25 Argument in SD_ARG0 and SD_ARG1 and write 0x0019 to SD_CMD.
Accordingly, CMD25 is issued, and the multiple block write operation is started.
- Response check
On receiving the response, the INFO0 bit (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear the INFO0 bit to 0 and read the response from SD_RSP00 and SD_RSP01.
If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. When this happens, the arguments for the CMD12 command are set in SD_ARG0 and SD_ARG1. If the command sequence is halted because the access end interrupt has been enabled, an interrupt will be generated by setting of the INFO2 bit (access end) bit in SD_INFO1 to 1 when reception of the response has been completed.
Clear the INFO2 bit to 0 and read the response.
- Data write and data transmit to SD card
Write 0xFFFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write 0x7D80 to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in the SD_INFO2 register is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card. Then, the CRC status and busy state are received from the SD card. Doing this repeats transfer of the number of blocks set in SD_SECCNT. However, a communications error or timeout may be generated if data are being received while writing to SD_BUF0 is in progress. When reception of the last block of data is completed, CMD12 is automatically issued and the response is received.
At this point, the arguments of CMD12 are reflected as the arguments of CMD25.
- Operation complete
When all-block data transmit and the CRC status receive are completed, the INFO2 bit (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear the INFO2 bit to 0 to read the response. This is the end of multiple block write operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

38.4.6 IO_RW_DIRECT Command (CMD52)

(1) Flowchart

38.5 Usage Note

(1) SD_BUF Illegal Write Access

When writing data to SD_BUF0 after the single block write or multi block write command is issued, the data of the size specified by SD_SIZE must be written to.

If the data of the size which exceeds the size specified by SD_SIZE is written to, the ERR4 bit in SD_INFO2 is set to 1. In addition, the data written to SD_BUF0 may not be transmitted and it causes the SCLKDIVEN bit in SD_INFO2 to hold the value of 0. In such cases, clearing the SDRST bit in SOFT_RST to 0 and then restoring its value to 1 clears the SCLKDIVEN bit to 1.

However, for the single byte or three bytes when the number of bytes setting in SD_SIZE is odd, or the fraction of bytes when the number of bytes setting in SD_SIZE is even, since the portion of dummy data writing is regarded as excess data and ignored, it is not within the scope of the above description (the fraction of bytes: the two bytes that are not in a four-byte unit).

(2) Block Number Limitation for Multiple Block Read

When performing a multiple block read of one or two blocks, depending on the timing with which the response register is read, the response value may not be read properly. When receiving one or two blocks of data, use single block read operation.

Figure 38.23 shows the processing flows of SD host interface (hardware) operation and software operation when a multiple block read is performed on two blocks. As shown in the incorrect operation of Figure 38.23, when an interrupt is generated on reception of the CMD18 response and the timing with which the response register is read by the interrupt is delayed, the data during the CMD12 response reception or the CMD12 response may be read. In the case of a multiple block read of three or more blocks, CMD12 is not issued until the block of data has been read, so this problem does not arise. Furthermore, in the case of a multiple block write, since the CMD25 response is read before the block of data is sent, the problem does not arise.

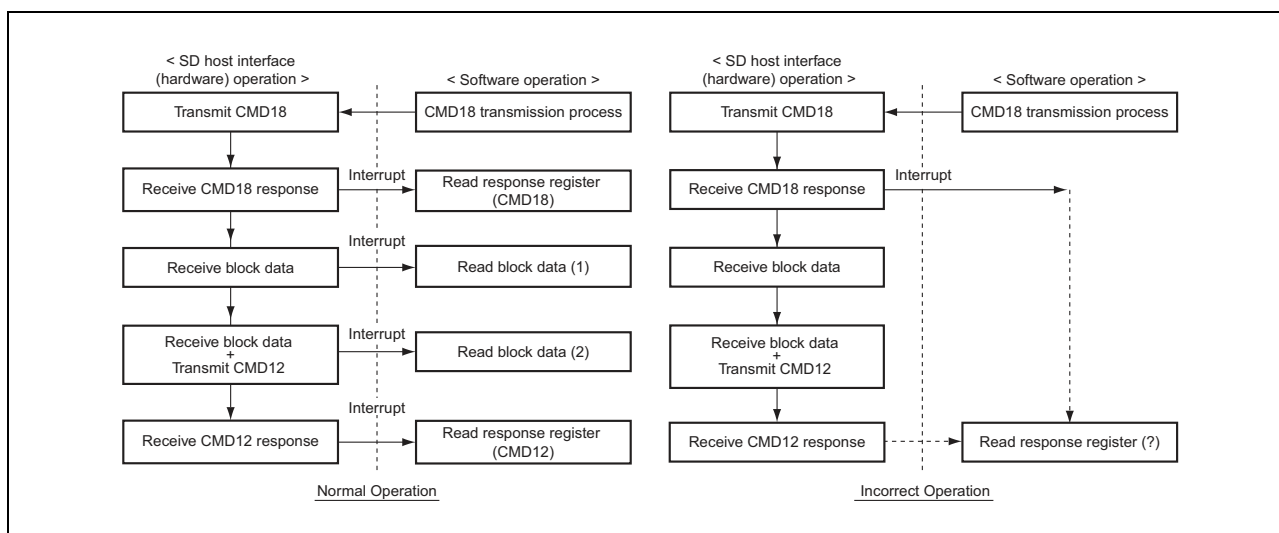

Figure 38.23 Flowcharts for Multiple Block Read Operation (Two Blocks)

(3) Automatic Control of SD_CLK Output

In the SD Card standard, 74 cycles of SD_CLK must be output before initialization of the card. For this reason, use automatic control of SD_CLK output after 74 cycles of SD_CLK have been output. Furthermore, if automatic control of SD_CLK output was in use, SD_CLK output is stopped on completion of the sequence for a communications error or timeout. Thus, in cases where state transitions within the SD card are necessary and so on after completion of the sequence, release automatic control of SD_CLK output and restart supply of SD_CLK to the SD card.

(4) Control of the C52PUB Setting for Multiple Block Write

If the C52PUB bit in SDIO_MODE is set to 1 during a sequence of multiple block write due to CMD53, CMD52 is not issued until SD_BUF becomes empty. For this reason, set the C52PUB bit after suspending writing to SD_BUF by following the appropriate procedure below.

- When DMA transfer is not in use
 1. Before setting the C52PUB bit, suspend writing to SD_BUF by making the setting in SD_INFO2 to disable BWE interrupts.
 2. Set the C52PUB bit in SDIO_MODE to 1 (so that CMD52 is issued when SD_BUF becomes empty).
 3. After the INFO0 interrupt processing in SD_INFO1 due to the issuing of CMD52 has been completed, restart writing to SD_BUF by making the setting in SD_INFO2 to enable BWE interrupts.
- When DMA transfer is in use
 1. Every time DMA transfer of the value set in SD_SIZE \times n blocks (where n = 1, 2, ...) proceeds, suspend writing to SD_BUF by DMA transfer before the C52PUB bit is set.
 2. Set the C52PUB bit in SDIO_MODE to 1 (so that CMD52 is issued when SD_BUF becomes empty).
 3. After the INFO0 interrupt processing in SD_INFO1 due to the issuing of CMD52 has been completed, restart writing to SD_BUF by DMA transfer.

(5) Erroneous Detection of SDIO interrupts

The SD host interface erroneously detects an SDIO interrupt when all of the following conditions are satisfied.

1. SDIO access
2. The SDIO device supports the SDIO interrupt (an optional part of the standard).
3. The SDIO device supports 4-bit width multi-block read of CMD53 (an optional part of the standard).
4. The SDIO device does not support the SDIO interrupt between 4-bit width data blocks (an optional part of the standard).

Avoid this problem by following the procedure below when the values of the SMB and S4MI bits in the card capability register of the SDIO device are 1 and 0, respectively.

1. Immediately before executing the multiple block read command, clear (to 0) the IOMOD bit of the SDIO_MODE register.
2. Execute the command.
3. Set (to 1) the IOMOD bit of the SDIO_MODE register immediately after multiple block read operation is completed.

(6) Setting STP bit during multiple read

During multiple block read with auto CMD12 setting 1 to SEC bit of SD_STOP, if performing a force-quit by setting 1 to STP bit of SD_STOP, the command sequence is not terminated depending on the timing of setting 1 to STP bit of SD_STOP.

To avoid this, if setting STP bit of SD_STOP during multiple block transfer, setting 0 to SEC bit of SD_STOP at the same time.

Switching the value of SEC bit of SD_STOP from 1 to 0, even if CBSY bit of SD_INFO2 is 1.

In case the command sequence is not terminated because of not setting 0 to SEC bit of SD_STOP at the same time, setting SDRST bit of SOFT_RST is also available to terminate the command sequence.

If performing a force-quit by setting 1 to IOABT bit of SDIO_MODE during CMD53 multiple block transfer, leave the value (=1) of SEC bit of SD_STOP as it is.

(7) Software Reset

For transitions to the software reset state by the SDRST bit in the SOFT_RST register, see section 42.3.6, **Software Reset**. However, where the procedure refers to the SRST bit, read this as the SDRST bit in the SOFT_RST register.

39. MMC Host Interface

The MMC host interface is a host controller conforming to the JEDEC Standard JESD84-A441 that allows connection with devices with the MMC interface.

39.1 Features

- Supports 1/4/8-bit MMC bus
- Supports the Single Data Rate only
- MMC clock frequency = $P1\phi$ frequency/ 2^n ($n = 1$ to 10)
- Supports High Priority Interrupt (HPI)*
- Supports background operation
- Data buffer: 512 bytes \times 2
- Three types of interrupt requests: normal operation, error/timeout, card detection
- DMA transfer requests: buffer write and buffer read
- Card detection function

Note: * Supports HPI in the sequences of CMD6, CMD24, CMD25 (pre-defined), and CMD38.

Figure 39.1 shows a block diagram of this module.

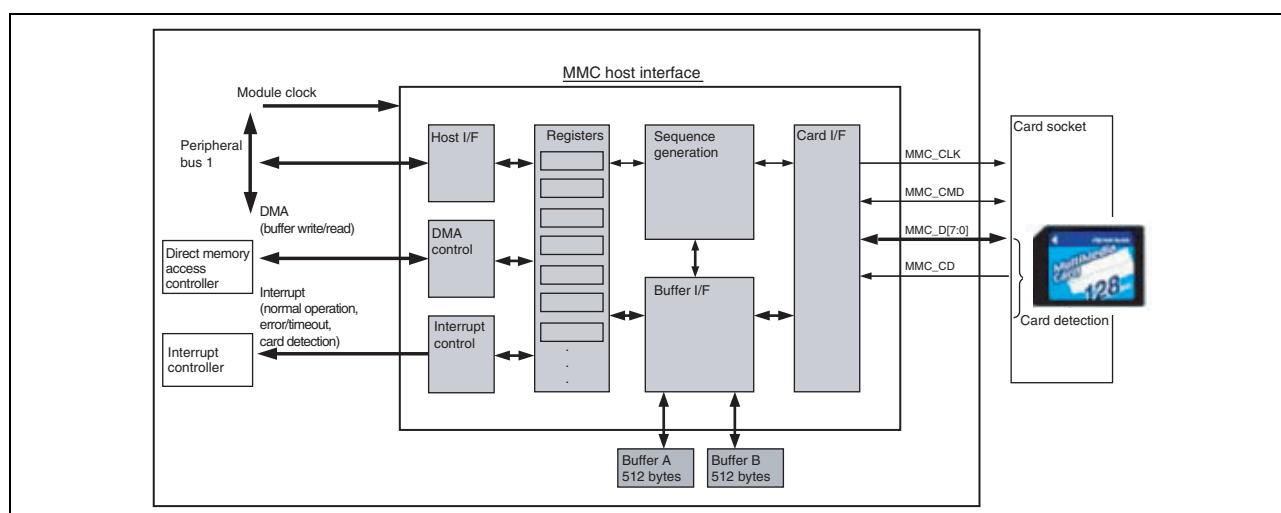

Figure 39.1 Block Diagram of MMC Host Interface

39.2 Input/Output Pins

Table 39.1 shows the pin configuration of this module.

Table 39.1 Pin Configuration

Pin Name	I/O	Function
MMC_CLK	Output	MMC clock
MMC_CMD	Input/output	Command/response
MMC_D[7:0]	Input/output	Transmit/receive data
MMC_CD	Input	Card detection*1

Note 1. Check the specifications of the card socket to be used before connection.

39.3 Register Descriptions

Table 39.2 shows the register configuration of this module.

Table 39.2 Register Configuration

Register Name	Abbreviation	R/W	Address	Access Size
Command setting register	CE_CMD_SET	R/W	H'E804C800	16
			H'E804C802	16
Argument register	CE_ARG	R/W	H'E804C808	32
Argument register for automatically-issued CMD12	CE_ARG_CMD12	R/W	H'E804C80C	32
Command control register	CE_CMD_CTRL	R/W	H'E804C810	32
Transfer block setting register	CE_BLOCK_SET	R/W	H'E804C814	32
Clock control register	CE_CLK_CTRL	R/W	H'E804C818	32

Version register	CE_VERSION	R/W	H'E804C87C	32

Note: • Do not access registers other than those shown above.

39.3.1 Command Setting Register (CE_CMD_SET)

CE_CMD_SET sets a command sequence.

The command sequence starts when the settings have been made in bits 31 to 16. Note that writing to CE_CMD_SET is disabled while a command sequence is proceeding (i.e., the value of CMDSEQ in CE_HOST_STS1 is 1).

CE_CMD_SET should be set according to the description in section 39.7.12, Setting Values of CE_CMD_SET. This register should be accessed in 16 bits. (The address of bits 31 to 16 is H'E804C800 and that of bits 15 to 0 is H'E804C802.)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	CMD[5:0]					RTYP[1:0]		RBSY	—	WDAT	DWEN	CMLTE	CMD12 EN	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W

16	CMD12EN	0	R/W	Automatic CMD12 Issuance (valid when multi-block transfer is selected)* 0: Does not issue CMD12 automatically. 1: Issues CMD12 automatically (= automatic CMD12) For details of automatic CMD12 issuance, see section 39.6.4, Automatic CMD12 Issuance. Note: Set the transfer block size to 512 bytes. Set RBSY to 0.

Bit	Bit Name	Initial Value	R/W	Description
15, 14	RIDXC[1:0]	00	R/W	Response Index Check Specify the items to be checked for [45:40] of a 6-byte response or [133:128] of a 17-byte response. 00: Checks the response index (ensure that the response index matches the command index.) 01: Checks the check bits (ensure that the bits are all 1.) 10: No checking 11: Setting prohibited
13, 12	RCRC7C [1:0]	00	R/W	Response CRC7 Check Specify the items to be checked for [7:1] of a 6-byte response or a 17-byte response. 00: Checks CRC7 (set the response type to 01) 01: Checks the check bits (set the response type to 01) 10: Checks internal CRC7 (R2 only) (set the response type to 10) 11: No checking
11	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
10	CRC16C	0	R/W	CRC16 Check in Reception (valid when "with data" and "read" are selected) 0: Checks CRC16 1: Does not check CRC16 (use when CMD14)
9	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
8	CRCSTE	0	R/W	CRC Status Reception (valid when "with data" and "write" are selected) 0: Receives CRC status 1: Does not receive CRC status (use when CMD19)
7	TBIT	0	R/W	Transmission Bit Setting 0: Sets the transmission bit ([46]) to 1. 1: Sets the transmission bit ([46]) to 0.
6	OPDM	0	R/W	Open-Drain Output Mode 0: Normal output 1: Open-drain output Note: This setting is only applied to the MMC_CMD line.
5, 4	—	00	R	Reserved These bits are always read as 0. The write value should always be 0.
3	SBIT	0	R/W	Read Data Start Bit Detection (valid when "with data" and "read" are selected) 0: Detects the start bit when the MMC_D signals set by DATW are all 0. 1: Detects the start bit when MMC_D[0] is 0.
2	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
1, 0	DATW[1:0]	00	R/W	Data Bus Width Setting (valid when "with data" is selected) 00: 1 bit 01: 4 bits 10: 8 bits 11: Setting prohibited

Note: * When HPI is executed, use multi-block transfer (pre-defined) without setting this bit to 1.

39.3.2 Argument Register (CE_ARG)

CE_ARG sets the argument for the command to be transmitted. Set CE_ARG before starting the command sequence.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	ARG[31:0]	H'00000000	R/W	These bits set [39:8] of a command. Note: Set the argument of automatically-issued CMD12 by CE_ARG_CMD12.

39.3.3 Argument Register for Automatically-Issued CMD12 (CE_ARG_CMD12)

CE_ARG_CMD12 is used to set the argument for the automatically-issued CMD12 in multi-block transfer.

For the automatically-issued CMD12, see section 39.6.4, Automatic CMD12 Issuance. Set CE_ARG_CMD12 before starting the command sequence.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	C12ARG[31:0]	H'00000000	R/W	These bits set [39:8] of the automatically-issued CMD12.

39.3.4 Command Control Register (CE_CMD_CTRL)

CE_CMD_CTRL is used to terminate a command sequence forcibly.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	BREAK
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	BREAK	0	R/W	Forcible Termination of Command Sequence To discontinue the current command sequence, write 1 to this bit while the bit is 0 and then write 0. After the above procedure, check if the value of the CMDSEQ bit in CE_HOST_STS1 has become 0 and then perform a software reset. Note: Since a software reset returns the register value to the initial value, the register needs be set again.

39.3.5 Transfer Block Setting Register (CE_BLOCK_SET)

CE_BLOCK_SET specifies the size of the block and the number of blocks for the data to be transferred. Set CE_BLOCK_SET before starting the command sequence.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	BLKCNT[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BLKSIZ[15:0]															
Initial value:	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	BLKCNT [15:0]	H'0000	R/W	Number of Blocks for Transfer Note: This setting is valid for multi-block transfer.
15 to 0	BLKSIZ [15:0]	H'0200	R/W	Transfer Block Size Note: Transfer block size should be set as follows. <ul style="list-style-type: none"> • Single-block transfer: 1 to 512 bytes • Multi-block transfer: 512 bytes

39.3.6 Clock Control Register (CE_CLK_CTRL)

CE_CLK_CTRL controls the MMC clock and sets timeout values. Do not change the setting of this register while a command sequence is in progress.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	CLKEN	—	—	—	—	CLKDIV[3:0]			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	SRSPTO[1:0]		SRBSYTO[3:0]			SRWDTO[3:0]			—	—	—	—		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	CLKEN	0	R/W	MMC Clock Output Control 0: Does not output the MMC clock (tied to low level) 1: Outputs the MMC clock
23 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
19 to 16	CLKDIV[3:0]	0000	R/W	MMC Clock Frequency Setting 0000: $P1\phi/2$ 0001: $P1\phi/2^2$ 0111: $P1\phi/2^8$ 1000: $P1\phi/2^9$ 1001: $P1\phi/2^{10}$ 1010 to 1111: Setting prohibited
15, 14	—	00	R	Reserved These bits are always read as 0. The write value should always be 0.
13, 12	SRSPTO [1:0]	00	R/W	Response Timeout Setting Specifies the timeout period for the RSPTO bit of CE_INT. 00: 64 MMC clock cycles 01: 128 MMC clock cycles 10: 256 MMC clock cycles 11: Setting prohibited
11 to 8	SRBSYTO [3:0]	0000	R/W	Response Busy Timeout Setting Specifies the timeout period for the RBSYTO bit of CE_INT. 0000: 2^{14} MMC clock cycles 0001: 2^{15} MMC clock cycles : 1110: 2^{28} MMC clock cycles 1111: 2^{29} MMC clock cycles
7 to 4	SRWDTO [3:0]	0000	R/W	Write Data/Read Data Timeout Setting Specifies the timeout period for the WDATTO and RDATTO bits of CE_INT. 0000: 2^{14} MMC clock cycles 0001: 2^{15} MMC clock cycles : 1110: 2^{28} MMC clock cycles 1111: 2^{29} MMC clock cycles
3 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

39.3.7 Buffer Access Configuration Register (CE_BUF_ACC)

CE_BUF_ACC configures the method of accessing data registers and mode of DMA transfer. Do not change the setting of this register while a command sequence is in progress. For explanation of the buffers, see section 39.6.3, Buffer Structure and Buffer Accesses.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	DMAW EN	DMAR EN	—	—	—	—	—	—	—	ATYP

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25	DMAWEN	0	R/W	Buffer Write DMA Transfer Request Enable 0: Disables DMA transfer request for buffer writing 1: Enables DMA transfer request for buffer writing
24	DMAREN	0	R/W	Buffer Read DMA Transfer Request Enable 0: Disables DMA transfer request for buffer reading 1: Enables DMA transfer request for buffer reading
23 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	ATYP	0	R/W	Buffer Access Select 0: When not swapped byte-wise. 1: When swapped byte-wise. Note: For explanation of buffer access, see section 39.6.3, Buffer Structure and Buffer Accesses.
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

39.3.8 Response Registers 3 to 0 (CE_RESP3 to CE_RESP0)

CE_RESP3 to CE_RESP0 are the registers for storing the response that has been received. For the formats of response values, see section 39.6.1, Command/Response Formats.

- CE_RESP3

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RSP[127:112]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RSP[111:96]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	RSP[127:96]	H'00000000	R	[127:96] of a 17-byte response are stored.

- CE_RESP2

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RSP[95:80]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RSP[79:64]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	RSP[95:64]	H'00000000	R	[95:64] of a 17-byte response are stored.

- CE_RESP1

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RSP[63:48]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RSP[47:32]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	RSP[63:32]	H'00000000	R	[63:32] of a 17-byte response are stored.

- CE_RESP0

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RSP[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RSP[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	RSP[31:0]	H'00000000	R	[39:8] of a 6-byte response or [31:0] of a 17-byte response are stored. Note: The response to the automatically-issued CMD12 is stored in CE_RESP_CMD12.

39.3.9 Response Register for Automatically-Issued CMD12 (CE_RESP_CMD12)

CE_RESP_CMD12 is the register for storing the response to the automatically-issued CMD12.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RSP12[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RSP12[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	RSP12[31:0]	H'00000000	R	[39:8] of a response to the automatically-issued CMD12 are stored.

39.3.10 Data Register (CE_DATA)

CE_DATA is used to access the buffers of this module.

For the write/read data formats, see section 39.6.2, Data Block Format.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DATA[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DATA[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DATA[31:0]	H'00000000	R/W	Buffer write/read data [31:0]

39.3.11 Interrupt Flag Register (CE_INT)

CE_INT indicates various status during execution of a command sequence. Each bit is set to 1 when its setting condition has been met. To clear flag(s), write 0 only to the bit(s) to be cleared and write 1 to the other bits.

For the operation in the case of an error or timeout, see section 39.6.7, Operation in the Case of Error/Timeout.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The writing value should always be 0.
26	CMD12DRE	0	R/W*1	Automatic CMD12 Issuance & Buffer Read Complete [Setting condition] Response busy for automatically-issued CMD12 and buffer reading have been completed. [Clearing condition] Writing a 0 to this bit Note: When CMD12DRE has been set, CMD12RBE, CMD12CRE, and BUFRE have also been set. So, these bits should be cleared as well.
25	CMD12RBE	0	R/W*1	Automatic CMD12 Issuance Response Busy Complete [Setting condition] Reception of the response and response busy for an automatically-issued CMD12 have been completed. [Clearing condition] Writing a 0 to this bit Note: When CMD12RBE is set, CMD12CRE is also set. So, clear the bit as well. When CMD12RBE is set during a multi-block write, DTRANE is also set. So clear the bit as well.
24	CMD12CRE	0	R/W*1	Automatic CMD12 Response Complete [Setting condition] The response to an automatically-issued CMD12 has been received. [Clearing condition] Writing a 0 to this bit
23	DTRANE	0	R/W*1	Data Transmission Complete [Setting conditions] Transmission of all blocks of data has been completed. <ul style="list-style-type: none"> When configured to receive CRC status: Completion of busy (data busy) after reception of CRC status When configured not to receive CRC status: Completion of data transmission [Clearing condition] Writing a 0 to this bit
22	BUFRE	0	R/W*1	Buffer Read Complete [Setting condition] All blocks of data have been received and the data have been read from the buffer [Clearing condition] Writing a 0 to this bit

Bit	Bit Name	Initial Value	R/W	Description
21	BUFWEN	0	R/W*1	<p>Buffer Write Ready [Setting condition] The buffer has become empty and ready for writing. [Clearing condition] Writing a 0 to this bit Note: When data is written to CE_DATA by the CPU, clear this bit first, and then write the amount of data equivalent to the block size set in the CE_BLOCK_SET register. Note that this bit is not set when DMA transfer request for buffer writing is enabled.</p>
20	BUFREN	0	R/W*1	<p>Buffer Read Ready [Setting condition] Transfer block size of data have been stored in the buffer and it has become ready for reading [Clearing condition] Writing a 0 to this bit Note: When data is read from CE_DATA by the CPU, clear this bit first, and then read the amount of data equivalent to the block size set in the CE_BLOCK_SET register. Note that this bit is not set when DMA transfer request for buffer reading is enabled.</p>
19, 18	—	00	R	<p>Reserved These bits are always read as 0. The write value should always be 0.</p>
17	RBSYE	0	R/W*1	<p>Response Busy Complete [Setting condition] Reception of a response and response busy have been completed [Clearing condition] Writing a 0 to this bit Note: When RBSYE has been set, CRSPE has also been set. So, this bit should be cleared as well. Completion of reception of the response and response busy for automatically-issued CMD12 is reflected in CMD12RBE.</p>
16	CRSPE	0	R/W*1	<p>Command/Response Complete [Setting conditions] A command has been transmitted or a response has been received</p> <ul style="list-style-type: none"> When configured not to receive response: A command has been transmitted When configured to receive 6- or 17-byte response: A response has been received <p>[Clearing condition] Writing a 0 to this bit Note: Completion of reception of the response to automatically-issued CMD12 is reflected in CMD12CRE.</p>
15	CMDVIO	0	R/W*1	<p>Command Issuance Error [Setting conditions] Illegal setting has been made in CE_CMD_SET or CE_BLOCK_SET</p> <ul style="list-style-type: none"> During execution of a command sequence: Writing to CMD[5:0] in CE_CMD_SET (The command sequence is not stopped automatically.) At the start of command sequence: Writing to CMD[5:0] in CE_CMD_SET when the registers have been set for one of the following combinations of selection <ul style="list-style-type: none"> No response + response busy No response + with data No data + automatic CMD12 issuance With data + single-block transfer + automatic CMD12 issuance With data + response busy + automatic CMD12 issuance With data + transfer block size = 0 With data + transfer block size ≥ 513 With data + multi-block transfer + number of blocks for transfer = 0 <p>[Clearing condition] Writing a 0 to this bit</p>

Bit	Bit Name	Initial Value	R/W	Description
14	BUFVIO	0	R/W*1	<p>Buffer Access Error [Setting conditions] Illegal buffer access has been attempted.</p> <ul style="list-style-type: none"> CE_DATA has been accessed exceeding the block size set in BLKSIZ[15:0] in CE_BLOCK_SET While data is being read from the card: CE_DATA has been accessed with BUFREN not set (when DMA is used, with no DMA transfer request asserted for buffer reading) While data is being written to the card: CE_DATA has been accessed with BUFWEN not set (when DMA is used, with no DMA transfer request asserted for buffer writing) <p>[Clearing condition] Writing a 0 to this bit Note: When BUFVIO is set, the command sequence is not stopped automatically. When an error occurs, this bit may be set.</p>
13, 12	—	00	R	<p>Reserved These bits are always read as 0. The write value should always be 0.</p>
11	WDATERR	0	R/W*1	<p>Write Data Error [Setting conditions] Error is found in the data that has been written.</p> <ul style="list-style-type: none"> Error is in the status of the CRC status Error is in the end bit of the CRC status <p>[Clearing condition] Writing a 0 to this bit Note: When WDATERR is set, the command sequence is stopped automatically.</p>
10	RDATERR	0	R/W*1	<p>Read Data Error [Setting conditions] Error is found in the read data.</p> <ul style="list-style-type: none"> Error is in CRC16 of the read data Error is in the end bit of the read data <p>[Clearing condition] Writing a 0 to this bit Note: When RDATERR is set, the command sequence is stopped automatically.</p>
9	RIDXERR	0	R/W*1	<p>Response Index Error [Setting condition] Error has been found in the index value of the response.</p> <ul style="list-style-type: none"> When an error has been found in [45:40] of a 6-byte response (including automatically-issued CMD12) or [133:128] of a 17-byte response (The items to be checked are set by RIDXC in CE_CMD_SET.) <p>[Clearing condition] Writing a 0 to this bit Note: When RIDXERR is set, the command sequence is stopped automatically.</p>
8	RSPERR	0	R/W*1	<p>Response Error [Setting conditions] Error has been found in the response values of the response.</p> <ul style="list-style-type: none"> Transmission bit in the response is high Error is in the end bit of the response When an error has been found in [7:1] of a 6-byte response (including automatically-issued CMD12) or a 17-byte response (The items to be checked are set by RCRC7C in CE_CMD_SET.) <p>[Clearing condition] Writing a 0 to this bit Note: When RSPERR is set, the command sequence is stopped automatically.</p>
7 to 5	—	All 0	R	<p>Reserved These bits are always read as 0. The write value should always be 0.</p>

Bit	Bit Name	Initial Value	R/W	Description
4	CRCSTO	0	R/W*1	CRC Status Timeout [Setting condition] CRC status could not be received [Clearing condition] Writing a 0 to this bit Note: The command sequence is not stopped even if CRCSTO is set.
3	WDATTO	0	R/W*1	Write Data Timeout [Setting condition] The busy status remains unchanged after the period set by SRWDTO in CE_CLK_CTRL after the CRC status was received. [Clearing condition] Writing a 0 to this bit Note: The command sequence is not stopped even if WDATTO is set.
2	RDATTO	0	R/W*1	Read Data Timeout [Setting conditions] <ul style="list-style-type: none"> Read data could not be received within the period set by SRWDTO in CE_CLK_CTRL after the read command was transmitted Read data could not be received within the period set by SRWDTO in CE_CLK_CTRL after the read data was received. [Clearing condition] Writing a 0 to this bit Note: The command sequence is not stopped even if RDATTO is set.
1	RBSYTO	0	R/W*1	Response Busy Timeout [Setting condition] The busy status remains unchanged after the period set by SRBSYTO in CE_CLK_CTRL after the command (including automatically-issued CMD12) was transmitted. [Clearing condition] Writing a 0 to this bit Note: The command sequence is not stopped even if RBSYTO is set.
0	RSPTO	0	R/W*1	Response Timeout [Setting condition] Response could not be received within the period set by SRSPTO in CE_CLK_CTRL after the command (including automatically-issued CMD12) was transmitted. [Clearing condition] Writing a 0 to this bit Note: The command sequence is not stopped even if RSPTO is set.

Note 1. A 0 is the only value that can be written to the bit. Writing a 1 is ignored.

39.3.12 Interrupt Enable Register (CE_INT_EN)

CE_INT_EN controls output of the CE_INT-related interrupt signals. If a flag in CE_INT is set to 1 while its corresponding bit in CE_INT_EN is set to 1, an interrupt request is output. For details on interrupt requests, see section 39.4, Interrupt Requests.

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	CRCSTE	0	R	CRC Status Error This bit is set to 1 when an error is found in the CRC status value.
30	CRC16E	0	R	Read Data CRC16 Error This bit is set to 1 when an error is found in CRC16 in the read data.
29	AC12CRCE	0	R	Automatic CMD12 Response CRC7 Error This bit is set to 1 when an error is found in [7:1] of the response to the automatically-issued CMD12. Note: The items to be checked are set by RCRC7C in CE_CMD_SET.
28	RSPCRC7E	0	R	Command Response CRC7 Error (other than automatically-issued CMD12) This bit is set to 1 when an error is found in [7:1] of a 6-byte response or a 17-byte response. Note: The items to be checked are set by RCRC7C in CE_CMD_SET.
27	CRCSTEBE	0	R	CRC Status End Bit Error This bit is set to 1 when an error is found in the end bit in CRC status.
26	RDATEBE	0	R	Read Data End Bit Error This bit is set to 1 when an error is found in the end bit in the read data.
25	AC12REBE	0	R	Automatic CMD12 Response End Bit Error This bit is set to 1 when an error is found in the end bit of the response to the automatically-issued CMD12.
24	RSPEBE	0	R	Command Response End Bit Error (other than automatically-issued CMD12) This bit is set to 1 when an error is found in the end bit of the response.
23	AC12IDXE	0	R	Automatic CMD12 Response Index Error This bit is set to 1 when an error is found in [45:40] of the response to the automatically-issued CMD12. Note: The items to be checked are set by RIDXC in CE_CMD_SET.
22	RSPIDXE	0	R	Command Response Index Error (other than automatically-issued CMD12) This bit is set to 1 when an error is found in [45:40] of a 6-byte response or [133:128] of a 17-byte response. Note: The items to be checked are set by RIDXC in CE_CMD_SET.
21 to 19	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
18 to 16	CRCST [2:0]	000	R	CRC Status Indicate the value of the CRC status that has been received.
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14	STRDATTO	0	R	Read Data Timeout <ul style="list-style-type: none"> This bit is set to 1 if read data is not received within the period set by the SRWDTO bits in CE_CLK_CTRL after a read command was transmitted. This bit is set to 1 if read data is not received within the period set by the SRWDTO bits in CE_CLK_CTRL after a read data was received.

Bit	Bit Name	Initial Value	R/W	Description
13	DATBSYTO	0	R	Data Busy Timeout This bit is set to 1 if busy status remains unchanged after the period set by the SRWDTO bits in CE_CLK_CTRL after the CRC status was received.
12	CRCSTTO	0	R	CRC Status Timeout This bit is set to 1 if CRC status could not be received.
11	AC12BSYTO	0	R	Automatic CMD12 Response Busy Timeout This bit is set to 1 if busy state remains unchanged after the period set by the SRBSYTO bits in CE_CLK_CTRL after the automatically-issued CMD12 was transmitted.
10	RSPBSYTO	0	R	Response Busy Timeout This bit is set to 1 if busy state remains unchanged after the period set by the SRBSYTO bits in CE_CLK_CTRL after a command (other than automatically-issued CMD12) was transmitted.
9	AC12RSPTO	0	R	Automatic CMD12 Response Timeout This bit is set to 1 if the response is not received within the period set by the SRSPTO bits in CE_CLK_CTRL after the automatically-issued CMD12 was transmitted.
8	STRSPTO	0	R	Response Timeout This bit is set to 1 if the response is not received within the period set by the SRSPTO bits in CE_CLK_CTRL after a command (other than automatically-issued CMD12) was transmitted.
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

39.3.15 DMA Mode Setting Register (CE_DMA_MODE)

CE_DMA_MODE sets the transfer unit for DMA transfer.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DMA SEL
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	DMASEL	0	R/W	DMA Transfer Size Select Selects the transfer unit for CE_DATA read/write DMA transfer. Set this bit in combination with the transfer size set in the DMA channel configuration register. 0: 2-byte (word) or 4-byte (longword) unit 1: 64-byte (longword × 16) unit Note: For DMA transfer in 64-byte units, set address H'E804C800 as the destination or source of DMA transfer instead of the data register (CE_DATA). Moreover, when a transfer error or timeout occurs during DMA transfer in 64-byte units, leading to the forced termination of transfer, write 0 to this bit and then set it to 1 again. Also do this whenever a software reset is used.

39.3.16 Card Detection/Port Control Register (CE_DETECT)

CE_DETECT controls card detection. For details on interrupt requests by card detection, see section 39.4, Interrupt Requests.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Initial value:	0	—	0	0	0	—	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W*	R/W*	R	R	R	R	R	R	R/W	R/W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 15	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
14	CDSIG	Undefined	R	MMC_CD Pin Status Indication Indicates the MMC_CD pin status.
13	CDRISE	0	R/W*1	MMC_CD Pin Rise Detection Flag [Setting condition] The MMC_CD pin level changes from low to high. [Clearing condition] Writing a 0 to this bit
12	CDFALL	0	R/W*1	MMC_CD Pin Fall Detection Flag [Setting condition] The MMC_CD pin level changes from high to low. [Clearing condition] Writing a 0 to this bit
11	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
10	—	Undefined	R	Reserved The write value should always be 0.
9 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5	MCDRISE	0	R/W	CDRISE Interrupt Enable 0: Disables interrupt output by the CDRISE flag. 1: Enables interrupt output by the CDRISE flag.
4	MCDFALL	0	R/W	CDFALL Interrupt Enable 0: Disables interrupt output by the CDFALL flag. 1: Enables interrupt output by the CDFALL flag.
3 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note 1. A 0 is the only value that can be written to the bit. Writing a 1 is ignored.

39.3.17 Special Mode Setting Register (CE_ADD_MODE)

CE_ADD_MODE controls the internal clock.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	CLK MAIN	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
19	CLKMAIN	0	R/W	Internal Clock Control 0: Normal mode 1: Low power consumption mode (only card detection is enabled)
18 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

39.3.18 Version Register (CE_VERSION)

CE_VERSION indicates the version number and controls software reset of this module.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SW RST	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VERSION[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	SWRST	0	R/W	Software Reset 0: Software reset cleared (normal operation) 1: Executes software reset. When SWRST is set to 1, all the register values are reset to the initial values. (SWRST is not reset to the initial value)
30 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	VERSION [15:0]	H'0003	R	Version Information Indicates the version number of this module.

39.4 Interrupt Requests

Table 39.3 shows the interrupt request specifications of this module.

This module generates three types of interrupt requests: normal operation, error/timeout, and card detection. When an interrupt flag is set to 1 and also the corresponding interrupt is enabled, an interrupt request is asserted.

Table 39.3 Specifications of Interrupt Requests

Flag Register	Bit	Mask Register	Bit	Interrupt Request
CE_INT	CMD12DRE	CE_INT_EN	MCMD12DRE	Normal operation interrupt (MMC2)
	CMD12RBE		MCMD12RBE	
	CMD12CRE		MCMD12CRE	
	DTRANE		MDTRANE	
	BUFRE		MBUFRE	
	BUFWEN		MBUFWEN	
	BUFREN		MBUFREN	
	RBSYE		MRBSYE	
	CRSPE		MCRSPE	
	CMDVIO		MCMDVIO	
	BUFVIO		MBUFVIO	
	WDATERR		MWDATERR	
	RDATERR		MRDATERR	
	RIDXERR		MRIDXERR	
	RSPERR		MRSPELL	
	CRCSTO		MCRCSO	
	WDATTO		MWDATTO	
	RDATTO		MRDATTO	
	RBSYTO		MRBSYTO	
	RSPTO		MRSPTO	
CE_DETECT	CDRISE	CE_DETECT	MCDRISE	Card detection interrupt (MMC0)
	CDFALL		MCDFALL	

39.5 DMA Specifications

This module provides two channels for DMA transfer requests: one for buffer reading and the other for buffer writing.

39.5.1 DMA for Buffer Writing

The DMA transfer request is asserted for buffer writing when the buffer has become empty while the DMAWEN bit in CE_BUF_ACC is 1.

The DMA transfer request stays asserted for the amount of data specified by BLKSIZ (the block size set in CE_BLOCK_SET) × BLKCNT (the number of blocks for transfer set in CE_BLOCK_SET), and negated after the last block has been transferred. Note that the BUFWEN bit in CE_INT will not be asserted in this case.

If an error occurs during DMA transfer or DMA transfer is forcibly terminated, the command sequence is stopped automatically, which causes the DMA transfer request to be negated.

39.5.2 DMA for Buffer Reading

The DMA transfer request is asserted for buffer reading when the buffer stores data of the block size specified in CE_BLOCK_SET while the DMAREN bit in CE_BUF_ACC is 1.

The DMA transfer request stays asserted for the amount of data specified by BLKSIZ (the block size set in CE_BLOCK_SET) × BLKCNT (the number of blocks for transfer set in CE_BLOCK_SET), and negated after the last block has been transferred. Note that the BUFREN bit in CE_INT will not be asserted in this case.

If an error occurs during DMA transfer or DMA transfer is forcibly terminated, the command sequence is stopped automatically, which causes the DMA transfer request to be negated.

39.6 Operation

39.6.1 Command/Response Formats

Figure 39.2 shows the format of the command to be transferred. The command index that is set in CMD[5:0] of CE_CMD_SET and the argument set in ARG[31:0] of CE_ARG are reflected in the command.

Figure 39.2 Command Format

Figure 39.3 and Figure 39.4 show the formats when a 6-byte response and 17-byte response (R2) are received, respectively. The response index is stored in RSPIDX[5:0] of CE_HOST_STS1, and the status value of the response is stored to CE_RESP0 or CE_RESP3 to CE_RESP0.

Figure 39.3 Format of 6-Byte Response

Figure 39.4 Format of 17-Byte Response (R2)

39.6.2 Data Block Format

Figure 39.5 shows the format of data blocks. For details on D0 to D3 in Figure 39.5, see section 39.6.3, Buffer Structure and Buffer Accesses. When data is written to a card, data stored in the buffer is transmitted. When data is read from a card, receive data is stored to the buffer.

Figure 39.5 Data Block Format

39.6.3 Buffer Structure and Buffer Accesses

This module has two units of 512-byte RAM as shown in Figure 39.6. Therefore, for multi-block writing, if one block of data (512 bytes) stored in one buffer has been transmitted but the other buffer is full, the next block of data can be continuously transmitted. For multi-block reading, if one block of receive data (512 bytes) has been stored in one buffer but the other buffer is empty, the next block of receive data can be continuously stored in the buffer.

If neither of the buffers is empty for multi-block reading, the MMC clock is stopped and reception is suspended. When one of the buffers becomes empty, the MMC clock supply is started to start reception.

The buffer is accessed with CE_DATA. CE_DATA should be accessed for $4 \times (n + 1)$ bytes ($n = 0, 1, 2, 3, \dots, 127$).

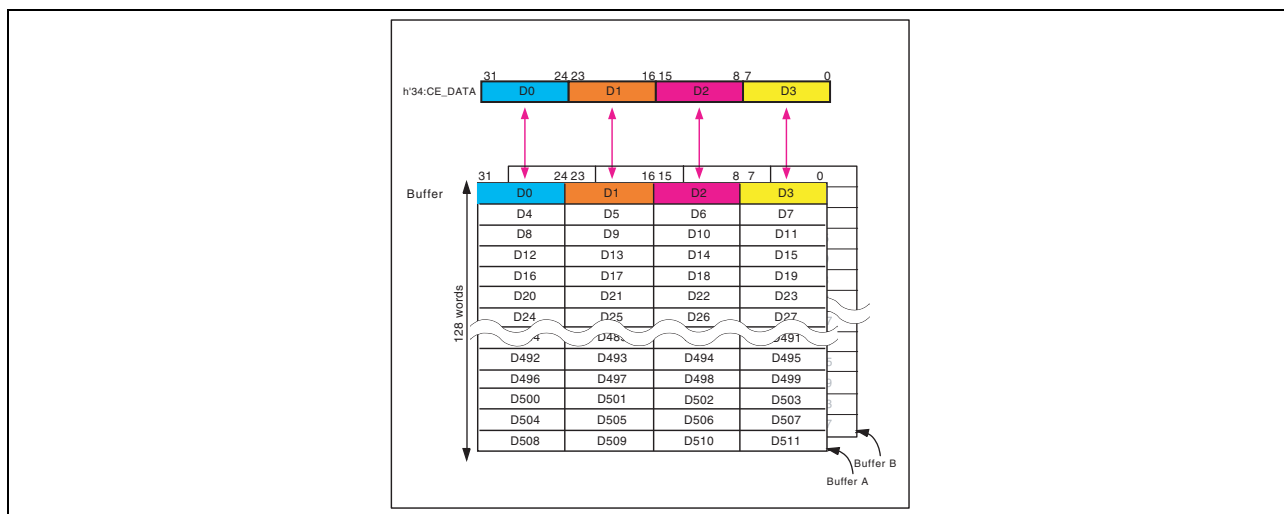

Figure 39.6 Double Buffer Structure

The buffer access select function allows byte-wise swapping of data when the buffer is accessed by writing to or reading from CE_DATA. This function is enabled by the setting of CE_BUFF_ACC. Figure 39.7 shows the specification of byte-wise swapping.

Figure 39.7 Specification of Byte-Wise Swapping

39.6.4 Automatic CMD12 Issuance

This module automatically issues CMD12 when multi-block transfer is performed with the CMD12EN bit in CE_CMD_SET set to 1.

Figure 39.8 shows the timing of automatic CMD12 issuance in multi-block read. CMD12 is issued such that the end bit of the command is sent two bits before the end bit of the data during reception of the last block.

Figure 39.8 Timing of Automatically-Issued CMD12 in Multi-Block Read (1-Bit Mode)

Figure 39.9 shows the timing of automatic CMD12 issuance in multi-block write. CMD12 is issued after the data busy after transmission of the last block has ended.

Figure 39.9 Timing of Automatically-Issued CMD12 in Multi-Block Write (1-Bit Mode)

The argument of the automatically-issued CMD12 is set by CE_ARG_CMD12. The value of [39:8] of the response to CMD12 is stored to CE_RESP_CMD12. The busy status on response reception is received.

39.6.5 High Priority Interrupt (HPI)

HPI should be executed as described below with reference to section 39.3, Register Descriptions and section 39.7, Examples of Setting.

(1) When HPI is executed during a write to the device

- (a) Terminate the command sequence forcibly.
- (b) Wait for the CMDSEQ bit in CE_HOST_STS1 to be cleared to 0.
- (c) Issue CMD12 (R1) to make the device in the rev state enter the prg state. Note that the device does not output the response when the device is in the prg state before issuance of CMD12(R1).
- (d) Issue CMD13 (R1).
- (e) Issue the HPI command.

(2) When HPI is executed during response busy while not writing to the device

- (a) Terminate the command sequence forcibly.
- (b) Wait for the CMDSEQ bit in CE_HOST_STS1 to be cleared to 0.
- (c) Issue CMD13 (R1).
- (d) Issue the HPI command*.

The procedure above is for HPI generated in the CMD6, CMD24, CMD25 (Pre-defined), or CMD38 sequence.

Note: * CMD12 (R1b) or CMD13 (R1b) depending on the device connected

39.6.6 Background Operation

Background operation should be executed as described below with reference to section 39.3, Register Descriptions and section 39.7, Examples of Setting.

To execute background operation, issue CMD6 (R1) to write to the BKOPS_START byte in the EXT_CSD register of the device.

Completion of background operation can be determined by checking the device state with CMD13 (R1) issued after CMD6 (R1) or by polling MMCDAT[0]. When the device state is indicated as “tran” or MMCDAT[0] is high, background operation is determined to be completed.

To suspend background operation, use HPI described in section 39.6.5.

39.6.7 Operation in the Case of Error/Timeout

This module may not be stopped in case of error occurrence. If the command sequence is in progress when an error occurs (check the CMDSEQ bit in CE_HOST_STS1), terminate the sequence forcibly and perform a software reset. The data for transmission or received data that had been stored in the buffers at the time of error occurrence are not guaranteed.

This module is not stopped when a timeout has occurred. To execute the next command after a timeout error has occurred, terminate the sequence forcibly, perform a software reset.

For forcible termination, refer to section 39.7.11, Forcible Termination.

39.7 Examples of Setting

This section shows the procedures for executing typical command sequences.

39.7.1 Legends

Figure 39.10 shows the legends for the symbols used in the figures in the following subsections.

Note: • This module does not support CMD11 and CMD20.

39.8 Usage Note

39.8.1 Card Detection

The CDRISE and CDFALL bits in CE_DETECT which are used for the card detection function do not have a chattering elimination function. The chattering elimination processing should be implemented by software.

39.8.2 Multi-Block Transfer

When HPI is executed, use pre-defined multi-block transfer.

39.8.3 Software Reset

For transitions to the software reset state by the SWRST bit in the CE_VERSION register, see [section 42.3.6, Software Reset](#). However, where the procedure refers to the SRST bit, read this as the SWRST bit in the CE_VERSION register.

40. On-Chip RAM

This LSI has an on-chip large-capacity RAM for display area and work area (128 Kbytes of this RAM are shared with the on-chip data retention RAM) and an on-chip data retention RAM, which can retain data in deep standby mode. These memory units can be used to store instructions or data.

The operation and write access to the large-capacity RAM (including on-chip data retention RAM) can be enabled or disabled through the RAM enable bits and RAM write enable bits.

The on-chip data retention RAM is assigned to page 0 in the on-chip large-capacity RAM. Retention or non-retention of data by the on-chip data retention RAM in deep standby mode is selectable on a per-page basis.

40.1 Features

- Page
 - The on-chip large-capacity RAM consists of five pages (four pages in the RZ/A1LC).
 - The on-chip data retention RAM consists of four pages. Page 0 has 16-Kbytes, page 1 has 16-Kbytes, page 2 has 32-Kbytes, and page 3 has 64-Kbytes.
- Memory map

The on-chip RAM is located in the address spaces shown in Table 40.1 and Table 40.2. Pages 0 to 3 of the large-capacity RAM each have a capacity of 512 Kbytes, and page 4 of the large-capacity RAM has a capacity of 1 Mbyte.

Table 40.1 Address Spaces of On-Chip Large-Capacity RAM

Page	Address	Mirror Address
Page 0 (512KB)	H'20000000 to H'2007FFFF	H'60000000 to H'6007FFFF
Page 1 (512KB)	H'20080000 to H'200FFFFFFF	H'60080000 to H'600FFFFFFF
Page 2 (512KB)	H'20100000 to H'2017FFFF	H'60100000 to H'6017FFFF
Page 3 (512KB)	H'20180000 to H'201FFFFFFF	H'60180000 to H'601FFFFFFF
Page 4 (1024KB)*	H'20200000 to H'202FFFFFFF	H'60200000 to H'602FFFFFFF

Note: * Reserved in the RZ/A1LC.

Table 40.2 Address Spaces of On-Chip Data Retention RAM

Page	Address	Mirror Address
Page 0 (16KB)	H'20000000 to H'20003FFF	H'60000000 to H'60003FFF
Page 1 (16KB)	H'20004000 to H'20007FFF	H'60004000 to H'60007FFF
Page 2 (32KB)	H'20008000 to H'2000FFFF	H'60008000 to H'6000FFFF
Page 3 (64KB)	H'20010000 to H'2001FFFF	H'60010000 to H'6001FFFF

- Ports

Each page of the on-chip large-capacity RAM has one read and write port and is connected to the AXI bus. The on-chip RAM for data retention, which has a port independent of the port in page 0, is shared with the read and write port in four pages.

- Method of arbitration

When the same port of the on-chip large-capacity RAM is accessed from different masters simultaneously, the AXI bus performs arbitration in round-robin mode.

- Number of access cycles

The number of cycles for access to read or write is one cycle of $B\phi$.

40.2 Usage Notes

40.2.1 Page Conflict

When the same page of the on-chip large-capacity RAM is accessed from different masters simultaneously, a conflict on the page occurs. Although each access is completed correctly, this kind of conflict degrades the memory access speed. Therefore, it is advisable to provide software measures to prevent such conflicts as far as possible. For example, no conflict will arise if different pages are accessed by each master.

40.2.2 Data Retention

Data in the large-capacity RAM (including on-chip data retention RAM) are retained in the states other than power-on reset and deep standby mode. In power-on reset and deep standby mode, these RAMs operate as described below.

(1) Power-on Reset

(a) On-Chip Large-Capacity RAM (Excluding On-Chip Data Retention RAM)

Data are retained on a power-on reset by disabling the setting of either the VRAME or VRAMWE bit. Data are not retained when the setting of the VRAME and VRAMWE bits are both enabled.

(b) On-Chip Data Retention RAM

Data are retained on a power-on reset by disabling the setting of any of the VRAME, VRAMWE, or RRAMWE, excluding the case that deep standby mode is canceled by power-on reset. Data are not retained when the setting of the VRAME, VRAMWE and RRAMWE bits are all enabled.

(2) Deep Standby Mode

(a) On-Chip Large-Capacity RAM (Excluding On-Chip Data Retention RAM)

Data are not retained.

(b) On-Chip Data Retention RAM

Data are retained in deep standby mode by enabling the setting of the RRAMKP bit, excluding the case that deep standby mode is canceled by power-on reset. In the case that deep standby mode is canceled by interrupt or pins for cancelling, power-on reset exception handling is executed, but the data are retained.

41. Ports

41.1 Features

The 176-pin package of this LSI has nine ports: JP0, P0 to P7. The 208-pin package of this LSI has eleven ports: JP0, P0 to P9. Each port pin is multiplexed with other peripheral module pin functions, and by setting the control registers, multiplexed pin functions (alternative functions) can be selectable.

41.1.1 Port group

This LSI has the following number of port groups.

Table 41.1 Port Group

Package	Number	Name
RZ/A1L 176-pin	9	P0 to P7, JP0
RZ/A1L 208-pin	11	P0 to P9, JP0

41.1.2 Port group index n

Throughout this section, the individual port groups are identified by the index "n" (n = 0 to 9), for example PMCn for the port mode control register, which is used for the Pn pin. The JTAG port has only the index 0.

41.1.3 Base address

The address of a register used to control a JTAG port is given as the base address <JPORn_base> and the offset address from the base address. The address of a register other than the ones used to control JTAG ports is given as the base address <PORTn_base> and the offset address from the base address.

Table 41.2 Base Addresses <PORTn_base> and <JPORn_base>

<PORTn_base> address	<JPORn_base> address
H'FCFE 3000	H'FCFE 7B00

41.2 Functional Overview

41.2.1 Mode of Pin Functions

Pins can operate in three modes.

- Port mode (PMn.PMnm bit = 0)
A pin in port mode operates as a general purpose input/output port.
The I/O mode is selected by setting the PMn.PMnm bit.
- Software I/O control alternative mode (PMn.PMnm bit = 1, PIPn.PIPnm bit = 0)
In this mode, the pins operate as alternative functions.
The I/O mode is selected by setting the PMn.PMnm bit by using software.
- Direct I/O control alternative mode (PMn.PMnm bit = 1, PIPn.PIPnm bit = 1)
In this mode, the pins operate as alternative functions.
Unlike the software I/O alternative mode, however, the I/O mode is selected by the alternative function.

An overview of the register settings is given in the tables below.

Table 41.3 Pin Function Configuration Overview

Mode	Register				
	PMn.PMnm	PMn.PMnm	PIBn.PIBnm	PIPn.PIPnm	I/O
Port mode	0	0	X	X	O
		1	0		—
			1		
Software I/O control alternative mode*	1	0	X	0	O
		1			I
Direct I/O control alternative mode*		X		1	Controlled by the alternative function

Caution: When the pins are in alternative mode (PMn.PMnm = 1), one of the eight alternative functions is selected by the PFCn, PFCEn, and PFCAEn registers. For details, see Table 41.6, Alternative Mode Selection.

41.2.2 Pin Data Input/Output

The registers used for data input/output are described below. The location that is read via the PPRn register differs depending on the pin mode.

- Output data

In port mode (PMCn.PMCnm = 0), the value of the Pn.Pnm bit is output from the Pn_m pin.

- Input data

When the PPRn register is read, either the level of the Pn_m pin, the value of the Pn.Pnm bit, or the value output by the alternative function is returned. Which value is returned depends on the pin mode and setting of several control bits. Table 41.4 shows the different PPRn read values.

Table 41.4 PPRn.PPRnm Bit Read Values

Mode	Register				PPRn.PPRnm Bit Read Value
	PMCn.PMCnm	PMn.PMnm	PIBCn.PIBCnm	PIPCn.PIPCnm	
Port mode	0	0	X	X	Pn.Pnm bit*
			0		Pn.Pnm bit
		1	1		Pn_m pin
Software I/O control alternative mode	1	0	X	0	Value output by the alternative function*
		1			Pn_m pin
Direct I/O control alternative mode		X		1	<ul style="list-style-type: none"> • Input: Pn_m pin • Output: Value output by the alternative function*

Caution: When PBDCn.PBDCnm = 1, the level of the Pn_m pin is returned as the read value of the PPRn.PPRnm bit.

41.3 Register Description

The following registers are used for setting the individual pins of the port groups:

Table 41.5 Register Configuration

Symbol	Register Name	R/W	16 Bit Access	32 Bit Access	Address
Pn	Port register	R/W	√	—	<PORTn_base> + 0000H + n × 4
PSRn	Port set/reset register	R/W	—	√	<PORTn_base> + 0100H + n × 4
PPRn	Port pin read register	R	√	—	<PORTn_base> + 0200H + n × 4

PFCEn	Port function control expansion register	R/W	√	—	<PORTn_base> + 0600H + n × 4
PNOTn	Port NOT register	W	√	—	<PORTn_base> + 0700H + n × 4
PMSRn	Port mode set/reset register	R/W	—	√	<PORTn_base> + 0800H + n × 4
PMCSRn	Port mode control set/reset register	R/W	—	√	<PORTn_base> + 0900H + n × 4
PFCAEn	Port Function Control Additional Expansion register	R/W	√	—	<PORTn_base> + 0A00H + n × 4
PIBCn	Port input buffer control register	R/W	√	—	<PORTn_base> + 4000H + n × 4
PBDCn	Port bi-direction control register	R/W	√	—	<PORTn_base> + 4100H + n × 4
PIPCn	Port IP control register	R/W	√	—	<PORTn_base> + 4200H + n × 4
JPPR0	Port pin read register	R	√	—	<JPORn_base> + 0020H
JPMC0	Port mode control register	R/W	√	—	<JPORn_base> + 0040H
JPMCSR0	Port mode control set/reset register	R/W	—	√	<JPORn_base> + 0090H
JPIBC0	Port input buffer control register	R/W	√	—	<JPORn_base> + 0400H
SNCRn	Serial sound interface noise canceler control register	R/W	—	√	<PORTn_base> + 0C00H

41.3.1 Port Register (Pn)

In port output mode (PMCn.PMCnm = 0 and PMn.PMnm = 0), this register sets the level of the Pn_m pin.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Pn15	Pn14	Pn13	Pn12	Pn11	Pn10	Pn9	Pn8	Pn7	Pn6	Pn5	Pn4	Pn3	Pn2	Pn1	Pn0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
15 to 0	Pn[15:0]	These bits set the output level of the Pn_m pin (m = 0 to 15). 0: Outputs low level 1: Outputs high level

41.3.2 Port Set and Reset Register (PSRn)

This register provides an alternative method for writing data to the Pn register.

The higher 16 bits of the PSRn register specify whether data can be written to the Pn.Pnm bit specified by the lower 16 bits of the PSRn register.

When reading, the higher 16 bits are read as 0000H. The lower 16 bits are read as the value of the Pn register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PSRn 31	PSRn 30	PSRn 29	PSRn 28	PSRn 27	PSRn 26	PSRn 25	PSRn 24	PSRn 23	PSRn 22	PSRn 21	PSRn 20	PSRn 19	PSRn 18	PSRn 17	PSRn 16
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PSRn 15	PSRn 14	PSRn 13	PSRn 12	PSRn 11	PSRn 10	PSRn 9	PSRn 8	PSRn 7	PSRn 6	PSRn 5	PSRn 4	PSRn 3	PSRn 2	PSRn 1	PSRn 0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
31 to 16	PSRn[31:16]	These are enable bits that specify whether the value of the corresponding lower bit of the PSRn.PSRnm bit is written to the corresponding Pn.Pnm bit. 0: Pn.Pnm is independent of PSRn.PSRnm. 1: Pn.Pnm becomes the value of the PSRn.PSRnm bit. Example: If PSRn.PSRn31 = 1, the value of PSRn.PSRn15 is written to Pn.Pn15.
15 to 0	PSRn[15:0]	These are data bits that specify the value of the Pn.Pnm bit if the corresponding higher bit, PSRn.PSRn (m+16), is 1. 0: Pn.Pnm = 0 1: Pn.Pnm = 1

41.3.3 Port Pin Read Register (PPRn/JPPR0)

The PPRn register reflects the level of the Pn_m pin, the value of the Pn.Pnm bit, or the value output by the alternative function. The read value depends on register settings as described in Table 41.4, PPRn.PPRnm Bit Read Values.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PPRn 15	PPRn 14	PPRn 13	PPRn 12	PPRn 11	PPRn 10	PPRn 9	PPRn 8	PPRn 7	PPRn 6	PPRn 5	PPRn 4	PPRn 3	PPRn 2	PPRn 1	PPRn 0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit Position	Bit Name	Function
15 to 0	PPRn[15:0]	The level of the Pn_m pin, the value of the Pn.Pnm bit, or the value output by the alternative function.

- Note:
1. For the PPRn register read value, see section 41.2.2, Pin Data Input/Output.
 2. The JPPR0[1:0] bits are control bits in the JTAG port pin read register (JPPR0).

41.3.4 Port Mode Register (PMn)

This register specifies whether the Pn_m pin is in input mode or in output mode.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PMn 15	PMn 14	PMn 13	PMn 12	PMn 11	PMn 10	PMn 9	PMn 8	PMn 7	PMn 6	PMn 5	PMn 4	PMn 3	PMn 2	PMn 1	PMn 0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
15 to 0	PMn[15:0]	Specifies input/output mode of the corresponding pin: 0: Output mode (output enabled) 1: Input mode (output disabled)

Caution: To use the Pn_m pin in port input mode (PMCn.PMCnm = 0 and PMn.PMnm = 1), the PIBCn.PIBCnm bit must be set to 1 so that the input buffer is enabled.

Note: After the register is reset (PIPCn.PIPCnm bit is 0), the PMn.PMnm bit specifies the I/O direction in port mode (PMCn.PMCnm = 0) and alternative mode (PMCn.PMCnm = 1). For the pins that are automatically configured in boot mode (see Table 8.3, Initial States by Areas in Boot Modes 0 and 1 to 3), the alternative function (not the PMn register) is used to control the I/O direction.

41.3.5 Port Mode Control Register (PMCn/JPMCO)

This register specifies whether the Pn_m pin is in port mode or in alternative mode.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PMCn 15	PMCn 14	PMCn 13	PMCn 12	PMCn 11	PMCn 10	PMCn 9	PMCn 8	PMCn 7	PMCn 6	PMCn 5	PMCn 4	PMCn 3	PMCn 2	PMCn 1	PMCn 0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
15 to 0	PMCn[15:0]	Specifies the operation mode of the corresponding pin: 0: Port mode 1: Alternative mode

Caution: The input/output control is not performed just by setting alternative mode (PMCn.PMCnm). Set 1 in the PIPCn.PIPCnm bit too when the I/O control is to be performed by using the alternative function.

Note: The JPMCO[1:0] bits are control bits in the JTAG port mode control register (JPMCO).

41.3.6 Port Function Control Register (PFCn)

This register, together with the PFCEn and PFCAEn register, specifies the alternative function of the pins.

The I/O direction of several alternative functions can be controlled directly by using the Pn_m pin. For these alternative functions, the PIPCn.PIPCnm bit must be set to “1”.

For all other alternative functions, the I/O direction is specified by using the PMn.PMnm bit.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PFCn 15	PFCn 14	PFCn 13	PFCn 12	PFCn 11	PFCn 10	PFCn 9	PFCn 8	PFCn 7	PFCn 6	PFCn 5	PFCn 4	PFCn 3	PFCn 2	PFCn 1	PFCn 0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
15 to 0	PFCn[15:0]	Specifies the alternative function of a pin.

Table 41.6 Alternative Mode Selection

PMCn. PMCnm	PFCAEn. PFCAEnm	PFCEn. PFCEnm	PFCn. PFCnm	PMn. PMnm	Function*2	
0	X	X	X	1	Port mode/input	
				0	Port mode/output	
1*1	0	0	0	1	Alternative mode/1st alternative function/input	
				0	Alternative mode/1st alternative function/output	
				1	Alternative mode/2nd alternative function/input	
				0	Alternative mode/2nd alternative function/output	
			1	0	1	Alternative mode/3rd alternative function/input
					0	Alternative mode/3rd alternative function/output
					1	Alternative mode/4th alternative function/input
					0	Alternative mode/4th alternative function/output
	1	0	0	1	Alternative mode/5th alternative function/input	
				0	Alternative mode/5th alternative function/output	
				1	Alternative mode/6th alternative function/input	
				0	Alternative mode/6th alternative function/output	
			1	0	1	Alternative mode/7th alternative function/input
					0	Alternative mode/7th alternative function/output
					1	Alternative mode/8th alternative function/input
					0	Alternative mode/8th alternative function/output

Cautions:1. When the PIPCn.PIPCnm bit is set to 1, the I/O direction is directly controlled by the alternative function and the setting of the PMn.PMnm bit becomes invalid.

2. Use alternative functions that are open to the public. If a mode to which no alternative function is assigned is selected, correct operation is not guaranteed.

41.3.7 Port Function Control Expansion Register (PFCEn)

This register, together with the PFCn and PFCAEn register, specifies the alternative function of the pins.

The I/O direction of several alternative functions can be controlled directly by using the Pn_m pin. For these alternative functions, the PIPCn.PIPCnm bit must be set to “1”.

For all other alternative functions, the I/O direction is specified by using the PMn.PMnm bit.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PFCEn	PFCEn	PFCEn	PFCEn	PFCEn	PFCEn	PFCEn	PFCEn	PFCEn	PFCEn	PFCEn	PFCEn	PFCEn	PFCEn	PFCEn	PFCEn
	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
15 to 0	PFCEn[15:0]	Specifies the alternative function of a pin.

41.3.8 Port NOT Register (PNOTn)

This register allows the Pn.Pnm bit to be inverted without directly writing to the Pn register.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PNOTn	PNOTn	PNOTn	PNOTn	PNOTn	PNOTn	PNOTn	PNOTn	PNOTn	PNOTn	PNOTn	PNOTn	PNOTn	PNOTn	PNOTn	PNOTn
	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R/W:	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit Position	Bit Name	Function
15 to 0	PNOTn[15:0]	Specifies whether to invert Pn.Pnm. 0: Pn.Pnm is not inverted ($Pnm \rightarrow Pnm$) 1: Pn.Pnm is inverted ($\overline{Pnm} \rightarrow Pnm$)

41.3.9 Port Mode Set and Reset Register (PMSRn)

This register provides an alternative method for writing data to the PMn register.

The higher 16 bits of the PMSRn register specify whether data can be written to the PMn.PMnm bit specified by the lower 16 bits of the PMSRn register.

When reading, the higher 16 bits are read as 0000H. The lower 16 bits are read as the value of the PMn register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PMSRn 31	PMSRn 30	PMSRn 29	PMSRn 28	PMSRn 27	PMSRn 26	PMSRn 25	PMSRn 24	PMSRn 23	PMSRn 22	PMSRn 21	PMSRn 20	PMSRn 19	PMSRn 18	PMSRn 17	PMSRn 16
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PMSRn 15	PMSRn 14	PMSRn 13	PMSRn 12	PMSRn 11	PMSRn 10	PMSRn 9	PMSRn 8	PMSRn 7	PMSRn 6	PMSRn 5	PMSRn 4	PMSRn 3	PMSRn 2	PMSRn 1	PMSRn 0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
31 to 16	PMSRn[31:16]	These are enable bits that specify whether the value of the corresponding lower bit of the PMSRn.PMSRnm bit is written to the corresponding PMn.PMnm bit. 0: PMn.PMnm does not depend on the PMSRn.PMSRnm bit. 1: PMn.PMnm becomes the value of the PMSRn.PMSRnm bit. Example: If PMSRn.PMSRn31 = 1, the value of PMSRn.PMSRn15 is written to PMn.PMn15.
15 to 0	PMSRn[15:0]	These are data bits that specify the value of the PMn.PMnm bit if the corresponding higher bit, PMSRn.PMSRn (m + 16), is 1. 0: PMn.PMnm = 0 1: PMn.PMnm = 1

41.3.10 Port Mode Control Set and Reset Register (PMCSRn/JPMCSR0)

This register provides an alternative method for writing data to the PMCn register.

The higher bits of the PMCSRn register specify whether data can be written to the PMCn.PMCnm bit specified by the lower bits of the PMCSRn register.

When reading, the higher 16 bits are read as 0000H. The lower 16 bits are read as the value of the PMCn register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PMCS Rn31	PMCS Rn30	PMCS Rn29	PMCS Rn28	PMCS Rn27	PMCS Rn26	PMCS Rn25	PMCS Rn24	PMCS Rn23	PMCS Rn22	PMCS Rn21	PMCS Rn20	PMCS Rn19	PMCS Rn18	PMCS Rn17	PMCS Rn16
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PMCS Rn15	PMCS Rn14	PMCS Rn13	PMCS Rn12	PMCS Rn11	PMCS Rn10	PMCS Rn9	PMCS Rn8	PMCS Rn7	PMCS Rn6	PMCS Rn5	PMCS Rn4	PMCS Rn3	PMCS Rn2	PMCS Rn1	PMCS Rn0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
31 to 16	PMCSRn[31:16]	These are enable bits that specify whether the value of the corresponding lower bit of the PMCSRn.PMCSRnm bit is written to the corresponding PMCn.PMCnm bit. 0: PMCn.PMCnm does not depend on the PMCSRn.PMCSRnm bit. 1: PMCn.PMCnm becomes the value of the PMCSRn.PMCSRnm bit. Example: If PMCSRn.PMCSRn31 = 1, the value of PMCSRn.PMCSRn15 is written to PMCn.PMCn15.
15 to 0	PMCSRn[15:0]	These are data bits that specify the value of the PMCn.PMCnm bit if the corresponding higher bit, PMCSRn.PMCSRn (m+16), is 1. 0: PMCn.PMCnm = 0 1: PMCn.PMCnm = 1

Note: The JPMCSR0[1:0] bits are control bits in the JTAG port mode control set and reset register (JPMCSR0).

41.3.11 Port Function Control Additional Expansion Register (PFCAEn)

This register, together with the PFCn and PFCEn register, specifies the alternative function of the pins.

The I/O direction of several alternative functions can be controlled directly by using the Pn_m pin. For these alternative functions, the PIPCn.PIPCnm bit must be set to "1".

For all other alternative functions, the I/O direction is specified by using the PMn.PMnm bit.

Use the PFCn.PFCnm, PFCEn.PFCEnm, and PFCAEn.PFCAEnm bits to select the alternative functions, and then set the PMCn.PMCnm bit to 1.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PFCAE n15	PFCAE n14	PFCAE n13	PFCAE n12	PFCAE n11	PFCAE n10	PFCAE n9	PFCAE n8	PFCAE n7	PFCAE n6	PFCAE n5	PFCAE n4	PFCAE n3	PFCAE n2	PFCAE n1	PFCAE n0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
15 to 0	PFCAEn[15:0]	Specifies the alternative function of a pin.

Caution: Although some alternative functions are assigned to multiple pins in this LSI, only one of the pins can be used for each alternative function. Do not set the same alternative function in multiple pins. For example, when the a/b/c pin is used as the b pin, the b/d/e pin cannot be used as the b pin. Before using the b/d/e pin, set the pin as an alternative function other than b.

Note: For the allocation of the alternative functions, see the table of the pin functions of each port.

41.3.12 Port Input Buffer Control Register (PIBCn/JPIBC0)

This register specifies whether to enable or disable the Pn_m pin's input buffer in port input mode (PMCn.PMCnm = 0 and PMn.PMnm = 1 or JPMC0.JPMC0 = 0).

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PIBCn 15	PIBCn 14	PIBCn 13	PIBCn 12	PIBCn 11	PIBCn 10	PIBCn 9	PIBCn 8	PIBCn 7	PIBCn 6	PIBCn 5	PIBCn 4	PIBCn 3	PIBCn 2	PIBCn 1	PIBCn 0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
15 to 0	PIBCn[15:0]	These bits enable or disable the input buffer. 0: Input buffer disabled 1: Input buffer enabled

Note: When the input buffer is disabled, through current does not flow even when the pin level is Hi-Z. Thus the pin does not need to be fixed to a high or low level externally (except for P2_0, P2_2, P2_7, P2_9, P5_8, P5_9, P5_10, P6_7, P7_2, P7_3, P7_6, and P7_9).

The JPIBC0[1:0] bits are control bits in the JTAG port input buffer control register (JPIBC0).

Caution: The input buffer is enabled regardless of the settings in this register when the output buffer is enabled and PBDCn.PBDCnm = 1.

41.3.13 Port Bidirection Control Register (PBDCn)

This register specifies whether to enable or disable the input buffers when the output buffers are enabled. If the PBDCn.PBDCnm bit is set to "1" when the output buffers are enabled, bidirectional mode is enabled, and the level of the Pn_m pin is always read via the PPRn.PPRnm bit.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PBDCn 15	PBDCn 14	PBDCn 13	PBDCn 12	PBDCn 11	PBDCn 10	PBDCn 9	PBDCn 8	PBDCn 7	PBDCn 6	PBDCn 5	PBDCn 4	PBDCn 3	PBDCn 2	PBDCn 1	PBDCn 0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
15 to 0	PBDCn[15:0]	Enables/disables bidirectional mode of the corresponding pin: 0: Bidirectional mode disabled 1: Bidirectional mode enabled

Caution: When using the Pn_m pin as an alternative function (PMCn.PMCnm = 1 and PMn.PMnm = 0), the level of the Pn_m pin can be read at the PPRn.PPRnm bit by setting PBDCn.PBDCnm to 1. Note, however, that in this case, the level of the Pn_m pin will be input to the alternative function that the Pn_m pin is being used as.

41.3.14 Port IP Control Register (PIPCn)

This register specifies whether the I/O direction of the Pn_m pin is controlled by the PMn.PMnm bit or by the alternative function in alternative mode (PMn.PMnm = 1). Set the PIPcn.PIPCnm bit to 0 to use the alternative functions listed in Table 41.7. Set the PIPcn.PIPCnm bit to 1 to use the alternative functions not listed in Table 41.7. If the PIPcn.PIPCnm bit is set to 1, the I/O direction is controlled by the alternative function, and the setting of the PMn.PMnm bit becomes invalid.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PIPCn 15	PIPCn 14	PIPCn 13	PIPCn 12	PIPCn 11	PIPCn 10	PIPCn 9	PIPCn 8	PIPCn 7	PIPCn 6	PIPCn 5	PIPCn 4	PIPCn 3	PIPCn 2	PIPCn 1	PIPCn 0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
15 to 0	PIPCn[15:0]	These bits specify how the I/O direction is controlled in alternative mode. 0: The I/O direction is controlled by the PMn.PMnm bit (software I/O control). 1: The I/O direction is controlled by the alternative function (direct I/O control).

Table 41.7 Alternative Functions for Which the PIPcn.PIPCnm Bit Should be Set to 0

Function	Pin Name	Remark
Multi-function timer pulse unit 2	TIOC0A	Set the PIPcn.PIPCnm bit to 0, and specify input or output by using the PMn.PMnm bit.

	SSITxD1	
	SSITxD3	
Watchdog timer	WDTOVF	Set the PIPcn.PIPCnm bit and the PMn.PMnm bit to 0.

41.3.15 Serial Sound Interface Noise Canceler Control Register (SNCR)

This register controls the noise canceler in the input route from the LSI pin to a serial sound interface and the pins for MII supported in the Ethernet. Four lower-order bits can be set only when slave mode is selected for the corresponding channel of the serial sound interface.

In master mode, the bit corresponding to the channel of the serial sound interface must be set to 0.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit Position	Bit Name	Function
6	ETSEL*	Enables or disables the Ethernet controller and EthernetAVB with respect to the pins for MII supported in the Ethernet. 0: The Ethernet controller is enabled and the EthernetAVB is disabled. 1: The EthernetAVB is enabled and the Ethernet controller is disabled.
5, 4	—	Reserved The write value should always be 0.
3	SSI3NCE	Serial Sound Interface Channel 3 Noise Canceler Enable Enables or disables the noise canceler of SSISCK3, SSIWS3, and SSIRxD3. 0: Noise canceler is disabled. 1: Noise canceler is enabled.
2	SSI2NCE	Serial Sound Interface Channel 2 Noise Canceler Enable Enables or disables the noise canceler of SSISCK2, SSIWS2, and SSIDATA2. 0: Noise canceler is disabled. 1: Noise canceler is enabled.
1	SSI1NCE	Serial Sound Interface Channel 1 Noise Canceler Enable Enables or disables the noise canceler of SSISCK1, SSIWS1, and SSIRxD1. 0: Noise canceler is disabled. 1: Noise canceler is enabled.
0	SSI0NCE	Serial Sound Interface Channel 0 Noise Canceler Enable Enables or disables the noise canceler of SSISCK0, SSIWS0, and SSIRxD0. 0: Noise canceler is disabled. 1: Noise canceler is enabled.

Note: * This bit is only present in the RZ/A1LU. For the RZ/A1L and RZ/A1LC, the write value should always be 0.

41.4 Port Function

Table 41.8 Number and Function of Ports

Port	Pin Name	Size (Number of Ports)	Input/Output	Note
JTAG Port 0	JP0_0, JP0_1	2 bits	input	
Port 0	P0_0 to P0_3	4 bits	input	
Port 1	P1_0 to P1_15	16 bits	input/open-drain output	Output of only the P1_0 to P1_7 pins is open-drain output.
Port 2	P2_0 to P2_9	10 bits	input/output	
Port 3	P3_0 to P3_15	16 bits	input/output	
Port 4	P4_0 to P4_7	8 bits	input/output	
Port 5	P5_0 to P5_15	16 bits	input/output	
Port 6	P6_0 to P6_15	16 bits	input/output	
Port 7	P7_0 to P7_11	12 bits	input/output	
Port 8	P8_0 to P8_15	16 bits	input/output	208-pin package only
Port 9	P9_0 to P9_5	6 bits	input/output	208-pin package only

41.5 JTAG Port 0 (JP0)

Table 41.9 Pin Function (JP0)

Port Mode		Alternative Mode	
Input	Output	Input	Output
JP0_0		TDI	
JP0_1			TDO

Caution: Only input in port mode.

Table 41.10 Control Registers (JP0)

Register	Register Size	Valid Bit		Offset Address <JPORn_base>	Initial Value
		Location	R/W		
JPPR0	16	1 and 0	R	H'0020	H'0000
JPMC0	16	1 and 0	R/W	H'0040	H'FFFF
JPMCSR0	32	17 and 16, 1 and 0	W, R/W	H'0090	H'0000_FFFF
JPIBC0	16	1 and 0	R/W	H'0400	H'0000

Caution: An initial value is read if the bit is invalid. The write value should always be the initial value.

41.6 Port 0 (P0)

Table 41.11 Pin Function (P0)

Port Mode		Alternative Mode							
		1st Alternative		2nd Alternative		3rd Alternative		4th Alternative	
Input	Output	Input	Output	Input	Output	Input	Output	Input	Output
P0_0				RxD0		IRQ4			
P0_1				RxD2		SSIRxD3		ADTRG	
P0_2				RxD1		IRQ7			
P0_3				RxD3		SPDIF_IN			

Cautions: 1. Only input in port mode.

2. P0_0, P0_1, P0_2, P0_3 pins are MD_BOOT0, MD_BOOT1, MD_CLK, MD_CLKS functions in the state of $\overline{RES} = L$.

Table 41.12 Control Registers (P0)

Register	Register Size	Valid Bit		Offset Address <PORTn_base>	Initial Value
		Location	R/W		
PPR0	16	3 to 0	R	H'0200	H'0000
PMC0	16	3 to 0	R/W	H'0400	H'0000
PFC0	16	3 to 0	R/W	H'0500	H'0000
PFCE0	16	3 to 0	R/W	H'0600	H'0000
PMCSR0	32	19 to 16, 3 to 0	W, R/W	H'0900	H'0000_0000
PFCAE0	16	3 to 0	R/W	H'0A00	H'0000
PIBC0	16	3 to 0	R/W	H'4000	H'0000

Caution: An initial value is read if the bit is invalid. The write value should always be the initial value.

41.7 Port 1 (P1)

Table 41.13 Pin Function (P1)

Port Mode		Alternative Mode							
		1st Alternative		2nd Alternative		3rd Alternative		4th Alternative	
Input	Output	Input	Output	Input	Output	Input	Output	Input	Output
P1_0	P1_0	RIIC0SCL		IRQ4		ET_RXD0		DV0_DATA0	
P1_1	P1_1	RIIC0SDA		IRQ5		ET_RXD1		DV0_DATA1	
P1_2	P1_2	RIIC1SCL		IRQ6		ET_RXD2		DV0_DATA2	
P1_3	P1_3	RIIC1SDA		IRQ7		ET_RXD3		DV0_DATA3	
P1_4	P1_4	RIIC2SCL		IRQ0		DREQ0		VIO_D0	
P1_5	P1_5	RIIC2SDA		IRQ1				VIO_D1	
P1_6	P1_6	RIIC3SCL		IRQ2		SSIRxD0		VIO_D2	
P1_7	P1_7	RIIC3SDA		IRQ3		RxD2		VIO_D3	
P1_8		AN0		IRQ0		RxD0		DV0_DATA4	
P1_9		AN1		IRQ1		RxD1		DV0_DATA5	
P1_10		AN2		IRQ2		RxD2		DV0_DATA6	
P1_11		AN3		IRQ3		RxD3		DV0_DATA7	
P1_12		AN4		IRQ4		ET_RXD0		VIO_D4	
P1_13		AN5		IRQ5		ET_RXD1		VIO_D5	
P1_14		AN6		IRQ6		ET_RXD2		VIO_D6	
P1_15		AN7		IRQ7		ET_RXD3		VIO_D7	

Caution: P1_0 to P1_7 pins are input with open-drain output. P1_8 to P1_15 pins are only input.

Table 41.14 Control Registers (P1)

Register	Register Size	Valid Bit		Offset Address <PORTn_base>	Initial Value
		Location	R/W		
P1	16	7 to 0	R/W	H'0004	H'0000
PSR1	32	23 to 16, 7 to 0	W, R/W	H'0104	H'0000_0000
PPR1	16	15 to 0	R	H'0204	H'0000
PM1	16	7 to 0	R/W	H'0304	H'FFFF*2
PMC1	16	15 to 0	R/W	H'0404	H'0000
PFC1	16	15 to 0	R/W	H'0504	H'0000
PFCE1	16	15 to 0	R/W	H'0604	H'0000
PNOT1	16	7 to 0	W	H'0704	H'0000
PMSR1	32	23 to 16, 7 to 0	W, R/W	H'0804	H'0000_FFFF
PMCSR1	32	23 to 16, 7 to 0	W, R/W	H'0904	H'0000_0000
PFCAE1	16	15 to 0	R/W	H'0A04	H'0000
PIBC1	16	15 to 0	R/W	H'4004	H'0000
PBDC1	16	15 to 0	R/W	H'4104	H'0000
PIPC1	16	7 to 0	R/W	H'4204	H'FF00*2

Cautions: 1. An initial value is read if the bit is invalid. The write value should always be the initial value.

2. The values of bits 8 to 15 of the PM1 and PIPC1 registers are fixed. When read, all of these bits are always read as 1.

41.8 Port 2 (P2)

Table 41.15 Pin Function (P2)

Port Mode		Alternative Mode									
		1st Alternative		2nd Alternative		3rd Alternative		4th Alternative		5th Alternative	
Input	Output	Input	Output	Input	Output	Input	Output	Input	Output	Input	Output
P2_0	P2_0		$\overline{CS3}$	RLIN30R*		SPDIF_IN		IRQ7			
P2_1	P2_1		\overline{RAS}		RLIN30TX*		SPDIF_OUT	IRQ6			
P2_2	P2_2		\overline{CAS}	CAN1RX		TIOC0C		IRQ5			
P2_3	P2_3		CKE		CAN1TX	TIOC0D					
P2_4	P2_4		$\overline{WE0}/$ DQMLL			TIOC4A					
P2_5	P2_5		$\overline{WE1}/\overline{WE}/$ DQMLU			TIOC3A					
P2_6	P2_6		$\overline{RD}/\overline{WR}$	SSIRxD3		TIOC2A					
P2_7	P2_7		$\overline{CS0}$	SSISCK3		TIOC1A		IRQ2			
P2_8	P2_8		\overline{RD}		SSITxD3	TIOC0A					CAN0TX
P2_9	P2_9		A0	SSIWS3		SCK0		IRQ1		CAN0RX	

Note: * RZ/A1L only

Table 41.16 Control Registers (P2)

Register	Register Size	Valid Bit		Offset Address <PORTn_base>	Initial Value
		Location	R/W		
P2	16	9 to 0	R/W	H'0008	H'0000
PSR2	32	25 to 16, 9 to 0	W, R/W	H'0108	H'0000_0000
PPR2	16	9 to 0	R	H'0208	H'0000
PM2	16	9 to 0	R/W	H'0308	H'FFFF
PMC2	16	9 to 0	R/W	H'0408	H'01C0 (In boot mode 0), H'0000 (Other than in boot mode 0)
PFC2	16	9 to 0	R/W	H'0508	H'0000
PFCE2	16	9 to 0	R/W	H'0608	H'0000
PNOT2	16	9 to 0	W	H'0708	H'0000
PMSR2	32	25 to 16, 9 to 0	W, R/W	H'0808	H'0000_FFFF
PMCSR2	32	25 to 16, 9 to 0	W, R/W	H'0908	H'0000_01C0 (In boot mode 0), H'0000_0000 (Other than in boot mode 0)
PFCAE2	16	9 to 0	R/W	H'0A08	H'0000
PIBC2	16	9 to 0	R/W	H'4008	H'0000
PBDC2	16	9 to 0	R/W	H'4108	H'01C0 (In boot mode 0), H'0000 (Other than in boot mode 0)
PIPC2	16	9 to 0	R/W	H'4208	H'01C0 (In boot mode 0), H'0000 (Other than in boot mode 0)

Cautions: 1. An initial value is read if the bit is invalid. The write value should always be the initial value.

2. For the pins that are automatically configured in boot mode, see Table 8.3, Initial States by Areas in Boot Modes 0 and 1 to 3.

41.9 Port 3 (P3)

Table 41.17 Pin Function (P3)

41.16 Port Control Logical Diagram

The figure below is a logical diagram of the port control function.

Note: This figure shows the logic for reference, not the circuit.

Figure 41.1 Port Control Logical Diagram

41.17 Flowchart Examples of Port Setting

(a) shows an example flow of setting the P_{n_m} pin to port mode. (b) shows an example flow of setting the P_{n_m} pin to software I/O control alternative mode. (c) shows an example flow of setting the P_{n_m} pin to direct I/O control alternative mode.

(a) In Port Mode

Figure 41.2 Example Flow of Port Settings (in Port Mode) (a)

(b) In Software I/O Control Alternative Mode

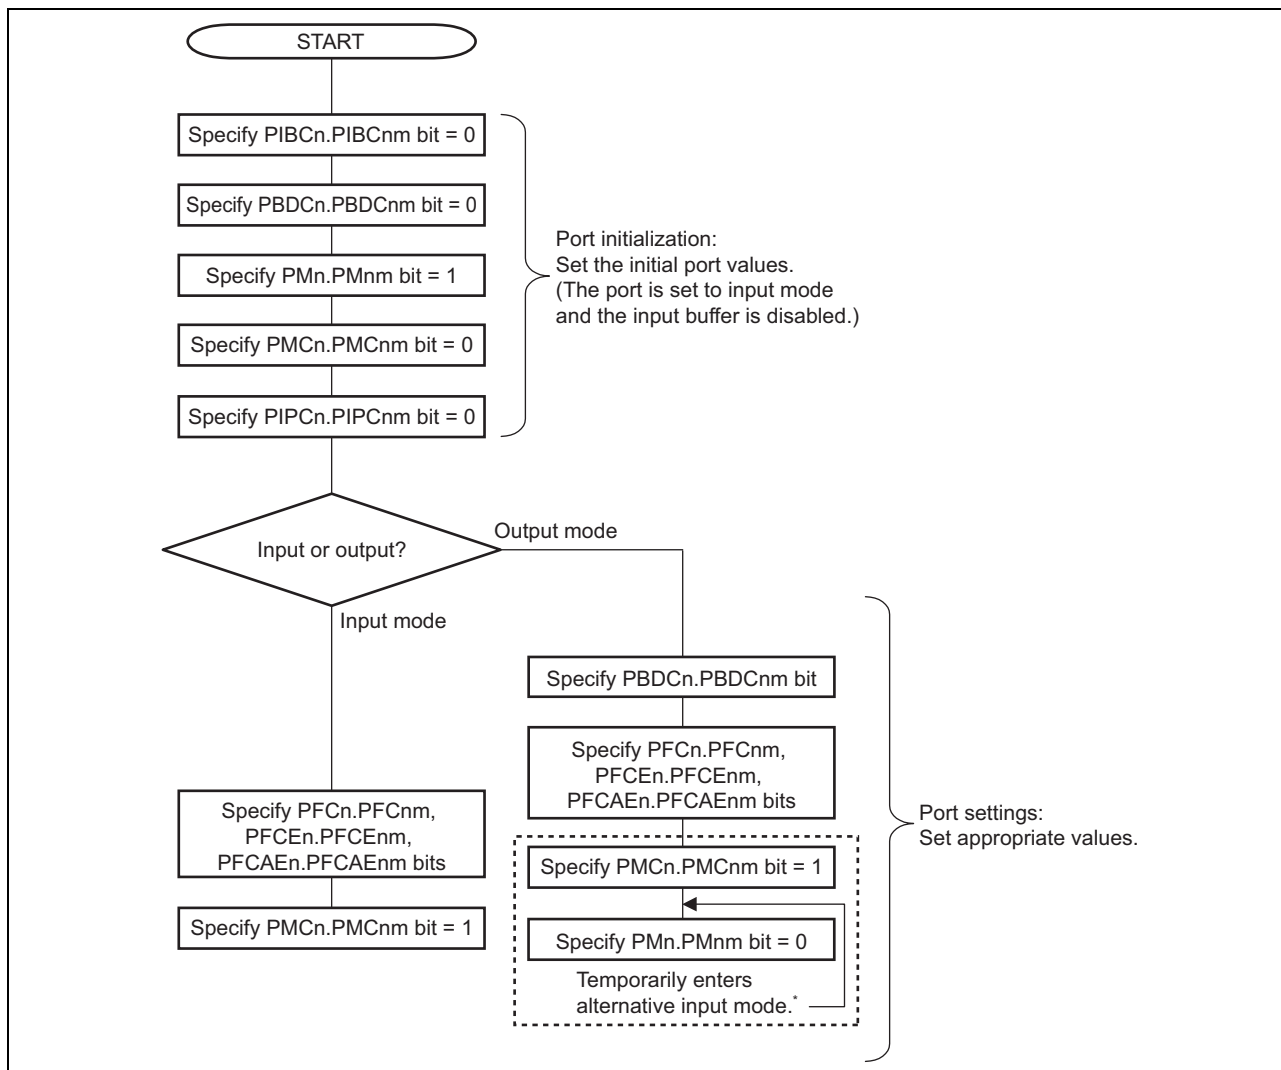

Figure 41.3 Example Flow of Port Settings (in Software I/O Control Alternative Mode) (b)

Caution: When the Pn_m pin is set to the output mode of the software I/O control alternative mode, alternative input mode is temporarily enabled during the period from when the PMCn.PMCnm bit is set to 1 to when the PMn.PMnm bit is set to 0. Therefore, if a signal regarding interrupt has been set for the port alternative function, configure the setting so that interrupt does not occur or becomes invalid.

(c) In Direct I/O Control Alternative Mode

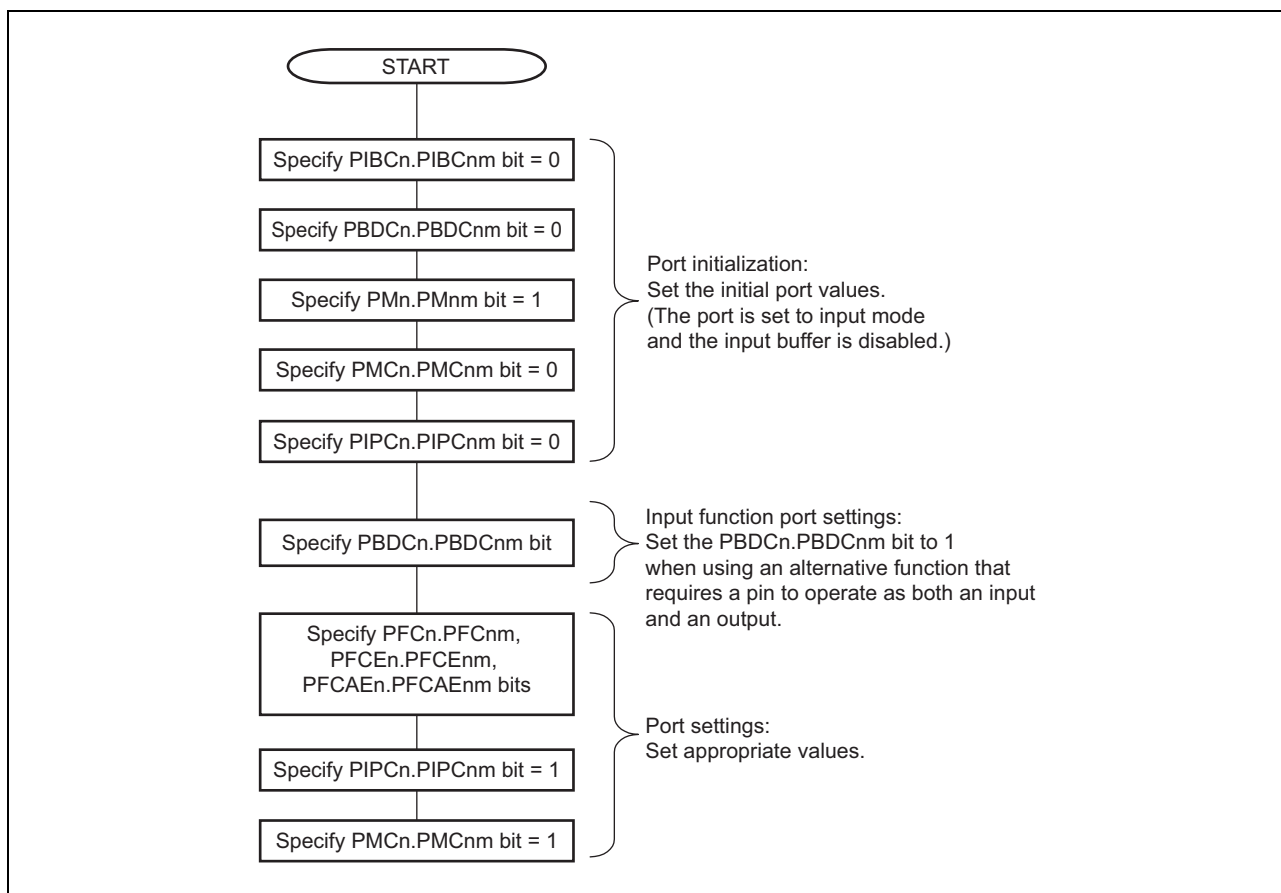

Figure 41.4 Example Flow of Port Settings (in Direct I/O Control Alternative Mode) (c)

42. Power-Down Modes

This LSI supports sleep mode, software standby mode, deep standby mode, and module standby mode. In power-down modes, functions of CPU, clocks, on-chip memory, or part of on-chip peripheral modules are halted or the power-supply is turned off, through which low power consumption is achieved. These modes are canceled by a reset or interrupt.

42.1 Features

42.1.1 States of Processing and Power-Down Modes

(1) States of processing

This LSI has three general states of processing: the reset state, the program execution state, and the power-down modes. Figure 42.1 shows transitions between these states.

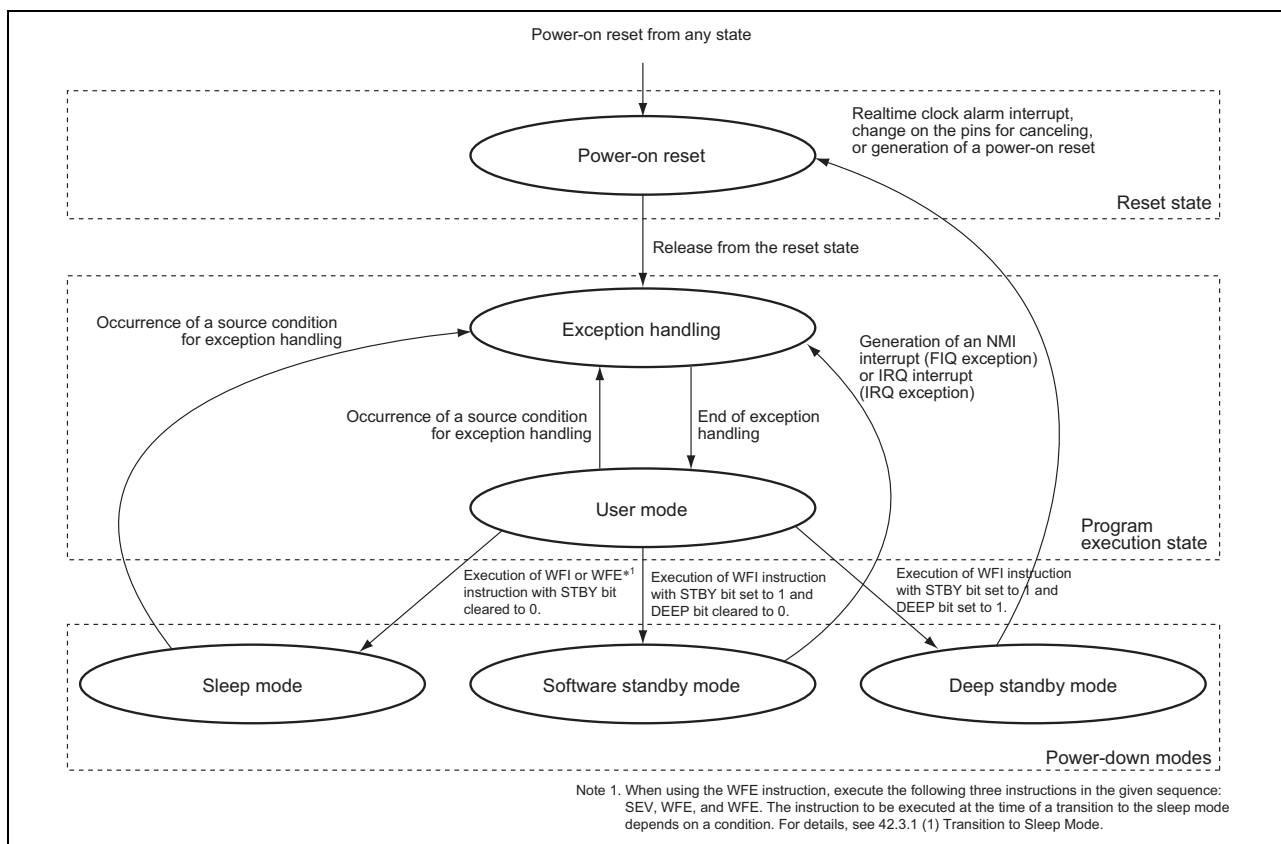

Figure 42.1 Transitions between Processing States

(2) Power-down modes

This LSI has the following power-down modes and function:

1. Sleep mode
2. Software standby mode
3. Deep standby mode
4. Module standby function

Table 42.1 shows the transition conditions for entering the modes from the program execution state, as well as the CPU and peripheral module states in each mode and the procedures for canceling each mode.

Table 42.1 States of Power-Down Modes

Power-Down Mode	Transition Conditions	State							Canceling Procedure
		CPU, CPU Register, Primary Cache, TLB	Secondary Cache	Large-Capacity On-Chip RAM (including on-chip data-retention RAM)	On-Chip Peripheral Modules	Realtime Clock	Internal Power Supply	External Memory	
Sleep mode	Execute WFI or WFE ⁶ instruction with STBY bit in STBCR1 cleared to 0	Halted Contents are held. ⁴	Running	Running	Running	Running ^{*1}	Applied	Auto-refresh	<ul style="list-style-type: none"> Interrupt Power-on reset
Software standby mode	Execute WFI instruction with STBY and DEEP bits in STBCR1 set to 1 and 0, respectively	Halted Contents are held. ⁴	Halted Contents are held. ⁴	Halted Contents are held. ⁵	Halted	Running ^{*1}	Applied	Self-refresh	<ul style="list-style-type: none"> NMI or IRQ interrupt Power-on reset
Deep standby mode	Execute WFI instruction with STBY and DEEP bits in STBCR1 set to 1	Halted Contents are not held.	Halted Contents are not held.	Halted Contents in on-chip data-retention RAM are held ² , and the other contents in large-capacity on-chip RAM are not held.	Halted	Running ^{*1}	Shut off	Self-refresh	<ul style="list-style-type: none"> Power-on reset^{*3} Realtime clock alarm interrupt^{*3} Change on the pins for canceling^{*3}
Module standby mode	Set the MSTP bits in STBCR2 to STBCR12 to 1	Running	Running	Running	Specified module halted	Halted	Applied	Auto-refresh	<ul style="list-style-type: none"> Clear MSTP bit to 0

Note 1. The realtime clock operates when the START bit in the RCR2 register is set to 1. For details, see section 13, Realtime Clock. When deep standby mode is canceled by a power-on reset, the running state cannot be retained. Make the initial setting for the realtime clock again.

Note 2. Setting the bits RRAMKP3 to RRAMKP0 in the RRAMKP register to 1 enables to retain the data in the corresponding area on the on-chip data-retention RAM during the transition to deep standby mode. When the deep standby mode is canceled by a power-on reset, the retained contents are initialized.

Note 3. Deep standby mode can be canceled by a power-on reset, a realtime clock alarm interrupt, or change on the pins for canceling (P2_0, P2_2, P2_7, P2_9, P5_8, P5_9, P5_10, P6_7, P7_2, P7_3, P7_6, P7_9, and NMI). Even when deep standby mode is canceled by a source other than a power-on reset, the reset exception handling is executed instead of the interrupt exception handling.

Note 4. When sleep mode or software standby mode is canceled by a power-on reset, the retained contents are initialized.

Note 5. By setting the VRAME bit in the SYSCR1 register or VRAMWE bit in the SYSCR2 register to enable accesses, the retained contents are initialized when software standby mode is canceled by a power-on reset. By setting the VRAME bit in the SYSCR1 register or VRAMWE bit in the SYSCR2 register to disable accesses, contents in the large-capacity on-chip RAM (including on-chip data-retention RAM) can be retained when software standby mode is canceled by a power-on reset. Note that the area at addresses from H'2002_0000 to H'2002_3FFF is used as working memory for the boot program in boot modes 1 to 3. In boot modes 2 and 3, a 28-Kbyte program is transferred from the external flash memory to the area at addresses from H'2002_4000 to H'2002_AFFF. For details, see section 3, Boot Mode.

Note 6. When using the WFE instruction, execute the following three instructions in the given sequence: SEV, WFE, and WFE. The instruction to be executed at the time of a transition to the sleep mode depends on a condition. For details, see section 42.3.1, (1) Transition to Sleep Mode.

42.2 Register Descriptions

Table 42.2 shows the register configuration.

Table 42.2 Register Configuration

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
Standby control register 1	STBCR1	R/W	H'00	H'FCFE0020	8
Standby control register 2	STBCR2	R/W	H'6A	H'FCFE0024	8

XTAL crystal oscillator gain control register	XTALCTR	R/W	H'00	H'FCFF1810	8

42.2.1 Standby Control Register 1 (STBCR1)

STBCR1 is an 8-bit readable/writable register that specifies the state of the power-down mode.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	STBY	DEEP	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	STBY	0	R/W	Software Standby, Deep Standby
6	DEEP	0	R/W	Specifies transition to software standby mode or deep standby mode. 0x: Executing WFI or WFE* ¹ instruction puts chip into sleep mode. 10: Executing WFI instruction puts chip into software standby mode.* ² 11: Executing WFI instruction puts chip into deep standby mode.* ² Note 1. When using the WFE instruction, execute the following three instructions in the given sequence: SEV, WFE, and WFE. The instruction to be executed at the time of a transition to the sleep mode depends on a condition. For details, see section 42.3.1, (1) Transition to Sleep Mode. Note 2. Do not execute the WFE instruction while the STBY bit in STBCR1 is 1.
5 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

[Legend]
x: Don't care

42.2.2 Standby Control Register 2 (STBCR2)

STBCR2 is an 8-bit readable/writable register that controls the operation of each module.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	HIZ	-	-	-	-	-	-	MSTP 20
Initial value:	0	1	1	0	1	0	1	0
R/W:	R/W	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	HIZ	0	R/W	Port High Impedance Selects whether the state of specific output pin is retained or high impedance in software standby mode or deep standby mode. As to which pins are controlled, see section 48.1, Pin States in section 48, States and Handling of Pins. 0: The pin state is retained in software standby mode or deep standby mode. 1: The pin is set to high-impedance in software standby mode or deep standby mode.
6, 5	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
4	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
3	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
2	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
1	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
0	MSTP20	0	R/W	Module Stop 20*1 [not for disclosure] When the MSTP20 bit is set to 1, the clock supply to CoreSight is halted. 0: CoreSight runs. 1: Clock supply to CoreSight is halted.

Note 1. The transition to and release from module stop mode proceed in the steps described in section 42.3.5, Module Standby Function.

42.2.3 Standby Control Register 3 (STBCR3)

STBCR3 is an 8-bit readable/writable register that controls the operation of each module.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	MSTP 37*1	MSTP 36	MSTP 35*1	—	MSTP 33	MSTP 32	MSTP 31	—
Initial value:	1	1	1	1	1	1	0	1
R/W:	R/W	R/W	R/W	R	R/W	R/W	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
7	MSTP37*1	1	R/W	Module Stop 37 When the MSTP37 bit is set to 1, the clock supply to the IEBus™ controller is halted. 0: The IEBus™ controller runs. 1: Clock supply to the IEBus™ controller is halted.
6	MSTP36	1	R/W	Module Stop 36 When the MSTP36 bit is set to 1, the clock supply to serial communication interface (IrDA) is halted. 0: Serial communication interface (IrDA) runs. 1: Clock supply to serial communication interface (IrDA) is halted.
5	MSTP35*1	1	R/W	Module Stop 35 When the MSTP35 bit is set to 1, the clock supply to the LIN interface channel 0 is halted. 0: The LIN interface channel 0 runs. 1: Clock supply to the LIN interface channel 0 is halted.
4	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
3	MSTP33	1	R/W	Module Stop 33 When the MSTP33 bit is set to 1, the clock supply to the multi-function timer pulse unit 2 is halted. 0: The multi-function timer pulse unit 2 runs. 1: Clock supply to the multi-function timer pulse unit 2 is halted.
2	MSTP32	1	R/W	Module Stop 32 When the MSTP32 bit is set to 1, the clock supply to the CAN interface is halted. 0: The CAN interface runs. 1: Clock supply to the CAN interface is halted.
1	MSTP31	0	R/W	Module Stop 31 When the MSTP31 bit is set to 1, the clock supply to the A/D converter is halted and the analog power supply to the A/D converter is shut off. 0: Clock signal and analog voltage are supplied to the A/D converter. 1: Supply of clock signal and analog voltage to the A/D converter is shut off.
0	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.

Note 1. This bit is only present in the RZ/A1L. For the RZ/A1LU and RZ/A1LC, the write value should always be 1.

42.2.4 Standby Control Register 4 (STBCR4)

STBCR4 is an 8-bit readable/writable register that controls the operation of each module.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	MSTP 47	MSTP 46	MSTP 45	MSTP 44	MSTP 43	—	—	—
Initial value:	1	1	1	1	1	1	1	1
R/W:	R/W	R/W	R/W	R/W	R/W	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	MSTP47	1	R/W	Module Stop 47 When the MSTP47 bit is set to 1, the clock supply to channel 0 of the serial communication interface with FIFO is halted. 0: Channel 0 of the serial communication interface with FIFO runs. 1: Clock supply to channel 0 of the serial communication interface with FIFO is halted.
6	MSTP46	1	R/W	Module Stop 46 When the MSTP46 bit is set to 1, the clock supply to channel 1 of the serial communication interface with FIFO is halted. 0: Channel 1 of the serial communication interface with FIFO runs. 1: Clock supply to channel 1 of the serial communication interface with FIFO is halted.
5	MSTP45	1	R/W	Module Stop 45 When the MSTP45 bit is set to 1, the clock supply to channel 2 of the serial communication interface with FIFO is halted. 0: Channel 2 of the serial communication interface with FIFO runs. 1: Clock supply to channel 2 of the serial communication interface with FIFO is halted.
4	MSTP44	1	R/W	Module Stop 44 When the MSTP44 bit is set to 1, the clock supply to channel 3 of the serial communication interface with FIFO is halted. 0: Channel 3 of the serial communication interface with FIFO runs. 1: Clock supply to channel 3 of the serial communication interface with FIFO is halted.
3	MSTP43	1	R/W	Module Stop 43 When the MSTP43 bit is set to 1, the clock supply to channel 4 of the serial communication interface with FIFO is halted. 0: Channel 4 of the serial communication interface with FIFO runs. 1: Clock supply to channel 4 of the serial communication interface with FIFO is halted.
2 to 0	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.

42.2.5 Standby Control Register 5 (STBCR5)

STBCR5 is an 8-bit readable/writable register that controls the operation of each module.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	MSTP 57	MSTP 56	—	—	—	—	MSTP 51	MSTP 50
Initial value:	1	1	1	1	1	1	1	1
R/W:	R/W	R/W	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	MSTP57	1	R/W	Module Stop 57 When the MSTP57 bit is set to 1, the clock supply to channel 0 of the serial communication interface (SCI) is halted. 0: Channel 0 of the serial communication interface (SCI) runs. 1: Clock supply to channel 0 of the serial communication interface (SCI) is halted.
6	MSTP56	1	R/W	Module Stop 56 When the MSTP56 bit is set to 1, the clock supply to channel 1 of the serial communication interface (SCI) is halted. 0: Channel 1 of the serial communication interface (SCI) runs. 1: Clock supply to channel 1 of the serial communication interface (SCI) is halted.
5 to 2	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
1	MSTP51	1	R/W	Module Stop 51 When the MSTP51 bit is set to 1, the clock supply to channel 0 of the OS timer is halted. 0: Channel 0 of the OS timer runs. 1: Clock supply to channel 0 of the OS timer is halted.
0	MSTP50	1	R/W	Module Stop 50 When the MSTP50 bit is set to 1, the clock supply to channel 1 of the OS timer is halted. 0: Channel 1 of the OS timer runs. 1: Clock supply to channel 1 of the OS timer is halted.

42.2.6 Standby Control Register 6 (STBCR6)

STBCR6 is an 8-bit readable/writable register that controls the operation of each module.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	MSTP 67	MSTP 66	—	—	—	—	MSTP 61*2	MSTP 60
Initial value:	1	1	1	1	1	1	1	0
R/W:	R/W	R/W	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	MSTP67	1	R/W	Module Stop 67 When the MSTP67 bit is set to 1, the clock supply to the A/D converter is halted. 0: The A/D converter runs. 1: Clock supply to channel 0 of the A/D converter is halted.
6	MSTP66	1	R/W	Module Stop 66*1 When the MSTP66 bit is set to 1, the clock supply to the capture engine unit is halted. 0: The capture engine unit runs. 1: Clock supply to the capture engine unit is halted.
5 to 2	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
1	MSTP61*2	1	R/W	Module Stop 61*1 When the MSTP61 bit is set to 1, the clock supply to the JPEG codec unit is halted. 0: The JPEG codec unit runs. 1: Clock supply to the JPEG codec unit is halted.
0	MSTP60	0	R/W	Module Stop 60 When the MSTP60 bit is set to 1, the clock supply to the realtime clock is halted. 0: The realtime clock runs. 1: Clock supply to the realtime clock is halted. Note: When the realtime clock is halted, set the bits in registers shown below. <ul style="list-style-type: none"> • Set bit RTCEN in the control register 2 (RCR2) to 0. • Set bits RCKSEL[1:0] in the control register 5 (RCR5) to 00. After the settings above, set bit MSTP60 to 1.

Note 1. The transition to and release from module stop mode proceed in the steps described in section 42.3.5, Module Standby Function.

Note 2. This bit is only present in the RZ/A1LU. For the RZ/A1L and RZ/A1LC, the write value should always be 1.

42.2.7 Standby Control Register 7 (STBCR7)

STBCR7 is an 8-bit readable/writable register that controls the operation of each module.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	MSTP 74	—	—	MSTP 71	MSTP 70
Initial value:	0	0	1	1	1	1	1	1
R/W:	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
4	MSTP74	1	R/W	Module Stop 74*1 When the MSTP74 bit is set to 1, the clock supply to the Ethernet controller is halted. 0: The Ethernet controller runs. 1: Clock supply to the Ethernet controller is halted.
3, 2	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
1	MSTP71	1	R/W	Module Stop 71 When the MSTP71 bit is set to 1, the clock supply to channel 0 of the USB 2.0 host/function module is halted. 0: Channel 0 of the USB 2.0 host/function module runs. 1: Clock supply to channel 0 of the USB 2.0 host/function module is halted.
0	MSTP70	1	R/W	Module Stop 70 When the MSTP70 bit is set to 1, the clock supply to channel 1 of the USB 2.0 host/function module is halted. 0: Channel 1 of the USB 2.0 host/function module runs. 1: Clock supply to channel 1 of the USB 2.0 host/function module is halted.

Note 1. The transition to and release from module stop mode proceed in the steps described in section 42.3.5, Module Standby Function.

42.2.8 Standby Control Register 8 (STBCR8)

STBCR8 is an 8-bit readable/writable register that controls the operation of each module.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	MSTP 84	MSTP 83*2	MSTP 82*3	MST P81	—
Initial value:	1	1	1	1	1	1	1	1
R/W:	R	R	R	R/W	R/W	R/W	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 5	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
4	MSTP84	1	R/W	Module Stop 84 When the MSTP84 bit is set to 1, the clock supply to the MMC host interface is halted. 0: The MMC host interface runs. 1: Clock supply to the MMC host interface is halted.
3	MSTP83*2	1	R/W	Module Stop 83*1 When the MSTP83 bit is set to 1, the clock supply to the media local bus is halted. 0: The media local bus runs. 1: Clock supply to the media local bus is halted.
2	MSTP82*3	1	R/W	Module Stop 82*1 When the MSTP82 bit is set to 1, the clock supply to the EthernetAVB is halted. 0: The EthernetAVB runs. 1: Clock supply to the EthernetAVB is halted.
1	MSTP81	1	R/W	Module Stop 81 When the MSTP81 bit is set to 1, the clock supply to SCUX is halted. 0: SCUX runs. 1: Clock supply to SCUX is halted.
0	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.

Note 1. The transition to and release from module stop mode proceed in the steps described in section 42.3.5, Module Standby Function.

Note 2. This bit is only present in the RZ/A1L. For the RZ/A1LU and RZ/A1LC, the write value should always be 1.

Note 3. This bit is only present in the RZ/A1LU. For the RZ/A1L and RZ/A1LC, the write value should always be 1.

42.2.9 Standby Control Register 9 (STBCR9)

STBCR9 is an 8-bit readable/writable register that controls the operation of each module.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	MSTP 97	MSTP 96	MSTP 95	MSTP 94	MSTP 93	—	MSTP 91	—
Initial value:	1	1	1	1	1	1	1	1
R/W:	R/W	R/W	R/W	R/W	R/W	R	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
7	MSTP97	1	R/W	Module Stop 97 When the MSTP97 bit is set to 1, the clock supply to channel 0 of the I ² C bus interface is halted. 0: Channel 0 of the I ² C bus interface runs. 1: Clock supply to channel 0 of the I ² C bus interface is halted.
6	MSTP96	1	R/W	Module Stop 96 When the MSTP96 bit is set to 1, the clock supply to channel 1 of the I ² C bus interface is halted. 0: Channel 1 of the I ² C bus interface runs. 1: Clock supply to channel 1 of the I ² C bus interface is halted.
5	MSTP95	1	R/W	Module Stop 95 When the MSTP95 bit is set to 1, the clock supply to channel 2 of the I ² C bus interface is halted. 0: Channel 2 of the I ² C bus interface runs. 1: Clock supply to channel 2 of the I ² C bus interface is halted.
4	MSTP94	1	R/W	Module Stop 94 When the MSTP94 bit is set to 1, the clock supply to channel 3 of the I ² C bus interface is halted. 0: Channel 3 of the I ² C bus interface runs. 1: Clock supply to channel 3 of the I ² C bus interface is halted.
3	MSTP93	1	R/W	Module Stop 93 When the MSTP93 bit is set to 1, the clock supply to channel 0 of the SPI multi I/O bus controller is halted. 0: Channel 0 of the SPI multi I/O bus controller runs. 1: Clock supply to channel 0 of the SPI multi I/O bus controller is halted.
2	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
1	MSTP91	1	R/W	Module Stop 91*1 When the MSTP91 bit is set to 1, the clock supply to the video display controller 5 is halted. 0: The video display controller 5 runs. 1: Clock supply to the video display controller 5 is halted.
0	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.

Note 1. The transition to and release from module stop mode proceed in the steps described in section 42.3.5, Module Standby Function.

42.2.10 Standby Control Register 10 (STBCR10)

STBCR10 is an 8-bit readable/writable register that controls the operation of each module.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	MSTP 107	MSTP 106	MSTP 105	—	—	MSTP 102*1	MSTP 101	—
Initial value:	1	1	1	1	1	1	1	1
R/W:	R/W	R/W	R/W	R	R	R/W	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
7	MSTP107	1	R/W	Module Stop 107 When the MSTP107 bit is set to 1, the clock supply to channel 0 of the Renesas serial peripheral interface is halted. 0: Channel 0 of the Renesas serial peripheral interface runs. 1: Clock supply to channel 0 of the Renesas serial peripheral interface is halted.
6	MSTP106	1	R/W	Module Stop 106 When the MSTP106 bit is set to 1, the clock supply to channel 1 of the Renesas serial peripheral interface is halted. 0: Channel 1 of the Renesas serial peripheral interface runs. 1: Clock supply to channel 1 of the Renesas serial peripheral interface is halted.
5	MSTP105	1	R/W	Module Stop 105 When the MSTP105 bit is set to 1, the clock supply to channel 2 of the Renesas serial peripheral interface is halted. 0: Channel 2 of the Renesas serial peripheral interface runs. 1: Clock supply to channel 2 of the Renesas serial peripheral interface is halted.
4, 3	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
2	MSTP102*1	1	R/W	Module Stop 102 When the MSTP102 bit is set to 1, the clock supply to the CD-ROM decoder is halted. 0: The CD-ROM decoder runs. 1: Clock supply to the CD-ROM decoder is halted.
1	MSTP101	1	R/W	Module Stop 101 When the MSTP101 bit is set to 1, the clock supply to the Renesas SPDIF interface is halted. 0: The Renesas SPDIF interface runs. 1: Clock supply to the Renesas SPDIF interface is halted.
0	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.

Note 1. This bit is only present in the RZ/A1L. For the RZ/A1LU and RZ/A1LC, the write value should always be 1.

42.2.11 Standby Control Register 11 (STBCR11)

STBCR11 is an 8-bit readable/writable register that controls the operation of each module.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	—	—	MSTP 115	MSTP 114	MSTP 113	MSTP 112	—	—
Initial value:	1	1	1	1	1	1	1	1
R/W:	R	R	R/W	R/W	R/W	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Description
7, 6	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
5	MSTP115	1	R/W	Module Stop 115 When the MSTP115 bit is set to 1, the clock supply to channel 0 of the serial sound interface is halted. 0: Channel 0 of the serial sound interface runs. 1: Clock supply to channel 0 of the serial sound interface is halted.
4	MSTP114	1	R/W	Module Stop 114 When the MSTP114 bit is set to 1, the clock supply to channel 1 of the serial sound interface is halted. 0: Channel 1 of the serial sound interface runs. 1: Clock supply to channel 1 of the serial sound interface is halted.
3	MSTP113	1	R/W	Module Stop 113 When the MSTP113 bit is set to 1, the clock supply to channel 2 of the serial sound interface is halted. 0: Channel 2 of the serial sound interface runs. 1: Clock supply to channel 2 of the serial sound interface is halted.
2	MSTP112	1	R/W	Module Stop 112 When the MSTP112 bit is set to 1, the clock supply to channel 3 of the serial sound interface is halted. 0: Channel 3 of the serial sound interface runs. 1: Clock supply to channel 3 of the serial sound interface is halted.
1, 0	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.

42.2.12 Standby Control Register 12 (STBCR12)

STBCR12 is an 8-bit readable/writable register that controls the operation of each module.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	MSTP 123	MSTP 122	MSTP 121	MSTP 120
Initial value:	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 4	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
3	MSTP123	1	R/W	Module Stop 123 When the MSTP123 bit is set to 1, the SD host interface 00 is halted. 0: The SD host interface 00 runs. 1: Clock supply to the SD host interface 00 is halted.
2	MSTP122	1	R/W	Module Stop 122 When the MSTP122 bit is set to 1, the SD host interface 01 is halted. 0: The SD host interface 01 runs. 1: Clock supply to the SD host interface 01 is halted.
1	MSTP121	1	R/W	Module Stop 121 When the MSTP121 bit is set to 1, the SD host interface 10 is halted. 0: The SD host interface 10 runs. 1: Clock supply to the SD host interface 10 is halted.
0	MSTP120	1	R/W	Module Stop 120 When the MSTP120 bit is set to 1, the SD host interface 11 is halted. 0: The SD host interface 11 runs. 1: Clock supply to the SD host interface 11 is halted.

Note: For details on this register, see section 38.3.2, Card Detect/Write Protect.

42.2.13 Software Reset Control Register 1 (SWRSTCR1)

SWRSTCR1 is an 8-bit readable/writable register that controls a software reset for the serial sound interface and the operation of the crystal resonator for audio.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	AXT ALE	SRST 16	SRST 15	SRST 14	SRST 13	—	—	—
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	AXTALE	0	R/W	AUDIO_X1 Clock Control Controls the function of AUDIO_X1 pin. 0: Runs the on-chip crystal oscillator/enables the external clock input. 1: Halts the on-chip crystal oscillator/disables the external clock input.
6	SRST16	0	R/W	Serial Sound Interface Channel 0 Software Reset Controls the serial sound interface channel 0 reset with software. 0: The serial sound interface channel 0 reset is canceled. 1: The serial sound interface channel 0 is reset.
5	SRST15	0	R/W	Serial Sound Interface Channel 1 Software Reset Controls the serial sound interface channel 1 reset with software. 0: The serial sound interface channel 1 reset is canceled. 1: The serial sound interface channel 1 is reset.
4	SRST14	0	R/W	Serial Sound Interface Channel 2 Software Reset Controls the serial sound interface channel 2 reset with software. 0: The serial sound interface channel 2 reset is canceled. 1: The serial sound interface channel 2 is reset.
3	SRST13	0	R/W	Serial Sound Interface Channel 3 Software Reset Controls the serial sound interface channel 3 reset with software. 0: The serial sound interface channel 3 reset is canceled. 1: The serial sound interface channel 3 is reset.
2 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

42.2.14 Software Reset Control Register 2 (SWRSTCR2)

This register is only provided in the RZ/A1LU.

SWRSTCR2 is an 8-bit readable/writable register that controls a software reset for each module.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	SRST 21	-
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	SRST21	0	R/W	JPEG Codec Unit Software Reset Controls the JPEG codec unit reset with software. 0: The JPEG codec unit reset is canceled. 1: The JPEG codec unit is reset.
0	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

42.2.15 System Control Register 1 (SYSCR1)

SYSCR1 is an 8-bit readable/writable register that enables or disables access (read and write) to a specified page in the large-capacity on-chip RAM.

When a VRAMEn (n = 0 to 4) bit in SYSCR1 is set to 1, access to page n is enabled. When a VRAMEn bit is cleared to 0, page n cannot be accessed. In this case, an undefined value is returned when reading data or fetching an instruction from page n, and writing to page n is ignored. The initial value of a VRAMEn bit is 1.

SYSCR1 should be set with a program located in an area other than the large-capacity on-chip RAM. Furthermore, an instruction to read SYSCR1 should be located immediately after the instruction to write to SYSCR1. If not, normal access is not guaranteed.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	VRAME 4	VRAME 3	VRAME 2	VRAME 1	VRAME 0
Initial value:	1	1	1	1	1	1	1	1
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 5	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
4	VRAME4	1	R/W	RAM Enable 4 (corresponding area: page 4*1 in large-capacity on-chip RAM) 0: Access to page 4 is disabled. 1: Access to page 4 is enabled.
3	VRAME3	1	R/W	RAM Enable 3 (corresponding area: page 3*1 in large-capacity on-chip RAM) 0: Access to page 3 is disabled. 1: Access to page 3 is enabled.
2	VRAME2	1	R/W	RAM Enable 2 (corresponding area: page 2*1 in large-capacity on-chip RAM) 0: Access to page 2 is disabled. 1: Access to page 2 is enabled.
1	VRAME1	1	R/W	RAM Enable 1 (corresponding area: page 1*1 in large-capacity on-chip RAM) 0: Access to page 1 is disabled. 1: Access to page 1 is enabled.
0	VRAME0	1	R/W	RAM Enable 0 (corresponding area: page 0*1 in large-capacity on-chip RAM) 0: Access to page 0 is disabled. 1: Access to page 0 is enabled.

Note 1. For addresses in each page, see section 40, On-Chip RAM.

42.2.16 System Control Register 2 (SYSCR2)

SYSCR2 is an 8-bit readable/writable register that enables or disables writing to a specified page in the large-capacity on-chip RAM.

When a VRAMWEn (n = 0 to 4) bit in SYSCR2 is set to 1, writing to page n is enabled. When a VRAMWEn bit is cleared to 0, writing to page n is ignored. The initial value of a VRAMWEn bit is 1.

SYSCR2 should be set with a program located in an area other than the large-capacity on-chip RAM. Furthermore, an instruction to read SYSCR2 should be located immediately after the instruction to write to SYSCR2. If not, normal access is not guaranteed.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	VRAM WE4	VRAM WE3	VRAM WE2	VRAM WE1	VRAM WE0
Initial value:	1	1	1	1	1	1	1	1
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 5	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
4	VRAMWE4	1	R/W	RAM Write Enable 4 (corresponding area: page 4*1 in large-capacity on-chip RAM) 0: Writing to page 4 is disabled. 1: Writing to page 4 is enabled.
3	VRAMWE3	1	R/W	RAM Write Enable 3 (corresponding area: page 3*1 in large-capacity on-chip RAM) 0: Writing to page 3 is disabled. 1: Writing to page 3 is enabled.
2	VRAMWE2	1	R/W	RAM Write Enable 2 (corresponding area: page 2*1 in large-capacity on-chip RAM) 0: Writing to page 2 is disabled. 1: Writing to page 2 is enabled.
1	VRAMWE1	1	R/W	RAM Write Enable 1 (corresponding area: page 1*1 in large-capacity on-chip RAM) 0: Writing to page 1 is disabled. 1: Writing to page 1 is enabled.
0	VRAMWE0	1	R/W	RAM Write Enable 0 (corresponding area: page 0*1 in large-capacity on-chip RAM) 0: Writing to page 0 is disabled. 1: Writing to page 0 is enabled.

Note 1. For addresses in each page, see section 40, On-Chip RAM.

42.2.17 System Control Register 3 (SYSCR3)

SYSCR3 is an 8-bit readable/writable register that enables or disables writing to a specified page in the on-chip data-retention RAM.

When a RRAMWEn (n = 0 to 3) bit in SYSCR3 is set to 1, writing to page n is enabled. When a RRAMWEn bit is cleared to 0, writing to page n is ignored. The initial value of a RRAMWEn bit is 0.

SYSCR3 should be set with a program located in an area other than the on-chip data-retention RAM.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	RRAM WE3	RRAM WE2	RRAM WE1	RRAM WE0
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	RRAMWE3	0	R/W	RAM Write Enable 3 (corresponding area: page 3*2 in on-chip data-retention RAM) 0: Writing to page 3 is disabled. 1: Writing to page 3 is enabled.
2	RRAMWE2	0	R/W	RAM Write Enable 2 (corresponding area: page 2*2 in on-chip data-retention RAM) 0: Writing to page 2 is disabled. 1: Writing to page 2 is enabled.
1	RRAMWE1	0	R/W	RAM Write Enable 1 (corresponding area: page 1*2 in on-chip data-retention RAM) 0: Writing to page 1 is disabled. 1: Writing to page 1 is enabled.
0	RRAMWE0	0	R/W	RAM Write Enable 0 (corresponding area: page 0*2 in on-chip data-retention RAM) 0: Writing to page 0 is disabled. 1: Writing to page 0 is enabled.

Note 1. For addresses in each page, see section 40, On-Chip RAM.

Note 2. When the VRAME0 bit in SYSCR1 is cleared to 0 (access to page 0 in large-capacity on-chip RAM is invalid), the on-chip data-retention RAM cannot be accessed (read and written), regardless of the setting of this bit.
When the VRAMWE0 bit in SYSCR2 is cleared to 0 (writing to page 0 in large-capacity on-chip RAM is invalid), the on-chip data-retention RAM cannot be written, regardless of the setting of this bit.

42.2.18 CPU Status Register (CPUSTS)

CPUSTS is an 8-bit readable register that indicates the status of the CPU.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	ISBUSY	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 5	—	All 0	R	Reserved These bits are always read as 0.
4	ISBUSY	0	R	State during Changing of the Frequency of CPU and Return from Software Standby Indicates that the frequency of CPU is being changed or that return from software standby is in progress. Do not execute a WFI instruction while this bit is 1. 0: The frequency of CPU is not being changed and returning from software standby is not in progress 1: The frequency of CPU is being changed or return from software standby is in progress
3 to 0	—	All 0	R	Reserved These bits are always read as 0.

42.2.19 Standby Request Register 1 (STBREQ1)

This register is used to request notification of whether a CPU or peripheral module is ready for standby. The CPU or peripheral module returns a standby acknowledgement on receipt of a request for notification if it is ready for standby.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	—	—	STBRQ 15	—	STBRQ 13*2	STBRQ 12*2	—	STBRQ 10
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R	R/W	R/W	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5	STBRQ15	0	R/W	Standby Request to CoreSight 0: The standby request to CoreSight is invalid. 1: The standby request to CoreSight is valid.*1
4	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
3	STBRQ13*2	0	R/W	Standby Request to JPEG Codec Unit 0: The standby request to the JPEG codec unit is invalid. 1: The standby request to the JPEG codec unit is valid.*1
2	STBRQ12*2	0	R/W	Standby Request to EthernetAVB 0: The standby request to the EthernetAVB is invalid. 1: The standby request to the EthernetAVB is valid.*1
1	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
0	STBRQ10	0	R/W	Standby Request to Capture Engine Unit 0: The standby request to the capture engine unit is invalid. 1: The standby request to the capture engine unit is valid.*1

Note 1. When the MSTP bit for the corresponding module is 1, writing 1 to the STBRQ bit has no effect.

Note 2. This bit is only present in the RZ/A1LU. For the RZ/A1L and RZ/A1LC, the write value should always be 0.

42.2.20 Standby Request Register 2 (STBREQ2)

This register is used to request notification of whether a peripheral module is ready for standby. The peripheral module returns a standby acknowledgement on receipt of a request for notification if it is ready for standby.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	STBRQ 27*2	STBRQ 26	STBRQ 25	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	STBRQ27*2	0	R/W	Standby Request to the media local bus 0: The standby request to the media local bus is invalid. 1: The standby request to the media local bus is valid.*1
6	STBRQ26	0	R/W	Standby Request to Ethernet Controller 0: The standby request to the Ethernet controller is invalid. 1: The standby request to the Ethernet controller is valid.*1
5	STBRQ25	0	R	Standby Request to Video Display Controller 5 0: The standby request to the video display controller 5 is invalid. 1: The standby request to of the video display controller 5 is valid.*1
4 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note 1. When the MSTP bit for the corresponding module is 1, writing 1 to the STBRQ bit has no effect.

Note 2. This bit is only present in the RZ/A1L. For the RZ/A1LU and RZ/A1LC, the write value should always be 0.

42.2.21 Standby Acknowledge Register 1 (STBACK1)

This register is used to provide notification that a CPU or peripheral module is in the standby ready state. The CPU or peripheral module returns a standby acknowledgement on reception of a standby notification request if it is ready for standby. This register is a read-only register.

Bit:	7	6	5	4	3	2	1	0
	—	—	STBAK 15	—	STBAK 13*2	STBAK 12*2	—	STBAK 10
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7, 6	—	All 0	R	Reserved These bits are always read as 0.
5	STBAK15	0	R	Standby Acknowledgement from CoreSight 0: The standby acknowledgement from CoreSight is invalid. 1: The standby acknowledgement from CoreSight is valid.*1
4	—	0	R	Reserved This bit is always read as 0.
3	STBAK13*2	0	R	Standby Acknowledgement from JPEG Codec Unit 0: The standby acknowledgement from the JPEG codec unit is invalid. 1: The standby acknowledgement from the JPEG codec unit is valid.*1
2	STBAK12*2	0	R	Standby Acknowledgement from EthernetAVB 0: The standby acknowledgement from the EthernetAVB is invalid. 1: The standby acknowledgement from the EthernetAVB is valid.*1
1	—	0	R	Reserved This bit is always read as 0.
0	STBAK10	0	R	Standby Acknowledgement from Capture Engine Unit 0: The standby acknowledgement from the capture engine unit is invalid. 1: The standby acknowledgement from the capture engine unit is valid.*1

Note 1. The bits in STBACK1 are set to 1 when a standby acknowledgement is transmitted from the module while the MSTP bit for the corresponding module is set to 0.

Note 2. This bit is only present in the RZ/A1LU.

42.2.22 Standby Acknowledge Register 2 (STBACK2)

This register is used to provide notification that a peripheral module is in the standby ready state. The peripheral module returns a standby acknowledgement on reception of a standby notification request if it is ready for standby. This register is a read-only register.

Bit:	7	6	5	4	3	2	1	0
	STBAK 27*2	STBAK 26	STBAK 25	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	STBAK27*2	0	R	Standby Acknowledgement from the media local bus 0: The standby acknowledgement from the media local bus is invalid. 1: The standby acknowledgement from the media local bus is valid.*1
6	STBAK26	0	R	Standby Acknowledgement from Ethernet Controller 0: The standby acknowledgement from the Ethernet controller is invalid. 1: The standby acknowledgement from the Ethernet controller is valid.*1
5	STBAK25	0	R	Standby Acknowledgement from Video Display Controller 5 0: The standby acknowledgement from the video display controller 5 is invalid. 1: The standby acknowledgement from the video display controller 5 is valid.*1
4 to 0	—	All 0	R	Reserved These bits are always read as 0.

Note 1. The bits in STBACK2 are set to 1 when a standby acknowledgement is transmitted from the module while the MSTP bit for the corresponding module is set to 0.

Note 2. This bit is only present in the RZ/A1L.

42.2.23 On-Chip Data-Retention RAM Area Setting Register (RRAMKP)

RRAMKP is an 8-bit readable/writable register that selects whether the contents of the corresponding area of the on-chip data-retention RAM are retained or not in deep standby mode.

When the RRAMKP3 to RRAMKP0 bits are set to 1, the contents of the corresponding area of the on-chip data-retention RAM are retained in deep standby mode. When these bits are cleared to 0, the contents of the corresponding area of the on-chip data-retention RAM are not retained in deep standby mode.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	RRAM KP3	RRAM KP2	RRAM KP1	RRAM KP0
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	RRAMKP3	0	R/W	On-Chip Data-Retention RAM Storage Area 3 (corresponding area: page 3*1 in on-chip data-retention RAM) 0: The contents of the on-chip data-retention RAM are not retained in deep standby mode. 1: The contents of the on-chip data-retention RAM are retained in deep standby mode.
2	RRAMKP2	0	R/W	On-Chip Data-Retention RAM Storage Area 2 (corresponding area: page 2*1 in on-chip data-retention RAM) 0: The contents of the on-chip data-retention RAM are not retained in deep standby mode. 1: The contents of the on-chip data-retention RAM are retained in deep standby mode.
1	RRAMKP1	0	R/W	On-Chip Data-Retention RAM Storage Area 1 (corresponding area: page 1*1 in on-chip data-retention RAM) 0: The contents of the on-chip data-retention RAM are not retained in deep standby mode. 1: The contents of the on-chip data-retention RAM are retained in deep standby mode.
0	RRAMKP0	0	R/W	On-Chip Data-Retention RAM Storage Area 0 (corresponding area: page 0*1 in on-chip data-retention RAM) 0: The contents of the on-chip data-retention RAM are not retained in deep standby mode. 1: The contents of the on-chip data-retention RAM are retained in deep standby mode.

Note 1. For addresses in each page, see section 40, On-Chip RAM.

42.2.24 Deep Standby Control Register (DSCTR)

DSCTR is an 8-bit readable/writable register that selects whether the states of the external memory control pins are retained or not when returning from deep standby mode and specifies the method to start the LSI.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	EBUS KEEPE	RAM BOOT	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	EBUSKEEPE	0	R/W	Retention of External Memory Control Pin State 0: The state of the external memory control pins is not retained when returning from deep standby mode. 1: The state of the external memory control pins is retained when returning from deep standby mode. Note: The following setting is prohibited: (EBUSKEEPE, RAMBOOT) = (1, 0).
6	RAMBOOT	0	R/W	Selection of Method after Returning from Deep Standby Mode Selects an activation method after returning from deep standby mode. 0: Activated according to the boot mode specified for a reset. 1: The program is read from the on-chip data-retention RAM. Instruction fetch from H'20000000 Note: The following setting is prohibited: (EBUSKEEPE, RAMBOOT) = (1, 0).
5 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

42.2.25 Deep Standby Cancel Source Select Register (DSSSR)

DSSSR is a 16-bit readable/writable register that consists of the bits for selecting a source to cancel deep standby mode. The realtime clock alarm interrupt or change on the pins for canceling (P2_0, P2_2, P2_7, P2_9, P5_8, P5_9, P5_10, P6_7, P7_2, P7_3, P7_6, P7_9, NMI) can be selected as a cancel source. The pins for canceling can be used for canceling deep standby, regardless of pin function settings in the general I/O port.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	P2_0	P7_6	P7_9	P5_10	P2_2	P7_2	NMI	—	RTCAR	P5_9	P7_3	P5_8	P2_7	P2_9	P6_7
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14	P2_0	0	R/W	Cancel by Change on P2_0 0: Deep standby mode is not canceled by change on the P2_0 pin. 1: Deep standby mode is canceled by change on the P2_0 pin.
13	P7_6	0	R/W	Cancel by Change on P7_6 0: Deep standby mode is not canceled by change on the P7_6 pin. 1: Deep standby mode is canceled by change on the P7_6 pin.
12	P7_9	0	R/W	Cancel by Change on P7_9 0: Deep standby mode is not canceled by change on the P7_9 pin. 1: Deep standby mode is canceled by change on the P7_9 pin.
11	P5_10	0	R/W	Cancel by Change on P5_10 0: Deep standby mode is not canceled by change on the P5_10 pin. 1: Deep standby mode is canceled by change on the P5_10 pin.
10	P2_2	0	R/W	Cancel by Change on P2_2 0: Deep standby mode is not canceled by change on the P2_2 pin. 1: Deep standby mode is canceled by change on the P2_2 pin.
9	P7_2	0	R/W	Cancel by Change on P7_2 0: Deep standby mode is not canceled by change on the P7_2 pin. 1: Deep standby mode is canceled by change on the P7_2 pin.
8	NMI	0	R/W	Cancel by Change on NMI 0: Deep standby mode is not canceled by change on the NMI pin. 1: Deep standby mode is canceled by change on the NMI pin.
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
6	RTCAR	0	R/W	Cancel by Realtime Clock Alarm Interrupt 0: Deep standby mode is not canceled by a realtime clock alarm interrupt. 1: Deep standby mode is canceled by a realtime clock alarm interrupt.
5	P5_9	0	R/W	Cancel by Change on P5_9 0: Deep standby mode is not canceled by change on the P5_9 pin. 1: Deep standby mode is canceled by change on the P5_9 pin.
4	P7_3	0	R/W	Cancel by Change on P7_3 0: Deep standby mode is not canceled by change on the P7_3 pin. 1: Deep standby mode is canceled by change on the P7_3 pin.
3	P5_8	0	R/W	Cancel by Change on P5_8 0: Deep standby mode is not canceled by change on the P5_8 pin. 1: Deep standby mode is canceled by change on the P5_8 pin.
2	P2_7	0	R/W	Cancel by Change on P2_7 0: Deep standby mode is not canceled by change on the P2_7 pin. 1: Deep standby mode is canceled by change on the P2_7 pin.
1	P2_9	0	R/W	Cancel by Change on P2_9 0: Deep standby mode is not canceled by change on the P2_9 pin. 1: Deep standby mode is canceled by change on the P2_9 pin.

Bit	Bit Name	Initial Value	R/W	Description
0	P6_7	0	R/W	Cancel by Change on P6_7 0: Deep standby mode is not canceled by change on the P6_7 pin. 1: Deep standby mode is canceled by change on the P6_7 pin.

42.2.26 Deep Standby Cancel Edge Select Register (DSESR)

DSESR is a 16-bit readable/writable register that consists of the bits for selecting an edge to be detected for the pin specified as a deep standby cancel source with DSSSR. This register setting is always valid for canceling deep standby, regardless of the interrupt controller setting.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	P2_0E	P7_6E	P7_9E	P5_10E	P2_2E	P7_2E	NMIE	—	—	P5_9E	P7_3E	P5_8E	P2_7E	P2_9E	P6_7E
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14	P2_0E	0	R/W	P2_0 Edge Detection 0: Falling edge of P2_0 is detected. 1: Rising edge of P2_0 is detected.
13	P7_6E	0	R/W	P7_6 Edge Detection 0: Falling edge of P7_6 is detected. 1: Rising edge of P7_6 is detected.
12	P7_9E	0	R/W	P7_9 Edge Detection 0: Falling edge of P7_9 is detected. 1: Rising edge of P7_9 is detected.
11	P5_10E	0	R/W	P5_10 Edge Detection 0: Falling edge of P5_10 is detected. 1: Rising edge of P5_10 is detected.
10	P2_2E	0	R/W	P2_2 Edge Detection 0: Falling edge of P2_2 is detected. 1: Rising edge of P2_2 is detected.
9	P7_2E	0	R/W	P7_2 Edge Detection 0: Falling edge of P7_2 is detected. 1: Rising edge of P7_2 is detected.
8	NMIE	0	R/W	NMI Edge Detection 0: Falling edge of NMI is detected. 1: Rising edge of NMI is detected.
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5	P5_9E	0	R/W	P5_9 Edge Detection 0: Falling edge of P5_9 is detected. 1: Rising edge of P5_9 is detected.
4	P7_3E	0	R/W	P7_3 Edge Detection 0: Falling edge of P7_3 is detected. 1: Rising edge of P7_3 is detected.
3	P5_8E	0	R/W	P5_8 Edge Detection 0: Falling edge of P5_8 is detected. 1: Rising edge of P5_8 is detected.
2	P2_7E	0	R/W	P2_7 Edge Detection 0: Falling edge of P2_7 is detected. 1: Rising edge of P2_7 is detected.
1	P2_9E	0	R/W	P2_9 Edge Detection 0: Falling edge of P2_9 is detected. 1: Rising edge of P2_9 is detected.
0	P6_7E	0	R/W	P6_7 Edge Detection 0: Falling edge of P6_7 is detected. 1: Rising edge of P6_7 is detected.

42.2.27 Deep Standby Cancel Source Flag Register (DSFR)

DSFR is a 16-bit readable/writable register composed of two types of bits. One is the flag that confirms which source canceled deep standby mode. The other is the bit that releases the state of pins after canceling deep standby mode. When deep standby mode is canceled by an interrupt (NMI or realtime clock alarm interrupt) and changes on the pins for canceling, this register retains the previous data although power-on reset exception handling is executed. When deep standby mode is canceled by a power-on reset, this register is initialized to H'0000.

All flags must be cleared immediately before transition to deep standby mode.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	IO KEEP	P2_0F	P7_6F	P7_9F	P5_10F	P2_2F	P7_2F	NMIF	-	RTC ARF	P5_9F	P7_3F	P5_8F	P2_7F	P2_9F	P6_7F
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*

Note: * Only 0 can be written after reading 1 to clear the flag.

Bit	Bit Name	Initial Value	R/W	Description
15	IOKEEP	0	R/(W)* ¹	Release of Pin State Retention Releases the retention of the pin state after canceling deep standby mode 0: Pin state not retained [Clearing condition] • Writing 0 after reading 1 1: Pin state retained [Setting condition] • When deep standby mode is entered
14	P2_0F	0	R/(W)* ¹	P2_0 Flag 0: No change on the P2_0 pin 1: Change on the P2_0 pin
13	P7_6F	0	R/(W)* ¹	P7_6 Flag 0: No change on the P7_6 pin 1: Change on the P7_6 pin
12	P7_9F	0	R/(W)* ¹	P7_9 Flag 0: No change on the P7_9 pin 1: Change on the P7_9 pin
11	P5_10F	0	R/(W)* ¹	P5_10 Flag 0: No change on the P5_10 pin 1: Change on the P5_10 pin
10	P2_2F	0	R/(W)* ¹	P2_2 Flag 0: No change on the P2_2 pin 1: Change on the P2_2 pin
9	P7_2F	0	R/(W)* ¹	P7_2 Flag 0: No change on the P7_2 pin 1: Change on the P7_2 pin
8	NMIF	0	R/(W)* ¹	NMI Flag 0: No interrupt on NMI pin 1: Interrupt on NMI pin
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
6	RTCARF	0	R/(W)* ¹	RTCAR Flag 0: No realtime clock alarm interrupt generated 1: Realtime clock alarm Interrupt generated
5	P5_9F	0	R/(W)* ¹	P5_9 Flag 0: No change on the P5_9 pin 1: Change on the P5_9 pin

Bit	Bit Name	Initial Value	R/W	Description
4	P7_3F	0	R/(W)*1	P7_3 Flag 0: No change on the P7_3 pin 1: Change on the P7_3 pin
3	P5_8F	0	R/(W)*1	P5_8 Flag 0: No change on the P5_8 pin 1: Change on the P5_8 pin
2	P2_7F	0	R/(W)*1	P2_7 Flag 0: No change on the P2_7 pin 1: Change on the P2_7 pin
1	P2_9F	0	R/(W)*1	P2_9 Flag 0: No change on the P2_9 pin 1: Change on the P2_9 pin
0	P6_7F	0	R/(W)*1	P6_7 Flag 0: No change on the P6_7 pin 1: Change on the P6_7 pin

Note 1. Only 0 can be written after reading 1 to clear the flag.

42.2.28 XTAL Crystal Oscillator Gain Control Register (XTALCTR)

XTALCTR is an 8-bit readable/writable register that controls the gain of the crystal oscillator for XTAL.

If the realtime clock uses the EXTAL input, the GAIN0 bit retains the previous value when software standby mode or deep standby mode is canceled by a source other than a power-on reset. If the realtime clock does not use the EXTAL input, this bit is initialized to 0 when software standby or deep standby mode is entered.

This register is initialized to H'00 when software standby or deep standby mode is canceled by a power-on reset.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	GAIN0
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GAIN0	0	R/W	XTAL Crystal Oscillator (EXTAL or XTAL Pin) Gain Select 0: Large gain 1: Small gain

42.3 Operation

42.3.1 Sleep Mode

(1) Transition to Sleep Mode

When causing the device to make a transition from the program execution state to sleep mode, follow procedure (a) or (b) depending on the condition described following the description of the procedures.

- (a) Execute the WFI instruction while the STBY bit in STBCR1 is 0.
- (b) While the STBY bit in STBCR1 is 0 and bits I and F in the current program status register (CPSR) corresponding to the interrupt source to trigger release from the sleep mode are 0 (mask disabled), execute the following three instructions in the given sequence: SEV, WFE, and WFE.

When the following condition is met, follow procedure (b) and do not use the WFI instruction other than to initiate a transition to software standby or deep standby.

- Software standby is also being used.
- When software standby is not being used, deep standby is being used, and the procedure (a) in 42.3.4 (1) Transition to Deep Standby Mode is followed to initiate the transition to deep standby.

Although the CPU halts immediately after a transition to the sleep mode, the contents of its internal registers remain unchanged. The on-chip peripheral modules continue to run. The clock output from the CKIO pin is continued.

Note: • When writing to STBCR1 register, see section 42.4, Usage Notes.

(2) Canceling Sleep Mode

Sleep mode is canceled by an interrupt (NMI, IRQ, and on-chip peripheral module) or a power-on reset.

- Canceling by an interrupt
When an NMI, IRQ, or on-chip peripheral module interrupt occurs, sleep mode is canceled and interrupt exception handling is executed. When the priority level of the generated interrupt is lower than the setting of the interrupt controller execution priority register, or the interrupt by the on-chip peripheral module is disabled on the module side, the interrupt request is not accepted and sleep mode is not canceled. When procedure (a) in 42.3.1 (1) Transition to Sleep Mode is followed and an interrupt request occurs with an interrupt masked by bits 6 (the FIQ mask bit) and 7 (the IRQ mask bit) in the CPSR register in the CPU, sleep mode is canceled but interrupt exception handling is not executed.
- Canceling by a reset
Sleep mode is canceled by a power-on reset.

42.3.2 Software Standby Mode

(1) Transition to Software Standby Mode

The LSI switches from a program execution state to software standby mode by executing the WFI instruction when the STBY bit and DEEP bit in STBCR1 are 1 and 0 respectively. In software standby mode, not only the CPU but also the clock and on-chip peripheral modules halt. The clock output from the CKIO pin also stops.

The contents of the CPU and cache registers remain unchanged. Some registers of on-chip peripheral modules are, however, initialized. As for the states of on-chip peripheral module registers in software standby mode, see [section 46.3, Register States](#).

The CPU takes one cycle to finish writing to STBCR1, and then executes processing for the next instruction. However, it takes one or more cycles to actually write. Therefore, execute a WFI instruction after reading STBCR1 to have the values written to STBCR1 by the CPU to be definitely reflected in the WFI instruction.

After a WFI instruction is issued, the hardware automatically stops the bus master following the wait for completion of the issuing-finished request from the bus master and the transition to software standby proceeds. Since the transition to software standby is not possible if completion of the issuing-finished request is not possible at this time, do not proceed with access to the registers of modules in the module-standby state and so on. Furthermore, as the issuing of unintended requests by the bus master is inhibited, using software to stop all bus masters in preparation for the procedure for the transition to software standby is also effective.

The procedure for switching to software standby mode is as follows:

1. Set the `standby_mode_en` bit of the power control register in the PL310 to 1. For the details of this register, see [CoreLink Level 2 Cache Controller L2C-310 Technical Reference Manual](#) issued by Arm Ltd.
2. Clear the TME bit in the watchdog timer control/status register (WTCSR) of the watchdog timer to 0 to stop the watchdog timer.
3. Set the CKS[2:0] bits of the WTCSR register and the watchdog timer counter (WTCNT) to appropriate values so that the watchdog timer overflow period will be at least the oscillation settling time on return from standby.
4. After setting the STBY and DEEP bits in STBCR1 to 1 and 0 respectively, read STBCR1. Then, execute a WFI instruction.

(2) Canceling Software Standby Mode

Software standby mode is canceled by interrupts (NMI or IRQ) or a reset (power-on reset). Clock signal starts to be output from the CKIO pin.

- Canceling by an interrupt

When the falling edge or rising edge of the NMI pin (selected by the NMI edge select bit (NMIE) in the interrupt control register 0 (ICR0) of the interrupt controller) or the falling edge or rising edge of an IRQ pin (IRQ7 to IRQ0) (selected by the IRQn sense select bits (IRQn1S and IRQn0S) in interrupt control register 1 (ICR1) of the interrupt controller) is detected, clock oscillation is started. This clock pulse is supplied only to the oscillation settling counter (watchdog timer) used to count the oscillation settling time.

After the elapse of the time set in the clock select bits (CKS[2:0]) in the watchdog timer control/status register (WTCSR) of the watchdog timer before the transition to software standby mode, the watchdog timer overflow occurs. Since this overflow indicates that the clock has been stabilized, the clock pulse will be supplied to the entire chip after this overflow. Software standby mode is thus cleared and NMI interrupt exception handling (IRQ interrupt exception handling in case of IRQ) is started. If the priority level of the generated interrupt is lower than the setting of the interrupt controller execution priority register, the interrupt request is not accepted and sleep mode is entered. So, cancel software standby mode by an interrupt whose priority level is higher than the setting of the interrupt controller execution priority register.

When canceling software standby mode by the NMI interrupt or IRQ interrupt, set the CKS[2:0] bits so that the watchdog timer overflow period will be equal to or longer than the oscillation settling time.

The clock output phase of the CKIO pin may be unstable immediately after detecting an interrupt and until software standby mode is canceled.

- Canceling by a reset

When the $\overline{\text{RES}}$ pin is driven low, software standby mode is canceled and the LSI enters the power-on reset state. After that, if the $\overline{\text{RES}}$ pin is driven high, the power-on reset exception handling is started.

Keep the $\overline{\text{RES}}$ pin low until the clock oscillation settles. The internal clock will continue to be output to the CKIO pin.

(3) Note on Transition to Software Standby Mode

Release from software standby mode is triggered by interrupts (NMI or IRQ) or a power-on reset. If, however, a WFI instruction and an interrupt other than NMI and IRQ are generated at the same time, software standby mode may be canceled due to acceptance of the interrupt.

When initiating a transition to software standby mode, make settings so that interrupts other than NMI and IRQ are not generated before execution of the WFI instruction.

(4) Note on Canceling Software Standby Mode

After software standby mode is canceled, unstable clock pulses are output from the CKIO pin during oscillation settling time. To prevent malfunction due to the unstable pulses, the CKOEN[1:0] bits in FRQCR should be modified.

42.3.3 Software Standby Mode Application Example

This example describes a transition to software standby mode on the falling edge of the NMI signal, and cancellation on the rising edge of the NMI signal. The timing is shown in Figure 42.2.

When the NMI pin is changed from high to low level while the NMI edge select bit (NMIE) in the interrupt control register 0 (ICR0) is set to 0 (falling edge detection), the NMI interrupt is accepted. When the NMIE bit is set to 1 (rising edge detection) by the NMI exception service routine, the STBY and DEEP bits in STBCR1 are set to 1 and 0 respectively, and a WFI instruction is executed, software standby mode is entered. Thereafter, software standby mode is canceled when the NMI pin is changed from low to high level.

Note: • When writing to STBCR1 register, see section 42.4, Usage Notes.

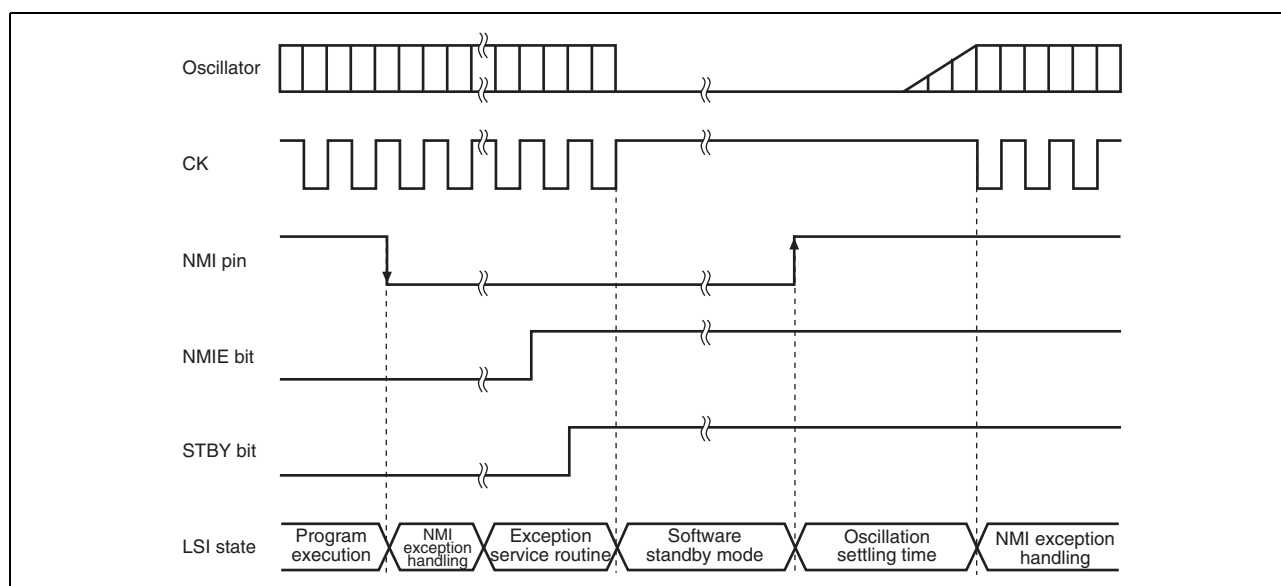

Figure 42.2 NMI Timing in Software Standby Mode (Application Example)

42.3.4 Deep Standby Mode

(1) Transition to Deep Standby Mode

The LSI switches from a program execution state to deep standby mode by executing the WFI instruction when the STBY bit and DEEP bit in STBCR1 are set to 1. In deep standby mode, not only the CPU, clocks, and on-chip peripheral modules but also power supply is turned off excluding the on-chip data-retention RAM area specified by the RRAMKP3 to RRAMKP0 bits in RRAMKP and realtime clock. This can significantly reduce power consumption. Therefore, data in the registers of the CPU, cache, and on-chip peripheral modules are not retained. Pin state values immediately before the transition to deep standby mode are retained.

The CPU takes one cycle to finish writing to STBCR1, and then executes processing for the next instruction. However, it actually takes one or more cycles to write. Therefore, execute a WFI instruction after reading STBCR1 to reflect the values written to STBCR1 by the CPU in the WFI instruction without fail.

After a WFI instruction is issued, the hardware automatically stops the bus master following the wait for completion of the issuing-finished request from the bus master and the transition to deep standby proceeds. Since the transition to deep standby is not possible if completion of the issuing-finished request is not possible at this time, do not proceed with access to the registers of modules in the module-standby state and so on. Furthermore, as the issuing of unintended requests by the bus master is inhibited, using software to stop all bus masters in preparation for the procedure for the transition to deep standby is also effective.

The procedure for switching to deep standby mode is as follows. Figure 42.3 also shows its flowchart.

1. Set the `standby_mode_en` bit of the power control register in the PL310 to 1. For the details of this register, see CoreLink Level 2 Cache Controller L2C-310 Technical Reference Manual issued by Arm Ltd.
2. Set the `RRAMKP3` to `RRAMKP0` bits in `RRAMKP` for the corresponding on-chip data-retention RAM area that must be retained. Transfer the programs to be retained to the specified areas of the on-chip data-retention RAM.
3. Set the `RAMBOOT` and `EBUSKEEPE` bits in `DSCTR` to specify the activation method for returning from deep standby mode and to select whether the external memory control pin status is retained or not.
4. When canceling deep standby mode by an interrupt, set the corresponding bit in `DSSSR` to select the pin or source to cancel deep standby mode. In this case, specify the input signal detection mode for the selected pin with the corresponding bit in `DSESR`.
5. Execute read and write of an arbitrary but the same address for each page in the on-chip data-retention RAM area. When this is not executed, data last written may not be written to the on-chip data-retention RAM. If there is a write to the on-chip data-retention RAM after this time, execute this processing after the last write to the on-chip data-retention RAM.

The procedures for steps 6 to 8 are as listed under (a) or (b), and which procedure is correct depends on the condition described after the procedures.

(a)

6. Set the `STBY` and `DEEP` bits in the `STBCR1` register to 1, and then read this register.
7. Clear the flag in the `DSFR` register.
8. Set the CPU interface control register (`ICCICR`) of the interrupt controller to 0 so that the CPU is not notified of interrupts other than NMIs. Then, read the `ICCICR` register.

(b)

6. Clear the flag in the `DSFR` register.
7. Set the CPU interface control register (`ICCICR`) of the interrupt controller to 0 so that the CPU is not notified of interrupts other than NMIs. Then, read the `ICCICR` register.
8. Set the `STBY` and `DEEP` bits in the `STBCR1` register to 1, and then read this register.

When the condition below is met, follow procedure (b).

- Software standby is not being used, the sleep mode is being used, and procedure (a) in section 42.3.1, (1) **Transition to Sleep Mode** is followed to initiate the transition to sleep mode.

9. Execute the WFI instruction.
10. The conflict between the instruction and the NMI interrupt may prevent transition to deep standby mode. After executing the WFI instruction, locate the branch instruction to return to step 9.

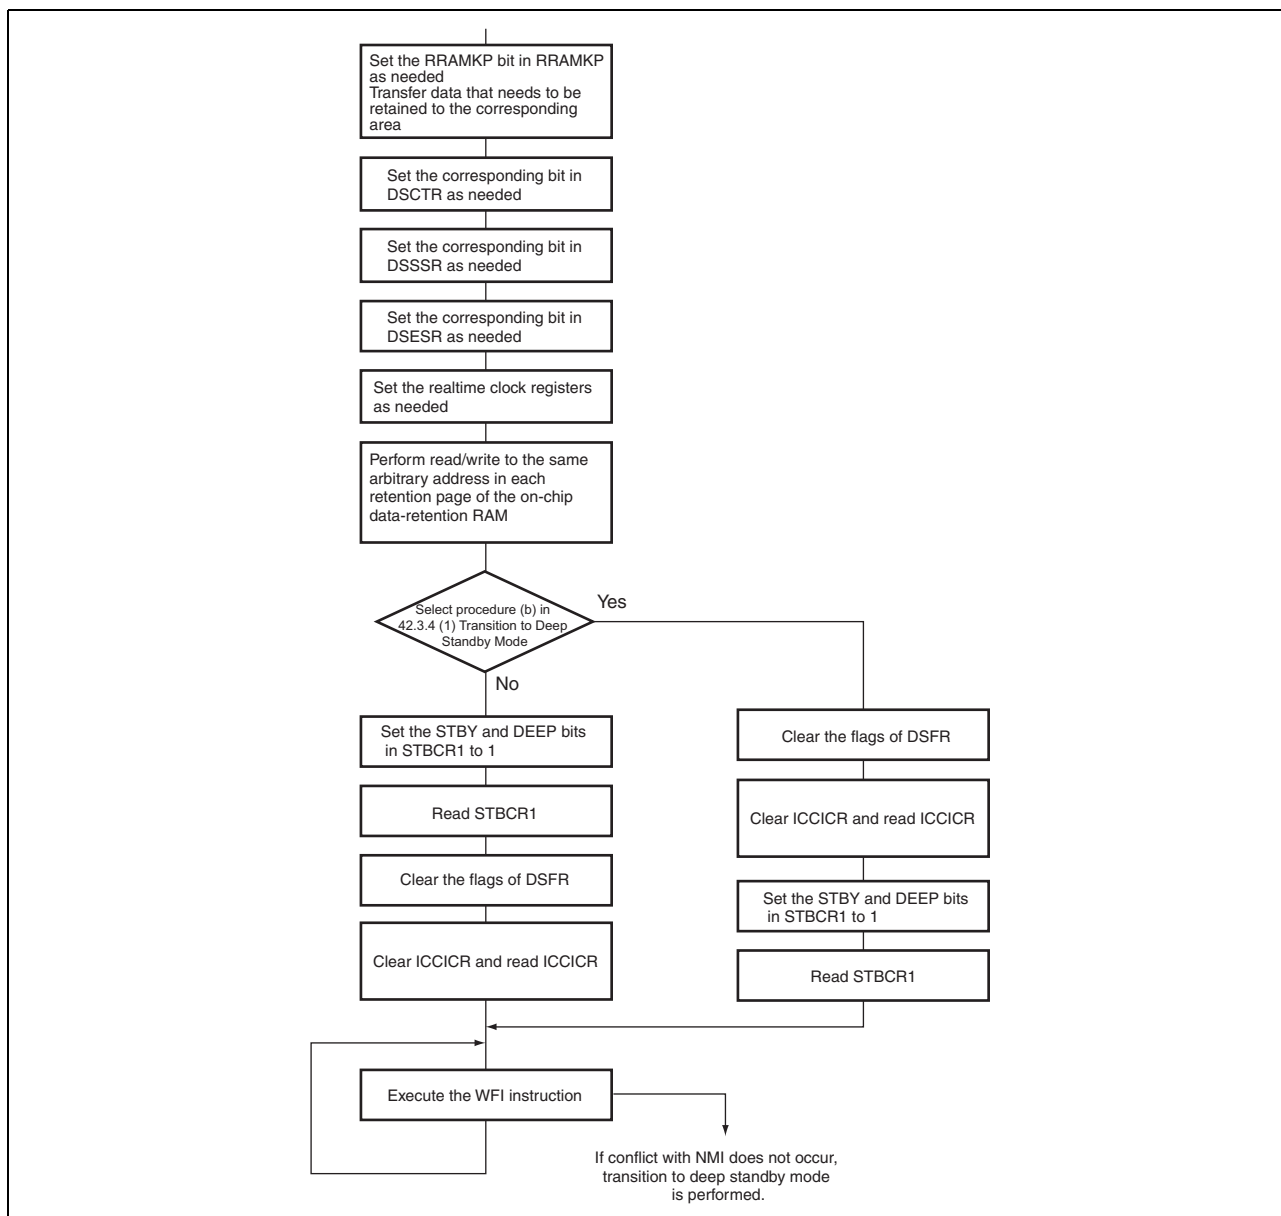

Figure 42.3 Flowchart of Transition to Deep Standby Mode

(2) Canceling Deep Standby Mode

Deep standby mode is canceled by interrupts (NMI or realtime clock alarm interrupt), change on the pins for canceling, or a reset (power-on reset). The realtime clock alarm interrupt can always cancel deep standby mode regardless of the settings of the execution priority register for the interrupt controller and of the alarm interrupt enable flag (RCR1.AIE). This interrupt can also always cancel this mode do regardless of the states of bit 6 (the FIQ mask bit) and bit 7 (the IRQ mask bit) in the CPSR register of the CPU. When canceling the mode by a source other than a reset, a power-on reset exception handling is executed instead of an interrupt exception handling.

Figure 42.4 shows the flowchart of canceling deep standby mode.

Figure 42.4 Flowchart of Canceling Deep Standby Mode

- Canceling by a source other than a reset

When the falling or rising edge of the NMI pin (selected by a corresponding bit in DSESR) or falling or rising edge of the pins for canceling (selected by a corresponding bit in DSESR) is detected or the realtime clock alarm interrupt (see section 13.4.4, Alarm Function) is generated, clock oscillation is started after the wait time for the oscillation settling time. After the oscillation settling time has elapsed, deep standby mode is canceled and the power-on reset exception handling is executed.

The clock output phase of the CKIO pin may be unstable immediately after detecting a cancel source and until deep standby mode is canceled.

The detecting of the NMI pin, the pins for canceling, and the realtime clock alarm interrupt becomes enable when the corresponding bits in DSSSR are set. The detected cancel sources are kept, but they are reflected to DSFR after canceling the deep standby mode. When the CPU accepts any interrupts and reads the interrupt response register (ICCIAR), all of the cancel sources that are kept are cleared. When the CPU enters the deep standby mode as the

detected cancel sources are kept, the deep standby mode is canceled immediately after the CPU enters the deep standby mode.

- Canceling with a reset

Driving the $\overline{\text{RES}}$ pin low cancels deep standby mode and causes a transition to the power-on reset state. After this, driving the $\overline{\text{RES}}$ pin high initiates power-on reset exception handling. Output of the internal clock from the CKIO pin also starts by driving the $\overline{\text{RES}}$ pin low.

Keep the $\overline{\text{RES}}$ pin low until the clock oscillation has settled.

(3) Operation after Canceling Deep Standby Mode

After canceling deep standby mode, the LSI can be activated through the external memory or from the on-chip data-retention RAM, which can be selected by setting the RAMBOOT bit in DSCTR. By setting the EBUSKEEPE bit, the states of the external memory control pins can be retained even after cancellation of deep standby mode. Table 42.3 shows the pin states after cancellation of deep standby mode according to the setting of each bit. Table 42.4 lists the external memory control pins.

Table 42.3 Pin States after Cancellation of Deep Standby Mode and System Activation Method by the DSCTR Settings

EBUSKEEPE Bit	RAMBOOT Bit	Activation Method	Pin States After Cancellation of Deep Standby Mode
0	0	External memory	The states of the external memory control pins are not retained. For other pins, the retention of their states is cancelled when the IOKEEP bit is cleared.
0	1	On-chip data-retention RAM	The states of the external memory control pins are not retained. After cancellation of deep standby mode, the retention of the external memory control pin states is cancelled. For other pins, the retention of their states is cancelled when the IOKEEP bit is cleared.
1	0	—	Setting prohibited.
1	1	On-chip data-retention RAM	The states of the external memory control pin are retained. The retention of the states of the external memory control pins and other pins is cancelled when the IOKEEP bit is cleared.

Table 42.4 External Memory Control Pins in Different Modes

Boot Mode 0 (CS0 Area: Bus Width: 16 Bits)	Boot Mode 1 (Serial Flash Boot)	Boot Mode 2 (eSD Boot)	Boot Mode 3 (eMMC Boot)
A[20:1] D[15:0] CS0, RD, CKIO	SPBCLK_0, SPBSSL_0, SPBMO0_0, SPBMO1_0	SD_CLK_0, SD_CMD_0, SD_D[3:0]_0	MMC_CLK, MMC_CMD, MMC_D[3:0]

When deep standby mode is canceled by interrupts (NMI or realtime clock alarm) or changes on the pins for canceling, the deep standby cancel source flag register (DSFR) can be used to confirm which source has canceled the mode. Pins retain the state immediately before the transition to deep standby mode. However, in system activation through the external memory, the retention of the states of the external memory control pins is cancelled so that programs can be fetched after cancellation of deep standby mode. Other pins, after cancellation of deep standby mode, continue to retain the pin states until writing 0 to the IOKEEP bit in DSFR after reading 1 from the same bit. In system activation from the on-chip data-retention RAM, after cancellation of deep standby mode, both the external memory control pins and other pins continues to retain the pin states until writing 0 to the IOKEEP bit in DSFR after reading 1 from the same bit. Reconfiguration of peripheral functions is required to return to the previous state of deep standby mode. Peripheral functions include all functions such as the clock pulse generator, interrupt controller, general I/O ports, and peripheral modules. After the reconfiguration, the retention of the pin state can be canceled and the LSI returns to the state prior to the transition to deep standby mode by reading 1 from the IOKEEP bit in DSFR and then writing 0 to it.

(4) Notes on Transition to Deep Standby Mode

If multiple canceling sources have been specified and multiple canceling sources are input, multiple cancel source flags will be set.

42.3.5 Module Standby Function

(1) Transition to Module Standby Function

Setting an MSTP bit in a standby control register to 1 halts supply of the clock signal to the corresponding on-chip peripheral module. This function can be used to reduce power consumption both while a program is running and in sleep mode. Disable a module before placing it in the module standby state. If interrupt requests are enabled, set the respective register in the target module or in the interrupt controller to disable interrupt requests. If DMA transfer requests are enabled, set the respective register in the target module to disable DMA transfer requests from the module and then set the respective register in the direct memory access controller to stop DMA transfers. In addition, do not attempt to access a module's registers while it is in the module standby state. The procedure for transitions to the module standby state depends on whether the STBREQ register has a bit for the corresponding module.

- (a) Procedure for transition to module standby of modules for which the STBREQ register does not have a corresponding bit

1. Set the MSTP bit of the corresponding module to 1.

- (b) Procedure for transition to module standby of modules for which the STBREQ register has a corresponding bit

1. Set the corresponding bit in the STBREQ register to 1 to generate a request to stop the module.
2. Confirm that the module is ready to be stopped by the corresponding bit in the STBACK register being set to 1.
3. Set the MSTP bit of the corresponding module to 1.

For states of registers in the module standby function, see section 46.3, Register States.

(2) Canceling Module Standby Function

Release from the module standby state can be achieved in two ways: starting the module by a power-on reset while the MSTP bit is set to 1, then clearing the MSTP bit to 0, or setting the MSTP bit to 0 to activate the module, setting the MSTP bit to 1 to place the module in the standby state, and then setting the MSTP bit to 0 again. If you use the latter approach, the procedure for release from module standby depends on whether the STBREQ register has a bit for the corresponding module.

- Release from the module standby state after the activation of the module by a power-on reset while the MSTP bit is set to 1

1. Clear the MSTP bit to 0.
2. After that, dummy-read the same register.

- Release from the module standby state after a transition to standby following activation of the module

- (a) Procedure for release from module standby of modules for which the STBREQ register does not have a corresponding bit

1. Clear the MSTP bit to 0, then dummy-read the same register.

- (b) Procedure for release from module standby of modules for which the STBREQ register has a corresponding bit

1. Clear the MSTP bit to 0, then dummy-read the same register.
2. Clear the corresponding bit in the STBREQ register to 0 to cancel the request to stop the module.
3. Confirm that the corresponding bit in the STBACK register has been cleared to 0, indicating the completion of release from standby.

42.3.6 Software Reset

Initialization equivalent to a power-on reset is only applied to the selected modules. The procedure for transitions to the software reset state varies according to whether the STBREQ register has a bit for the corresponding module. Follow the procedures below according to whether this is or is not the case. If DMA transfer requests are enabled, make the settings to stop the DMA transaction for the corresponding channel before transitions to the software reset state. For stopping the DMA transaction, see section 9.7.11, Transfer Status.

(1) Transition to Software Reset State

- (a) Procedure for transition to the software reset state of modules for which the STBREQ register does not have a corresponding bit

1. Set the SRST bit of the corresponding module to 1, then dummy-read the same register.

- (b) Procedure for transition to the software reset state of modules for which the STBREQ register has a corresponding bit

1. Set the corresponding bit in the STBREQ register to 1 to generate a request to stop the module.
 2. Confirm that the corresponding bit in the STBACK register has been set to 1.
 3. Set the SRST bit of the corresponding module to 1, then dummy-read the same register.

(2) Canceling Software Reset

- (a) Procedure for release from the software reset state of modules for which the STBREQ register does not have a corresponding bit

1. Clear the SRST bit of the corresponding module to 0, then dummy-read the same register.

- (b) Procedure for release from the software reset state of modules for which the STBREQ register has a corresponding bit

1. Clear the SRST bit of the corresponding module to 0, then dummy-read the same register.
 2. Clear the corresponding bit in the STBREQ register to 0 to cancel the request to stop the module.
 3. Confirm that the corresponding bit in the STBACK register has been cleared to 0.

42.3.7 Adjustment of XTAL Crystal Oscillator Gain

The gain of the crystal oscillator for XTAL can be adjusted using the GAIN0 bit in XTALCTR. To modify the gain of the signal on the EXTAL or XTAL pin, PLL settling time is needed. The settling time is counted using the on-chip watchdog timer.

After a change to the value of the GAIN0 bit, the hardware automatically stops the bus master following the wait for completion of the issuing-finished request from the bus master and the change to the gain for the crystal oscillator in use with XTAL proceeds. Since the change to the gain for the crystal oscillator in use with XTAL cannot start if completion of the issuing-finished request is not possible at this time, do not proceed with access to the registers of modules in the module-standby state and so on. Furthermore, as the issuing of unintended requests by the bus master is inhibited, using software to stop all bus masters in preparation for the procedure to change the gain for the crystal oscillator in use with XTAL is also effective.

1. The large gain is selected in the initial state.
2. Set the standby_mode_en bit of the power control register in the PL310 to 1. For the details of this register, see CoreLink Level 2 Cache Controller L2C-310 Technical Reference Manual issued by Arm Ltd.
3. Set the watchdog timer so that the specified settling time should be obtained and stop the watchdog timer.

Specifically, the following settings are necessary:

TME in WTCSR = 0: Stop the watchdog timer.

CKS[2:0] in WTCSR: Division ratio for watchdog timer count clock

WTCNT: Initial counter value

(The watchdog timer starts counting on the set clock.)

4. Set the GAIN0 bit to the desired value.
5. The LSI is internally stopped and the watchdog timer starts counting. The clock is supplied only to the watchdog timer and other internal clocks are stopped. In this state, the CKIO pin continues to output an unstable clock. To avoid malfunction due to the unstable clock, modify the CKOEN2 bit in FRQCR appropriately. Since this state is equivalent to the software standby mode state, some registers of on-chip peripheral modules are initialized. For details, see section 46.3, Register States.
6. When an overflow occurs on the watchdog timer, the specified clock supply is started and the LSI starts operation. The watchdog timer stops after an overflow.

42.4 Usage Notes

42.4.1 Usage Notes on Setting Registers

When writing to the registers related to power-down modes, note the following.

When writing to the register related to power-down modes, the CPU, after executing a write instruction, executes the next instruction without waiting for the write operation to complete.

Therefore, to reflect the change specified by writing to the register while the next instruction is executed, insert a dummy read of the same register between the register write instruction and the next instruction.

42.4.2 Usage Notes when the Realtime Clock is not Used

When the realtime clock is not used, set the MSTP60 bit in STBCR6 to 1 after setting the bits in registers of the realtime clock. For details, see section 42.2.6, Standby Control Register 6 (STBCR6).

- Set the RTCEN bit in the control register 2 (RCR2) to 0
- Set the RCKSEL[1:0] bits in the control register 5 (RCR5) to 00.

42.4.3 Usage Notes Applying when the USB_X1 Pin is not to be Used

When a 48 MHz clock is not being supplied to the USB_X1 pin, set registers according to the below procedure in the initial settings after release from the power-on reset state or deep standby mode.

(1) When the USB2.0 host/function module is not to be used

1. Set the MSTP71 bit in the STBCR7 register to 0 and dummy-read STBCR7.
2. Set the UCKSEL bit in the SYSCFG0_0 register to 1.
3. Wait for at least 20 cycles of the EXTAL clock.
4. Set the MSTP71 bit in the STBCR7 register to 1 and dummy-read STBCR7.

(2) When the USB2.0 host/function module is to be used

1. Set the MSTP71 bit* in the STBCR7 register to 0 and dummy-read STBCR7.
2. Set the UCKSEL bit in the SYSCFG0_0 register to 1.
3. Follow the procedure of example 1 in section 28.4.1 (5) Setting the Clock Supply for the USB Module.
4. Make the initial settings of the USB2.0 host/function module.

Note: * When channel 1 of the USB2.0 host/function module is to be used, also set the MSTP70 bit to 0.

42.4.4 Notes on Using IRQ Pins as Triggers for Release from Standby when Software Standby is in Use

To use an IRQ pin as the trigger for release from standby when software standby is in use, see section 7.8.4, Notes on Using IRQ Pins as Triggers for Release from Standby when Software Standby is in Use.

43. Debugger Interface

This LSI incorporates a debugger interface to support the boundary scan function and connection to the emulator.

43.1 Features

The debugger interface is a serial input/output interface which has a JTAG (Joint Test Action Group, IEEE Std.1149.1 and IEEE Standard Test Access Port and Boundary-Scan Architecture) interface and CoreSight debug interface.

This module has TAP controllers for the boundary scan and CoreSight debug function.

Driving the BSCANP pin high selects the boundary-scan TAP controller, and driving the BSCANP pin low selects the CoreSight debug TAP controller.

Figure 43.1 is a block diagram of this module and Table 43.1 shows the JTAG pin mode.

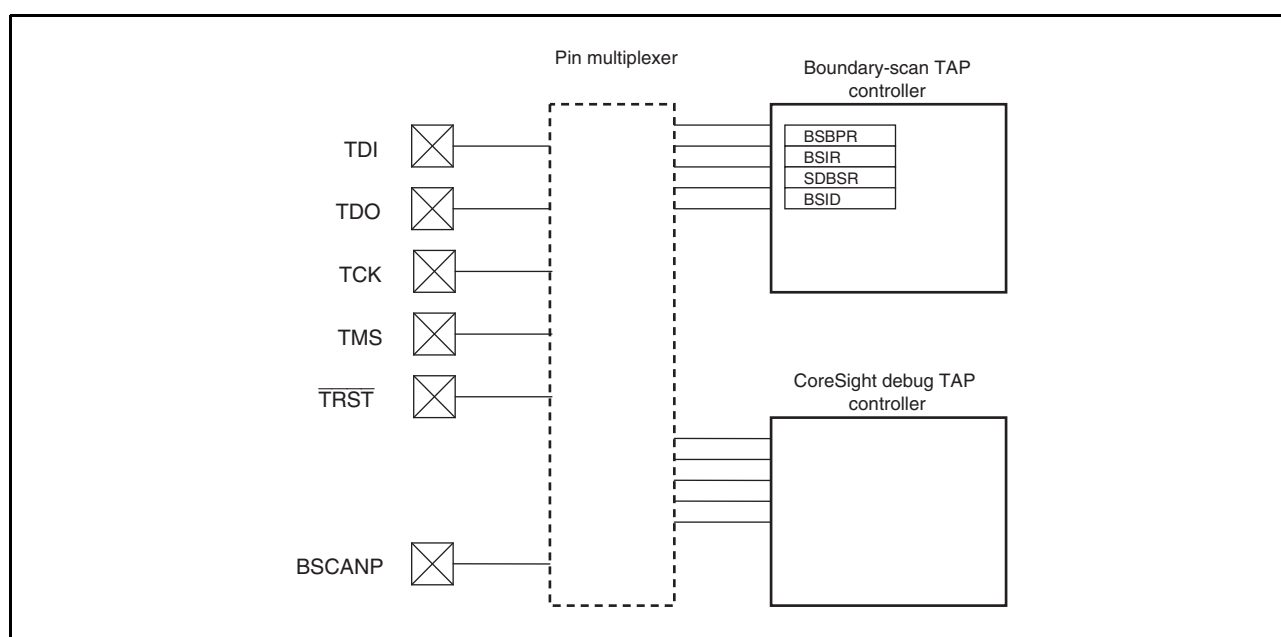

Figure 43.1 Block Diagram

Table 43.1 JTAG Pin Mode

BSCANP	JTAG Pin Mode
0	Normal operation (CoreSight debug mode)
1	Boundary-scan mode

The following lists the features of CoreSight.

- JTAG interface
Supports JTAG and serial wire debug mode (SWD)
- Trace interface
Outputs 4-bit × 66-Mbps (33-MHz DDR) trace data
4-Kbyte Embedded Trace FIFO (ETF)
- Controls by ICE registers
Control of resetting, debug-enable signal supplied to the CPU, and disabling power shut-off in deep-standby mode during debugging (fake debug mode)

Figure 43.2 is a block diagram of CoreSight, Table 43.2 to Table 43.5 show the input/output pins of the cross-trigger interface (CTI), and Table 43.6 shows the address map for CoreSight. For details of CoreSight other than ICE registers, see the technical reference manual issued by Arm Ltd.

43.2 Input/Output Pins

Table 43.7 shows the pin configuration of the debugger interface.

Table 43.7 Pin Configuration

Name	Pin Name	Input/ Output	Function
Test clock	TCK/SWDCLK	Input	Data is input in serial to this module via the data input pin (TDI) or data is output via the data output pin (TDO) in synchronization with this signal. Functions as the SWDCLK pin in serial wire debug (SWD) mode.
Test mode select	TMS/SWDIO	Input, Input/ Output	Changing this signal in synchronization with the TCK signal determines the state of the TAP controller circuit. Its protocol conforms to the subset of the JTAG standard (IEEE standard 1149.1). Functions as the SWDIO pin in serial wire debug (SWD) mode.
Test reset	$\overline{\text{TRST}}^*1$	Input	This signal is received asynchronously with the TCK signal. Asserting this signal resets this module. When power is supplied, this pin should be asserted for a given period regardless of whether or not this module function is used. For details on resetting, see section 43.5.2, Reset Signal Setting.
Test data input	TDI	Input	Data is sent to this module by changing this signal in synchronization with the TCK signal.
Test data output	TDO	Output	Data is read from this module by reading this signal in synchronization with the TCK signal. This pin also functions as an output pin in the serial wire debug (SWD) mode. However, a fixed value (the high level) is output because this product does not support the SWO function.
Boundary scan setting	BSCANP	Input	Input a high-level signal during boundary-scan testing. Input a low-level signal during normal use.
Clock output	TRACECLK	Output	Trace clock output pin
Enable output	TRACECTL	Output	Trace enable output pin
Data output	TRACEDAT3 to TRACEDATA0	Output	Trace data output pins

Note 1. When designing a board that can use an emulator, the $\overline{\text{RES}}$ and $\overline{\text{TRST}}$ pin circuits should be designed so that they can be set low and the $\overline{\text{TRST}}$ pin can be controlled independently at power-on. When the $\overline{\text{TRST}}$ pin is not in use, it should be either fixed to low level or connected to the $\overline{\text{RES}}$ pin (or another pin which operates in the same manner as the $\overline{\text{RES}}$ pin).

43.3 Registers for Boundary-Scan TAP Controller

The boundary-scan TAP controller has the following registers.

Table 43.8 List of Registers of Boundary-Scan TAP Controller

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
Bypass register	BSBPR	—	—	—	—
Instruction register	BSIR	—	H'55	—	—
Boundary scan register	SDBSR	—	—	—	—
ID register	BSID	—	H'081A6447* ¹ H'082F4447* ²	—	—

Note 1. RZ/A1L

Note 2. RZ/A1LU and RZ/A1LC

43.3.1 Bypass Register (BSBPR)

BSBPR is a 1-bit register that cannot be accessed by the CPU. When the BSIR register is set to BYPASS mode, BSBPR is connected between the TDI and TDO pins. The initial value is undefined.

43.3.2 Instruction Register (BSIR)

BSIR is an 8-bit register. This register is initialized by TRST assertion or in the TAP test-logic-reset state. BSIR cannot be accessed by the CPU.

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	TI[7:0]	01010101	—	Test Instruction The instructions of this module are transferred to BSIR by a serial input. For commands, see Table 43.9.

Table 43.9 Commands Supported for Boundary-Scan TAP Controller

Bits 7 to 0								Description
TI7	TI6	TI5	TI4	TI3	TI2	TI1	TI0	
0	0	0	0	0	0	0	0	EXTEST
0	1	0	0	0	0	0	0	SAMPLE/PRELOAD
0	1	0	1	0	1	0	1	IDCODE (Initial value)
1	1	0	1	0	0	0	0	CLAMP
1	0	0	0	0	0	0	0	HIGHZ
1	1	1	1	1	1	1	1	BYPASS
Other than above								Reserved

43.3.3 Boundary Scan Register (SDBSR)

SDBSR is a shift register, located on the PAD, for controlling the input/output pins of this LSI. SDBSR cannot be accessed by the CPU. The initial value is undefined.

Using the EXTEST, SAMPLE/PRELOAD, CLAMP, and HIGHZ commands, a boundary scan test conforming to the JTAG standard can be carried out. Table 43.10 shows the correspondence between the pins of the RZ/A1L and RZ/A1LC group products and the boundary scan register bits.

Table 43.11 shows the correspondence between the pins of the RZ/A1LU group products and the boundary scan register bits.

Note 1. The pin names are as listed in the "Port function/dedicated function" column of Table 1.4, List of Pins in section 1.6, List of Pins.

Note 2. Open-drain pin. Setting the data bit for the pin to 0 makes the pin output a low-level signal and setting the data bit for the pin to 1 places the pin in the hi-Z state.

Note 3. Bits of type “control” are active low. When the control bit is at the low level, the corresponding pin becomes an output.

Note 1. The pin names are as listed in the "Port function/dedicated function" column of Table 1.4, List of Pins in section 1.6, List of Pins.

Note 2. Open-drain pin. Setting the data bit for the pin to 0 makes the pin output a low-level signal and setting the data bit for the pin to 1 places the pin in the hi-Z state.

Note 3. Bits of type "control" are active low. When the control bit is at the low level, the corresponding pin becomes an output.

43.3.4 ID Register (BSID)

BSID is a 32-bit read-only register that cannot be accessed by the CPU. BSID can be only be read from the pins when the IDCODE command is set.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

	0	1	0	0	0	1	0	0	0	1	0	0	0	1	1	1

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DID[31:0]	H'081A6447* ¹ H'082F4447* ²	—	Device IDCODE This is the ID register stipulated by JTAG. Note that the higher-order four bits may be changed depending on the version of the chip.

Note 1. RZ/A1L

Note 2. RZ/A1LU and RZ/A1LC

43.4 ICE Registers

The debugger interface has the following ICE registers.

ICE registers are exclusively for use in debugging. Do not use these registers other than for debugging.

Table 43.12 Configuration of ICE Registers

Register Name	Abbreviation	R/W	Initial Value	Address		Access Size
				Viewed from CPU	Viewed from Debugger	
Mode reset control register	ICEREGMDRSTCTL	R/W	H'0000111E	H'FC00F000	H'8000F000	32
JTAG trace select register	ICEREGJTTRCSEL	R/W	H'00800000	H'FC00F004	H'8000F004	32
Clock power control register	ICEREGCLKPWRCTRL	R/W	H'00000000	H'FC00F014	H'8000F014	32
Lock access register	ICEREGLOCKACCES	W	—	H'FC00FFB0	H'8000FFB0	32

43.4.1 Mode Reset Control Register (ICEREGMDRSTCTL)

ICEREGMDRSTCTL is used to set the debug mode and to perform software reset.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R/W	R/W	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved The read value is always 0.
20	NIDEN_CPU0	0	R/W	CPU Noninvasive Debug Enable Controls the noninvasive debug enable signal (NIDEN/SPNIDEN) supplied to the CPU. This bit is only effective when the PINSETEN bit in ICEREGJTTRCSEL is set to 0.
19 to 17	—	All 0	R	Reserved The read value is always 0.
16	DBGEN_CPU0	0	R/W	CPU Debug Enable Controls the debug enable signal (DBGEN/SPIDEN) supplied to the CPU. This bit is only effective when the PINSETEN bit in ICEREGJTTRCSEL is set to 0.
15 to 13	—	All 0	R	Reserved The read value is always 0.
12	RSTRB_CPU0_DERSTZ	1	R/W	NEON Reset (low-active) Resets the NEON unit in the CPU.
11 to 9	—	All 0	R	Reserved The read value is always 0.
8	RSTRB_CPU0_CPURSTZ	1	R/W	CPU Reset (low-active) Resets all systems on the CPU block other than debugging resources.

Bit	Bit Name	Initial Value	R/W	Description
7 to 5	—	All 0	R	Reserved The read value is always 0.
4	RSTRB_SYS_YSRSTZ	1	R/W	System Reset (low-active) Resets all systems on the chip other than debugging resources.
3	—	1	R/W	Reserved The read value is always 1. The write value should always be 1.
2	RSTRB_CPU_PRSTDBGZ	1	R/W	CPU Subsystem Debug Peripheral Reset (low-active) Resets the debug-APB block in the CPU subsystem.
1	RSTRB_CPU_YSRSTZ	1	R/W	CPU Subsystem Reset (low-active) Resets the CPU subsystem other than those for debugging.
0	—	0	R	Reserved The read value is always 0.

43.4.2 JTAG Trace Select Register (ICEREGJTTRCSEL)

ICEREGJTTRCSEL is used to control trace data output to the respective pins and debug enable signal supplied to the CPU.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	PINSET EN	—	—	TRCMU X_SEL	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R	0	R/W	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved The read value is always 0.
23	PINSETEN	1	R/W	Selects control method of debug enable signal supplied to the CPU. 0: Supply of the DBGEN and NIDEN signals is determined by the ICEREGMDRSTCTL register. 1: Supply of the DBGEN and NIDEN signals is determined by the BSCANP pin.
22, 21	—	All 0	R	Reserved The read value is always 0.
20	TRCMUX_SEL	0	R/W	Sets the priority of the function multiplexed on the pins to which trace output is assigned. 0: The function of the pins depends on the general I/O port setting. 1: The pins act as trace outputs regardless of the general I/O port setting.
19 to 0	—	All 0	R	Reserved The read value is always 0.

43.4.3 Clock Power Control Register (ICEREGCLKPWRCTRL)

ICEREGCLKPWRCTRL is used to set the fake debug mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	FAKED BGCTRL	—	—	—	—	—	—	FAKED BG
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved The read value is always 0.
7	FAKEDBGCTRL	0	R/W	Enables or disables the fake debug mode. 0: The power control is determined by the standby control register 1 (STBCR1). 1: The power control is determined by this register.
6 to 1	—	All 0	R	Reserved The read value is always 0.
0	FAKEDBG	0	R/W	Selects whether or not to stop the power supply in deep standby mode. 0: The power supply is actually stopped in deep standby mode. 1: The power supply is not stopped even in deep standby mode.

43.4.4 Lock Access Register (ICEREGLOCKACCESS)

ICEREGLOCKACCESS is used to enable access to ICE registers by the CPU.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ICEREGLOCKACCESS															
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ICEREGLOCKACCESS															
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	ICEREGLOCKACCESS	—	W	To enable access to ICE registers by the CPU, first write H'C5AC CE55 to this register.

43.5 Operation

43.5.1 TAP Controller

Figure 43.3 shows the internal states of the TAP controller. State transitions basically conform to the JTAG standard.

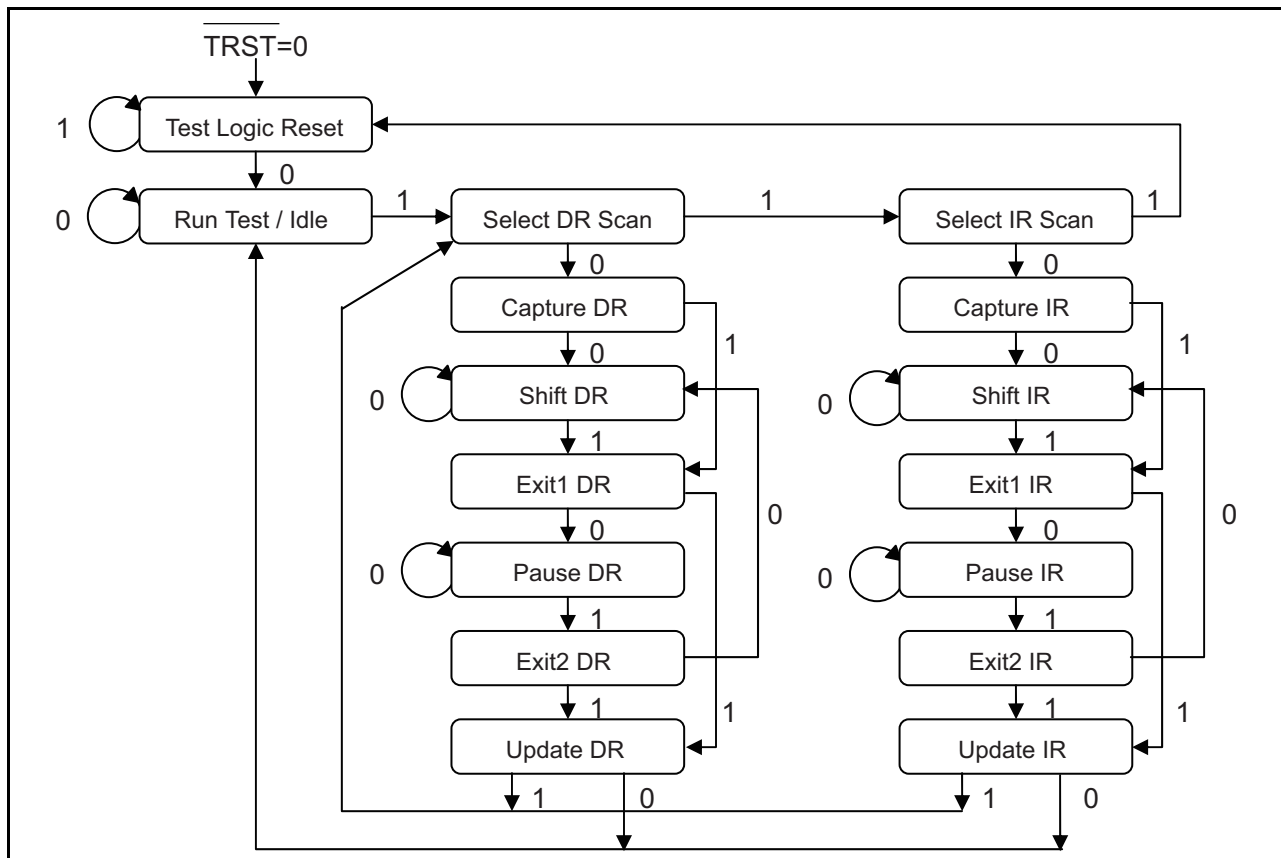

Figure 43.3 State Transitions of TAP Controller

Note: State transition occur according to the TMS value at the rising edge of the TCK signal. The TDI value sampled at the rising edge of the TCK signal and shifted at the falling edge of the TCK signal. TDO value is output at the rising edge of the TCK signal. The TDO signal is in a Hi-Z state for TAP controller states other than Shift-DR and Shift-IR. A transition to the Test-Logic-Reset state by clearing $\overline{\text{TRST}}$ to 0 is performed asynchronously with the TCK signal.

43.5.2 Reset Signal Setting

Table 43.13 Reset Signal Setting

$\overline{\text{RES}}$	$\overline{\text{TRST}}$	Chip State
L	L	The chip is power-on reset and this module is reset.*1
	H	The chip is power-on reset.*1
H	L	This module is only reset.*2
	H	Normal operation*2

Note 1. By asserting the $\overline{\text{RES}}$ and $\overline{\text{TRST}}$ signals, the CPU and CoreSight enter the reset state. Set the debugging function while asserting the $\overline{\text{RES}}$ signal after negating the $\overline{\text{TRST}}$ signal.

Note 2. Do not negate the $\overline{\text{TRST}}$ signal while the $\overline{\text{RES}}$ signal is at the high-level.

Note 3. When the $\overline{\text{TRST}}$ pin is to be negated, make sure that the specification for $\overline{\text{RES}}$ input rise time (t_{RS}) or $\overline{\text{RES}}$ negating hold time (t_{RSNH}) in Table 47.6, Control Signal Timing, is satisfied.

43.6 Boundary Scan

Commands can be set in BSIR by this module to place this module's pins in boundary scan mode stipulated by JTAG.

43.6.1 Supported Instructions

This LSI supports three mandatory instructions stipulated by JTAG standard (BYPASS, SAMPLE/PRELOAD, and EXTEST) and three option instructions (IDCODE, CLAMP, and HIGHZ).

(1) BYPASS

BYPASS is a mandatory instruction that operates the bypass register. This instruction is used to shorten the shift path to speed up serial data transfer involving other LSI on the printed circuit board. This LSI's system circuits are not affected by execution of this instruction.

(2) SAMPLE/PRELOAD

SAMPLE/PRELOAD is used to input data from this LSI's internal circuit to the boundary scan register, outputs data from the scan path, and loads data onto the scan path. While this instruction is being executed, signals input to this LSI pins are transmitted directly to the internal circuit, and the values of the internal circuit are directly output externally from the output pins. This LSI's system circuits are not affected by execution of this instruction.

In a SAMPLE operation, a snapshot of a value to be transferred from an input pin to the internal circuit, or a value to be transferred from the internal circuit to an output pin, is latched into the boundary scan register and read from the scan path. Snapshot latching is performed in synchronization with the rising edge of the TCK signal in the Capture-DR state. Snapshot latching does not affect normal operation of this LSI.

In a PRELOAD operation, an initial value is set in the parallel output latch of the boundary scan register from the scan path prior to the EXTEST instruction. Without a PRELOAD operation, when the EXTEST instruction was executed an undefined value would be output from the output pin until completion of the initial scan sequence (transfer to the output latch) (with the EXTEST instruction, the parallel output latch value is constantly output to the output pin).

(3) EXTEST

This instruction is provided to test external circuit when this LSI is mounted on a printed circuit board. When this instruction is executed, output pins are used to output test data (previously set by the SAMPLE/PRELOAD instruction) from the boundary scan register to the printed circuit board, and input pins are used to latch test results into the boundary scan register from the printed circuit board. If testing is carried out by using the EXTEST instruction N times, the Nth test data is scanned-in when test data (N-1) is scanned out. The data loaded into the output pin boundary scan register in the Capture-DR state are not used for external circuit testing (data are replaced by the shift operation).

(4) IDCODE

Commands can be set in BSIR via pins of this module to place the module's pins in the IDCODE mode stipulated by JTAG. When this module is initialized ($\overline{\text{TRST}}$ is asserted or TAP is in the Test-Logic-Reset state), the IDCODE mode is entered.

(5) CLAMP, HIGHZ

Commands can be set in BSIR via pins of this module to place the module's pins in the CLAMP or HIGHZ mode stipulated by JTAG.

43.6.2 Points for Attention

1. Boundary scan mode does not cover clock-related signals (EXTAL, XTAL, CKIO, AUDIO_X1, AUDIO_X2, USB_X1, USB_X2, RTC_X1, and RTC_X2).
2. Boundary scan mode does not cover reset-related signal ($\overline{\text{RES}}$).
3. Boundary scan mode does not cover this module's signals (TCK, TDI, TDO, TMS, $\overline{\text{TRST}}$, and BSCANP).
4. Boundary scan mode does not cover USB-related signals (DP0, DP1, DM0, DM1, VBUS0, VBUS1, and REFRIN).
5. Boundary scan mode does not cover P0_3.

43.7 Usage Notes

1. Once a command of this module is set, it will not be modified unless another command is reissued. If the same command is given continuously, the command must be set after a command (BYPASS, etc.) that does not affect LSI operations is once set.
2. Regardless of whether or not this module is to be used, it should be initialized by asserting the $\overline{\text{TRST}}$ signal when power is supplied and on release from deep standby mode (excluding fake debug mode) through assertion of the $\overline{\text{RES}}$ signal.
3. Be sure to wait for at least 200 ns after negating the $\overline{\text{TRST}}$ signal before starting TAP controller operation.
4. Be sure to fix the TMS pin to the high level until 200 ns have elapsed after negation of the $\overline{\text{TRST}}$ signal.

44. JPEG Codec Unit

This module is only incorporated in the RZ/A1LU.

The JPEG codec unit (JCU) incorporates a JPEG codec conforming to the JPEG baseline compression and decompression standard to provide high-speed compression of image data and high-speed decoding of JPEG data.

44.1 Features

The JPEG codec unit has the following features:

- Conforms to the JPEG baseline standard within the range described in this document.
This module does not support the following basic features:
Scanning with two elements
Non-interleave scanning with multiple elements
- Operational precision: Conforming to JPEG Part 2, ISO-IEC10918-2
- Image input/output system: Block interleave method
- Pixel format:
Compression: YCbCr422 (H = 2:1:1, V = 1:1:1)
Decompression: YCbCr444 (H = 1:1:1, V = 1:1:1), YCbCr422 (H = 2:1:1, V = 1:1:1), YCbCr411 (H = 4:1:1, V = 1:1:1), YCbCr420 (H = 2:1:1, V = 2:1:1)
Output pixel format to the buffer: YCbCr422, ARGB8888, RGB565
- Four quantization tables provided
- Four Huffman tables provided (two tables for AC coefficients and two tables for DC coefficients)
- Markers supported: SOI (start of image), SOF0 (start of frame type 0), SOS (start of scan), DQT (define quantization tables), DHT (define Huffman tables), DRI (define restart interval), RSTm (restart marks), and EOI (end of image)
- Image data rate: Max. 133.34 Mbytes/s (at 66.67-MHz operation)
- The buffer size can be reduced by using the mode in which data transfer is temporarily stopped each time the specified number of lines or the specified amount of data is transferred during image data or coded data input/output.
- Processing unit: 8-byte address boundary units can be set
- Image sizes that can be processed: Sizes divisible by the minimum coded unit (MCU): 8 lines by 8 pixels in YCbCr444; 8 lines by 16 pixels in YCbCr422; 8 lines by 32 pixels in YCbCr411; 16 lines by 16 pixels in YCbCr420

Note: • Compression and decompression processing of images in unsupported pixel formats or unsupported image sizes should be avoided.

Figure 44.1 shows a block diagram.

Figure 44.1 Block Diagram

44.2 Register Descriptions

Table 44.1 shows the JCU registers.

Table 44.1 Register Configuration

Register Name	Abbreviation	R/W	Address	Access Size
JPEG code mode register	JCMOD	R/W	H'E801 7000	8
JPEG code command register	JCCMD	R/W	H'E801 7001	8
JPEG code quantization table number register	JCQTN	R/W	H'E801 7003	8
JPEG code Huffman table number register	JCHTN	R/W	H'E801 7004	8
JPEG code DRI upper register	JCDRIU	R/W	H'E801 7005	8
JPEG code DRI lower register	JCDRID	R/W	H'E801 7006	8
JPEG code vertical size upper register	JCVSZU	R/W	H'E801 7007	8
JPEG code vertical size lower register	JCVSZD	R/W	H'E801 7008	8
JPEG code horizontal size upper register	JCHSZU	R/W	H'E801 7009	8
JPEG code horizontal size lower register	JCHSZD	R/W	H'E801 700A	8
JPEG code data count upper register	JCDTCU	R	H'E801 700B	8
JPEG code data count middle register	JCDTCM	R	H'E801 700C	8
JPEG code data count lower register	JCDTCD	R	H'E801 700D	8
JPEG interrupt enable register 0	JINTE0	R/W	H'E801 700E	8
JPEG interrupt status register 0	JINTS0	R/W	H'E801 700F	8
JPEG code decode error register	JCDERR	R/W	H'E801 7010	8

JPEG code quantization table 1 register	JCQTBL1	R/W	H'E801 7140 to H'E801 717F	8
JPEG code quantization table 2 register	JCQTBL2	R/W	H'E801 7180 to H'E801 71BF	8
JPEG code quantization table 3 register	JCQTBL3	R/W	H'E801 71C0 to H'E801 71FF	8

Table 44.1 Register Configuration

Register Name	Abbreviation	R/W	Address	Access Size
JPEG code Huffman table DC0 register	JCHTBD0	W	H'E801 7200 to H'E801 721B	8
JPEG code Huffman table AC0 register	JCHTBA0	W	H'E801 7220 to H'E801 72D1	8
JPEG code Huffman table DC1 register	JCHTBD1	W	H'E801 7300 to H'E801 731B	8
JPEG code Huffman table AC1 register	JCHTBA1	W	H'E801 7320 to H'E801 73D1	8

Note: • For the settings of the JPEG code quantization table and JPEG code Huffman table, see section 44.3.1 (4), Table Setting.

44.2.1 JPEG Code Mode Register (JCMOD)

JCMOD sets the operating mode before the JCU starts operation.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	DSP	REDU[2:0]		
Initial value:	0	0	0	0	0	0	0	0
R/W(compress):	R	R	R	R	R/W	R/W	R/W	R/W
R/W(decompress):	R	R	R	R	R/W	R	R	R

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7 to 4	—	All 0		R	Reserved These bits are always read as 0. The write value should always be 0.
3	DSP	0		R/W	Compression/Decompression Set 0: Compression process 1: Decompression process Note: • When changing between processing for compression and for decompression, be sure to reset this module in advance by setting the SRST21 bit in the software reset control register 2 (SWRSTCR2) of the power-down modes.
2 to 0	REDU[2:0]	000	R/W	R	Pixel Format [Compression] 001: YCbCr422 Other than above: Setting prohibited. [Decompression] 000: YCbCr444 001: YCbCr422 110: YCbCr411 010: YCbCr420 Other than above: Error (JCU cannot process normally.)

44.2.2 JPEG Code Command Register (JCCMD)

JCCMD sets commands. Bits of this register need not be cleared to 0 after setting a command. Multiple commands must not be set simultaneously.

Bit:	7	6	5	4	3	2	1	0
	BRST	—	—	—	—	JEND	JRST	JSRT
Initial value:	0	0	0	0	0	0	0	0
R/W(compress):	R*/W	R	R	R	R	R*/W	Undefined	R*/W
R/W(decompress):	R*/W	R	R	R	R	R*/W	R*/W	R*/W

Note: * Values read from these bits are undefined.

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7	BRST	0	R*/W		Bus Reset Setting this bit to 1 resets the internal circuits. While the JCU is in operation (from setting the JPEG core process start command to writing the last output coded/image data), do not set this bit to 1. For the bus reset processing, see section 44.5, Bus Reset Processing.
6 to 3	—	All 0	R		Reserved These bits are always read as 0. The write value should always be 0.
2	JEND	0	R*/W		Interrupt Request Clear Command This bit is valid only for the interrupt sources corresponding to bits INS6, INS5, and INS3 in JINTS0. To clear an interrupt request, set this bit to 1.
1	JRST	0	Invalid	R*/W	JPEG Core Process Stop Clear Command To clear the process-stopped state caused by requests to read the image size and pixel format (enabled by the INT3 bit in JINTE0), set this bit to 1.
0	JSRT	0	R*/W		JPEG Core Process Start Command To start JPEG core processing, set this bit to 1. Do not write this bit to 1 again while the JCU is in operation.

Note: * Values read from these bits are undefined.

44.2.3 JPEG Code Quantization Table Number Register (JCQTN)

JCQTN sets the quantization table number before compression process is started.

- To use quantization table No. 0 (JCQTBL0) as the first color component, set QT1 to B'00
- To use quantization table No. 1 (JCQTBL1) as the first color component, set QT1 to B'01
- To use quantization table No. 2 (JCQTBL2) as the first color component, set QT1 to B'10
- To use quantization table No. 3 (JCQTBL3) as the first color component, set QT1 to B'11

Bit:	7	6	5	4	3	2	1	0
	—	—	QT3[1:0]	QT2[1:0]	QT1[1:0]			
Initial value:	0	0	0	0	0	0	0	0
R/W(compress):	R	R	R/W	R/W	R/W	R/W	R/W	R/W
R/W(decompress):	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7, 6	—	All 0		R	Reserved These bits are always read as 0. The write value should always be 0.
5, 4	QT3[1:0]	00	R/W	R	Quantization table number for the third color component
3, 2	QT2[1:0]	00	R/W	R	Quantization table number for the second color component
1, 0	QT1[1:0]	00	R/W	R	Quantization table number for the first color component

44.2.4 JPEG Code Huffman Table Number Register (JCHTN)

JCHTN sets the Huffman table number (AC/DC) before compression process is started.

- To use DC/AC Huffman table No. 0 (JCHTBD0 and JCHTBA0) as the first color component, set bits HTA1 and HTD1 to B'0
- To use DC/AC Huffman table No. 1 (JCHTBD1 and JCHTBA1) as the first color component, set bits HTA1 and HTD1 to B'1

Bit:	7	6	5	4	3	2	1	0
	—	—	HTA3	HTD3	HTA2	HTD2	HTA1	HTD1
Initial value:	0	0	0	0	0	0	0	0
R/W(compress):	R	R	R/W	R/W	R/W	R/W	R/W	R/W
R/W(decompress):	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7, 6	—	All 0		R	Reserved These bits are always read as 0. The write value should always be 0.
5	HTA3	0	R/W	R	Huffman table number (AC) for the third color component
4	HTD3	0	R/W	R	Huffman table number (DC) for the third color component
3	HTA2	0	R/W	R	Huffman table number (AC) for the second color component
2	HTD2	0	R/W	R	Huffman table number (DC) for the second color component
1	HTA1	0	R/W	R	Huffman table number (AC) for the first color component
0	HTD1	0	R/W	R	Huffman table number (DC) for the first color component

44.2.5 JPEG Code DRI Upper Register (JCDRIU)

JCDRIU sets the upper bytes of the minimum coded units (MCUs) preceding an RST marker.

Bit:	7	6	5	4	3	2	1	0
	DRIU[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W(compress):	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
R/W(decompress):	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7 to 0	DRIU[7:0]	H'00	R/W	Invalid	Upper Bytes of MCUs Preceding RST Marker When both upper and lower bytes are set to H'00, neither a DRI nor an RST marker is placed.

44.2.6 JPEG Code DRI Lower Register (JCDRID)

JCDRID sets the lower bytes of MCUs preceding an RST marker.

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7 to 0	DRID[7:0]	H'00	R/W	Invalid	Lower Bytes of MCUs Preceding RST Marker When both upper and lower bytes are set to H'00, neither a DRI nor an RST marker is placed.

44.2.7 JPEG Code Vertical Size Upper Register (JCVSZU)

JCVSZU sets the upper bytes of the vertical image size.

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7 to 0	VSZU[7:0]	H'00	R/W	R	Upper Bytes of Vertical Image Size In decompression process, a downloaded value from the JPEG coded data is set.

44.2.8 JPEG Code Vertical Size Lower Register (JCVSZD)

JCVSZD sets the lower bytes of the vertical image size.

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7 to 0	VSZD[7:0]	H'00	R/W	R	Lower Bytes of Vertical Image Size In decompression process, a downloaded value from the JPEG coded data is set.

44.2.9 JPEG Code Horizontal Size Upper Register (JCHSZU)

JCHSZU sets the upper bytes of the horizontal image size.

Bit:	7	6	5	4	3	2	1	0
HSZU[7:0]								
Initial value: 0 0 0 0 0 0 0 0 0								
R/W(compress): R/W R/W R/W R/W R/W R/W R/W R/W								
R/W(decompress): R R R R R R R R								

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7 to 0	HSZU[7:0]	H'00	R/W	R	Upper Bytes of Horizontal Image Size In decompression process, a downloaded value from the JPEG coded data is set.

44.2.10 JPEG Coded Horizontal Size Lower Register (JCHSZD)

JCHSZD sets the lower bytes of the horizontal image size.

Bit:	7	6	5	4	3	2	1	0
HSZD[7:0]								
Initial value: 0 0 0 0 0 0 0 0 0								
R/W(compress): R/W R/W R/W R/W R/W R/W R/W R/W								
R/W(decompress): R R R R R R R R								

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7 to 0	HSZD[7:0]	H'00	R/W	R	Lower Bytes of Horizontal Image Size In decompression process, a downloaded value from the JPEG coded data is set.

44.2.11 JPEG Code Data Count Upper Register (JCDCU)

The upper bytes for the counted amount of data to be compressed are set to JCDCU. The values of this register are reset before compression starts.

Bit:	7	6	5	4	3	2	1	0
DCU[7:0]								
Initial value: 0 0 0 0 0 0 0 0 0								
R/W(compress): R R R R R R R R								
R/W(decompress): Undefined Undefined Undefined Undefined Undefined Undefined Undefined Undefined								

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7 to 0	DCU[7:0]	H'00	R	Invalid	Upper bytes of the counted amount of data to be compressed

44.2.12 JPEG Code Data Count Middle Register (JCDCM)

The middle bytes for the counted amount of data to be compressed are set to JCDCM. The values of this register are reset before compression starts.

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7 to 0	DCM[7:0]	H'00	R	Invalid	Middle bytes of the counted amount of data to be compressed

44.2.13 JPEG Code Data Count Lower Register (JCDCD)

The lower bytes for the counted amount of data to be compressed are set to JCDCD. The values of this register are reset before compression starts.

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7 to 0	DCD[7:0]	H'00	R	Invalid	Lower bytes of the counted amount of data to be compressed

44.2.14 JPEG Interrupt Enable Register 0 (JINTE0)

JINTE0 enables interrupts.

When any of bits INT7 to INT5 is set to B'1, the INS5 bit in JINTS0 indicates B'1 as the error status upon occurrence of the compression data error, and the ERR bit in JCDERR indicates the particular error code.

Bit:	7	6	5	4	3	2	1	0
	INT7	INT6	INT5	—	INT3	—	—	—
Initial value:	0	0	0	0	0	0	0	0
R/W(compress):	Undefined	Undefined	Undefined	R	Undefined	R	R	R
R/W(decompress):	R/W	R/W	R/W	R	R/W	R	R	R

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7	INT7	0	Invalid	R/W	This bit enables an interrupt to be generated when the number of data in the restart interval of the Huffman-coding segment is not correct in decompression. When this bit is not set to enable interrupt generation, an error code is not returned.
6	INT6	0	Invalid	R/W	This bit enables an interrupt to be generated when the total number of data in the Huffman-coding segment is not correct in decompression. When this bit is not set to enable interrupt generation, an error code is not returned.
5	INT5	0	Invalid	R/W	This bit enables an interrupt to be generated when the final number of MCU data in the Huffman-coding segment is not correct in decompression. When this bit is not set to enable interrupt generation, an error code is not returned.
4	—	0		R	Reserved This bit is always read as 0. The write value should always be 0.
3	INT3	0	Invalid	R/W	This bit enables an interrupt to be generated when it has been determined that the image size and the subsampling setting of the compressed data can be read through analyzing the data.
2 to 0	—	All 0		R	Reserved These bits are always read as 0. The write value should always be 0.

44.2.15 JPEG Interrupt Status Register 0 (JINTS0)

JINTS0 identifies the interrupt sources.

The interrupt sources of this register should be cleared by clearing the corresponding interrupt status bits to 0 and setting the relevant bit in JCCMD appropriately.

Bit:	7	6	5	4	3	2	1	0
	—	INS6	INS5	—	INS3	—	—	—
Initial value:	0	0	0	0	0	0	0	0
R/W(compress):	R	R/W*	Undefined	R	Undefined	R	R	R
R/W(decompress):	R	R/W*	R/W*	R	R/W*	R	R	R

Note: * Clear this bit by writing 0 to it.
Do not write 1 to this bit.

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7	—	0		R	Reserved This bit is always read as 0. The write value should always be 0.
6	INS6	0		R/W*	This bit is set to 1 when the JCU completes compression process normally.
5	INS5	0	Invalid	R/W*	This bit is set to 1 when a compressed data error occurs.
4	—	0		R	Reserved This bit is always read as 0. The write value should always be 0.
3	INS3	0	Invalid	R/W*	This bit is set to 1 when the image size and pixel format can be read. When an interrupt occurs, this module stops processing and the state is indicated by the JCRST register. To make the JCU resume processing, set the JPEG core process stop clear command bit (JRST) in JCCMD.
2 to 0	—	All 0		R	Reserved These bits are always read as 0. The write value should always be 0.

Note: * Clear this bit by writing 0 to it. Do not write 1 to this bit.

44.2.16 JPEG Code Decode Error Register (JCDERR)

JCDERR indicates the error code to identify the type of the error which has occurred in the compressed data analysis for decompression. The values of this register are reset before the JCU starts decompression.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	ERR[3:0]			
Initial value:	0	0	0	0	1	0	1	0
R/W(compress):	R	R	R	R	Undefined	Undefined	Undefined	Undefined
R/W(decompress):	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7 to 4	—	All 0		R	Reserved These bits are always read as 0.
3 to 0	ERR[3:0]	1010	Invalid	R/W	Error Code (See tables 44.3 and 44.4.)

44.2.17 JPEG Code Reset Register (JCRST)

JCRST indicates a processing-stopped state caused by requests to read the image size and pixel format (enabled by the INT3 bit in JINTE0). To resume processing, set the JPEG core process stop clear command bit (JRST) in JCCMD.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	RST
Initial value:	0	0	0	0	0	0	0	0
R/W(compress):	R	R	R	R	R	R	R	Undefined
R/W(decompress):	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7 to 1	—	All 0		R	Reserved These bits are always read as 0.
0	RST	0	Invalid	R/W	Operating State 0: State other than below 1: Suspended state caused by interrupt sources of JINTE0

44.2.18 JPEG Interface Compression Control Register (JIFECNT)

JIFECNT controls the compression process.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W(compress):	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
R/W(decompress):	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	JOUT RINI	JOUT RCMD	JOUTC	—	JOUTSWAP[2:0]	—	DIN RINI	DIN RCMD	DIN LC	—	DINSWAP[2:0]				
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W(compress):	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W
R/W(decompress):	R	Undefined	Undefined	Undefined	R	Undefined	Undefined	Undefined	R	Undefined	Undefined	Undefined	R	Undefined	Undefined	Undefined

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
31 to 15	—	All 0		R	Reserved These bits are always read as 0. The write value should always be 0.
14	JOUTRINI	0	R/W	Invalid	Address Initialization when Output Coded Data is Resumed This bit is only valid when the count mode for stopping the output of coded data is on. Set this bit before writing 1 to the data resume command bit. 0: The transfer address is not initialized when the output of coded data is restarted. 1: The transfer address is initialized when the output of coded data is restarted.
13	JOUTR CMD	0	R/W	Invalid	Output Coded Data Resume Command This bit is only valid when the count mode for stopping the output of coded data is on. Setting this bit to 1 resumes writing output coded data. This bit is always read as 0.
12	JOUTC	0	R/W	Invalid	Count Mode Setting for Stopping Output Coded Data 0: Count mode for stopping the output of coded data is off. 1: Count mode for stopping the output of coded data is on.
11	—	0		R	Reserved This bit is always read as 0. The write value should always be 0.
10 to 8	JOUT SWAP[2:0]	000	R/W	Invalid	Byte/Word/Longword Swap Output coded data in compression is swapped. 000: (1) (2) (3) (4) (5) (6) (7) (8) 001: (2) (1) (4) (3) (6) (5) (8) (7) [Byte swap] 010: (3) (4) (1) (2) (7) (8) (5) (6) [Word swap] 011: (4) (3) (2) (1) (8) (7) (6) (5) [Word - byte swap] 100: (5) (6) (7) (8) (1) (2) (3) (4) [Longword swap] 101: (6) (5) (8) (7) (2) (1) (4) (3) [Longword - byte swap] 110: (7) (8) (5) (6) (3) (4) (1) (2) [Longword - word swap] 111: (8) (7) (6) (5) (4) (3) (2) (1) [Longword - word - byte swap]
7	—	0		R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
6	DINRINI	0	R/W	Invalid	Address Initialization when Resuming Input of Image Data Lines This bit is only valid when the count mode for stopping the input of image data lines is on. Set this bit before writing 1 to the data-line resume command bit. 0: The transfer address is not initialized when the input of image data lines is restarted. 1: The transfer address is initialized when the input of image data lines is restarted.
5	DINRCMD	0	R/W	Invalid	Input Image Data Lines Resume Command This bit is valid only when the count mode for stopping the input of image data lines is on. Setting this bit to 1 resumes reading input image data. This bit is always read as 0.
4	DINLC	0	R/W	Invalid	Count Mode Setting for Stopping Input Image Data Lines 0: Count mode for stopping the input of image data lines is off. 1: Count mode for stopping the input of image data lines is on.
3	—	0		R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	DINSWAP [2:0]	000	R/W	Invalid	Byte/Word Swap Input image data in compression is swapped. 000: (1) (2) (3) (4) (5) (6) (7) (8) 001: (2) (1) (4) (3) (6) (5) (8) (7) [Byte swap] 010: (3) (4) (1) (2) (7) (8) (5) (6) [Word swap] 011: (4) (3) (2) (1) (8) (7) (6) (5) [Word - byte swap] 100: (5) (6) (7) (8) (1) (2) (3) (4) [Longword swap] 101: (6) (5) (8) (7) (2) (1) (4) (3) [Longword - byte swap] 110: (7) (8) (5) (6) (3) (4) (1) (2) [Longword - word swap] 111: (8) (7) (6) (5) (4) (3) (2) (1) [Longword - word - byte swap]

44.2.19 JPEG Interface Compression Source Address Register (JIFESA)

JIFESA sets the source address of the input image data. This register should be set in 8-byte units.

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
31 to 3	ESA[31:3]	H'0000	R/W	Invalid	Input Image Data Source Address (in 8-byte units)
2 to 0	ESA[2:0]	0000	R		The lower three bits should be set to 0.

44.2.20 JPEG Interface Compression Line Offset Register (JIFESOFST)

JIFESOFST sets the line offset of the input image data (refer to section 44.3.4, Storing Image Data). This register should be set in 8-byte units.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W(compress):	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
R/W(decompress):	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	ESMW[14:0]														
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W(decompress):	R	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
31 to 15	—	All 0		R	Reserved These bits are always read as 0. The write value should always be 0.
14 to 3	ESMW [14:3]	H'0000	R/W	Invalid	Input Image Data Lines Offset (in 8-byte units) The lower three bits should be set to 0.
2 to 0	ESMW[2:0]		R		

44.2.21 JPEG Interface Compression Destination Address Register (JIFEDA)

JIFEDA sets the destination address of the output coded data. This register should be set in 8-byte units.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	EDA[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W(compress):	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
R/W(decompress):	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W(compress):	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R
R/W(decompress):	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
31 to 3	EDA[31:3]	H'0000	R/W	Invalid	Output Coded Data Destination Address (in 8-byte units)
2 to 0	EDA[2:0]	0000	R		The lower three bits should be set to 0.

44.2.22 JPEG Interface Compression Source Line Count Register (JIFESLC)

JIFESLC sets the number of input image data lines when the count mode for stopping the input of image data lines is on (the DINLC bit in JIFECNT is set to 1). This register should be set in 8-line units.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	1	1	1	1	1	1	1	1	1	1	1	1	1	0	0	0
R/W(compress):	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W(decompress):	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
31 to 16	—	H'FFF8		R	Reserved Values read from these bits are undefined. The write value should always be 0.
15 to 3	LINES[15:3]	H'FFF8	R/W	Invalid	Number of Input Image Data Lines to be Read (in 8-line units)
2 to 0	LINES[2:0]		R		The lower three bits should be set to 0.

44.2.23 JPEG Interface Compression Destination Count Register (JIFEDDC)

JIFEDDC sets the amount of output coded data when the count mode for stopping the output of coded data is on (the JOUTC bit in JIFECNT is set to 1). This register should be set in 8-byte units.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W(compress):	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W(decompress):	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
31 to 16	—	H'FFF8	R	Invalid	Reserved Values read from these bits are undefined. The write value should always be 0.
15 to 3	JDATAS[15:3]	H'FFF8	R/W	Invalid	Amount of Output Coded Data to be Written (in 8-byte units)
2 to 0	JDATAS[2:0]		R		The lower three bits should be set to 0.

44.2.24 JPEG Interface Decompression Control Register (JIFDCNT)

JIFDCNT controls the decompression process.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	VINTER[1:0]	HINTER[1:0]	OPF[1:0]	—	—	—	—	—	—	—	—	—	—	—

R/W(decompress):	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
31, 30	—	All 0		R	Reserved These bits are always read as 0. The write value should always be 0.
29, 28	VINTER[1:0]	00	Invalid	R/W	Vertical Subsampling Subsamples vertical output image data. 00: No subsampling 01: Subsamples output data into 1/2. 10: Subsamples output data into 1/4. 11: Subsamples output data into 1/8.
27, 26	HINTER[1:0]	00	Invalid	R/W	Horizontal Subsampling Subsamples horizontal output image data. 00: No subsampling 01: Subsamples output data into 1/2. 10: Subsamples output data into 1/4. 11: Subsamples output data into 1/8.
25, 24	OPF[1:0]	00	Invalid	R/W	Specifies output image data pixel format. 00: YCbCr422 01: ARGB8888 10: RGB565 11: Setting prohibited
23 to 15	—	All 0		R	Reserved These bits are always read as 0. The write value should always be 0.
14	JINRINI	0	Invalid	R/W	Address Initialization when Input Coded Data is Resumed This bit is only valid when the count mode for stopping the input of coded data is on. Set this bit before writing 1 to the data resume command bit. 0: The transfer address is not initialized when the input of coded data is restarted. 1: The transfer address is initialized when the input of coded data is restarted.
13	JINRCMD	0	Invalid	R/W	Input Coded Data Resume Command This bit is valid only when the count mode for stopping the input of coded data is on. Setting this bit to 1 resumes reading input coded data. This bit is always read as 0.
12	JINC	0	Invalid	R/W	Count Mode Setting for Stopping Input Coded Data 0: Count mode for stopping the input of coded data is off. 1: Count mode for stopping the input of coded data is on.
11	—	0		R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
10 to 8	JINSWAP [2:0]	000	Invalid	R/W	Byte/Word/Longword Swap Input coded data in decompression is swapped. 000: (1) (2) (3) (4) (5) (6) (7) (8) 001: (2) (1) (4) (3) (6) (5) (8) (7) [Byte swap] 010: (3) (4) (1) (2) (7) (8) (5) (6) [Word swap] 011: (4) (3) (2) (1) (8) (7) (6) (5) [Word - byte swap] 100: (5) (6) (7) (8) (1) (2) (3) (4) [Longword swap] 101: (6) (5) (8) (7) (2) (1) (4) (3) [Longword - byte swap] 110: (7) (8) (5) (6) (3) (4) (1) (2) [Longword - word swap] 111: (8) (7) (6) (5) (4) (3) (2) (1) [Longword - word - byte swap]
7	—	0		R	Reserved This bit is always read as 0. The write value should always be 0.
6	DOUTRINI	0	Invalid	R/W	Address Initialization when Resuming Output of Image Data Lines This bit is only valid when the count mode for stopping the output of image data lines is on. Set this bit before writing 1 to the data-line resume command bit. 0: The transfer address is not initialized when the output of lines of image data is restarted. 1: The transfer address is initialized when the output of lines of image data is restarted.
5	DOUTRCMD	0	Invalid	R/W	Output Image Data Lines Resume Command This bit is valid only when the count mode for stopping the output of image data lines is on. Setting this bit to 1 resumes writing image data. This bit is always read as 0.
4	DOUTLC	0	Invalid	R/W	Count Mode for Stopping Output Image Data Lines 0: Count mode for stopping the output of image data lines is off. 1: Count mode for stopping the output of image data lines is on.
3	—	0		R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	DOUTSWAP [2:0]	000	Invalid	R/W	Byte/Word Swap Output image data in decompression is swapped. 000: (1) (2) (3) (4) (5) (6) (7) (8) 001: (2) (1) (4) (3) (6) (5) (8) (7) [Byte swap] 010: (3) (4) (1) (2) (7) (8) (5) (6) [Word swap] 011: (4) (3) (2) (1) (8) (7) (6) (5) [Word - byte swap] 100: (5) (6) (7) (8) (1) (2) (3) (4) [Longword swap] 101: (6) (5) (8) (7) (2) (1) (4) (3) [Longword - byte swap] 110: (7) (8) (5) (6) (3) (4) (1) (2) [Longword - word swap] 111: (8) (7) (6) (5) (4) (3) (2) (1) [Longword - word - byte swap]

44.2.25 JPEG Interface Decompression Source Address Register (JIFDSA)

JIFDSA sets the source address of the input coded data. This register should be set in 8-byte units.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DSA[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W(compress):	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined

R/W(decompress):	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
31 to 3	DSA[31:3]	H'0000	Invalid	R/W	Input Coded Data Source Address (in 8-byte units)
2 to 0	DSA[2:0]	0000		R	The lower three bits should be set to 0.

44.2.26 JPEG Interface Decompression Line Offset Register (JIFDDOFST)

JIFDDOFST sets the line offset of the output image data to be transferred to the external buffer (refer to section 44.3.4, Storing Image Data). This register should be set in 8-byte units.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
31 to 16	—	All 0		R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 3	DDMW[14:3]	H'0000	Invalid	R/W	Output Image Data Lines Offset (in 8-byte units)
2 to 0	DDMW[2:0]			R	The lower three bits should be set to 0.

44.2.27 JPEG Interface Decompression Destination Address Register (JIFDDA)

JIFDDA sets the destination address of the output image data. This register should be set in 8-byte units.

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
31 to 3	DDA[31:3]	H'0000	Invalid	R/W	Output Image Data Destination Address (in 8-byte units)
2 to 0	DDA[2:0]	0000		R	The lower three bits should be set to 0.

44.2.28 JPEG Interface Decompression Source Data Count Register (JIFDSDC)

JIFDSDC sets the amount of input coded data when the count mode for stopping the input of coded data is on (the JINC bit in JIFDCNT is set to 1). This register should be set in 8-byte units.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
31 to 16	—	H'FFF8		R	Reserved Values read from these bits are undefined. The write value should always be 0.
15 to 3	JDATAS[15:3]	H'FFF8	Invalid	R/W	Amount of Input Coded Data to be Read (in 8-byte units)The lower three bits should be set to 0.
2 to 0	JDATAS[2:0]			R	

44.2.29 JPEG Interface Decompression Destination Line Count Register (JIFDDLCL)

JIFDDLCL sets the number of lines of output image data when the count mode for stopping the output of image data lines is on (the DOUTLCL bit in JIFECNT is set to 1). This register is used to set the number of lines of output image data in MCU units.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
31 to 16	—	H'FFF8		R	Reserved Values read from these bits are undefined. The write value should always be 0.
15 to 3	LINES[15:3]	H'FFF8	Invalid	R/W	Specify the number of lines of output image data to be written. The setting is in MCU units. When data are to be output in YCbCr444, YCbCr422 or YCbCr411 format, the number of lines of output image data is <this setting> x 1. When data are to be output in YCbCr420 format, the number of lines of output image data is <this setting> x 2. The lower three bits should be set to 0.
2 to 0	LINES[2:0]			R	

44.2.30 JPEG Interface Decompression α Set Register (JIFDADT)

JIFDADT is used to set the α value when output is in ARGB8888 format.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W(compress):	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R	Undefined	Undefined	Undefined
R/W(decompress):	R	R	R	R	R	R	R	R	R	Undefined	Undefined	Undefined	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
31 to 7	—	All 0		R	Reserved These bits are always read as 0. The write value should always be 0.
6	CBTEN	0	R/W	Invalid	Enables or disables a data transfer processing interrupt request (JDTI) when the CBTF bit in JINTS1 is set to 1. 0: Disables an interrupt request. 1: Enables an interrupt request.
5	DINLEN	0	R/W	Invalid	Enables or disables a data transfer processing interrupt request (JDTI) when the DINLF bit in JINTS1 is set to 1. 0: Disables an interrupt request. 1: Enables an interrupt request.
4	JOUTEN	0	R/W	Invalid	Enables or disables a data transfer processing interrupt request (JDTI) when the JOUTF bit in JINTS1 is set to 1. 0: Disables an interrupt request. 1: Enables an interrupt request.
3	—	0		R	Reserved This bit is always read as 0. The write value should always be 0.
2	DBTEN	0	Invalid	R/W	Enables or disables a data transfer processing interrupt request (JDTI) when the DBTF bit in JINTS1 is set to 1. 0: Disables an interrupt request. 1: Enables an interrupt request.
1	JINEN	0	Invalid	R/W	Enables or disables a data transfer processing interrupt request (JDTI) when the JINF bit in JINTS1 is set to 1. 0: Disables an interrupt request. 1: Enables an interrupt request.
0	DOUTLEN	0	Invalid	R/W	Enables or disables a data transfer processing interrupt request (JDTI) when the DOUTLF bit in JINTS1 is set to 1. 0: Disables an interrupt request. 1: Enables an interrupt request.

44.2.32 JPEG Interrupt Status Register 1 (JINTS1)

JINTS1 indicates the interrupt sources.

The interrupt sources of this register should be cleared by writing 0 to this register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W(compress):	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
R/W(decompress):	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	CBTF	DINLF	JOUTF	—	DBTF	JINF	DOU TLF
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W(compress):	R	R	R	R	R	R	R	R	R	R/W*	R/W*	R/W*	R	Undefined	Undefined	Undefined
R/W(decompress):	R	R	R	R	R	R	R	R	R	Undefined	Undefined	Undefined	R	R/W*	R/W*	R/W*

Note: * When the bit is read as 1, write 0 to clear it.
When the bit is read as 0, write 1 to it.

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
31 to 7	—	All 0		R	Reserved These bits are always read as 0. The write value should always be 0.
6	CBTF	0	R/W*	Invalid	This bit is set to 1 when the last output coded data is written in compression.
5	DINLF	0	R/W*	Invalid	This bit is set to 1 when the number of input image data lines indicated by JIFESLC is read in compression. This bit is valid only when the DINLC bit in JIFECNT is set to 1.
4	JOUTF	0	R/W*	Invalid	This bit is set to 1 when the amount of output coded data indicated by JIFEDDC is written in compression. This bit is valid only when the JOUTC bit in JIFECNT is set to 1.
3	—	0		R	Reserved This bit is always read as 0. The write value should always be 0.
2	DBTF	0	Invalid	R/W*	This bit is set to 1 when the last output image data is written in decompression.
1	JINF	0	Invalid	R/W*	This bit is set to 1 when the amount of input coded data indicated by JIFSDC is read in decompression. This bit is valid only when the JINC bit in JIFDCNT is set to 1.
0	DOUTLF	0	Invalid	R/W*	In decompression, this bit is set to 1 when the number of lines of output image data indicated by JIFDDL have been written. This bit is only valid when the DOUCLC bit in JIFDCNT is set to 1.

Note: * When the bit is read as 1, write 0 to clear it.
When the bit is read as 0, write 1 to it.

44.2.33 JPEG Input Image Data CbCr Range Setting Register (JIFESVSZ)

JIFESVSZ sets the CbCr range of input image data.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W(compress):	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
R/W(decompress):	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DINY CHG	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W(decompress):	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DOUTY CHG	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W(compress):	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
R/W(decompress):	Undefined	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
31 to 16	—	All 0		R	Reserved These bits are always read as 0. The write value should always be 0.
15	DOUTYCHG	0	Invalid	R/W	Output Image Data CbCr Range Setting 0: Range from -128 to 127 1: Range from 0 to 255
14 to 0	—	All 0		R	Reserved These bits are always read as 0. The write value should always be 0.

44.3 Operation

44.3.1 Compression

(1) Overview of Processing

The compression process flows are described below.

1. The JPEG core is activated.

A marker is output. (After a marker is output, image data can be input.)

Approximately 30,000 cycles (necessary for making SOI to SOS markers)

2. Image data is transferred in MCUs from the external buffer to the JCU.

If the count mode for stopping the input of image data lines is on, reading is stopped each time the number of lines set in JIFESLC is read. Reading is resumed by setting the DINRCMD bit in JIFECNT to 1.

When the DINRINI bit in JIFECNT is zero, the addresses for reading on resumption are continued from the addresses in the previous round of transfer.

When the DINRINI bit is one, the address set in JIFESA is used on resumption.

Reading is also stopped when one frame of image data is completely transferred.

If the count mode for stopping the input of image data lines is off, reading is continued until one frame of image data is completely transferred.

3. Image data is input to the JPEG core.

The input data is processed in MCUs at any time in the JPEG core.

4. Coded data is transferred from the JCU to the external buffer.

When the count mode for stopping the output of coded data is on, writing is stopped each time the amount of coded data set in JIFEDDC is written. Writing is resumed by setting the JOUTRCMD bit in JIFECNT to 1.

When the JOUTRINI bit in JIFECNT is zero, the addresses for writing on resumption are continued from the addresses in the previous round of transfer.

When the JOUTRINI bit is one, the address set in JIFEDA is used on resumption.

Writing is also stopped when one frame of coded data is completely transferred.

If the count mode for stopping the output of coded data is off, writing is continued until one frame of coded data is completely transferred.

5. Compression is completed after one frame of data is processed completely.

(2) Flowchart (Compression)

(a) Initial Settings

After completing the JPEG core settings and input/output buffer settings and transferring image data to the external buffer, activate this module by setting the JSRT bit in JCCMD to 1. After the JCU has been activated, the JPEG markers (SOI to SOS) are generated and output. It takes approximately 30,000 cycles to generate the markers.

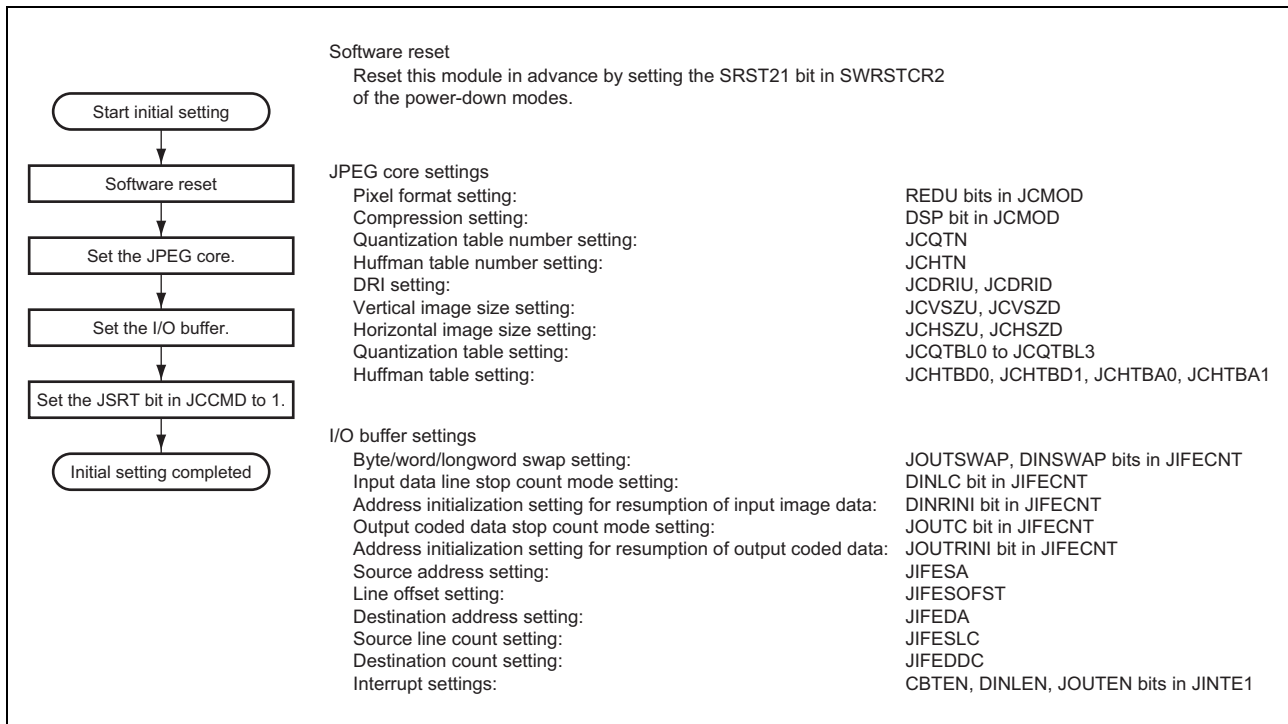

Figure 44.2 Compression Initial Setting Flow

(b) Compression Process

The compression process flows are described below.

- When JPEG compression process has been completed, the INS6 bit in JINTS0 is set to 1. However, the JCU continues processing since the coded data remains to be transferred. The CBTF bit in JINTS1 is set to 1 when the last coded data is transferred. The interrupt source is cleared by writing 0 to the INS6 bit. However, the interrupt request asserted by this interrupt source cannot be cleared by writing 0 to the INS6 bit. Set an interrupt request clear command (by setting the JEND bit in JCCMD to 1) to clear the interrupt request.
- When the JCU has completed compression and all coded data has been transferred, the CBTF flag in JINTS1 is set to 1. When the CBTEN bit in JINTE1 is 1 here, an interrupt is generated. The interrupt source is cleared by writing 0 to the CBTF flag.
- If the count mode for stopping image data lines is on, when the specified number of image data lines set in JIFESLC has been read, the DINLF flag in JINTS1 is set to 1, and reading is stopped. When the DINLEN bit in JINTE1 is 1 here, an interrupt is generated. An interrupt source is cleared by writing 0 to the DINLEN bit. Setting the DINRCMD bit in JIFECNT to 1 resumes reading. When the DINRINI bit in JIFECNT is zero, the addresses for reading on resumption are continued from the addresses in the previous round of transfer. When the DINRINI bit is one, the address set in JIFESA is used on resumption.
- If the count mode for stopping the output of coded data is on, when the specified amount of coded data set in JIFEDDC has been written, the JOUTF flag in JINTS1 is set to 1, and writing is stopped. When the JOUTEN bit in JINTE1 is 1 here, an interrupt is generated. An interrupt source is cleared by writing 0 to the JOUTF bit. Setting the JOUTRCMD bit in JIFECNT to 1 resumes writing.

When the JOUTRINI bit in JIFECNT is zero, the addresses for writing on resumption are continued from the addresses in the previous round of transfer.

When the JOUTRINI bit is one, the address set in JIFEDA is used on resumption.

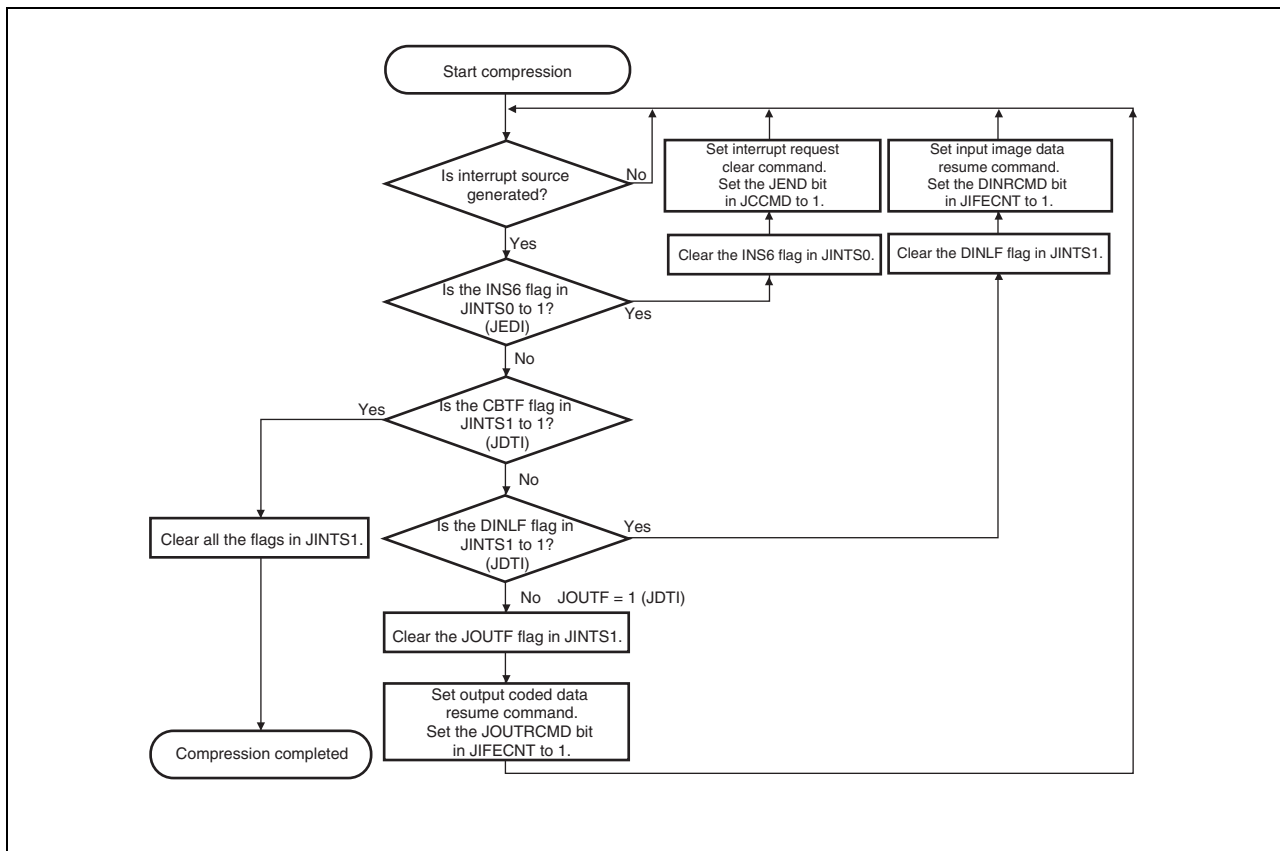

Figure 44.3 Compression Process Flow

(3) JPEG Coded Data Format

Figure 44.4 shows the data output stream in compression. The amount of coded data from SOI to EOI is indicated by JCDTCU, JCDTCM, and JCDTCD. When both JCDRIU and JCDRID are set to H'0000 0000, the following markers are not output.

- DRI marker
- RST marker (in compressed image data)

Figure 44.4 JPEG Coded Data Format

DQT: Not output for unused table.

DHT: Output in order DC0, AC0, DC1, and AC1. Not output for unused table.

SOF0: Component identifiers are C1 = first color component, C2 = second color component, and C3 = third color component.

SOS: Scan component selectors are CS1 = first color component, CS2 = second color component, and CS3 = third color component.

Header Volume (Reference):

- SOI: 2 bytes (FFD8)
- DQT: 134 bytes when two quantization tables are used, 199 bytes when three quantization tables are used (± 65 bytes/table increase or decrease)
- DRI: 6 bytes
- SOF0: 19 bytes (4:2:2)
- DHT: 420 bytes (two tables are used)
- SOS: 14 bytes (4:2:2)
- EOI: 2 bytes (FFD9)

(4) Table Setting**(a) Quantization Table Specification**

The order of addresses shown in 8×8 blocks corresponds to that of the register addresses. Do not access this table while the JCU is in processing.

Table 44.2 Quantization Table

00	01	02	03	04	05	06	07
08	09	0A	0B	0C	0D	0E	0F
10	11	12	13	14	15	16	17
18	19	1A	1B	1C	1D	1E	1F
20	21	22	23	24	25	26	27
28	29	2A	2B	2C	2D	2E	2F

JCQTBL0 (H'E801 7100) = H'00

JCQTBL0 (H'E801 7101) = H'01

JCQTBL0 (H'E801 7102) = H'02

JCQTBL0 (H'E801 7103) = H'03

:

JCQTBL0 (H'E801 713F) = H'3F

(b) Huffman Table Specification

Examples of the Huffman table specification given in the ITU-T T81 Annex K.3.3 recommended by JPEG are shown below. In compression, the following settings must be specified for all the codes so that Huffman codes can be generated for all the group numbers.

- DC Huffman table: The number of codes for each code length is 12.
The group numbers in order of frequency of occurrence are 12.
- AC Huffman table: The number of codes for each code length is 162.
The zero run length/the group numbers in order of frequency of occurrence are 162.

Do not access the following tables while the JCU is in processing. In particular, read access is prohibited.

- Table K.3/T81
 - JCHTBD0 (H'E801 7200) = H'00
 - JCHTBD0 (H'E801 7201) = H'01
 - JCHTBD0 (H'E801 7202) = H'05
 - JCHTBD0 (H'E801 7203) = H'01
 - :
 - JCHTBD0 (H'E801 721B) = H'0B
- Table K.4/T81
 - JCHTBD1 (H'E801 7300) = H'00
 - JCHTBD1 (H'E801 7301) = H'03
 - JCHTBD1 (H'E801 7302) = H'01
 - JCHTBD1 (H'E801 7303) = H'01

 - JCHTBA1 (H'E801 7323) = H'02
 - :
 - JCHTBA1 (H'E801 73D1) = H'FA

(5) Input Pixel Format

Image data in the YCbCr422 format can be input to this module. Allocation of data in the YCbCr422 format can be changed by the DINSWAP bits in JIFECNT as shown below.

- When the DINSWAP bits = 000

b63	b56	b55	b48	b47	b40	b39	b32	b31	b24	b23	b16	b15	b8	b7	b0
Y0 8 bits	Cb0 8 bits	Y1 8 bits	Cr0 8 bits	Y2 8 bits	Cb1 8 bits	Y3 8 bits	Cr1 8 bits								

- When the DINSWAP bits = 001

b63	b56	b55	b48	b47	b40	b39	b32	b31	b24	b23	b16	b15	b8	b7	b0
Cb0 8 bits	Y0 8 bits	Cr0 8 bits	Y1 8 bits	Cb1 8 bits	Y2 8 bits	Cr1 8 bits	Y3 8 bits								

- When the DINSWAP bits = 010

b63	b56	b55	b48	b47	b40	b39	b32	b31	b24	b23	b16	b15	b8	b7	b0
Y1 8 bits	Cr0 8 bits	Y0 8 bits	Cb0 8 bits	Y3 8 bits	Cr1 8 bits	Y2 8 bits	Cb1 8 bits								

- When the DINSWAP bits = 100

b63	b56	b55	b48	b47	b40	b39	b32	b31	b24	b23	b16	b15	b8	b7	b0
Y2 8 bits	Cb1 8 bits	Y3 8 bits	Cr1 8 bits	Y0 8 bits	Cb0 8 bits	Y1 8 bits	Cr0 8 bits								

- When the DINSWAP bits = 101

b63	b56	b55	b48	b47	b40	b39	b32	b31	b24	b23	b16	b15	b8	b7	b0
Cb1 8 bits	Y2 8 bits	Cr1 8 bits	Y3 8 bits	Cb0 8 bits	Y0 8 bits	Cr0 8 bits	Y1 8 bits								

- When the DINSWAP bits = 110

b63	b56	b55	b48	b47	b40	b39	b32	b31	b24	b23	b16	b15	b8	b7	b0
Y3 8 bits	Cr1 8 bits	Y2 8 bits	Cb1 8 bits	Y1 8 bits	Cr0 8 bits	Y0 8 bits	Cb0 8 bits								

- When the DINSWAP bits = 111

b63	b56	b55	b48	b47	b40	b39	b32	b31	b24	b23	b16	b15	b8	b7	b0
Cr1 8 bits	Y3 8 bits	Cb1 8 bits	Y2 8 bits	Cr0 8 bits	Y1 8 bits	Cb0 8 bits	Y0 8 bits								

(6) Output Coded Data

In the case of compression, coded data are output. This module handles the output of coded data in 16-bit units. For this reason, if the coded data have an odd code length (are fractional), the final code for output will be H'D9FF.

The JOUTSWAP bits in JIFECNT can be used to alter the arrangement of coded data in the output.

44.3.2 Decompression

(1) Overview of Processing

The decompression process flows are described below.

1. The JPEG core is activated.
2. Coded data is transferred from the external buffer to the JCU.
If the count mode for stopping the input of coded data is on, reading is stopped each time the amount of coded data set in JIFDSLCL is read. Reading is resumed by setting the JINRCMD bit in JIFDCNT to 1. When the JINRINI bit in JIFDCNT is zero, the addresses for reading on resumption are continued from the addresses in the previous round of transfer.
When the JINRINI bit is one, the address set in JIFDSA is used on resumption. Reading is stopped when the end of the coded data is detected.
If the count mode for stopping the input of coded data is off, reading is continued until the end of code is detected. With this module, more coded data may be read than the coded data size since coded data reading is continued until the end of code is detected.
3. Coded data is input to the JPEG core.
The input data is processed in MCUs at any time in the JPEG core.
4. Image data is transferred in MCUs from the JCU to the external buffer.
When the count mode for stopping the output of image data lines is on, writing is stopped each time the number of image data lines set in JIFDDLCL is written. Writing is resumed by setting the DOUTRCMD bit in JIFECNT to 1. When the DOUTRINI bit in JIFDCNT is zero, the addresses for writing on resumption are continued from the addresses in the previous round of transfer.
When the DOUTRINI bit is one, the address set in JIFDDA is used on resumption. Writing is stopped when one frame of image data is completely transferred.
If the count mode for stopping the output of image data lines is off, writing is continued until one frame of image data is completely transferred.
5. Decompression is completed after one frame of data is processed completely.

(a) Initial Settings

- When the INT3 bit in JINTE0 is set to 0:
After completing the JPEG core settings and input/output buffer settings and transferring coded data to the external buffer, activate this module by setting the JSRT bit in JCCMD to 1.
- When the INT3 bit in JINTE0 is set to 1:
After completing the JPEG core settings and input buffer settings and transferring coded data to the external buffer, activate this module by setting the JSRT bit in JCCMD to 1.
When the image size and pixel format become readable after the coded data has been decompressed, the INS3 bit in JINTS0 is set. At this time, decompression is temporarily stopped.
After the image size and pixel format have been read, set the output buffer.
Setting the JRST bit in JCCMD to 1 after interrupt handling resumes decompression.

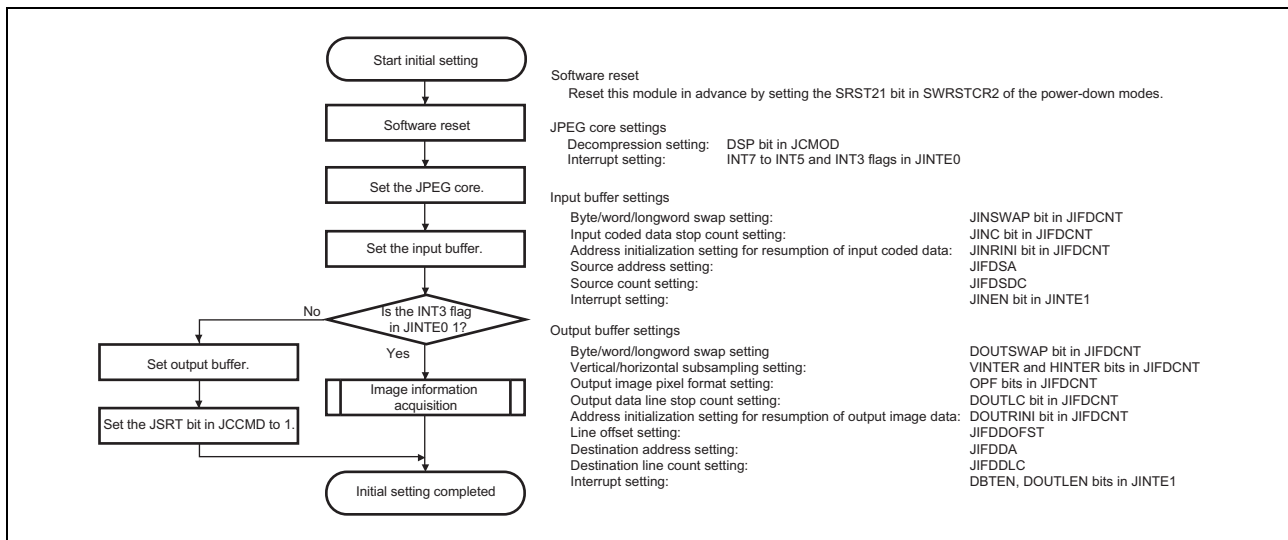

Figure 44.5 Decompression Initial Setting Flow

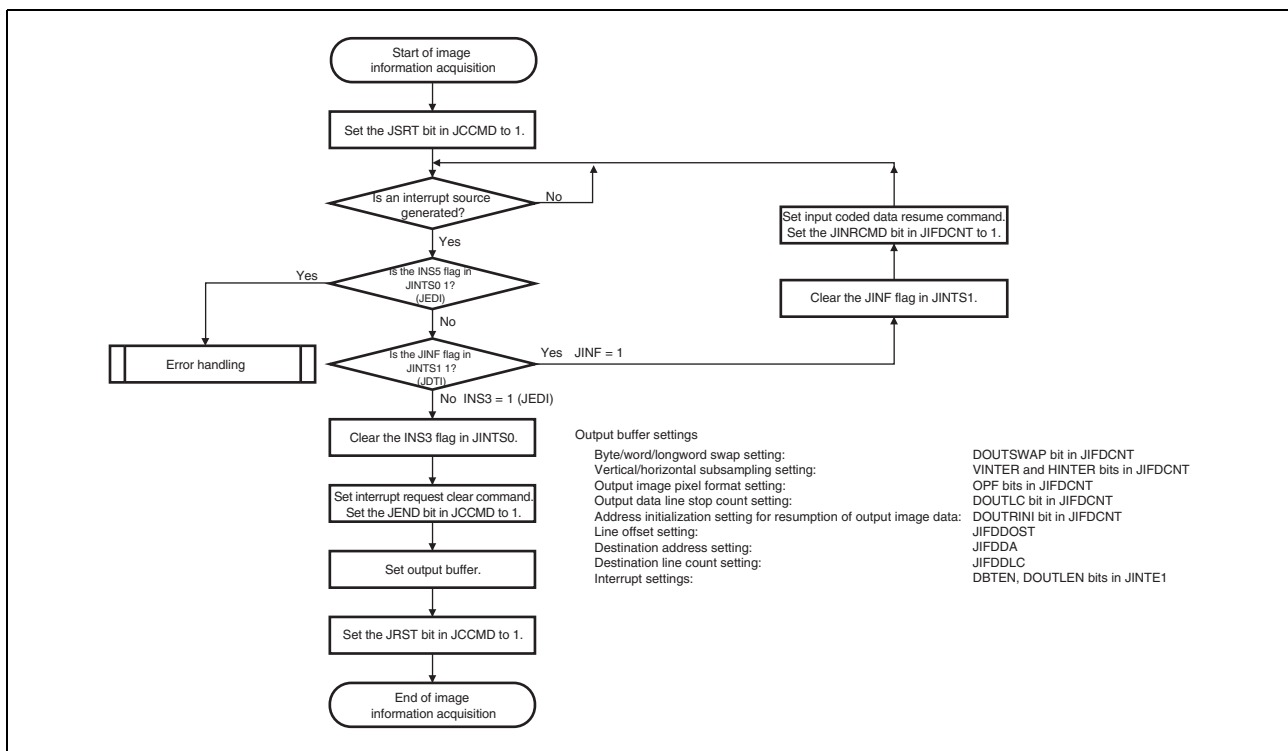

Figure 44.6 Image Information Acquisition Flow

(b) Decompression Process

The decompression process flows are described below.

- When JPEG decompression process has been completed, the INS6 bit in JINTS0 is set to 1. However, the JCU continues processing since the image data remains to be transferred. The DBTF bit in JINTS1 is set to 1 when the last image data is transferred. The interrupt source is cleared by writing 0 to the INS6 bit. However, the interrupt request asserted by this interrupt source cannot be cleared by writing 0 to the INS6 bit. Set an interrupt request clear command (by setting the JEND bit in JCCMD to 1) to clear the interrupt request.
- When the JCU has completed decompression process and all image data has been transferred, the DBTF flag in JINTS1 is set to 1. When the DBTEN bit in JINTE1 is 1 here, an interrupt is generated. The interrupt source is cleared by writing 0 to the DBTF flag.
- If the count mode for stopping input coded data is on, when the specified amount of coded data set in JIFSDC have been read, the JINF flag in JINTS1 is set to 1, and reading is stopped. When the JINEN bit in JINTE1 is 1 here, an interrupt is generated. An interrupt source is cleared by writing 0 to the JINF bit. Setting the JINRCMD bit in JIFDCNT to 1 resumes reading.

When the JINRINI bit in JIFDCNT is zero, the addresses for reading on resumption are continued from the addresses in the previous round of transfer.

When the JINRINI bit is one, the address set in JIFDSA is used on resumption.

- If the count mode for stopping the output image data is on, when the specified number of image data lines set in JIFDDL have been written, the DOUTLF flag in JINT1 is set to 1, and writing is stopped. When the DOUTLEN bit in JINTE1 is 1 here, an interrupt is generated. An interrupt source is cleared by writing 0 to the DOUTLF bit. Setting the DOUTRCMD bit in JIFDCNT to 1 resumes writing.

When the DOUTRINI bit in JIFDCNT is zero, the addresses for writing on resumption are continued from the addresses in the previous round of transfer.

When the DOUTRINI bit is one, the address set in JIFDDA is used on resumption.

Figure 44.7 Decompression Process Flow

(c) Error Handling

If the INS5 bit in JINTS0 is 1, it indicates that there is an error in the input JPEG coded data and that the decompression process by this module has been ended. Read the ERR bits in JCDERR to determine the cause of the error. The interrupt signal asserted due to the interrupt source indicated by the INS5 bit cannot be negated by clearing the interrupt status through 0-writing. To clear the interrupt request, set the interrupt request clear command (by setting the JEND bit in JCCMD to 1).

If decompression or compression is to proceed after error handling is completed, start by making the initial settings.

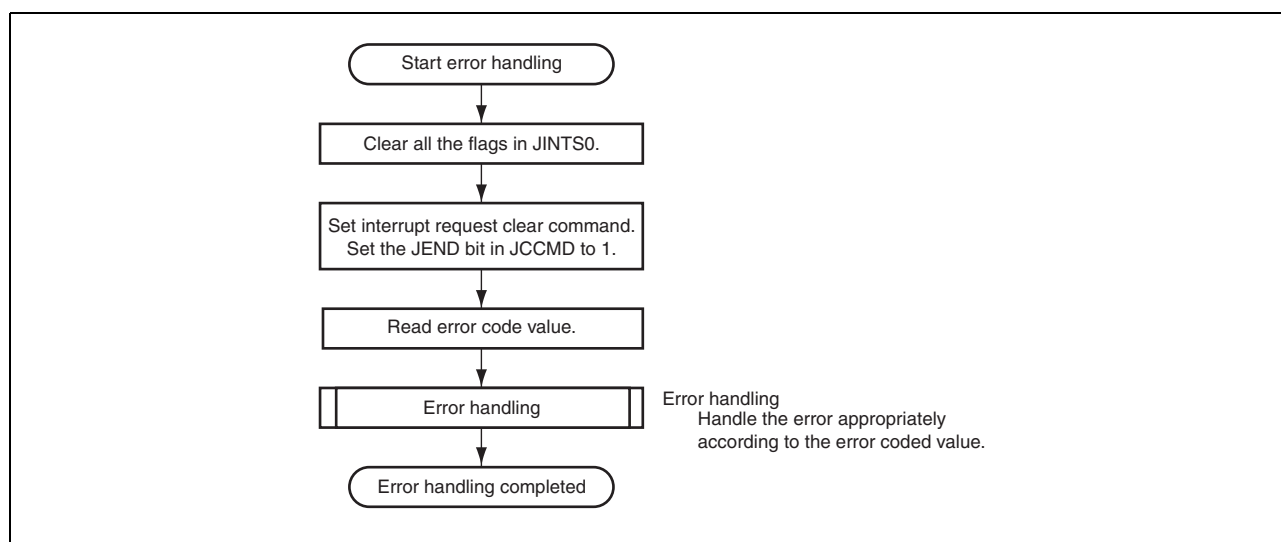

Figure 44.8 Error Handling Flow

(2) Input JPEG Coded Data

Markers to be processed in decompression are SOI, SOF0, SOS, DQT, DHT, DRI, RSTm, and EOI. Other markers except for the error markers shown below are ignored even if they are read.

The JINSWAP bits in JIFDCNT can be used to alter the arrangement for the input of coded data.

(3) JPEG Decompression Errors

(a) Error Marker

If a marker error is found while analyzing compressed data for decompression, the code to identify the error type (shown in Table 44.3) is set to ERR bits in JCDERR. When an error is detected, the JCU generates an interrupt signal and terminates decoding. The stored code value will be set to B'1010 (default value) at the start of processing of the next frame or after a bus reset.

Table 44.3 Decompression Error Codes

Code	Description
B'0000	Normal
B'0001	SOI not detected: SOI not detected until EOI detected
B'0010	SOF1 to SOFF detected
B'0011	Unprovided pixel format detected
B'0100	SOF accuracy error: Other than 8 detected
B'0101	DQT accuracy error: Other than 0 detected
B'0110	Component error 1: The number of SOF0 header components detected is other than 1, 3, or 4
B'0111	Component error 2: The number of components differs between SOF0 header and SOS
B'1000	SOF0, DQT, and DHT not detected when SOS detected
B'1001	SOS not detected: SOS not detected until EOI detected
B'1010	EOI not detected (default)
B'1011	Restart interval data number error detected
B'1100	Image size error detected
B'1101	Last MCU data number error detected
B'1110	Block data number error detected

(b) Huffman Coded Segment Error

During the compressed data analysis in decompression operation, if there is an increase or decrease in the decoded data count due to an error resulting from bit reversal or missing data in the Huffman-coded segment, determine the error type, and set the error code in the ERR bit in JCDERR. Table 44.4 lists the segment error codes. The error code is set, interrupt signal is issued, and the process is ended only if the bits INT7 to INT5 in JINTE0 corresponding to the detected error is set to 1. The set code value will turn to the default value (B'1010) at the start of processing of the next frame or after a bus reset.

However, in this error detection, if an error in the Huffman-coded segment does not result in an alteration in the decoded data count, the error will go undetected.

[Example]

The number of data in a Huffman coded segment with pixel format setting YCbCr422, DRI = 2, X = 80 pixels, and Y = 8 pixels

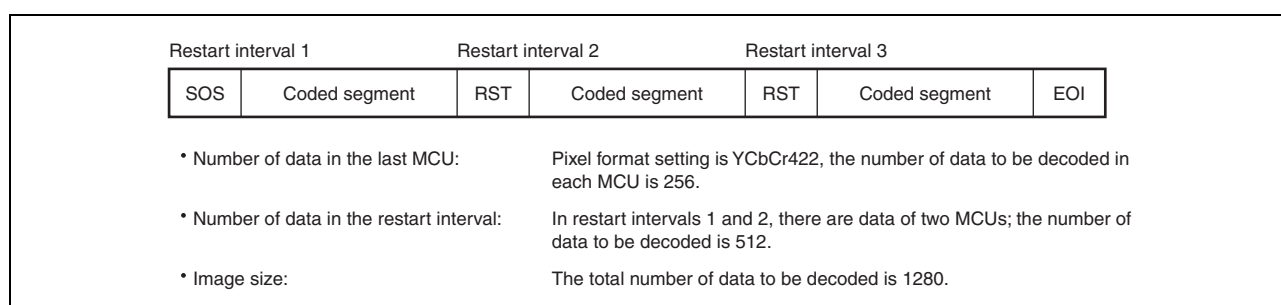

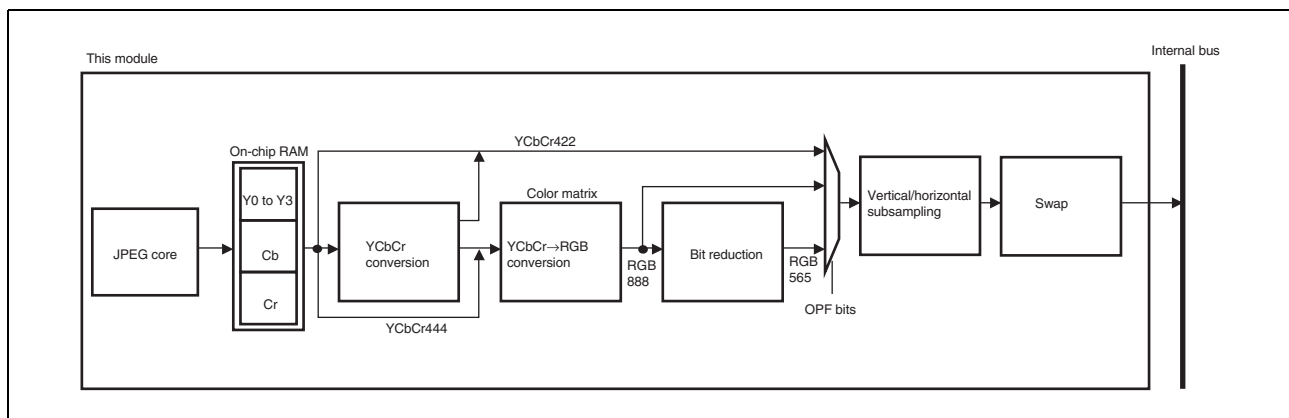

Figure 44.9 Huffman Coded Segment

Table 44.4 Segment Error Codes

Code	Description
B'0000	Normal
B'1011	Restart interval data number error: The number of data in each interval is compared with the number of data specified by the DRI marker. If an interval has more or less data that is specified by the DRI marker, the decompression error code (1011) is set. The last interval which is shorter than the restart interval is not compared. If the DRI marker segment is not placed or the specified number is 00, an error is not detected even if the RST _m marker is placed. Also an <i>m</i> which indicates the order of RST _m marker modulo 8 (<i>m</i> = 0 to 7) is exempt from the error detection analysis. When the INT7 bit in JINTE0 is set to 0, this error is not detected.
B'1100	Image size error: The data number of an image which is calculated from the number of lines specified by the frame parameter and the number of samples per line is compared with the total number of data from SOS to EOI (in pixel units). If the numbers of data do not match, the decompression error code (1100) is set. When the INT6 bit in JINTE0 is set to 0, this error is not detected. The data number of an image is shown in MCU units. Thus the number of lines and the number of samples per line for calculation need to be shown in MCU units.
B'1101	Last MCU data number error: Whether the number of data in the MCUs at the EOI detection is shown in MCU units is checked and fractions are detected. If error (1100) occurs simultaneously, error (1100) has priority. When the INT5 bit in JINTE0 is set to 0, this error is not detected.
B'1110	Block data number error: Whether a block is an 8 × 8 array is checked; the check is performed for fractions. When bits INT7 to INT5 in JINTE0 are all set to 0, this error is not detected.

44.3.3 Output Pixel Format in Decompression

This module is capable of decompressing JPEG encoded data created in the YCbCr444, YCbCr422, YCbCr411 and YCbCr420 formats. The pixel format of the output image will be YCbCr422, ARGB8888, or RGB565. The flow of conversion of decompressed data to the given output pixel format is shown below.

**Figure 44.10 Block Diagram of Output Pixel Format Conversion in Decompression**

(1) On-chip RAM

Data decoded by the JPEG core are stored in MCUs on RAM in this module.

(2) YCbCr Conversion

When data are to be output in the ARGB8888 or RGB565 format, data in the YCbCr422, YCbCr411 or YCbCr420 format are first converted to the YCbCr444 format.

When data are to be output in the YCbCr422 format, data in the YCbCr444, YCbCr411 or YCbCr420 format are converted to the YCbCr422 format.

Conversion is performed using simple interpolation.

(3) YCbCr → RGB Conversion

Data in the YCbCr444 format are converted to the RGB888 format. The following formulae are used.

$$R = 1.000Y + 1.402Cr$$

$$G = 1.000Y - 0.344Cb - 0.714Cr$$

$$B = 1.000Y + 1.772Cb$$

(4) Bit Reduction

RGB888 data is reduced to RGB565 data. The lower three bits of red and blue, and lower two bits of green are removed.

(5) Output Pixel Format Selection

The pixel format to be output is selected by the OPF bit in JIFDCNT.

Allocation of data (while the DOUTSWAP bits in JIFDCNT = 000) in the pixel format is shown below.

- YCbCr422 (32 bits/pixel)

b31	b24 b23	b16 b15	b8 b7	b0
Y0 8 bits	Cb 8 bits	Y1 8 bits	Cr 8 bits	

- ARGB8888 (32 bits/pixel)

b31	b24 b23	b16 b15	b8 b7	b0
*	Red 8 bits	Green 8 bits	Blue 8 bits	

Note: * This value is determined by the ALPHA[7:0] bits in JIFDADT.

- RGB565 (16 bits/pixel)

b15	b11 b10	b5 b4	b0
Red 5 bits	Green 6 bits	Blue 5 bits	

(6) Vertical/Horizontal Subsampling

The output data can be horizontally and vertically subsampled according to the VINTER and HINTER bit setting in JIFDCNT.

Figure 44.11 to Figure 44.13 show line subsampling modes.

For the output formats ARGB8888 and RGB565, one cell represents one pixel in the figures.

For the output format YCbCr422, one cell represents one set of Y0Cb0Y1Cr0 in the figures.

As subsampling is carried out by minimum coded units (MCU), the numbers of the horizontal and vertical block units will vary according to the decompressed pixel format.

Table 44.5 and Table 44.6 show the values of n and m in the figures.

Horizontal:

Table 44.5 Number of Horizontal Blocks

Compression Format	Output Format	n
YCbCr444	YCbCr422	1/2
YCbCr444	ARGB8888, RGB565	1
YCbCr422	YCbCr422	1
YCbCr422	ARGB8888, RGB565	2
YCbCr411	YCbCr422	2
YCbCr411	ARGB8888, RGB565	4
YCbCr420	YCbCr422	1
YCbCr420	ARGB8888, RGB565	2

Vertical:

Table 44.6 Number of Vertical Blocks

Compression Format	Output Format	m
YCbCr444	YCbCr422	1
YCbCr444	ARGB8888, RGB565	1
YCbCr422	YCbCr422	1
YCbCr422	ARGB8888, RGB565	1
YCbCr411	YCbCr422	1
YCbCr411	ARGB8888, RGB565	1
YCbCr420	YCbCr422	2
YCbCr420	ARGB8888, RGB565	2

- Subsampling into 1/2
Even lines are skipped by subsampling.

Figure 44.11 MCU when subsampling into 1/2 is selected

- Subsampling into 1/4
The second, third, and fourth lines are skipped by subsampling.

Figure 44.12 MCU when subsampling into 1/4 is selected

- Subsampling into 1/8
The second, third, fourth, fifth, sixth, seventh, and eighth lines are skipped by subsampling.

Figure 44.13 MCU when subsampling into 1/8 is selected

(7) Swap

Allocation of data can be changed by the DOUTSWAP bits in JIFECNT.

44.3.4 Storing Image Data

Figure 44.14 shows the buffer area for storing the image data.

- Start address
Compression: JIFESA
Decompression: JIFDDA
- Horizontal size
Compression, decompression: JCHSZU, JCHSZD
- Vertical size
Compression, decompression: JCVSAU, JCVSZD
- Offset
Compression: JIFESOFST
Decompression: JIFDDOFST

Figure 44.14 Image of Storing Image Data

44.4 Interrupts

Two types of interrupt requests, namely compression/decompression process interrupt request (JEDI) and data transfer interrupt request (JDTI), are available in this module. The two types of interrupt requests are each related to multiple sources. The interrupt request cancellation methods differ depending on the source of the interrupt request.

44.4.1 Compression/Decompression Process Interrupt Request (JEDI)

The flags in JINTS0 indicate compression/decompression-related sources. The interrupt requests asserted by these interrupt sources cannot be negated by clearing the corresponding interrupt status bits to 0. Issue an interrupt request clear command (by setting the JEND bit in JCCMD to 1) to clear the interrupt request. When a flag in JINTS0 is set to 1, a compression/decompression process interrupt request is sent to the interrupt controller.

(1) Compression

- JPEG compression process end

When the INS6 bit in JINTS0 is 1, the JPEG compression process has been successfully completed. After all of the coded data is transferred, the JCU completes compression.

(2) Decompression

- JPEG decompression process end

When the INS6 bit in JINTS0 is 1, the JPEG decompression process has been successfully completed. After all of the image data is transferred, JCU completes decompression.

- JPEG decompression error occurrence

When the INS5 bit in JINTS0 is 1, the input JPEG coded data has an error and the JCU has stopped the decompression process. Read the error code (ERR bits in JCDERR) and identify the error source. This interrupt occurs when any of the INT7 to INT5 bits in JINTE0 is 1.

- Request for reading the image size and pixel format

When the INS3 bit in JINTS0 is 1, JPEG coded data has been input and information regarding the image size and pixel format can be read. Since the JPEG decompression process is suspended, resume the JPEG decompression process by setting the process stop clear command after accessing the necessary registers. This interrupt occurs when the INT3 bit in JINTE0 is 1.

44.4.2 Data Transfer Interrupt Request (JDTI)

The flags in JINTS1 are the interrupt sources for transferring the image data and coded data. The interrupt requests asserted by these interrupt sources can be negated by clearing the corresponding interrupt status bits to 0.

(1) Compression

- Interrupt request generated after the specified number of input image data lines has been read

When the DINLF bit in JINTS1 is 1, the number of image data lines specified by JIFESLC has been transferred; transfer the rest of the image data to the external buffer and resume transferring the data from the external buffer. A data transfer interrupt request is sent when the DINLEN bit in JINTE1 is 1.

- Interrupt request generated after the specified amount of output coded data have been written to

When the JOUTF bit in JINTS1 is 1, the amount of coded data specified by JIFEDDC has been transferred. Secure a space for the next coded data in the external buffer, and resume transfer process. The data transfer interrupt request is sent when the JOUTEN bit in JINTE1 is 1.

- Interrupt request generated after all processes are completed

When the CBTF bit in JINTS1 is 1, the JCU has completed compression and transferred all of the coded data. The data transfer interrupt request is sent when the CBTEN bit in JINTE1 is set to 1.

(2) Decompression

- Interrupt request generated after the specified number of output image data lines has been written to
When the DOUTLF bit in the JINTS1 is 1, the number of image data lines specified by JIFDDL has been transferred. Secure a space for the next coded data in the external buffer, and resume transfer process. A data transfer interrupt request is sent when the DOUTLEN bit in JINTE1 is 1.
- Interrupt request generated after the specified amount of input coded data has been read
The JINF bit in JINTS1 becomes 1 when the amount of coded data specified by JIFDSDC has been transferred. Secure the next coded data in the external buffer, and resume transfer process. A data transfer interrupt is also sent at this time if the JINEN bit in JINTE1 is 1.
- Interrupt request generated after all processes are completed
The DBTF bit in JINTS1 becomes 1 when the JCU has completed decompression and transferred all of the coded data. A data transfer interrupt request is also sent at this time if the DBTEN bit in JINTE1 is set to 1.

44.5 Bus Reset Processing

Issuing the bus reset command (setting the BRST bit in JCCMD to 1) causes a bus reset.

When the JCU is in operation, the bus reset command should not be issued. Registers below are initialized by a bus reset.

- JPEG code data count upper register (JCDTCU)
- JPEG code data count middle register (JCDTCM)
- JPEG code data count lower register (JCDTCD)
- JPEG interrupt status register 0 (JINTS0)
- JPEG code decode error register (JCDERR)
- JPEG code reset register (JCRST)

45. EthernetAVB

This module is only incorporated in the RZ/A1LU.

45.1 Overview

The EthernetAVB incorporates an Ethernet controller (E-MAC) that conforms to the definition of the MAC (Media Access Control) layer for Ethernet in the IEEE 802.3 standard.

When connected with a physical-layer LSI chip (PHY-LSI) that complies with the standard, the E-MAC is able to transmit and receive Ethernet (IEEE 802.3) frames. The E-MAC has a single MAC layer interface.

The EthernetAVB has a dedicated direct memory access controller (AVB-DMAC) for transferring transmitted Ethernet frames to and received Ethernet frames from respective storage areas in the on-chip RAM at high speed.

The AVB-DMAC is compliant with the following three standards formulated for IEEE 802.1BA: the IEEE 802.1AS timing and synchronization protocol, the IEEE 802.1Qav real-time transfer, and the IEEE 802.1Qat stream reservation protocol.

For the on-chip RAM, see section 40, On-Chip RAM.

45.1.1 Specifications (Functions)

Table 45.1 lists the specifications of the EthernetAVB module.

Table 45.1 Specifications (Functions)

Item	Description
Protocol	Flow control conforming with the IEEE 802.3x standard
Data transmission and reception	Transmission and reception of Ethernet (IEEE 802.3) frames
Transfer speed	Supports transfer at 10 and 100 Mbps
Mode	Full-duplex mode
Interface	Supports the IEEE 802.3 standard MII (Media Independent Interface)
Summary of the EthernetAVB function	<p>An intelligent frame separation DMAC (AVB-DMAC) conforming with the following standards stipulated for IEEE 802.1BA:</p> <ul style="list-style-type: none"> • IEEE 802.1AS (time synchronization protocol) • IEEE 802.1Qav (real-time transfer) • IEEE 1722 (AVTP presentation timestamp) <p>IEEE 802.1Qat is supported by software.</p> <ul style="list-style-type: none"> • Descriptor management system • Identification and sorting of frame data, and extraction and gathering of valid video data • Controllable interrupt frequency (reducing the load on the CPU)

45.1.2 Block Diagram

Figure 45.1 is a block diagram of the EthernetAVB.

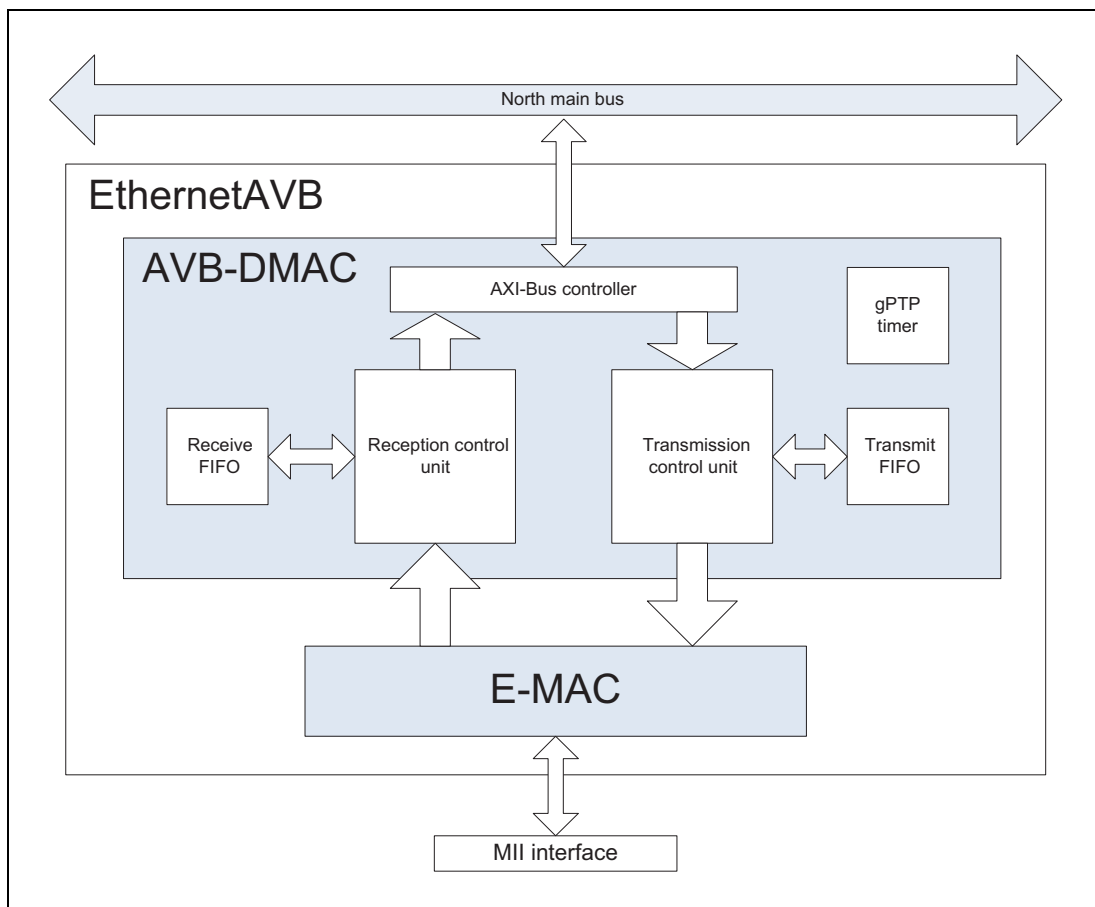

Figure 45.1 Block Diagram of EthernetAVB

45.1.3 I/O Pins

Table 45.2 lists the pins for use by EthernetAVB.

Table 45.2 Pin Configuration

Pin Name	I/O	Function
ET_TXD[3:0]	O	Transmit data signal
ET_TXEN	O	Transmit data enable signal
ET_RXD[3:0]	I	Receive data signal
ET_RXDV	I	Receive data enable signal
ET_TXCLK	I	Transmit clock signal
ET_RXCLK	I	Receive clock signal
ET_TXER	O	Transmit error signal
ET_RXER	I	Reception error signal
ET_MDC	O	Management information transfer clock signal
ET_MDIO	I/O	Management information transmit/receive data
ET_CRSD	I	Carrier detection signal
ET_COL	I	Collision detection signal
AVB_CAPTURE	I	Signal for capturing AVTP presentation times
AVB_GPTP_ EXTERN	I	External clock signal for gPTP timer

45.2 Register Descriptions

Table 45.3 and Table 45.4 list the EthernetAVB related registers and their configurations.

Table 45.3 Configuration of AVB-DMAC-related Registers (1/2)

Register Name	Symbol	Address	Access size
AVB-DMAC mode register	CCC	H'E821 5000	32
Descriptor base address table register	DBAT	H'E821 5004	32
Descriptor base address load request register	DLR	H'E821 5008	32
AVB-DMAC status register	CSR	H'E821 500C	32
Current descriptor address register q (q = 0 to 21)	CDARq	H'E821 5010+q*4	32
Error status register	ESR	H'E821 5088	32
Receive configuration register	RCR	H'E821 5090	32
Receive queue configuration register i (i = 0 to 4)	RQCi	H'E821 5094+i*4	32
Receive padding configuration register	RPC	H'E821 50B0	32
Unread frame counter stop level register	UFCS	H'E821 50C0	32
Unread frame counter register i (i = 0 to 4)	UFCVi	H'E821 50C4+i*4	32
Unread frame counter decrement register i (i = 0 to 4)	UFCDi	H'E821 50E0+i*4	32
Separation filter offset register	SFO	H'E821 50FC	32
Separation filter pattern register i (i = 0 to 31)	SFPi	H'E821 5100+i*4	32
Separation filter mask register i (i = 0, 1)	SFMi	H'E821 51C0+i*4	32
Transmit configuration register	TGC	H'E821 5300	32
Transmit configuration control register	TCCR	H'E821 5304	32
Transmit status register	TSR	H'E821 5308	32
Time stamp FIFO access register 0	TFA0	H'E821 5310	32
Time stamp FIFO access register 1	TFA1	H'E821 5314	32
Time stamp FIFO access register 2	TFA2	H'E821 5318	32
CBS increment value register c (c = 0, 1)	CIVRc	H'E821 5320+c*4	32
CBS decrement value register c (c = 0, 1)	CDVRc	H'E821 5328+c*4	32
CBS upper limit register c (c = 0, 1)	CULc	H'E821 5330+c*4	32
CBS lower limit register c (c = 0, 1)	CLLc	H'E821 5338+c*4	32
Descriptor interrupt control register	DIC	H'E821 5350	32
Descriptor interrupt status register	DIS	H'E821 5354	32
Error interrupt control register	EIC	H'E821 5358	32
Error interrupt status register	EIS	H'E821 535C	32
Receive interrupt control register 0	RIC0	H'E821 5360	32
Receive interrupt status register 0	RIS0	H'E821 5364	32
Receive interrupt control register 1	RIC1	H'E821 5368	32
Receive interrupt status register 1	RIS1	H'E821 536C	32
Receive interrupt control register 2	RIC2	H'E821 5370	32
Receive interrupt status register 2	RIS2	H'E821 5374	32
Transmit interrupt control register	TIC	H'E821 5378	32
Transmit interrupt status register	TIS	H'E821 537C	32
Interrupt summary status register	ISS	H'E821 5380	32
gPTP configuration control register	GCCR	H'E821 5390	32
gPTP maximum transit time register	GMTT	H'E821 5394	32

Table 45.3 Configuration of AVB-DMAC-related Registers (2/2)

Register Name	Symbol	Address	Access size
gPTP presentation time comparison register	GPTC	H'E821 5398	32
gPTP timer increment register	GTI	H'E821 539C	32
gPTP timer offset configuration register i (i = 0 to 2)	GTOi	H'E821 53A0+i*4	32
gPTP interrupt control register	GIC	H'E821 53AC	32
gPTP interrupt status register	GIS	H'E821 53B0	32
gPTP presentation time capture register	GCPT	H'E821 53B4	32
gPTP timer capture register i (i = 0 to 2)	GCTi	H'E821 53B8+i*4	32
gPTP capture event control register	GCEC	H'E821 53D8	32

Table 45.4 Configuration of E-MAC-related Registers

Register Name	Symbol	Address	Access size
E-MAC mode register	ECMR	H'E821 5500	32
Receive frame length register	RFLR	H'E821 5508	32
E-MAC status register	ECSR	H'E821 5510	32
E-MAC interrupt permission register	ECSIPR	H'E821 5518	32
PHY interface register	PIR	H'E821 5520	32
Automatic PAUSE frame register	APR	H'E821 5554	32
Manual PAUSE frame register	MPR	H'E821 5558	32
PAUSE frame transmit counter	PFTCR	H'E821 555C	32
PAUSE frame receive counter	PFRCR	H'E821 5560	32
Automatic PAUSE frame retransmission count register	TPAUSER	H'E821 5564	32
MAC address high register	MAHR	H'E821 55C0	32
MAC address low register	MALR	H'E821 55C8	32
CRC error frame receive counter register	CEFCR	H'E821 5740	32
Frame receive error counter register	FRECR	H'E821 5748	32
Too-short frame receive counter register	TSFRCR	H'E821 5750	32
Too-long frame receive counter register	TLFRCR	H'E821 5758	32
Residual-bit frame receive counter register	RFCR	H'E821 5760	32
Multicast address frame receive counter register	MAFCR	H'E821 5778	32

45.2.1 AVB-DMAC Mode Register (CCC)

The CCC register specifies the operating mode of the AVB-DMAC.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b1, b0	OPC[1:0]	Operating Mode Configuration B'00: Reset mode B'01: Configuration mode B'10: Operation mode B'11: Standby mode

FCE (Flow Control Enable) Bit

This bit enables flow control by the E-MAC.

Writing to this bit is only possible when the current operating mode is configuration mode.

LBME (Loopback Mode Enable) Bit

This bit enables loopback mode.

In loopback mode, the transmission lines are internally connected to the reception lines. When loopback mode is to be used, the Ethernet transmission clock must be supplied to the MII interface. A received clock signal is not required. Writing to this bit is only possible when the current operating mode is configuration mode.

CAUTION

Data for transmission are still output normally. To eliminate effects on external modules, pin control should be applied to block the output of data. For pin control, see section 41., Ports.

BOC (First Byte Specification) Bit

Specifies the allocation of the first byte from a received Ethernet frame to the on-chip RAM.

This configuration setting does not affect the format and filter parameters of the descriptor in the on-chip RAM.

Writing to this bit is only possible when the current operating mode is configuration mode.

Figure 45.2 to Figure 45.4 show how data from frames received via the Ethernet connection are stored in the on-chip RAM.

Figure 45.2 Data for Reception in an Ethernet Frame

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

DPTR+8	Byte8							Byte9							Byte10							Byte11										

Figure 45.4 When CCC.BOC = 1

CSEL[1:0] (gPTP Clock Select) Bits

These bits select the clock source for the gPTP timer.

Writing to these bits is only possible when the current operating mode is configuration mode.

DTSR (Data Transfer Suspend Request) Bit

This bit can suspend access to the on-chip RAM.

The access is suspended on completion of the transfer of the frame currently being transferred.

This function disables access to the on-chip RAM without affecting normal operation of the AVB-DMAC. Use this bit when exclusive control over the contents of the on-chip RAM is necessary, for example, in checking its integrity.

Note that the transmission and reception queues are not processed while access is suspended.

Change neither the AVB-DMAC settings nor the mode from when this bit is set to 1 to complete suspension until when the data transfer suspend status bit (CSR.DTS) is set to 1.

OPC[1:0] (Operating Mode Configuration) Bits

These bits specify the operating mode.

For the operating modes, see section 45.3.1.1, Operating Modes.

Writing to this bit is possible in any of the operating modes, but should not be done after the standby request has been issued to the EthernetAVB. For issuance of the standby request to the EthernetAVB, see section 42., Power-Down Modes.

45.2.2 Descriptor Base Address Table Register (DBAT)

The DBAT register is used to set the base address of the descriptor table.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 45.6 DBAT register contents

Bit Position	Bit Name	Function
b31 to b0	TA[31:0]	Table Address Base address of the descriptor table in the on-chip RAM

CAUTION

The setting of this bit must be a multiple of four (i.e. b0 and b1 must be set to 0).

TAL3[1:0] (Table Address) Bits

These bits specify the base address of the descriptor table in the on-chip RAM.

For the structure of this table, see section 45.3.3, Descriptors.

Writing to this bit is only possible when the current operating mode is configuration mode.

45.2.3 Descriptor Base Address Load Request Register (DLR)

The DLR register is used to issue a request to load the values from the current descriptor address register q (CDARq) for each queue to the descriptor base address table register (DBAT).

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b19	LBA19	Base Address Load Request (Rx15: Stream 13) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b18	LBA18	Base Address Load Request (Rx14: Stream 12) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b17	LBA17	Base Address Load Request (Rx13: Stream 11) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b16	LBA16	Base Address Load Request (Rx12: Stream 10) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b15	LBA15	Base Address Load Request (Rx11: Stream 9) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b14	LBA14	Base Address Load Request (Rx10: Stream 8) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b13	LBA13	Base Address Load Request (Rx9: Stream 7) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.

Table 45.7 DLR register contents (2/2)

Bit Position	Bit Name	Function
b12	LBA12	Base Address Load Request (Rx8: Stream 6) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b11	LBA11	Base Address Load Request (Rx7: Stream 5) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b10	LBA10	Base Address Load Request (Rx6: Stream 4) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b9	LBA9	Base Address Load Request (Rx5: Stream 3) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b8	LBA8	Base Address Load Request (Rx4: Stream 2) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b7	LBA7	Base Address Load Request (Rx3: Stream 1) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b6	LBA6	Base Address Load Request (Rx2: Stream 0) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b5	LBA5	Base Address Load Request (Rx1: Network Control) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b4	LBA4	Base Address Load Request (Rx0: Best Effort) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b3	LBA3	Base Address Load Request (Tx3: Stream Class A) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b2	LBA2	Base Address Load Request (Tx2: Stream Class B) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b1	LBA1	Base Address Load Request (Tx1: Network Control) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b0	LBA0	Base Address Load Request (Tx0: Best Effort) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.

LBAq (Base Address Load Request) Bits

Each bit is used to issue requests to load base addresses and to indicate that a base address is currently being loaded.

Setting a bit to 1 issues a request for loading the descriptor base address for the queue q ($q = 0$ to 21), to change the current descriptor address bit (CDARq.CDA) to $DBAT.TA + 8 * q$.

If transfer is currently in progress, loading is executed on completion of transfer for the current frame.

Completion of loading leads to automatic setting of the corresponding bit to 0.

For the transmission queues, base address load requests are executed even while fetching is in progress (the transmit start request bit in the transmit configuration control register (TCCR.TSRQt) is 1).

Therefore, be sure to check that fetching is not in progress before issuing a request.

Writing to a bit of this register is only possible when the current operating mode is configuration mode.

Only 1 can be written to this bit.

45.2.4 AVB-DMAC Status Register (CSR)

The CSR register is used to indicate the operating mode in which the AVB-DMAC is running and the individual communications states.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 45.8 CSR register contents

Bit Position	Bit Name	Function
b31 to b21	—	Reserved These bits are read as 0. The write value should be 0.
b20	RPO	Receive Process Status 0: Reception completed. 1: Reception is in progress.
b19	TPO3	Transmit Process Status 3 (Stream Class A) 0: Transmission completed. 1: Transmission is in progress.
b18	TPO2	Transmit Process Status 2 (Stream Class B) 0: Transmission completed. 1: Transmission is in progress.
b17	TPO1	Transmit Process Status 1 (Network Control) 0: Transmission completed. 1: Transmission is in progress.
b16	TPO0	Transmit Process Status 0 (Best Effort) 0: Transmission completed. 1: Transmission is in progress.
b16 to b9	—	Reserved These bits are read as 0. The write value should be 0.
b8	DTS	Data Transfer Suspend Status 0: Normal operation 1: Transmission is suspended.
b7 to b4	—	Reserved These bits are read as 0. The write value should be 0.
b3 to b0	OPS[3:0]	Operating Mode Status B'0001: Reset mode B'0010: Configuration mode B'0100: Operation mode B'1000: Standby mode Other settings are reserved.

RPO (Receive Process Status) Bit

This bit indicates whether a reception queue contains an unread received frame.

This bit being set to 1 indicates that a received frame is yet to be stored in the on-chip RAM.

- [Clearing conditions]
The current operating mode is not operation mode.
Received frames in the reception FIFO all being stored in the on-chip RAM.
- [Setting condition]
A received frame being stored in the reception FIFO (but not yet in the on-chip RAM)

TPO3 (Transmit Process Status 3) Bit

This bit indicates whether a class A stream is being transmitted.

This bit being set to 1 indicates that the AVB-DMAC is fetching data for transmission from the on-chip RAM, or the E-MAC is transmitting data.

- [Clearing conditions]
The current operating mode is not operation mode.
Completion of transfer of all frames for transmission from the transmission FIFO (the transmit start request bit in the transmit configuration control register (TCCR.TSRQ3) is 0)
- [Setting condition]
Transmission being started (by writing 1 to the transmit start request bit in the transmit configuration control register (TCCR.TSRQ3))

TPO2 (Transmit Process Status 2) Bit

This bit indicates whether a class B stream is being transmitted.

This bit being set to 1 indicates that the AVB-DMAC is fetching data for transmission from the on-chip RAM, or the E-MAC is transmitting data.

- [Clearing conditions]
The current operating mode is not operation mode.
Completion of transfer of all frames for transmission from the transmission FIFO (the transmit start request bit in the transmit configuration control register (TCCR.TSRQ2) is 0)
- [Setting condition]
Transmission being started (by writing 1 to the transmit start request bit in the transmit configuration control register (TCCR.TSRQ2))

TPO1 (Transmit Process Status 1) Bit

This bit indicates whether a network control is being transmitted.

This bit being set to 1 indicates that the AVB-DMAC is fetching data for transmission from the on-chip RAM, or the E-MAC is transmitting data.

- [Clearing conditions]
The current operating mode is not operation mode.
Completion of transfer of all frames for transmission from the transmission FIFO (the transmit start request bit in the transmit configuration control register (TCCR.TSRQ1) is 0)
- [Setting condition]
Transmission being started (by writing 1 to the transmit start request bit in the transmit configuration control register (TCCR.TSRQ1))

TPO0 (Transmit Process Status 0) Bit

This bit indicates whether a best effort is being transmitted.

This bit being set to 1 indicates that the AVB-DMAC is fetching data for transmission from the on-chip RAM, or the E-MAC is transmitting data.

- [Clearing conditions]
The current operating mode is not operation mode.
Completion of transfer of all frames for transmission from the transmission FIFO (the transmit start request bit in the transmit configuration control register (TCCR.TSRQ0) is 0)
- [Setting condition]
Transmission being started (by writing 1 to the transmit start request bit in the transmit configuration control register (TCCR.TSRQ0))

DTS (Data Transfer Suspend Status) Bit

This bit indicates whether access to the on-chip RAM is enabled.

- [Clearing condition]
The current operating mode is not operation mode.
The data transfer suspend request bit in the AVB-DMAC mode register (CCC.DTSR) being 0.
- [Setting condition]
Access to the on-chip RAM not proceeding while the data transfer suspend request bit (CCC.DTSR) in the AVB-DMAC mode register (CCC) is 1 (if the on-chip RAM is being accessed, this bit is set to 1 on completion of access).

OPS[3:0] (Operating Mode Status) Bits

These bits indicate the current operating mode.

For the operating modes, see section 45.3.1.1, Operating Modes.

45.2.5 Current Descriptor Address Register q (CDARq) (q = 0 to 21)

The CDARq register indicates the current descriptor address.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
CDA[15:0]																
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 45.9 CDARq (q = 0 to 21) register contents

Bit Position	Bit Name	Function
b31 to b0	CDA[31:0]	Current Descriptor Address The address of the current descriptors for the transmission queues

CDA[31:0] (Current Descriptor Address) Bits

CDAR0 to CDAR3 indicate the addresses of the current descriptors for the corresponding transmission queues while CDAR4 to CDAR21 indicate the addresses of the current descriptors for the corresponding reception queues.

If the operating mode is changed to operation mode, the contents of the register for the queue to be used are set in the descriptor base address table register (DBAT).

Also, when the descriptor base address load request register (DLR) issues a load request, the contents of the corresponding register are set in the descriptor base address table register (DBAT).

Conditions for updating:

These bits are set to 0 when the operating mode is not operation mode.

This register is updated in response to processing of the descriptor for a queue.

45.2.6 Error Status Register (ESR)

The ESR register indicates the error status in the AVB-DMAC.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	EIL	ET[3:0]			—	—	—	EQN[4:0]					
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 45.10 ESR register contents

Bit Position	Bit Name	Function
b31 to b13	—	Reserved These bits are read as 0. The write value should be 0.
b12	EIL	Error Information Lost 0: No error information lost. 1: Error information lost.
b11 to b8	ET[3:0]	Error Type B'0000: Descriptor reading error from the on-chip RAM B'0001: Descriptor writing error to the on-chip RAM B'0010: Illegal descriptor reading error B'0100: Data/time stamp reading error from the on-chip RAM B'0101: Data/time stamp writing error to the on-chip RAM B'1001: Transmission frame size error B'1010: Transmission FIFO overflow error
b7 to b5	—	Reserved These bits are read as 0. The write value should be 0.
b4 to b0	EQN[4:0]	Error Queue Number Error queue number.

EIL (Error Information Lost) Bit

This bit indicates that error information has been lost because a new error was detected when the previous error remained unprocessed.

Conditions for updating:

This bit is set to 0 when the operating mode is not operation mode.

This bit is also set to 0 when 0 is written to the queue error interrupt status bit in the error interrupt status register (EIS.QEF).

This bit is set to 1 when the condition for setting the queue error interrupt status bit in the error interrupt status register (EIS.QEF) to 1 is satisfied when the queue error interrupt status bit in the error interrupt status register (EIS.QEF) is 1.

ET[3:0] (Error Type) Bits

These bits indicate the detail of the error detected.

When the detected error is related to descriptor reading (ESR.ET = B'0000 or B'0010), the current descriptor address bits in the current descriptor address register q (CDARq.CDA) are not updated thus the same descriptor is processed again. To handle this, correct the descriptor.

When the detected error is related to descriptor writing (ESR.ET = B'0001), the current descriptor address bits in the current descriptor address register q (CDARq.CDA) and the transmit start request bit in the transmit configuration control register (TCCR.TSRQt) are updated as in the normal case thus the descriptor chain processing is not affected.

The other errors are temporary and might be eliminated by transfer continuation. For details, refer to section 45.3.2.3, **Checking Integrity**.

This bit should be referred to only when the queue error interrupt status bit in the error interrupt status register (EIS.QEF) is 1.

Conditions for updating:

These bits are updated when the condition for setting the queue error interrupt status bit in the error interrupt status register (EIS.QEF) to 1 is satisfied when the queue error interrupt status bit in the error interrupt status register (EIS.QEF) is 0.

EQN (Error Queue Number) Bits

These bits indicate the queue number in which the error has been detected.

When ESR.EQN is 0 to 3, it means that the related queue is a transmission queue and the EQN value is the transmission queue number. When ESR.EQN is 4 or larger, it means that the related queue is a reception queue and the “ESR.EQN – 4” is the reception queue number r.

Refer to these bits only when the queue error interrupt status bit in the error interrupt status register (EIS.QEF) is 1.

Conditions for updating:

These bits are updated when the condition for setting the queue error interrupt status bit in the error interrupt status register (EIS.QEF) to 1 is satisfied when the EIS.QEF bit is 0.

45.2.7 Receive Configuration Register (RCR)

The RCR register is used to make settings related to reception for the AVB-DMAC.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	RFCL[12:0]												
Initial value	0	0	0	1	1	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	ETS2	ETS0	ESF[1:0]	ENCF	EFFS	
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 45.11 RCR register contents

Bit Position	Bit Name	Function
b31 to b29	—	Reserved These bits are read as 0. The write value should be 0.
b28 to b16	RFCL[12:0]	Receive FIFO Caution Level
b15 to b6	—	Reserved These bits are read as 0. The write value should be 0.
b5	ETS2	Time Stamp Enable (Stream) 0: Time stamping is disabled. 1: Time stamping is enabled.
b4	ETS0	Time Stamp Enable (Best Effort) 0: Time stamping is disabled. 1: Time stamping is enabled.
b3, b2	ESF[1:0]	Stream Filtering Select Settings for reception queues 2 to 17 B'00: Filtering is disabled. Frames are processed in queue 0 (best effort). B'01: The filter for separating AVB stream frames from non-AVB stream frames is enabled; non-matching frames from the stream are processed in queue 0 (best effort). B'10: The filter for separating AVB stream frames from non-AVB stream frames is enabled; non-matching frames are discarded. B'11: The filter for separating AVB stream frames from non-AVB stream frames is enabled; non-matching frames from a stream are processed in queue 0 (best effort).
b1	ENCF	Network Control Filtering Enable Setting for reception queue 1 (network control) 0: Network control is disabled. 1: Network control is enabled.
b0	EFFS	Error Frame Enable 0: Error frames are disabled. 1: Error frames are enabled.

RFCL[12:0] (Receive FIFO Caution Level) Bits

These bits set the caution level for the reception FIFO and are used to maintain the priority order of the storage of received data and the fetching of data for transmission.

If the reception FIFO contains less data than this level, processing of both transmission and reception queues becomes pending.

If the reception FIFO contains more data than this level, only data in the reception queue are transferred, and processing of the transmission queue becomes pending.

Writing to this bit is only possible when the current operating mode is configuration mode.

CAUTION

- In the case of this LSI chip, set these bits to H'1800.

ETS2 (Time Stamp Enable (Stream)) Bit

Enables the inclusion of time-stamp information in reception queues 2 to 17.

The descriptor structure differs depending on whether time-stamp information is included or not. The reception queue in which time-stamp information is enabled uses the extended descriptor.

Writing to this bit is only possible when the current operating mode is configuration mode.

ETS0 (Time Stamp Enable (Best Effort)) Bit

Enables the inclusion of time-stamp information in reception queue 0.

The descriptor structure differs depending on whether time-stamp information is included or not. The reception queue 0 in which time-stamp information is enabled uses the extended descriptor.

Writing to this bit is only possible when the current operating mode is configuration mode.

ESF[1:0] (Stream Filtering Select) Bits

These bits select separation filtering for reception queues 2 to 17.

The queue-dependent separation filter can be used in combination with the identification of AVB stream frames.

When the value is B'00, filtering is disabled and frames from streams are processed in reception queue 0 (best effort).

When the value is B'01, the separation filter is enabled for both AVB stream frames and non-AVB stream frames; frames from non-matching streams are processed in reception queue 0 (best effort).

When the value is B'10, the separation filter is enabled for AVB stream frames; frames from non-matching streams are discarded.

When the value is B'11, the separation filter is enabled for AVB stream frames; frames from non-matching streams are processed in reception queue 0 (best effort).

For separation filtering, see 45.3.4.1 (1) Separation Filtering.

Writing to this bit is only possible when the current operating mode is configuration mode.

ENCF (Enable Network Control Filtering) Bit

Enables the AVB network control frame for reception queue 1.

When reception queue 1 is disabled, a received frame is stored in reception queue 0 (best effort).

Writing to this bit is only possible when the current operating mode is configuration mode.

EFFS (Enable Error Frame) Bit

Enables or disables the reception of frames that have been classified as error frames by the E-MAC.

Received error frames are stored in reception queue 0 (best effort).

An indicator of error detection by the E-MAC during reception is stored in the descriptor (DESCR.MS).

Writing to this bit is only possible when the current operating mode is configuration mode.

45.2.8 Receive Queue Configuration Register i (RQCi) (i = 0 to 4)

The RQC0 register is used to set up reception queues 0 to 3.

The RQC1 register is used to set up reception queues 4 to 7.

The RQC2 register is used to set up reception queues 8 to 11.

The RQC3 register is used to set up reception queues 12 to 15.

The RQC4 register is used to set up reception queues 16 to 17.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b7, b6	—	Reserved These bits are read as 0. The write value should be 0.
b5, b4	UFCC0[1:0]	Unread Frame Counter Configuration (Receive Queue 0+i*4) These bits set the unread frame counter used in reception queue 0+4*i.

Table 45.12 RQCi register contents (2/2)

Bit Position	Bit Name	Function
b3, b2	—	Reserved These bits are read as 0. The write value should be 0.
b1, b0	RSM0[1:0]	Receive Synchronous Mode (Receive Queue 0+i*4) B'00: Mode with write-back Other than B'00: Setting prohibited

UFCCr[1:0] (r = 0 to 17) Unread Frame Counter Configuration Bits

These bits set the unread frame counter for reception queue r.

With the AVB-DMAC, four patterns of settings are available for the unread frame counter. Use the unread frame counter stop level configuration register (UFCS) to set the stop level of the unread frame counter.

When these bits are set to B'00, the stop function is disabled.

Writing to the bits is only possible when the current operating mode is configuration mode.

RSMr[1:0] (r = 0 to 17) Receive Synchronous Mode Bits

These bits set receive synchronous mode.

Set B'00 in this bit.

Writing to the bits is only possible when the current operating mode is configuration mode.

45.2.9 Receive Padding Configuration Register (RPC)

The RPC register is used to set padding for received frames.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	DCNT[7:0]

R/W	R	R	R	R	R	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Table 45.13 RPC register contents

Bit Position	Bit Name	Function
b31 to b24	—	Reserved These bits are read as 0. The write value should be 0.
b23 to b16	DCNT[7:0]	Stored Data Counter These bits specify the amount of data to be stored with the descriptor. The setting is in words. I.e. 1 in the counter indicates 1 word (4 bytes).
b15 to b11	—	Reserved These bits are read as 0. The write value should be 0.
b10 to b8	PCNT[2:0]	Stored Padding Counter These bits indicate the amount of padding to be stored in data areas for descriptors. The setting is in words. I.e. 1 in the counter indicates 1 word (4 bytes).
b7 to b0	—	Reserved These bits are read as 0. The write value should be 0.

CAUTION

Padding can be used to extend frame lengths, but frame lengths should not exceed 4 Kbytes.

DCNT[7:0] Stored Data Counter Bits

These bits specify the amount of the frame data (1 to 255) to be stored following the padding. Counting by one indicates one word (4 bytes). For example, when these bits are set to 47, the amount of data is 47 words (= 188 bytes).

When these bits are 0, all received data have been stored following the initial padding.

Writing to the bits is only possible when the current operating mode is configuration mode.

For details on padding, see section 45.3.4.3 (c) Padding.

PCNT[2:0] Stored Padding Counter Bits

These bits specify the amount of padding to be appended to the on-chip RAM. Counting by one indicates one word (4 bytes). For example, when these bits are set to 1, the amount of padding is one word (= 4 bytes).

Writing to the bits is only possible when the current operating mode is configuration mode.

For details on padding, see section 45.3.4.3 (c) Padding.

45.2.10 Unread Frame Counter Stop Level Configuration Register (UFCS)

The UFCS register sets the stop levels for unread frames.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

	—	—	SL1[5:0]						—	—	SL0[5:0]					
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Table 45.14 UFCS register contents

Bit Position	Bit Name	Function
b31, b30	—	Reserved These bits are read as 0. The write value should be 0.
b29 to b24	SL3[5:0]	Stop Level 3 Unread frame count stop level 3
b23, b22	—	Reserved These bits are read as 0. The write value should be 0.
b21 to b16	SL2[5:0]	Stop Level 2 Unread frame count stop level 2
b15, b14	—	Reserved These bits are read as 0. The write value should be 0.
b13 to b8	SL1[5:0]	Stop Level 1 Unread frame count stop level 1
b7, b6	—	Reserved These bits are read as 0. The write value should be 0.
b5 to b0	SL0[5:0]	Stop Level 0 Unread frame count stop level 0 These bits are read as 0. The write value should be 0.

SL0 to SL3[5:0] Stop Level 0 to 3 Bits

These bits set the stop levels for unread frames.

One of the four stop levels from 0 to 3 can be set for each reception queue. When these bits are set to 0, the stop function is disabled. The level to be used is specified by the receive queue configuration register i (RQC $_i$) ($i = 0$ to 4).

Writing to the bits is only possible when the current operating mode is configuration mode.

45.2.11 Unread Frame Counter Register i (UFCVi) (i = 0 to 4)

The UFCV0 register indicates the number of unread frames in reception queues 0 to 3.

The UFCV1 register indicates the number of unread frames in reception queues 4 to 7.

The UFCV2 register indicates the number of unread frames in reception queues 8 to 11.

The UFCV3 register indicates the number of unread frames in reception queues 12 to 15.

The UFCV4 register indicates the number of unread frames in reception queues 16 and 17.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 45.15 UFCS0 register contents

Bit Position	Bit Name	Function
b31, b30	—	Reserved These bits are read as 0. The write value should be 0.
b29 to b24	CV3[5:0]	Unread Frame Count 3+4*i Number of unread frames in reception queue 3+4*i
b23, b22	—	Reserved These bits are read as 0. The write value should be 0.
b21 to b16	CV2[5:0]	Unread Frame Count 2+4*i Number of unread frames in reception queue 2+4*i
b15, b14	—	Reserved These bits are read as 0. The write value should be 0.
b13 to b8	CV1[5:0]	Unread Frame Count 1+4*i Number of unread frames in reception queue 1+4*i
b7, b6	—	Reserved These bits are read as 0. The write value should be 0.
b5 to b0	CV0[5:0]	Unread Frame Count 0+4*i Number of unread frames in reception queue 0+4*i

CVr[5:0] Unread Frame Count r (r = 0 to 17) Bits

These bits indicate the number of unread frames in reception queue r.

The number of unread frames is decremented by the value that is written to the unread frame counter decrement register i (UFCDi).

For a description of how to use unread frames, refer to section 45.3.4.4, Unread Frame Counters.

Conditions for updating:

The bits are set to 0 when the operating mode is not operation mode and when the descriptor base address load request register (DLR) issues a base address load request.

The value of these bits is incremented when a frame is stored in reception queue *r* normally and a write transaction to the corresponding descriptor is issued. (The maximum setting is H'3F. If the value exceeds H'3F, incrementation will not proceed.) Note that the value is incremented without waiting for response to the write transaction. Therefore confirm that the descriptor type (DESCR.DT) of the corresponding descriptor has been updated before processing the received data.

The value is decremented by the value written to the unread frame counter decrement register *i* (UFCDi). Confirm that the descriptor types (DESCR.DT) of all the target descriptors for decrementing have been updated before decrementing.

45.2.12 Unread Frame Counter Decrement Register i (UFCDi) (i = 0 to 4)

The UFCD0 register is used to decrement unread counters in reception queues 0 to 3.

The UFCD1 register is used to decrement unread counters in reception queues 4 to 7.

The UFCD2 register is used to decrement unread counters in reception queues 8 to 11.

The UFCD3 register is used to decrement unread counters in reception queues 12 to 15.

The UFCD4 register is used to decrement unread counters in reception queues 16 and 17.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 45.16 UFCDi register contents

Bit Position	Bit Name	Function
b31, b30	—	Reserved These bits are read as 0. The write value should be 0.
b29 to b24	DV3[5:0]	Unread Frame Decrement Value 3+4*i Unread frame decrement value for reception queue 3+4*i
b23, b22	—	Reserved These bits are read as 0. The write value should be 0.
b21 to b16	DV2[5:0]	Unread Frame Decrement Value 2+4*i Unread frame decrement value for reception queue 2+4*i
b15, b14	—	Reserved These bits are read as 0. The write value should be 0.
b13 to b8	DV1[5:0]	Unread Frame Decrement Value 1+4*i Unread frame decrement value for reception queue 1+4*i
b7, b6	—	Reserved These bits are read as 0. The write value should be 0.
b5 to b0	DV0[5:0]	Unread Frame Decrement Value 0+4*i Unread frame decrement value for reception queue 0+4*i

DVr[5:0] Unread Frame Decrement Value r (r = 0 to 17) Bits

These bits set the decrement value for unread frames in reception queue r. The value of an unread frame counter register i (UFCDi) (i = 0 to 4) is decremented by the value set in the corresponding bits of this register.

Write H'3F to these bits to reset the unread counters in reception queue r.

These bits are always read as 0.

45.2.13 Separation Filter Offset Register (SFO)

The SFO register sets an offset into frames for use by the separation filter.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 45.17 SFO register contents

Bit Position	Bit Name	Function
b31 to b6	—	Reserved These bits are read as 0. The write value should be 0.
b5 to b0	FBP[5:0]	First Byte Position Position in Ethernet frames of the first byte of the bytes to be used by the separation filter

FBP[5:0] First Byte Position Bits

These bits set the position in Ethernet frames of the first byte of the bytes to be used by the separation filter.

When these bits are 0, the separation filter starts from the start of each Ethernet frame (first byte of the destination address). For bytes in Ethernet frames, see Figure 45.2, in section 45.2.1, AVB-DMAC Mode Register (CCC).

Writing to the bits is only possible when the current operating mode is configuration mode.

For separation filtering, see section 45.3.4.1 (1) Separation Filtering.

CAUTION

Received frames having fewer bytes than the setting of these bits + 8 bytes are judged to be non-matching by the separation filter. In this case, the data will either be sorted into a reception queue or discarded in accord with the setting of the separation filtering select bits in the receive configuration register (RCR.ESF).

45.2.14 Separation Filter Pattern Register i (SFPi) (i = 0 to 31)

Pairs of SFPi registers set the pattern for the separation filters to be used by the corresponding reception queues 2 to 17.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
FPs[31+32*(i%2):16+32*(i%2)]																
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
FPs[15+32*(i%2):0+32*(i%2)]																
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 45.18 SFPi register contents

Bit Position	Bit Name	Function
b31 to b0	FPs[31+32*(i%2):0+32*(i%2)]	Separation Filter Pattern These bits set the pattern of the separation filter. The 64-bit filter pattern is set for each queue.

FPs[63:0](s = i/2) Separation Filter Pattern Bits

These bits set the pattern for a separation filter to be used with reception queues 2 to 17 (for streams 0 to 15).

Each queue has a 64-bit setting; reception queue 2 (for stream 0) uses SFP0 and SFP1, reception queue 17 (for stream 15) uses SFP30 and SFP31, and so on.

SFPi.FPs[7:0] (where i is an even number) are used for the byte of Ethernet frame data specified by the separation filter offset register, while SFPi.FPs[63:56] (where i is the corresponding odd number) are used for the byte at the address specified by the separation filter offset register (SFO) + 7.

Data from received frames passes the separation filter when the following formula is satisfied.

$$(\text{Data from received frames} \ \& \ \text{SFMi.CFM}) == \text{SFPi.FPs}$$

Eight bytes from the position specified by the start byte position bits (SFO.FBP) of data in the received frames are used by the separation filter.

Writing to the bits is only possible when the current operating mode is configuration mode.

For separation filtering, see section 45.3.4.1 (1) Separation Filtering.

45.2.15 Separation Filter Mask Register i (SFMi) (i = 0 or 1)

A pair of SFMi registers sets the mask value for the separation filter used by the corresponding reception queue 2 to 17.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 45.19 SFMi register contents

Bit Position	Bit Name	Function
b31 to b0	CFM[31:0]	Separation Filter Mask These bits set the mask value for the separation filter.

CFM[63:0] Separation Filter Mask Bits

These bits set the mask value for the separation filter for use with the corresponding reception queue 2 to 17 (stream 0 to 15).

SFM0.CFM[7:0] are used for bytes of Ethernet frame data specified by the separation filter offset register, while SFM1.CFM[63:56] are used for the separation filter offset register (SFO) + 7.

Writing to the bits is only possible when the current operating mode is configuration mode.

For separation filtering, see section 45.3.4.1 (1) Separation Filtering.

45.2.16 Transmit Configuration Register (TGC)

The TGC register is used to make settings related to transmission for the AVB-DMAC.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 45.20 TGC register contents (1/2)

Bit Position	Bit Name	Function
b31 to b22	—	Reserved These bits are read as 0. The write value should be 0.
b21, b20	TBD3[1:0]	Transmit FIFO Size (Stream Class A) Number of frames to be fetched from transmission queue 3 (for stream class A) CAUTION Write 2 to these bits.
b19, b18	—	Reserved These bits are read as 0. The write value should be 0.
b17, b16	TBD2[1:0]	Transmit FIFO Size (Stream Class B) Number of frames to be fetched from transmission queue 2 (for stream class B) CAUTION Write 2 to these bits.
b15, b14	—	Reserved These bits are read as 0. The write value should be 0.
b13, b12	TBD1[1:0]	Transmit FIFO Size (Network Control) Number of frames to be fetched from transmission queue 1 (for network control) CAUTION Write 2 to these bits.
b11, b10	—	Reserved These bits are read as 0. The write value should be 0.
b9, b8	TBD0[1:0]	Transmit FIFO Size (Best Effort) Number of frames to be fetched from transmission queue 0 (for best effort) CAUTION Write 2 to these bits.
b7, b6	—	Reserved These bits are read as 0. The write value should be 0.
b5, b4	TQP[1:0]	Transmit Queue Priority 00: Non-ABV mode 01: AVB mode 1 10: Setting prohibited 11: AVB mode 2

Table 45.20 TGC register contents (2/2)

Bit Position	Bit Name	Function
b3	TSM3	Transmit Synchronous Mode (Stream Class A) 0: With write-back 1: Setting prohibited
b2	TSM2	Transmit Synchronous Mode (Stream Class B) 0: With write-back 1: Setting prohibited
b1	TSM1	Transmit Synchronous Mode (Network Control) 0: With write-back 1: Setting prohibited
b0	TSM0	Transmit Synchronous Mode (Best Effort) 0: With write-back 1: Setting prohibited

TBD0 to TBD3[1:0] Transmit FIFO Size (Stream Class A/ Stream Class B/Network Control/ Best Effort) Bits

These bits set the sizes of the transmission FIFO buffers for use with each of the transmission queues.

Writing to these bits is only possible when the current operating mode is configuration mode.

Set these bits to 2.

TQP[1:0] Transmit Queue Priority Bits

These bits set the priority of the transmission queues.

B'00: Non-AVB mode: Q3→Q2→Q1→Q0

B'01: AVB mode 1: Q3 (CBS)→Q2 (CBS)→Q1→Q0

B'10: Setting prohibited

B'11: AVB mode 2: Q1→Q3 (CBS)→Q2 (CBS)→Q0

For the credit-based shaping (CBS) algorithm, see section 45.3.6, CBS (Credit-Based Shaping).

The CBS algorithm is not applied in non-AVB mode (i.e. when the value is B'00).

Writing to the bits is only possible when the current operating mode is configuration mode.

TSM0 to TSM3 Transmit Synchronous Bits

Set these bits to 0.

45.2.17 Transmit Configuration Control Register (TCCR)

The TCCR register controls transmission by the AVB-DMAC and is used to make related settings.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

R/W	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 45.21 TCCR register contents

Bit Position	Bit Name	Function
b31 to b10	—	Reserved These bits are read as 0. The write value should be 0.
b9	TFR	Time Stamp FIFO Release 0(W): No request to the time-stamp FIFO. 1(W): Releases the oldest entry in the time-stamp FIFO.
b8	TFEN	Time Stamp FIFO Enable 0: Recording of transmission time stamps in the time-stamp FIFO is disabled. 1: Recording of transmission time stamps in the time-stamp FIFO is enabled.
b7 to b4	—	Reserved These bits are read as 0. The write value should be 0.
b3	TSRQ3	Transmit Start Request (Queue 3 (Stream Class A)) 0(R): Transmission queue is empty or stopped. 1(W): A transmission start request is issued. 1(R): Fetching of data for transmission is pending.
b2	TSRQ2	Transmit Start Request (Queue 2 (Stream Class B)) 0(R): Transmission queue is empty or stopped. 1(W): A transmission start request is issued. 1(R): Fetching of data for transmission is pending.
b1	TSRQ1	Transmit Start Request (Queue 1 (Network Control)) 0(R): Transmission queue is empty or stopped. 1(W): A transmission start request is issued. 1(R): Fetching of data for transmission is pending.
b0	TSRQ0	Transmit Start Request (Queue 0 (Best Effort)) 0(R): Transmission queue is empty or stopped. 1(W): A transmission start request is issued. 1(R): Fetching of data for transmission is pending.

TFR Time Stamp FIFO Release Bit

This bit releases the oldest entry in the time-stamp FIFO.

When 1 is written to this bit, the TFAi register is updated by the oldest entry in the time-stamp FIFO.

For a description of how to use the time-stamp FIFO, see section 45.3.5.4, Time Stamping in Transmission.

This bit is always read as 0.

When the time stamp FIFO count bits (TSR.TFFL) are set to B'000, 1 should not be written to this bit.

TFEN Time Stamp FIFO Enable Bit

This bit enables storage in the time-stamp FIFO.

When it is set, time-stamp information is stored for descriptors with DESCR.TSR set to 1 (for DESCR.TSR, see section 45.3.5.2 (2) Configuration of Transmission Frame Data Descriptors).

When 0 is set in this bit, no entries are made in the time-stamp FIFO.

For a description of how to use the time-stamp FIFO, see section 45.3.5.4, Time Stamping in Transmission.

TSRQt Transmit Start Request (Queue t) (t = 0 to 3) Bit

This bit issues a request to start transmission for transmission queue t.

When read, this bit being set to 1 indicates that transmission queue t has a frame that has not yet been fetched to the transmission FIFO.

Frame transmission by the E-MAC is processed independently from fetching to the transmission FIFO. The timing of transmission from a queue depends on the priority order of transmission.

For the scheduling of transmission queues, see section 45.3.5.1, Transmission Modes.

Writing to this bit is only possible when the current operating mode is configuration mode.

Only 1 can be written to the bit. Writing 0 to the bit has no effect.

Conditions for updating:

The bit is set to 0 when the operating mode is not operation mode, when a descriptor of type EEMPTY, FEMPTY, or LEMPTY (no usable data) is processed, when an EOS descriptor is processed, and when a descriptor with defective data is processed.

45.2.18 Transmit Status Register (TSR)

The TSR register indicates the state of transmission by the AVB-DMAC.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	TFFL[2:0]		—	—	—	—	—	CCS1[1:0]		CCS0[1:0]	
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 45.22 TSR register contents

Bit Position	Bit Name	Function
b31 to b11	—	Reserved These bits are read as 0. The write value should be 0.
b10 to b8	TFFL[2:0]	Time Stamp FIFO Count Number of time-stamp FIFOs
b7 to b4	—	Reserved These bits are read as 0. The write value should be 0.
b3, b2	CCS1[1:0]	CBS Counter Status 1 (Class A) B'00: The current credit value is within the limit. B'01: The current credit value is less than or equal to the lower limit. B'10: The current credit value is greater than or equal to the upper limit. B'11: (Reserved)
b1, b0	CCS0[1:0]	CBS Counter Status 0 (Class B) B'00: The current credit value is within the limit. B'01: The current credit value is less than or equal to the lower limit. B'10: The current credit value is greater than or equal to the upper limit. B'11: (Reserved)

TFFL[3:0] Time Stamp FIFO Count Bits

These bits indicate the number of time stamps in the time-stamp FIFO.

The values 0 and 2 indicate that the time-stamp FIFO is empty and full, respectively (values 3 to 7 are reserved).

Conditions for updating:

The bits are set to 0 when the operating mode is not operation mode and when the time stamp FIFO enable bit in the transmit configuration control register (TCCR.TFEN) = 0.

When the time stamp FIFO enable bit (TCCR.TFEN) is 1 and these bits are not 2, the value of these bits is incremented after a frame with DESCR.TSR set has been transmitted by the E-MAC (for DESCR.TSR, see section 45.3.5.2 (2) Configuration of Transmission Frame Data Descriptors).

The value of these bits is decremented if it is not 0 when 1 is written to the time stamp FIFO release bit in the transmit configuration control register (TCCR.TFR).

CCS0 and CCS1[1:0] CBS Counter Status 0 and 1 Bits

These bits indicate the CBS (credit-based shaping) state of stream data transmission queues 0 and 1. If the calculated credit value is outside the range specified by CBS upper limit register c (CULc) and CBS lower limit register c (CLLc), it falls outside the range for CBS.

Conditions for updating:

The bits are set to B'00 when the operating mode is not operation mode.

The bits are set to B'00 when the credit value calculated by the CBS is within the range specified by the CBS upper limit register c (CULc) (c = 0, 1) and the CBS lower limit register c (CLLc) (c = 0, 1).

The bits are set to B'01 if the credit value calculated by the CBS is lower than the value in CBS lower limit register c (CLLc).

The bits are set to B'10 if the credit value calculated by the CBS is higher than the value in CBS upper limit register c (CULc).

45.2.19 Time Stamp FIFO Access Register 0 (TFA0)

TFA0 indicates the time stamp value.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 45.23 TFA0 register contents

Bit Position	Bit Name	Function
b31 to b0	TSV[31:0]	Time Stamp Value Time stamp value

TSV[79:0] Time Stamp Value Bits

These 80 bits consist of TFA0.TSV[31:0], TFA1.TSV[63:32], and TFA2.TSV[79:64], which together indicate the oldest time stamp value stored in the time-stamp FIFO.

Once the time-stamp FIFO is full, no further time-stamp values are stored.

Conditions for updating:

The bits are set to H'0000 0000 when the operating mode is not operation mode.

The register is updated whenever a value is stored in the time-stamp FIFO (when the time-stamp FIFO count bit in the transmit status register (TSR.TFFL) changes from 0 to 1).

The register is updated when the oldest entry is released (when the time stamp FIFO release bit in the transmit configuration control register (TCCR.TFR) is set to 1).

45.2.20 Time Stamp FIFO Access Register 1 (TFA1)

The TFA1 register indicates the time-stamp value.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 45.25 TFA2 register contents

Bit Position	Bit Name	Function
b31 to b26	—	Reserved These bits are read as 0.
b25 to b16	TST[9:0]	Time Stamp Tag Time-stamp tag
b15 to b0	TSV[79:64]	Time Stamp Value Time-stamp value

TST[9:0] Time Stamp Tag Bits

These bits indicate the contents of the DESCR.TAG bit within the descriptor for frame transmission. These values are used to check the correlation between frames within the transmission queue and the time-stamp values (accessible through time stamp FIFO access register i (TFA i .TSV, $i = 0$ to 2)) which can be placed in the FIFO.

For the tagging of frames in transmission, see section 45.3.5.4, Time Stamping in Transmission.

When the time stamp FIFO count bits (TSR.TFFL) are 0, do not refer to these bits.

Conditions for updating:

The bits are set to H'000 when the operating mode is not operation mode.

Updated when a value is stored in the time-stamp FIFO (when the value of the time stamp FIFO count bit in the transmit status register (TSR.TFFL) changes from 0 to 1).

Updated when the oldest entry has been released (1 is set in the time stamp FIFO release bit in the transmit configuration control register (TCCR.TFR)).

TSV[73:64] Time Stamp Value Bits

For details, see section 45.2.19, Time Stamp FIFO Access Register 0 (TFA0).

45.2.22 CBS Increment Value Register c (CIVRc) (c = 0 or 1)

The CIVR0 register sets the increment in the CBS algorithm for transmission queue 2 (for stream class B).

The CIVR1 register sets the increment in the CBS algorithm for transmission queue 3 (for stream class A).

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 45.26 CIVRc register contents

Bit Position	Bit Name	Function
b31 to b0	CIV[31:0]	CBS Increment Value Setting value: 1 to 65535 (H'00000001 to H'0000FFFF)

CIV[31:0] CBS Increment Value Bits

These bits set the increment for the CBS algorithm.

Set a value in the range from 1 to 65535 (H'0000 0001 to H'0000 FFFF).

The value to be written to these bits depends on the Ethernet bit rate and $B\phi$ (internal bus clock). For details, see section 45.3.6, CBS (Credit-Based Shaping).

45.2.23 CBS Decrement Value Register c (CDVRc) (c = 0 or 1)

The CDVR0 register sets the decrement in the CBS algorithm for transmission queue 2 (for stream class B).

The CDVR1 register sets the decrement in the CBS algorithm for transmission queue 3 (for stream class A).

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Bit Position	Bit Name	Function
b31 to b0	CDV[31:0]	CBS Decrement Value Setting value: -1 to -65536 (H'FFFF FFFF to H'FFFF 0000)

CDV[31:0] CBS Decrement Value Bits

These bits set the decrement for the CBS algorithm.

Set a negative value from -1 to -65536 (H'FFFF FFFF to H'FFFF 0000).

The value to be written to these bits depends on the Ethernet bit rate and $B\phi$ (internal bus clock). For details, see section 45.3.6, CBS (Credit-Based Shaping).

45.2.24 CBS Upper Limit Register c (CULc) (c = 0 or 1)

The CUL0 register sets the upper limit for credit values calculated by using the CSB algorithm for transmission queue 2 (for stream class B).

The CUL1 register sets the upper limit for credit values calculated by using the CSB algorithm for transmission queue 3 (for stream class A).

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 45.28 CUL0 and CUL1 register contents

Bit Position	Bit Name	Function
b31?b0	ULV[31:0]	CBS Upper Limit Upper limit on CBS values

ULV[31:0] CBS Upper Limit Bits

These bits set the upper limit for credit values calculated by using the CBS algorithm.

The setting is a limiting value for error detection and does not normally affect operation of the algorithm.

Write a positive value to these bits.

For details, see section 45.3.6, CBS (Credit-Based Shaping).

45.2.25 CBS Lower Limit Register c (CLLc) (c = 0 or 1)

The CUL0 register sets the lower limit for credit values calculated by using the CSB algorithm for transmission queue 2 (for stream class B).

The CUL1 register sets the lower limit for credit values calculated by using the CSB algorithm for transmission queue 3 (for stream class A).

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b0	—	Reserved This bit is read as 0. The write value should be 0.

RPE1 to RPE15 Descriptor Interrupt Enable Bits 1 to 15

When an interrupt source flag is set (a bit from among the DPF1 to DPF15 bits in the descriptor interrupt status register (DIS) = 1) while the interrupt is enabled, the interrupt is issued.

45.2.27 Descriptor Interrupt Status Register (DIS)

The DIS register indicates the state of descriptor interrupts.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b2	DPF2	Descriptor Interrupt Status2 0: The interrupt is not pending. 1: The interrupt is pending.
b1	DPF1	Descriptor Interrupt Status1 0: The interrupt is not pending. 1: The interrupt is pending.
b0	—	Reserved This bit is read as 0. The write value should be 0.

DPF1 to DPF15 Descriptor Interrupt Status Bits

The corresponding bit indicates completion of the processing of a descriptor with DESC.R.DIE set to the corresponding number from 1 to 15 within the reception or transmission queue.

When DESC.R.DIE is 0, the descriptor interrupt is not generated.

Only 0 can be written to these bits.

[Conditions for Changing]

A bit is set to 0 when the operating mode is not operation mode.

A bit is set to 1 when a descriptor with DESC.R.DIE set to the corresponding number from 1 to 15 is processed and a write transaction to the corresponding descriptor is issued. Note that the bit is set to 1 without waiting for response to the write transaction. Therefore confirm that the descriptor type (DESC.R.DT) of the corresponding descriptor has been updated before post-processing the processed descriptor.

45.2.28 Error Interrupt Control Register (EIC)

The EIC register controls the AVB-DMAC-related error interrupts.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

b3	SEE	Separation Filter Error Interrupt Enable 0: Disabled 1: Enabled
b2	QEE	Queue Error Interrupt Enable 0: Disabled 1: Enabled
b1, b0	—	Reserved These bits are read as 0. The write value should be 0.

TFFE Time Stamp FIFO Full-Error Interrupt Enable Bits

When the time stamp FIFO is full (TFFF in the error interrupt status register (EIS) = 1) and the interrupt is enabled, the interrupt is issued.

CULE1 CBS Upper Limit Error Interrupt Enable Bit (Class A)

When the Class A CBS reaches its upper limit (CULF1 in the error interrupt status register (EIS) = 1) and the interrupt is enabled, the interrupt is issued.

CULE0 CBS Upper Limit Error Interrupt Enable Bit (Class B)

When the Class B CBS reaches its upper limit (CULF0 in the error interrupt status register (EIS) = 1) and the interrupt is enabled, the interrupt is issued.

CLLE1 CBS Lower Limit Error Interrupt Enable Bit (Class A)

When the Class A CBS reaches its lower limit (CLLF1 in the error interrupt status register (EIS) = 1) and the interrupt is enabled, the interrupt is issued.

CLLE0 CBS Lower Limit Error Interrupt Enable Bit (Class B)

When the Class B CBS reaches its lower limit (CLLF0 in the error interrupt status register (EIS) = 1) and the interrupt is enabled, the interrupt is issued.

SEE Separation Filter Error Interrupt Enable Bit

When the separation filter error is detected (SEF in the error interrupt status register (EIS) = 1) and the interrupt is enabled, the interrupt is issued.

QEE Queue Error Interrupt Enable Bit

When the queue error is detected (QEF in the error interrupt status register (EIS) = 1) and the interrupt is enabled, the interrupt is issued.

45.2.29 Error Interrupt Status Register (EIS)

The EIS register indicates the states of AVB-DMAC-related error interrupts.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 45.33 EIS register contents

Bit Position	Bit Name	Function
b31 to b17	—	Reserved These bits are read as 0. The write value should be 0.
b16	QFS	Queue Full Error Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b15 to b9	—	Reserved These bits are read as 0. The write value should be 0.
b8	TFFF	Time Stamp FIFO Full Error Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b7	CULF1	CBS Upper Limit Error Interrupt Status (Class A) 0: The interrupt is not pending. 1: The interrupt is pending.
b6	CULF0	CBS Upper Limit Error Interrupt Status (Class B) 0: The interrupt is not pending. 1: The interrupt is pending.
b5	CLLF1	CBS Lower Limit Error Interrupt Status (Class A) 0: The interrupt is not pending. 1: The interrupt is pending.
b4	CLLF0	CBS Lower Limit Error Interrupt Status (Class B) 0: The interrupt is not pending. 1: The interrupt is pending.
b3	SEF	Separation Filter Error Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b2	QEF	Queue Error Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b1, b0	—	Reserved These bits are read as 0. The write value should be 0.

QFS Queue Full Error Status Bit

With the interrupts enabled, this bit indicates that a queue is full (the receive queue r full interrupt status bit (QFFr) or the receive FIFO full interrupt status bit (RFFF) in receive interrupt status register 2 (RIS2) = 1).

[Conditions for Changing]

If the receive queue r full interrupt status bit (RIS2.QFFr) and the receive queue r full interrupt enable bit in the receive interrupt control register 2 (RIC2.QFEr) are updated, this bit is also updated.

If the receive FIFO full interrupt status bit (RIS2.RFFF) and the receive FIFO full interrupt enable bit (RIC2.RFFE) are updated, this bit is also updated.

TFFF Time Stamp FIFO Full-Error Interrupt Status Bit

This bit indicates that a new transmission time stamp has been discarded due to the time-stamp FIFO being full (i.e. has reached the overflow state).

Only 0 can be written to the bit.

[Conditions for Changing]

The bit is set to 0 when the operating mode is not operation mode.

The bit is set to 1 when a frame with DESCR.TSR set is transmitted while the time stamp FIFO enable bit in the transmit configuration control register (TCCR.TFEN) is set to 1 and the time stamp FIFO count bit in the transmit status register (TSR.TFFL) is set to 2.

CULF1 CBS Upper Limit Error Interrupt Status Bit (Class A)

This bit indicates that CBS counter 1 has exceeded the set upper limit (CUL1.ULV in the CBS upper limit register c (CULc)).

Only 0 can be written to the bit.

[Conditions for Changing]

This bit is set to 0 when the operating mode is not operation mode.

This bit is set to 1 when the value of the CBS counter status 1 (Class A) bits in the transmit status register (TSR.CCS1) change from 00 (indicating a value within the range between the limits) to 10 (indicating a value over the upper limit).

CULF0 CBS Upper Limit Error Interrupt Status Bit (Class B)

This bit indicates that CBS counter 0 has exceeded the set upper limit (CUL0.ULV in the CBS upper limit register c (CULc)).

Only 0 can be written to the bit.

[Conditions for Changing]

The bit is set to 0 when the operating mode is not operation mode.

The bit is set to 1 when the value of the CBS counter status 0 (Class B) bit in the transmit status register changes from 00 (indicating a value within the range between the limits) to 10 (indicating a value over the upper limit).

CULF1 CBS Lower Limit Error Interrupt Status Bit (Class A)

This bit indicates that CBS counter 1 has fallen below the set lower limit (CLL1.LLV in CBS lower limit register c (CLLc)).

Only 0 can be written to the bit.

[Conditions for Changing]

The bit is set to 0 when the operating mode is not operation mode.

The bit is set to 1 when the value of the CBS counter status 1 (Class A) bit in the transmit status register (TSR.CCS1) changes from 00 (indicating a value within the range between the limits) to 01 (indicating a value less than the lower limit).

CLLF0 CBS Lower Limit Error Interrupt Status Bit (Class B)

This bit indicates that CBS counter 0 has fallen below the set lower limit (CLL0.LLV in the CBS lower limit register c (CLLc)).

Only 0 can be written to the bit.

[Conditions for Changing]

The bit is set to 0 when the operating mode is not operation mode.

The bit is set to 1 when the value of the CBS counter status 0 (Class B) bit in the transmit status register (TSR.CCS0) changes from 00 (indicating a value within the range between the limits) to 01 (indicating a value less than the lower limit).

SEF Separation Filter Error Interrupt Status Bit

This bit indicates that a received frame has been discarded due to non-matching of the defined separation filter.

Only 0 can be written to this bit.

[Conditions for Changing]

The bit is set to 0 when the operating mode is not operation mode.

If the stream filtering select bits in the receive configuration register (RCR.ESF) are B'10, this bit is set to 1 when the received frame is discarded because the received AVB stream data frame has not match any of the separation filters.

QEF Queue Error Interrupt Status Bit

This bit indicates that an error is detected when the transmission and reception queues are processed. For details, see section 45.3.2.3, Checking Integrity.

Only 0 can be written to this bit.

[Conditions for Changing]

The bit is set to 0 when the operating mode is not operation mode.

If an error in the transmission and reception queues is detected, this bit is set to 1.

45.2.30 Receive Interrupt Control Register 0 (RIC0)

The RIC0 register controls the AVB-DMAC receive interrupts.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b0	FRE0	Receive Frame Interrupt Enable 0 (Best Effort) 0: Disabled 1: Enabled

FRE0 to FRE17 Receive Frame Interrupt Enable Bits 0 to 17

When an interrupt source flag is set (a bit from among the receive interrupt status bits in the receive interrupt status register (RIS0.FRFO to 17) = 1) while the interrupt is enabled, the interrupt is issued.

45.2.31 Receive Interrupt Status Register 0 (RIS0)

The RIS0 register indicates the states of the AVB-DMAC receive interrupts.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b0	FRF0	Receive Frame Interrupt Status 0 (Best Effort) 0: The interrupt is not pending. 1: The interrupt is pending.

FRF0 to FRF17 Receive Frame Interrupt Status Bits 0 to 17

Each bit indicates that a corresponding frame has been stored normally in reception queues 0 to 17 and that data are ready for CPU processing.

Only 0 can be written to the bit.

[Conditions for Changing]

A bit is set to 0 when the operating mode is not operation mode.

A bit is set to 0 when a value is written to the unread frame counter decrement register i (UFCD i) ($i = 0$ to 4), and this decrements the value of unread frame counter register i (UFCV i) ($i = 0$ to 4) to 0.

When a frame is stored in reception queue normally and a write transaction to the corresponding descriptor is issued, the corresponding bit is set to 1. Note that the bit is set to 1 without waiting for response to the write transaction. Therefore confirm that the descriptor type (DESCR.DT) of the corresponding descriptor has been updated before processing the received data.

45.2.32 Receive Interrupt Control Register 1 (RIC1)

The RIC1 register controls the AVB-DMAC receive interrupts.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Bit Position	Bit Name	Function
b31	RFWE	Receive FIFO Warning Interrupt Enable 0: Disabled 1: Enabled
b30 to b0	—	Reserved These bits are read as 0. The write value should be 0.

RFWE Receive FIFO Warning Interrupt Enable Bit

If the reception FIFO reaches the caution level (the value set in the receive FIFO caution level bits in the receive configuration register (RCR.RFCL) with the corresponding interrupt enabled, the interrupt is issued.

45.2.33 Receive Interrupt Status Register 1 (RIS1)

The RIS1 register indicates the states of the AVB-DMAC receive interrupts.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 45.37 RIS1 register contents

Bit Position	Bit Name	Function
b31	RFWF	Receive FIFO Warning Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b30 to b0	—	Reserved These bits are read as 0. The write value should be 0.

RFWF Receive FIFO Warning Interrupt Status Bit

This bit indicates that the reception FIFO has reached the set caution level (the value set in the receive FIFO caution level bits in the receive configuration register (RCR.RFCL)).

Only 0 can be written to the bit.

[Conditions for Changing]

The bit is set to 0 when the operating mode is not operation mode.

The bit is set to 1 when the reception FIFO exceeds the set caution level (the value set in the receive FIFO caution level bits in the receive configuration register (RCR.RFCL)).

45.2.34 Receive Interrupt Control Register 2 (RIC2)

The RIC2 register controls the AVB-DMAC receive interrupts.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b8	QFF8	Receive Queue 8 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b7	QFF7	Receive Queue 7 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.

Table 45.39 RIS2 register contents (2/2)

Bit Position	Bit Name	Function
b6	QFF6	Receive Queue 6 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b5	QFF5	Receive Queue 5 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b4	QFF4	Receive Queue 4 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b3	QFF3	Receive Queue 3 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b2	QFF2	Receive Queue 2 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b1	QFF1	Receive Queue 7 (Network Control) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b0	QFF0	Receive Queue 0 (Best Effort) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.

RFFF Receive FIFO Full Interrupt Status Bit

This bit indicates that a frame was received but storing it was not possible due to the reception FIFO being full.

When receiving a frame is not possible, the frame will be discarded.

Other information regarding discarded frames is not retained. Even if the frame is not discarded, this bit may also be set to 1 if the E-MAC determines that the frame is an error frame

Only 0 can be written to the bit.

[Conditions for Changing]

The bit is set to 0 when the operating mode is not operation mode.

The bit is set to 1 when the reception FIFO cannot hold received data.

QFF0 to 17 Receive 0 to 17 Full Interrupt Status Bits

These bits indicate that reception queue r did not have space for storing a received frame.

A reception queue is treated as full when it has no descriptors (descriptor type (DESCR.DT) = FEMPTY, FEMPTY_IS, FEMPTY_IC, or FEMPTY_ND) available or reaches the set level for stopping.

CAUTION

If no FEMPTY descriptors or no empty space for descriptors remains in the queue during storing of a divided frame (see section 45.3.4.3 (b) Divided Frames), an error frame is stored in the queue. Such error frames are treated as descriptor sequence errors.

[Conditions for Changing]

A bit is set to 0 when the operating mode is not operation mode.

A bit is set to 1 when reception queue r has no space available for storage.

A bit is set to 1 when the unread frame counter (unread frame counter register i (UFCVi) (i = 0 to 4)) reaches the set level for stopping.

A bit is set to 1 when the unread frame counter reaches the level for stopping before the subsequent received frame is discarded.

45.2.36 Transmit Interrupt Control Register (TIC)

The TIC register controls the AVB-DMAC transmit interrupts.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 45.40 TIC register contents

Bit Position	Bit Name	Function
b31 to b10	—	Reserved These bits are read as 0. The write value should be 0.
b9	TFWE	Time Stamp FIFO Warning Interrupt Enable 0: Disabled 1: Enabled
b8	TFUE	Time Stamp FIFO Update Interrupt Enable 0: Disabled 1: Enabled
b7 to b0	—	Reserved These bits are read as 0. The write value should be 0.

TFWE Time Stamp FIFO Warning Interrupt Enable Bit

When the time-stamp FIFO reaches the warning level while the interrupt is enabled, the interrupt is issued.

TFUE Time Stamp FIFO Update Interrupt Enable Bit

When the time-stamp FIFO is updated while the interrupt is enabled, the interrupt is issued.

45.2.37 Transmit Interrupt Status Register (TIS)

The TIS register indicates the states of the AVB-DMAC transmit interrupts.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	TFWF	TFUF	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R	R

Table 45.41 TIS register contents

Bit Position	Bit Name	Function
b31 to b10	—	Reserved These bits are read as 0. The write value should be 0.
b9	TFWF	Time Stamp FIFO Warning Interrupt Status 0: The interrupt is not pending. 1: The time-stamp FIFO has reached the warning level.
b8	TFUF	Time Stamp FIFO Update Interrupt Status 0: The interrupt is not pending. 1: The time-stamp FIFO has been updated.
b7 to b0	—	Reserved These bits are read as 0. The write value should be 0.

TFWF Time Stamp FIFO Warning Interrupt Status Bit

This bit indicates that the transmission time-stamp FIFO has reached the warning level.

Only 0 can be written to the bit.

[Conditions for Changing]

The bit is set to 0 when the operating mode is not operation mode and when the time stamp FIFO enable bit in the transmit configuration control register (TCCR.TFEN) is 0.

The bit is set to 1 after a frame including DESCR.TSR set has been transmitted and one entry has already been stored in the time-stamp FIFO.

TFUF Time Stamp FIFO Update Interrupt Status Bit

This bit indicates that the transmission time-stamp FIFO has been updated.

Only 0 can be written to the bit.

[Conditions for Changing]

The bit is set to 0 when the operating mode is not operation mode, when the time stamp FIFO enable bit in the transmit configuration control register (TCCR.TFEN) is 0, and when 1 is written to the time stamp FIFO release bit in the transmit configuration control register (TCCR.TFR).

The bit is set to 1 when the time stamp FIFO enable bit (TCCR.TFEN) is 1 after a frame including DESCR.TSR set has been transmitted.

45.2.38 Interrupt Summary Status Register (ISS)

The ISS register gives a summary of the states of AVB-DMAC-related interrupts.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b20	DPS4	Descriptor Interrupt 4 Summary 0: The interrupt is not pending. 1: The interrupt is pending.
b19	DPS3	Descriptor Interrupt 3 Summary 0: The interrupt is not pending. 1: The interrupt is pending.

Table 45.42 ISS register contents (2/2)

Bit Position	Bit Name	Function
b18	DPS2	Descriptor Interrupt 2 Summary 0: The interrupt is not pending. 1: The interrupt is pending.
b17	DPS1	Descriptor Interrupt 1 Summary 0: The interrupt is not pending. 1: The interrupt is pending.
b16 to b14	—	Reserved These bits are read as 0. The write value should be 0.
b13	CGIS	gPTP Interrupt Summary 0: The interrupt is not pending. 1: The interrupt is pending.
b12	RFWS	Receive FIFO Warning Interrupt Summary 0: The interrupt is not pending. 1: The interrupt is pending.
b11 to b10	—	Reserved These bits are read as 0. The write value should be 0.
b9	TFWS	Time Stamp FIFO Warning Interrupt Summary 0: The interrupt is not pending. 1: The interrupt is pending.
b8	TFUS	Time Stamp FIFO Update Interrupt 0: The interrupt is not pending. 1: The interrupt is pending.
b7	MS	E-MAC Interrupt Summary 0: The interrupt is not pending. 1: The interrupt is pending.
b6	ES	Error Interrupt Summary 0: The interrupt is not pending. 1: The interrupt is pending.
b5 to b0	—	Reserved These bits are read as 0. The write value should be 0.

DPS1 to DPS15 Descriptor Interrupt 1 to 15 Summary Bits

These bits are set to 1 when the given descriptor interrupt enable bit (DIC.DPE1 to DPE15) and descriptor interrupt status flag (DIS.DPF1 to DPF15) are both 1.

CGIS gPTP Interrupt Summary Bit

This bit is set to 1 when either interrupt-related bit in the two gPTP-related interrupt registers (GIC and GIS) is 1.

RFWS Receive FIFO Warning Interrupt Summary Bit

This bit is set to 1 when the receive FIFO warning interrupt enable bit (RIC1.RFWE) and receive FIFO warning interrupt status flag (RIS1.RFWF) are both 1.

TFWS Time Stamp FIFO Warning Interrupt Summary Bit

This bit is set to 1 when the time stamp FIFO warning interrupt enable bit (TIC.TFWE) and time stamp FIFO warning interrupt status flag (TIS.TFWF) are both 1.

TFUS Time Stamp FIFO Update Interrupt Summary Bit

This bit is set to 1 when the time stamp FIFO update interrupt enable bit (TIC.TFUE) and time stamp FIFO update interrupt status flag (TIS.TFUF) are both 1.

MS E-MAC Interrupt Summary Bit

This bit is set to 1 when an E-MAC interrupt is issued.

ES Error Interrupt Summary Bit

This bit is set to 1 when any of the valid flags in the error interrupt status register (EIS) is 1 or the queue full error interrupt status bit (EIS.QFS) in the error interrupt status register (EIS) is 1.

45.2.39 gPTP Configuration Control Register (GCCR)

The GCCR register is used to set and control the gPTP (generalized precision time protocol).

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 45.43 GCCR register contents

Bit Position	Bit Name	Function
b31 to b10	—	Reserved These bits are read as 0. The write value should be 0.
b9, b8	TCSS[1:0]	Timer Capture Source Select 00: gPTP timer value 01: Adjusted gPTP timer value 10: AVTP presentation time 11: Setting prohibited
b7, b6	—	Reserved These bits are read as 0. The write value should be 0.
b5	LMTT	Maximum Transit Time Configuration Request 0: Setting completed 1(W): Issue a configuration request. 1(R): Completion of settings is pending.
b4	LPTC	Presentation Time Compare Value Configuration Request 0: Setting completed 1(W): Issue a configuration request. 1(R): Completion of settings is pending.
b3	LTI	Timer Increment Value Configuration Request 0: Setting completed 1(W): Issue a configuration request. 1(R): Completion of settings is pending.
b2	LTO	Timer Offset Value Configuration Request 0: Setting completed 1(W): Issue a configuration request. 1(R): Completion of settings is pending.
b1, b0	TCR[1:0]	Timer Control Request 00: Timer control is not requested. 01: gPTP/AVPT presentation time reset 10: Setting prohibited 11: Captures the value set in the TCSS bit.

TCSS[1:0] Timer Capture Source Select Bits

These bits select the source used for updating the captured timer register (gPTP timer capture register (GCTi.CTV)).

These bits should still be controlled when timer control is not being requested (GCCR.TCR = B'00).

LMTT Maximum Transit Time Configuration Request Bit

This bit issues requests for configuring the gPTP maximum transit time configuration register (GMTT).

Only 1 can be written to the bit.

[Conditions for Changing]

The bit is set to 1 when the operating mode is not operation mode.

The bit is set to 0 when the value of the gPTP maximum transit time configuration register (GMTT) is reflected in the gPTP timer.

LPTC Presentation Time Compare Value Configuration Request Bit

This bit issues requests for configuring the gPTP presentation time comparison register (GPTC).

Only 1 can be written to the bit.

[Conditions for Changing]

The bit is set to 1 when the operating mode is not operation mode.

The bit is set to 0 when the value of the gPTP presentation time comparison register (GPTC) is reflected in the gPTP timer.

LTI Timer Increment Value Configuration Request Bit

This bit issues requests for configuring the gPTP timer increment configuration register (GTI).

Only 1 can be written to the bit.

[Conditions for Changing]

The bit is set to 1 when the operating mode is not operation mode.

The bit is set to 0 when the value of the gPTP timer increment configuration register (GTI) is reflected in the gPTP timer.

LTO Timer Offset Value Configuration Request Bit

This bit issues requests for configuring gPTP timer offset configuration register i (GTOi).

Only 1 can be written to the bit.

[Conditions for Changing]

The bit is set to 1 when the operating mode is not operation mode.

The bit is set to 0 when the value of gPTP timer offset configuration register i (GTOi) is reflected in the gPTP timer.

TCR[1:0] Timer Control Request Bits

These bits issue requests for controlling the gPTP timer.

Writing to the bits is only possible when the current operating mode is operation mode and the bits are B'00.

Do not write to the bit when the gPTP timer clock select bit in the AVB-DMAC mode register is B'00.

[Conditions for Changing]

The bits are set to B'00 when the operating mode is not operation mode and on completion of the requested processing.

45.2.40 gPTP Maximum Transit Time Configuration Register (GMTT)

The GMTT register sets the maximum time for transitions of the gPTP timer.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 45.44 GMTT register contents

Bit Position	Bit Name	Function
b31 to b0	MTTV[31:0]	Maximum Transit Time The maximum transition time for addition to the presentation time

MTTV[31:0] Maximum Transit Time Bits

These bits set the maximum transition time for use in calculating AVTP presentation times.

Write the desired setting to the bits, then issue the configuration request by setting the maximum transit time configuration request bit in the gPTP configuration control register (GCCR.LMTT) to 1.

CAUTION

Do not write a value to these bits when the operating mode is operation mode and the maximum transit time configuration request bit (GCCR.LMTT) is 1.

45.2.41 gPTP Presentation Time Comparison Register (GPTC)

The GPTC register sets a value for comparison with presentation times in the gPTP timer.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 45.45 GPTC register contents

Bit Position	Bit Name	Function
b31 to b0	PTCV[31:0]	Presentation Time Comparison Value Value for comparison with the gPTP presentation times

PTCV[31:0] Presentation Time Comparison Value Bits

These bits set a value for comparison with AVTP timer values to which a maximum transit time is not appended.

Write the desired setting to the bits, then issue the configuration request by setting the presentation time comparison value configuration request bit in the gPTP configuration control register (GCCR.LPTC) to 1.

CAUTION

Do not write a value to these bits when the operating mode is operation mode and the presentation time comparison value configuration request bit (GCCR.LPTC) is 1.

Do not set these bits to a value in the range from $x-1$ to $x+1$ (x is the setting value of the gPTP timer increment value bits (GTI.TIV)).

45.2.42 gPTP Timer Increment Configuration Register (GTI)

The GTI register sets the increment for the gPTP timer.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 45.46 GTI register contents

Bit Position	Bit Name	Function
b31 to b28	—	Reserved These bits are read as 0. The write value should be 0.
b27 to b0	TIV[27:0]	gPTP Timer Increment Value Increment for the gPTP timer

TIV[27:0] Bits (gPTP Timer Increment Value)

When the gPTP clock select bits in the AVB-DMAV mode register (CCC.CSEL) are selecting a clock signal, these bits set the value by which the timer is incremented each time a cycle of that clock signal elapses.

Write the desired setting to the bits, then issue the configuration request by setting the timer increment value configuration request bit in the gPTP configuration control register (GCCCR.LTI) to 1.

CAUTION

Do not write a value to these bits when the operating mode is operation mode and the timer increment value configuration request bit (GCCCR.LTI) is 1.

Do not write 0 to the bits.

45.2.43 gPTP Timer Offset Configuration Register i (GTOi) (i = 0 to 2)

The GTOi register sets an offset value for the gPTP timer.

The offset value is added to the combination of bits 0 to 31 in GTO0, 32 to 63 in GTO1, and 64 to 95 in GTO2, which together make up the gPTP timer.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	TOV[31+32*i:16+32*i]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	TOV[15+32*i:32*i]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 45.47 GTOi register contents

Bit Position	Bit Name	Function
b31 to b0	TOV[31+32*i:32*i]	Timer Offset Value Offset value for the gPTP timer

TOV[79:0] Timer Offset Value Bits

This is an 80-bit value consisting of the settings in GTO0.TOV[31:0], GTO1.TOV[63:32], and GTO2.TOV[95:64], and is used to set an offset for adding to the value of the gPTP timer.

Write the desired setting to the bits, then issue the configuration request by setting the timer offset value configuration request bit in the gPTP configuration control register (GCCR.LTO) to 1.

CAUTION

Do not write a value to these bits when the operating mode is operation mode and the timer offset value configuration request bit (GCCR.LTO) is 1.

Write H'0000 to GTO2.TOV[95:80].

Set a value in the range from 0 to 10^9-1 (H'0000 0000 to H'3B9A C9FF) in GTO0.TOV[31:0].

45.2.44 gPTP Interrupt Control Register (GIC)

The GCI register is used to control gPTP-related interrupts.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 45.48 GIC register contents

Bit Position	Bit Name	Function
b31 to b3	—	Reserved These bits are read as 0. The write value should be 0.
b2	PTME	Presentation Time Match Interrupt Enable 0: Disabled 1: Enabled
b1	PTOE	Presentation Time Overrun Interrupt Enable 0: Disabled 1: Enabled
b0	PTCE	Presentation Time Capture Interrupt Enable 0: Disabled 1: Enabled

PTME Presentation Time Match Interrupt Enable Bit

When this bit is 1, setting of the presentation time match interrupt flag in the gPTP interrupt status register (GIS.PTMF) to 1 leads to generation of that interrupt.

PTOE Presentation Time Overrun Interrupt Enable Bit

When this bit is 1, setting of the presentation time overrun interrupt flag in the gPTP interrupt status register (GIS.PTOF) to 1 leads to generation of that interrupt.

PTCE Presentation Time Capture Interrupt Enable Bit

When this bit is 1, setting of the presentation time capture interrupt flag in the gPTP interrupt status register (GIS.PTCF) to 1 leads to generation of that interrupt.

45.2.45 gPTP Interrupt Status Register (GIS)

The GIC register indicates the state of the gPTP-related interrupt.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 45.49 GIS register contents

Bit Position	Bit Name	Function
b31 to b3	—	Reserved These bits are read as 0. The write value should be 0.
b2	PTMF	Presentation Time Match Interrupt Flag 0: The interrupt is not pending. 1: The interrupt is pending.
b1	PTOF	Presentation Time Overrun Interrupt Flag 0: The interrupt is not pending. 1: The interrupt is pending.
b0	PTCF	Presentation Time Capture Interrupt Flag 0: The interrupt is not pending. 1: The interrupt is pending.

PTMF Presentation Time Match Interrupt Flag Bit

This bit indicates that the value of the AVTP timer exceeds the value of the gPTP presentation time comparison register (GPTC).

Only 0 can be written to the bit.

[Conditions for Changing]

The bit is set to 0 when the operating mode is not operation mode.

The bit is set to 1 when the AVTP timer value is greater than or equal to the value of the gPTP presentation time comparison register (GPTC).

PTOF Presentation Time Overrun Interrupt Flag Bit

This bit indicates that a capture event is generated before completion of the previous capture process.

Only 0 can be written to the bit.

[Conditions for Changing]

The bit is set to 0 when the operating mode is not operation mode.

The bit is set to 0 when the presentation time capture interrupt flag bit (GIS.PTCF) is set to 0. The bit is set to 1 when a capture event is generated while the value of the presentation time capture interrupt flag bit (GIS.PTCF) is 1.

PTCF Presentation Time Capture Interrupt Flag Bit

This bit indicates that a capture event is generated.

Only 0 can be written to the bit.

[Conditions for Changing]

The bit is set to 0 when the operating mode is not operation mode.

The bit is set to 1 when a capture event is generated.

45.2.46 gPTP Presentation Time Capture Register (GCPT)

The GCPT register indicates the captured presentation time.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 45.50 GCPT register contents

Bit Position	Bit Name	Function
b31 to b0	CPTV[31:0]	Presentation Time Capture Presentation time value

CPTV[31:0] Presentation Time Capture Bits

These bits indicate the AVTP presentation time captured in response to a capture event. Read the time value from these bits and clear the presentation time capture interrupt flag bit (GIS.PTCF) before triggering a next capture.

Whether capturing a correct value was possible can be confirmed by following the procedure below.

1. Read these bits.
2. Read the presentation time overrun interrupt flag bit (GIS.PTOF).
3. Read these bits again.
4. Check whether the presentation time overrun interrupt flag bit (GIS.PTOF) is set to 1 and whether the value read from these bits has changed. If either of the two conditions is met, a correct value has not been captured.

[Conditions for Changing]

The bits are set to H'00000000 when the operating mode is not operation mode.

When a capture event occurs, the bits are updated with the AVTP presentation time value at the time of the event.

45.2.47 gPTP Timer Capture Register i (GCTi) (i = 0 to 2)

The GCTi registers form an 80-bit register that captures the gPTP timer value.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
CTV[15+32*i:32*i]																
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 45.51 GCTi register contents

Bit Position	Bit Name	Function
b31 to b0	CTV[31+32*i:32*i]	gPTP Timer Capture Value Captured timer value

CTV[79:0] gPTP Timer Capture Value Bits

These 80 bits consist of GCT0.CTV[31:0], GCT1.CTV[63:32] and GCT2.CTV[79:64], which together indicate captured timer values.

When B'00 (value of the gPTP timer) or B'01 (corrected gPTP timer value) is selected by the timer capture source select bits in the gPTP configuration control register (GCCR.TCSS), the corresponding 80-bit values are stored in GCT0.CTV[31:0], GCT1.CTV[63:32], and GCT2.CTV[79:64].

When B'10 (AVTP presentation time) is selected by the timer capture source select bit (GCCR.TCSS), the corresponding 32-bit values are stored in GCT0.CTV[31:0].

Actual writing of the timer value specified by the timer capture source select bits (GCCR.TCSS) proceeds when B'11 (timer capture request) is written to the timer control request bits in the gPTP configuration control register (GCCR.TCR).

Do not read the value while the value of the timer control request bits (GCCR.TCR) is B'11, because this indicates that storage is still in progress.

When operating mode is not operation mode, the bits are set to H'00000000.

45.2.48 gPTP Capture Event Control Register (GCEC)

The GCEC register sets the capture event.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b4	DEN	Divider Operation Enable 0: Divider operation is disabled. 1: Divider operation is enabled.
b3 to b1	—	Reserved These bits are read as 0. The write value should be 0.
b0	CES	Capture Event Select 0: External capture event (AVB_CAPTURE pin) 1: Output from the divider

CAUTION

Set the bits following the procedure described below. For pin control, see section 41., Ports.

<1> Change the capture event from an external capture event (AVB_CAPTURE pin) to output from the divider.

1. Perform pin control to disable the AVB_CAPTURE pin function.
2. Make the setting for the serial sound interface.
3. Set GCEC.CES to 1.
4. Set a desired value in GCEC.SCS and GCEC.DRC.
5. Set GCEC.DEN to 1.

<2> Change the capture event from output from the divider to the external capture event (AVB_CAPTURE pin).

1. Set GCEC.DEN to 0.
2. Wait for 2 cycles of output from the divider specified by GCEC.SCS and GCEC.DRC.
3. Set GCEC.CES to 0.
4. Perform pin control to enable the AVB_CAPTURE pin function.

<3> Switch SCS or DRC while output from the divider is selected as the capture event.

1. Set GCEC.DEN to 0.
2. Wait for 2 cycles of output from the divider specified by GCEC.SCS and GCEC.DRC.
3. Set a desired value in GCEC.SCS and GCEC.DRC.
4. Set GCEC.DEN to 1.

DRC[10:0] Division Ratio Setting Bits

These bits set the division ratio which is used in dividing the SSIWS signal supplied from the serial sound interface by the divider.

The division ratio is “the value set in these bits + 1”.

SCS[1:0] Serial Sound Interface Channel Select Bits

These bits select the channel of the serial sound interface which supplies the SSIWS signal to the divider.

CAUTION

The frequency of the SSIWS signal of the selected channel must be equal to or smaller than a quarter of the clock frequency set by the gPTP clock select bits (CCC.CSEL).

DEN Divider Operation Enable Bit

This bit sets the operating state of the divider.

Change the settings of GCEC.DRC, GCEC.SCS, GCEC.CES, and serial sound interface after setting this bit to 0.

Do not set this bit to 1 while GCEC.CES is set to 0.

CES Capture Event Select Bit

This bit sets the supply source of the capture event.

The capture event is detected on the rising edge of the signal selected by this bit.

CAUTION

When the external capture event (AVB_CAPTURE pin) is selected, the AVB_CAPTURE pin should be held high for at least two cycles of the clock specified by the gPTP clock select bits (CCC.CSEL) to generate an external capture event.

When output from the divider is selected, perform pin control to disable the AVB_CAPTURE

pin function. For pin control, see section 41., Ports.

45.2.49 E-MAC Mode Register (ECMR)

ECMR is used to specify the operating mode of the E-MAC. The settings in this register are normally made in the initialization process following a reset.

The operating mode settings must not be changed while transmission or reception is enabled (i.e. while the RE or TE bit in this register is 1).

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 45.53 ECMR register contents (1/2)

Bit Position	Bit Name	Function
b31 to b27	—	Reserved These bits are read as 0. The write value should be 0.
b26	TRCCM	Counter Clear Mode 0: Writing to a counter register leads to the register being cleared to 0. 1: Reading from a counter register leads to the register being cleared to 0.
b25, b24	—	Reserved These bits are read as 0. The write value should be 0.
b23	RCSC	Checksum Calculation 0: Checksums are not automatically calculated. 1: Checksums are automatically calculated.
b22	—	Reserved This bit is read as 0. The write value should be 0.
b21	DPAD	Data Padding 0: Padding to make up 60 bytes is inserted in data for transmission when fewer than 60 bytes are to be transmitted. 1: Padding is not inserted in data for transmission when fewer than 60 bytes are to be transmitted and the data are transmitted without being changed.
b20	RZPF	PAUSE Frame Reception with Time = 0 0: Reception of PAUSE frames with the TIME parameter value 0 is disabled. 1: Reception of PAUSE frames with the TIME parameter value 0 is enabled.
b19	ZPF	PAUSE Frame Usage with TIME = 0 Enable 0: Control in response to and for the sending of PAUSE frames with the TIME parameter value 0 is disabled. 1: Control in response to and for the sending of PAUSE frames with the TIME parameter value is 0 is enabled.
b18	PFR	PAUSE Frame Receive Mode 0: PAUSE frames are not transferred to the AVB-DMAC. 1: PAUSE frames are transferred to the AVB-DMAC.
b17	RXF	Operating Mode for Flow Control in Reception 0: Detection of PAUSE frames is disabled. 1: Flow control for the receiving port is enabled.

Table 45.53 ECMR register contents (2/2)

Bit Position	Bit Name	Function
b16	TXF	Operating Mode for Flow Control in Transmission 0: Flow control for the transmitting port is disabled (PAUSE frames are not automatically transmitted). 1: Flow control for the transmitting port is enabled (PAUSE frames are automatically transmitted as required).
b15 to b7	—	Reserved These bits are read as 0. The write value should be 0.
b6	RE	Reception Enable 0: Reception is disabled. 1: Reception is enabled.
b5	TE	Transmission Enable 0: Transmission is disabled. 1: Transmission is enabled.
b4 to b2	—	Reserved These bits are read as 0. The write value should be 0.
b1	DM	Full-duplex Transfer Enable 0: Disables full-duplex transfer. 1: Enables full-duplex transfer.
b0	PRM	Promiscuous Mode 0: Normal operation 1: Promiscuous mode operation

TRCCM Counter Clear Mode Bit

This bit sets the method for clearing the counter register. Refer to the descriptions of the counter registers.

RCSC Checksum Calculation Bit

Setting this bit to 1 enables automatic calculation of checksums for data in received frames.

Only the data field of an Ethernet frame is in the scope of checksum calculation. Specifically, the checksum is calculated from the data field, which follows the length/type field and is followed by the CRC field. Calculation only involves 16-bit addition; it does not involve bit inversion.

DPAD Data Padding Control Bit

This bit specifies padding or non-padding of data when less than 60 bytes are to be transmitted.

When this bit is set to 1, data are transmitted without padding; when it is set to 0, data are padded to make up 60-byte units for transmission.

RZPF (PAUSE Frame Reception with Time = 0) Bit

When the RZPF bit is set to 0, received PAUSE frames with the Timer value 0 are discarded.

When the RZPF bit is set to 1, release from the transmission wait state follows reception of a PAUSE frame with the Timer value 0.

ZPF (PAUSE Frame Usage with TIME = 0 Enable) Bit

When the ZPF bit is set to 0, the next frame to be transmitted is not transmitted until the time specified by the Timer value has elapsed.

Received PAUSE frames with the Timer value 0 are discarded.

When the ZPF bit is set to 1, if the amount of data in the reception FIFO becomes less than the setting of the receive FIFO critical level bits (RCR.RFCL) before the time specified by the Timer value elapses, a PAUSE frame with a Timer value of 0 is automatically transmitted. If the interface is in the transmission wait state, it is released from that state on receiving a PAUSE frame with a Timer value of 0.

PFR PAUSE Frame Receive Mode Bit

This bit specifies whether PAUSE frames are transferred to the AVB-DMAC.

RXF (Operating Mode for Flow Control in Reception) Bit

When the RXF bit is set to 1 and a PAUSE frame is received, a next frame to be transmitted is not transmitted until the time indicated by the Timer value in the PAUSE frame has elapsed. However, the transmission of a current frame is continued. The number of received PAUSE frames is also counted. For details, see section 45.2.57, PAUSE Frame Receive Counter (PFRCCR).

Setting this bit to 0 disables PAUSE frame detection.

TXF (Operating Mode for Flow Control in Transmission) Bit

The TXF bit enables or disables flow control in transmission by the port.

Setting this bit to 0 disables PAUSE frame detection.

RE Reception Enable Bit

If this bit is switched from reception being enabled (RE = 1) to reception being disabled (RE = 0) while a frame is being received, reception will continue until reception of that frame is completed.

TE Transmission Enable Bit

If this bit is switched from transmission being enabled (TE = 1) to transmission being disabled (TE = 0) while a frame is being transmitted, transmission will continue until transmission of that frame is completed.

DM Full-Duplex Transfer Enable Bit

This bit enables or disables full-duplex transfer.

PRM Promiscuous Mode Bit

Setting the PRM bit enables all Ethernet frames to be received. All Ethernet frames means all receivable frames, irrespective of differences or enabled/disabled status (destination address, broadcast address, multicast bit, etc.).

45.2.50 Receive Frame Length Register (RFLR)

The RFLR register specifies the maximum length (in bytes) of frames that can be received by this LSI. Settings in this register must not be changed while reception is enabled (while the RE bit in the E-MAC mode register (EMCR) is 1).

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 45.54 RFLR register contents

Bit Position	Bit Name	Function
b31 to b18	—	Reserved These bits are read as 0. The write value should be 0.
b17 to b0	RFL[17:0]	Receive Frame Length H'00000 to H'005EE: 1,518 bytes H'005EF: 1,519 bytes H'005F0: 1,520 bytes : : H'007FF: 2,047 bytes H'00800: 2,048 bytes : : H'01000: 4,096 bytes : : H'10000: 65,535 bytes : : H'20000 to H'3FFFF: 131,072 bytes

RFL[17:0] Receive Frame Length Bits

Frame data described here refers to all fields from the destination address up to the CRC data. Frame contents from the destination address up to the data are actually transferred to memory. CRC data are not included in the transfer. When more data than the specified number of bytes are received, the portion of data that exceeds the specified value is discarded.

45.2.51 E-MAC Status Register (ECSR)

The ECSR register indicates the state of the E-MAC. The CPU can be notified of the state. For bits associated with interrupts, the interrupt can be enabled or disabled by the corresponding bit in the E-MAC Interrupt Permission Register (ECSIPR) described in section 45.2.52, E-MAC Interrupt Permission Register (ECSIPR).

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Table 45.55 ECSR register contents

Bit Position	Bit Name	Function
b31 to b5	—	Reserved These bits are read as 0. The write value should be 0.
b4	PFROI	PAUSE Frame Retransmit Retry Over 0: PAUSE frame retransmit retry count does not exceed the upper limit. 1: PAUSE frame retransmit retry count exceeds the upper limit.
b3 to b1	—	Reserved These bits are read as 0. The write value should be 0.
b0	ICD	Illegal Carrier Detection 0: PHY-LSI has not detected an illegal carrier on the line. 1: PHY-LSI has detected an illegal carrier on the line.

PFROI PAUSE Frame Retransmit Retry Over Bit

This bit indicates that retransmission count has exceeded the retransmit upper limit set in the PAUSE frame retransmission count register (TPAUSER) during PAUSE frame retransmission when the flow control is enabled.

Writing 1 to this bit clears it to 0.

ICD Illegal Carrier Detection Bit

This bit indicates that the PHY-LSI has detected an illegal carrier on the line. If a change in the signal input from the PHY-LSI occurs in a period shorter than the software recognition period, the correct information may not be obtained. Refer to the timing specification for the PHY-LSI used.

Writing 1 to this bit clears it to 0.

45.2.52 E-MAC Interrupt Permission Register (ECSIPR)

The ECSIPR register enables or disables the states indicated by the ECSR register as interrupt sources. Each effective bit disables or enables interrupts corresponding to the bits in ECSR.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	PFROIP	—	—	—	—	ICDIP

R/W	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R	R/W

Table 45.56 ECSIPR register contents

Bit Position	Bit Name	Function
b31 to b5	—	Reserved These bits are read as 0. The write value should be 0.
b4	PFROIP	PAUSE Frame Retransmit Interrupt Enable 0: Interrupts on setting of the PFROI bit is disabled. 1: Interrupts on setting of the PFROI bit is enabled.
b3 to b1	—	Reserved These bits are read as 0. The write value should be 0.
b0	ICDIP	Illegal Carrier Detect Interrupt Enable 0: Interrupts on setting of the ICD bit is disabled. 1: Interrupt on setting of the ICD bit is enabled.

PFROIP PAUSE Frame Retransmit Interrupt Enable Bit

Setting this bit to 1 selects interrupt generation on setting of the PAUSE frame retransmit retry over bit (ECSR.PFROI) in the E-MAC status register to 1.

ICDIP Illegal Carrier Detect Interrupt Enable Bit

Setting this bit to 1 selects interrupt generation on setting of the illegal carrier detection bit (ECSR.ICD) in the E-MAC status register to 1.

45.2.53 PHY Interface Register (PIR)

The PIR register provides a means of access to the PHY-LSI internal registers via the MII.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	MDI	MDO	MMD	MDC
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	—	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Table 45.57 PIR register contents

Bit Position	Bit Name	Function
b31 to b4	—	Reserved These bits are read as 0. The write value should be 0.
b3	MDI	MII Management Data-In Indicates the level of the ET_MDIO pin.
b2	MDO	MII Management Data-Out Holds data for output from the ET_MDIO pin.
b1	MMD	MII Management Mode 0: Read direction is specified. 1: Write direction is specified.
b0	MDC	MII Management Data Clock The value set in this bit is output from the ET_MDC pin, which supplies the management data clock for the MII.

MDI MII Management Data-In Bit

This bit indicates the level of the ET_MDIO pin.

MDO MII Management Data-Out Bit

This bit holds data for output from the ET_MDIO pin.

The ET_MDIO pin outputs a value set in this bit when the MMD bit is set to 1 (to specify writing as the direction). Data are not output while the MMD bit is set to 0 (to specify reading as the direction).

MMD MII Management Mode Bit

This bit specifies the direction for data through MDIO (reading or writing).

MDC MII Management Data Clock Bit

Values set in this bit are output on the ET_MDC pin to supply the MII with the management data clock. For the method of access to the MII registers, see section 45.3.12, Connection to PHY-LSI.

45.2.54 Automatic PAUSE Frame Register (APR)

The APR register is used to set the value for the TIME parameter of automatically transmitted PAUSE frames. When a PAUSE frame is automatically transmitted, the value set in this register is used as its TIME parameter.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	AP[15:0]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 45.58 APR register contents

Bit Position	Bit Name	Function
b31 to b16	—	Reserved These bits are read as 0. The write value should be 0.
b15 to b0	AP[15:0]	Automatic PAUSE These bits set the TIME parameter value of an automatic PAUSE frame.*1 H'0000: — H'0001: 512 × 1 bit-period H'0002: 512 × 2 bit-period ⋮ H'FFFF: 512 × 65535 bit-period Note 1. A bit-period changes relative to the transfer speed as follows. 100Mbps: 1 bit-period = 10 ns 10Mbps: 1 bit-period = 100 ns

AP[15:0] Automatic PAUSE Bit

These bits set the value of the TIME parameter in automatically transmitted PAUSE frames. The unit for the setting is 512-bit periods.

Set these bits to a value other than H'0000 when the flow control in transmission (PAUSE frame transmission) is enabled (ECMR.TXF = 1).

45.2.55 Manual PAUSE Frame Register (MPR)

The MPR register is used to set the value for the TIME parameter of manually generated PAUSE frames. When a PAUSE frame is manually transmitted, the value set in this register is used as its TIME parameter.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 45.59 MPR register contents

Bit Position	Bit Name	Function
b31 to b16	—	Reserved These bits are read as 0. The write value should be 0.
b15 to b0	MP[15:0]	Manual PAUSE These bits set the TIME parameter value of a manual PAUSE frame.*1 H'0000: — H'0001: 512 × 1 bit-period H'0002: 512 × 2 bit-period ⋮ H'FFFF: 512 × 65535 bit-period Note 1. A bit-period changes relative to the transfer speed as follows. 100Mbps: 1 bit-period = 10 ns 10Mbps: 1 bit-period = 100 ns

MP[15:0] Manual PAUSE Bits

These bits set the value of the TIME parameter in manually generated PAUSE frames.

The unit for the setting is 512 bit periods.

45.2.56 PAUSE Frame Transmit Counter (PFTCR)

The PFTCR register is a counter that indicates the number of times PAUSE frames have been transmitted.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

	PFTXC[15:0]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 45.60 PFTCR register contents

Bit Position	Bit Name	Function
b31 to b16	—	Reserved These bits are read as 0.
b15 to b0	PFTXC[15:0]	PAUSE Frame Transmit Counter Counter for counting the number of transmitted PAUSE frames

PFTXC[15:0] PAUSE Frame Transmit Counter Bits

These bits indicate the total number of PAUSE frames that have been transmitted (both manually and automatically).

The bits are cleared to 0 when they are read.

If counting up and clearing of the counter coincide, clearing the counter takes priority.

45.2.57 PAUSE Frame Receive Counter (PFRCR)

The RFRCCR register is a counter that indicates the number of times PAUSE frames have been received.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	PFRXC[15:0]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 45.61 RFRCCR register contents

Bit Position	Bit Name	Function
b31 to b16	—	Reserved These bits are read as 0.
b15 to b0	PFRXC[15:0]	PAUSE Frame Receive Counter Counter for counting the number of received PAUSE frames

PFRXC[15:0] PAUSE Frame Receive Counter Bits

These bits indicate the number of PAUSE frames that have been received when flow control in reception is enabled (the RXF bit in ECMR = 1).

The bits are cleared to 0 when they are read.

If counting up and clearing the counter coincide, clearing the counter takes priority.

45.2.58 Automatic PAUSE Frame Retransmission Count Register (TPAUSER)

The TPAUSER register sets the upper limit of automatic PAUSE frame retransmission count.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 45.62 TPAUSER register contents

Bit Position	Bit Name	Function
b31 to b16	—	Reserved These bits are read as 0.
b15 to b0	TPAUSE[15:0]	Automatic PAUSE Frame Retransmission Count Upper Limit H'0000: No limitation H'0001: Once : : H'FFFF: 65535 times

TPAUSE[15:0] Automatic PAUSE Frame Retransmission Count Upper Limit Bits

The bits set the upper limit of automatic PAUSE frame retransmission count.

The setting in the bits must not be changed while transmission is enabled (EMCR.TE = 1).

45.2.59 MAC Address High Register (MAHR)

The MAHR register specifies the 32 higher-order bits of the 48-bit MAC address. The settings in this register are normally made in the initialization process after a reset.

The settings in this register must not be changed while transmission or reception is enabled.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 45.63 MAHR register contents

Bit Position	Bit Name	Function
b31 to b0	MA[47:16]	MAC Address Bits 47 to 16 These bits are used to set the 32 higher-order bits of the MAC address.

MA[47:16] MAC Address Bits 47 to 16

These bits are used to set the 32 higher-order bits of the MAC address.

For example, if the MAC address is 01-23-45-67-89-AB (hexadecimal), set H'0123 4567 in the MAHR register.

45.2.60 MAC Address Low Register (MALR)

The MALR register specifies the 16 lower-order bits of the 48-bit MAC address. The settings in this register are normally made in the initialization process after a reset.

The settings in this register must not be changed while transmission or reception is enabled.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 45.64 MALR register contents

Bit Position	Bit Name	Function
b31 to b16	—	Reserved These bits are read as 0. The write value should be 0.
b15 to b0	MA[15:0]	MAC Address Bits 15 to 0 These bits are used to set the 16 lower-order bits of the MAC address.

MA[15:0] MAC Address Bits 15 to 0

These bits are used to set the 16 lower-order bits of the MAC address.

For example, if the MAC address is 01-23-45-67-89-AB (hexadecimal), set H'89AB in the MALR register.

45.2.61 CRC Error Frame Receive Counter Register (CEFCR)

The CEFCR register is a counter that indicates the number of times frames with CRC errors were received. Counting up stops when the value in this register reaches H'FFFF FFFF.

Table 45.65 CEFCR register contents

Bit Position	Bit Name	Function
b31 to b0	CEFC[31:0]	CRC Error Frame Counter These bits indicate the number of CRC error frames received.

CEFC[31:0] CRC Error Frame Counter Bits

These bits indicate the number of received frames having CRC errors.

The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register is set to 1.

When TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

45.2.62 Frame Receive Error Counter Register (FRECR)

The FRECR register is a counter that indicates the number of frames for which receive errors were generated by input on the ET_RXER pin from the PHY-LSI. Counting up stops when the value in this register reaches H'FFFF FFFF.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 45.66 FRECR register contents

Bit Position	Bit Name	Function
b31 to 0	FRECR[31:0]	Frame Receive Error Counter These bits indicate the number of errors during frame reception.

FRECR[31:0] Frame Receive Error Counter Bits

These bits indicate the number of errors during frame reception.

The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register is set to 1.

When TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

45.2.63 Too-Short Frame Receive Counter Register (TSFRCR)

The TSFRCR register is a counter that indicates the number of received frames that were fewer than 64 bytes in length. Counting stops when the value in this register reaches H'FFFF FFFF.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
TSFRC[31:16]

Table 45.67 TSFRCR register contents

Bit Position	Bit Name	Function
b31 to b0	TSFRC[31:0]	Too-Short Frame Receive Counter These bits indicate the number of frames received with a length of less than 64 bytes.

TSFRC[31:0] Too-Short Frame Receive Counter Bits

These bits indicate the number of received frames that were fewer than 64 bytes in length.

The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register is set to 1.

When TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

45.2.64 Too-Long Frame Receive Counter Register (TLFRCR)

The TLFRCR register is a counter that indicates the number of received frames that were longer than the value specified in the receive frame length register (RFLR). Counting up stops when the value in the TLFRCR register reaches H'FFFF FFFF.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 45.68 TLFRCR register contents

Bit Position	Bit Name	Function
b31 to b0	TLFC[31:0]	Too-Long Frame Receive Counter These bits indicate the number of frames received with a length exceeding the value in RFLR.

TLFC[31:0] Too-Long Frame Receive Counter Bits

These bits indicate the number of received frames that were longer than the value in RFLR.

The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register is set to 1.

When TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

45.2.65 Residual-Bit Frame Receive Counter Register (RFCR)

The RFCR register is a counter that indicates the number of received frames containing “residual bits” (trailing bits not making up an 8-bit unit). Counting up stops when the value in this register reaches H'FFFF FFFF.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 45.69 RFCR register contents

Bit Position	Bit Name	Function
b31 to b0	RFC[31:0]	Residual-Bit Frame Receive Counter These bits indicate the number of received frames containing residual bits.

RFC[31:0] Residual-Bit Frame Receive Counter Bits

These bits indicate the number of received frames containing residual bits.

The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register is set to 1.

When TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

45.2.66 Multicast Address Frame Receive Counter Register (MAFCR)

The MAFCR register is a counter that indicates the number of received frames for which a multicast address was specified. Counting up stops when the value in this register reaches H'FFFF FFFF.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 45.70 MAFCR register contents

Bit Position	Bit Name	Function
b31 to b0	MAFC[31:0]	Multicast Address Frame Counter These bits indicate the number of multicast frames that have been received.

MAFC[31:0] Multicast Address Frame Counter Bits

These bits indicate the number of multicast frames that have been received.

The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register is set to 1.

When TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

45.3 Operation

The EthernetAVB consists of the following functional units:

- DMA transfer controller (AVB-DMAC): Handles DMA transfer between the data storage areas for reception and transmission in the on-chip RAM and the reception and transmission FIFO buffers
- MAC controller (E-MAC): Handles transfer between the reception and transmission FIFO buffers and the MII

Using its direct memory access (DMA) function, the AVB-DMAC handles DMA transfer of frame data between the destinations for storing Ethernet frame data for transmission and reception in the on-chip RAM and the FIFO buffers for reception and transmission. Data cannot be directly read from or written to the FIFO buffers.

To handle DMA transfer, the AVB-DMAC requires information that includes the addresses for storage of data for transmission and received data. These data are referred to as descriptors. The AVB-DMAC reads data for transmission from the storage area for data to be transmitted according to the information in descriptors and writes received data to the storage area for received data accompanied by information in descriptors. The descriptors are placed in the on-chip RAM. Arranging multiple descriptors in descriptor lists allows the continuous reception or transmission of multiple Ethernet frames.

The E-MAC supports an MII, which provides an interface format for the externally connected PHY-LSI. The E-MAC constructs Ethernet frames from data written to the transmission FIFO and transmits these frames to the MII. It also performs CRC checking of Ethernet frames received from the MII and writes the frames to the reception FIFO.

45.3.1 AVB-DMAC Operating Modes

Figure 45.5 illustrates the operating modes of the AVB-DMAC.

Transitions of AVB-DMAC operating mode are under the control of the items listed below.

- CPU operating mode (power-on reset)
- Configuration of the operating mode configuration bits (CCC.OPC) in the AVB-DMAC mode register

The current operating mode can be determined by reading the operating mode status bits in the AVB-DMAC status register (CSR.OPS).

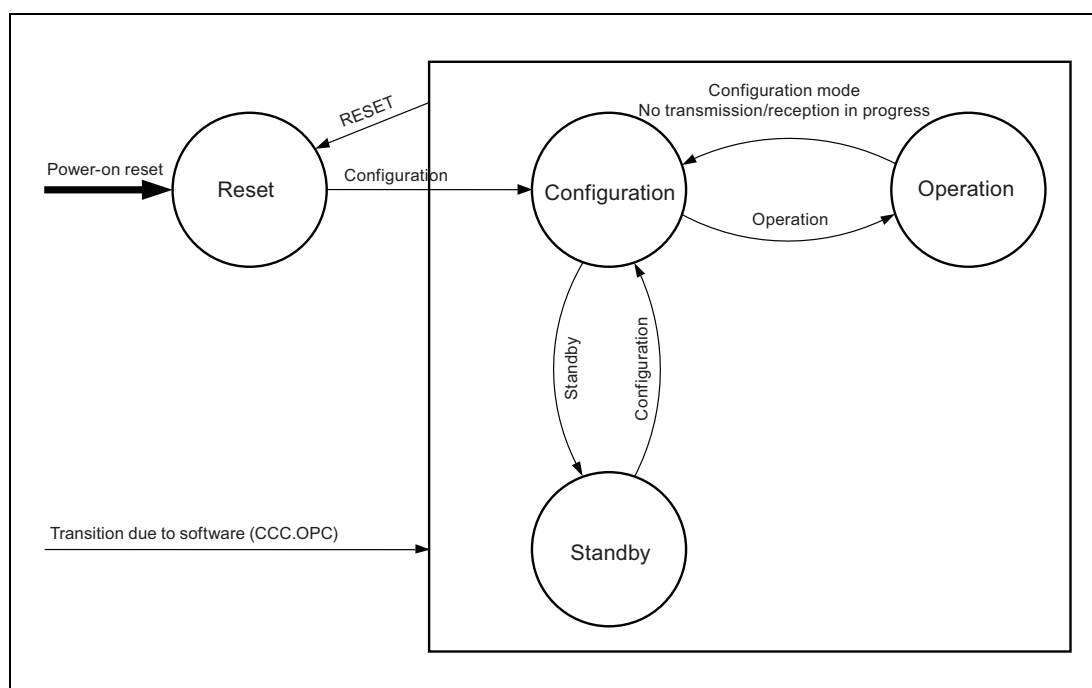

Figure 45.5 Operating Mode of AVB-DMAC

45.3.1.1 Operating Modes

(1) Reset mode

After a power-on reset, the AVB-DMAC enters reset mode.

In reset mode, only the AVB-DMAC operating mode control function is controllable and other functions are all stopped. This mode is designed for reduced power when the Ethernet function is not necessary.

(2) Configuration mode

In configuration mode, various settings for the AVB-DMAC can be made.

The operation of most functions is stopped and all status registers are initialized to their reset values.

The E-MAC functions in this mode.

(3) Operation mode

In operation mode, all functions of the AVB-DMAC can operate.

Ethernet communications can only proceed in this mode.

(4) Standby mode

In standby mode, only the operating mode control function and E-MAC can be used. Other functions cannot be used.

45.3.1.2 How to Set the Operating Mode

Set the operating mode configuration bits in the AVB-DMAC status register (CSR.OPC) to select the operating mode. Furthermore, the current operating mode can be checked by reading the operating mode status bits in the AVB-DMAC status register (CSR.OPS).

Transitions other than from operation mode to configuration mode are made after the value is written to the operating mode configuration bits (CCC.OPC) (Figure 45.6).

For transitions from operation mode to configuration mode, follow the procedure in Figure 45.7 because any transmission and reception in progress will be executed before the transition to configuration mode.

Figure 45.6 Flow for Transitions of Operating Mode (Other than from Operation Mode to Configuration Mode)

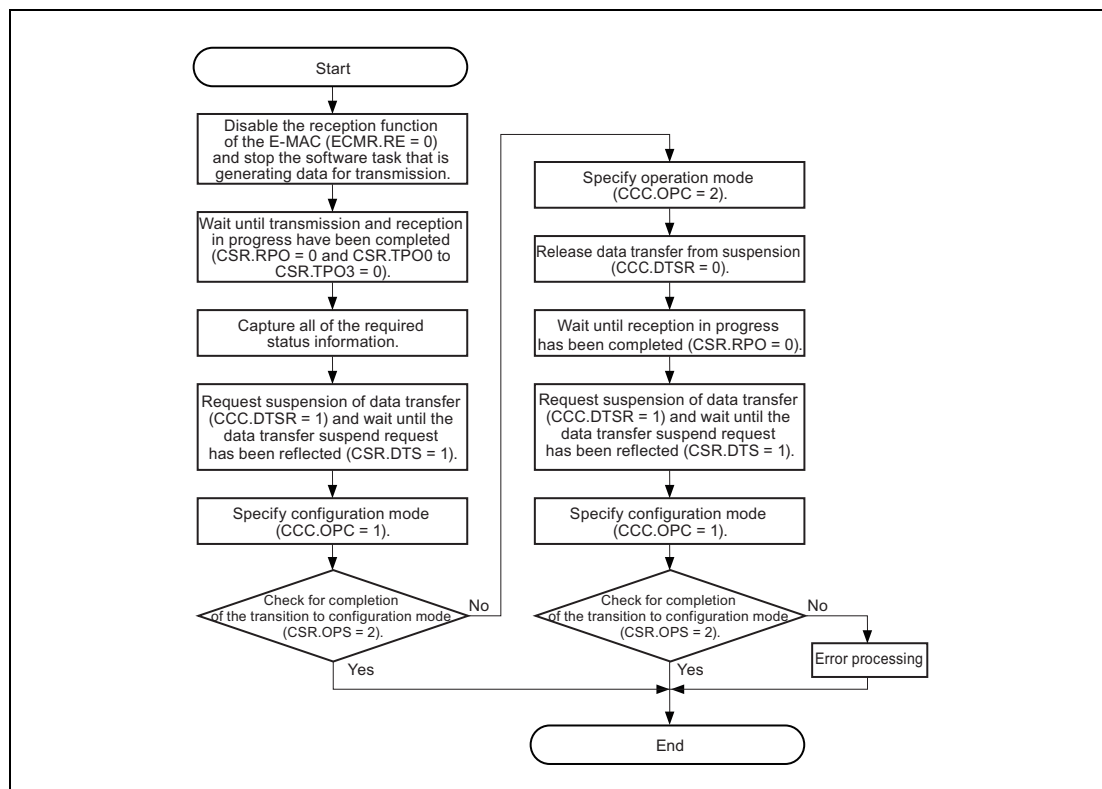

Figure 45.7 Flow for Transitions of Operating Mode (from Operation Mode to Configuration Mode)

In the transition from operation mode to configuration mode, the AVB-DMAC executes the following operations before the transition is completed. Read the operating mode status bits in the AVB-DMAC status register (CSR.OPS) to check that the transition to configuration mode has been completed.

- If the transfer of a frame between the reception FIFO and on-chip RAM is in progress, this is completed (other received frames remaining in the FIFO and any frames that are subsequently received by the E-MAC are discarded).
- If the transfer of a frame is in progress between the transmission FIFO and on-chip RAM, this is completed (frames for transmission remaining in the on-chip RAM will not be transmitted).
- All frames for transmission in the transmission FIFO are transferred to the E-MAC.

Notes:

When the operating mode shifts to configuration mode, all status registers are cleared.

We recommend following the procedure below in the case of this transition.

1. Disable reception.
2. Since reception actually stopping after being disabled requires time, wait for an interval equivalent to that for reception of a maximum length packet.
3. Stop the software task that is generating data for transmission.
4. Wait until the receive process status bit (CSR.RPO) and the transmit process status bits (CSR.TPO0 to 3) in the AVB-DMAC status register are set to 0.
5. Capture all of the required status information.

6. Set the operating mode configuration bits in the AVB-DMAC mode register (CCC.OPC) to initiate the transition to configuration mode.

45.3.1.3 Operating Mode Transitions Due to Hardware

The following hardware factors can also initiate transitions of the AVB-DMAC operating mode.

- (1) Power-on reset

Resetting of the LSI chip leads to resetting of the entire EthernetAVB module. The operating mode shifts to reset mode.

45.3.2 Common Control for Transmission and Reception

45.3.2.1 Initialization Procedure

Figure 45.8 shows the overall initialization procedure in outline.

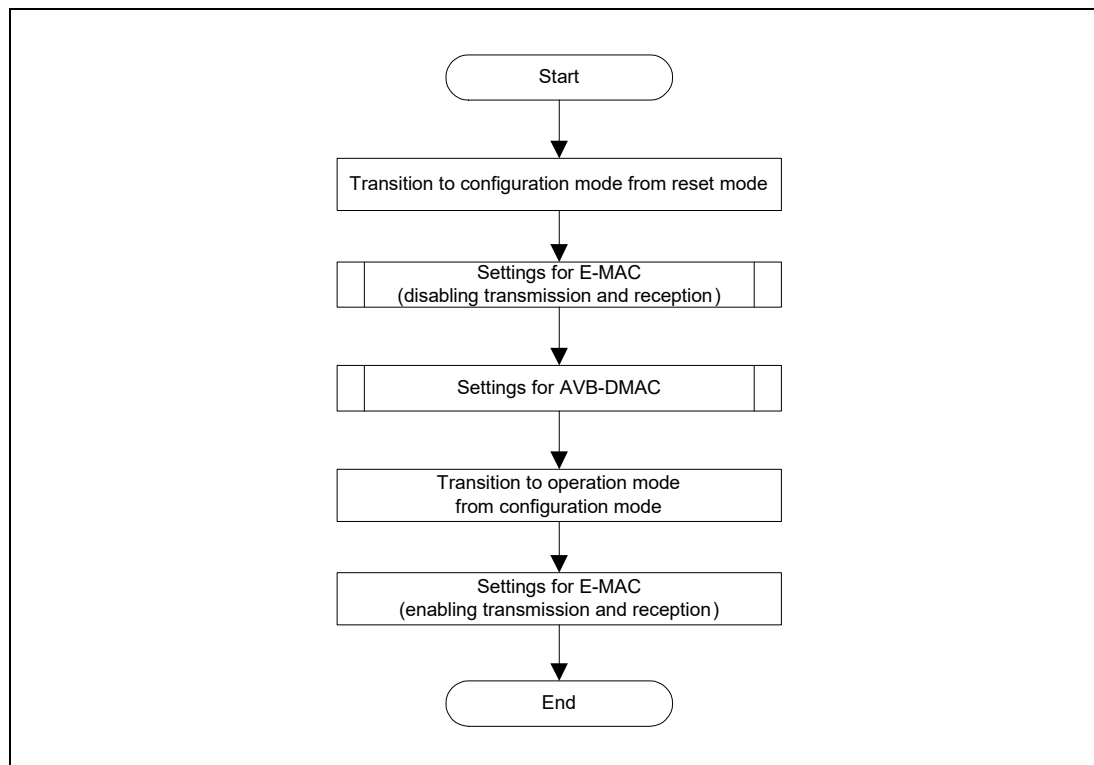

Figure 45.8 Outline of the Initialization Procedure

(1) Initializing the Receiver Section

Before starting reception, follow the procedure below.

Set the operating mode to operation mode or standby mode, and do not enable reception until the settings for the AVB-DMAC are completed.

- Set the operating mode to configuration mode.
- Set AVB filtering for network control frames and AVB stream frames to suit the specifications of the product the chip will be used in.
- Create a descriptor chain for each queue to be used.
- Set the base address for the descriptor table in the descriptor base address table register (DBAT).
- Specify the maximum frame length with the receive frame length upper limit register (RFLR).
- Specify whether padding is to be used with the receive padding configuration register (RPC).
- Set the unread frame counter for each queue with unread frame counter registers 0 to 4.

(2) Initializing the Transmitter Section

Figure 45.9 illustrates initialization of the transmitter section.

Figure 45.9 Procedure for Initializing the Transmitter Section

(3) Initializing the E-MAC Section

Figure 45.10 illustrates initialization of the E-MAC section.

Figure 45.10 Procedure for Initializing the E-MAC Section

(4) Initialization of the AVB-DMAC Unit

Figure 45.11 illustrates initialization of the AVB-DMAC unit.

For a description of how to set up the descriptors and the CBS, see section 45.3.3, Descriptors, and section 45.3.6, CBS (Credit-Based Shaping).

Figure 45.11 Procedure for Initializing the AVB-DMAC Unit

45.3.2.2 Scheduling Reception and Transmission

The EthernetAVB normally has independent buses for transmission and reception. Furthermore, the four processes of fetching, storing, transmission and reception are basically independent of one another. Fetching and storing, however, share the same bus master so cannot be executed simultaneously. Access to the bus master is controlled by the scheduler.

Figure 45.12 is a schematic view of EthernetAVB operations in transmission and reception.

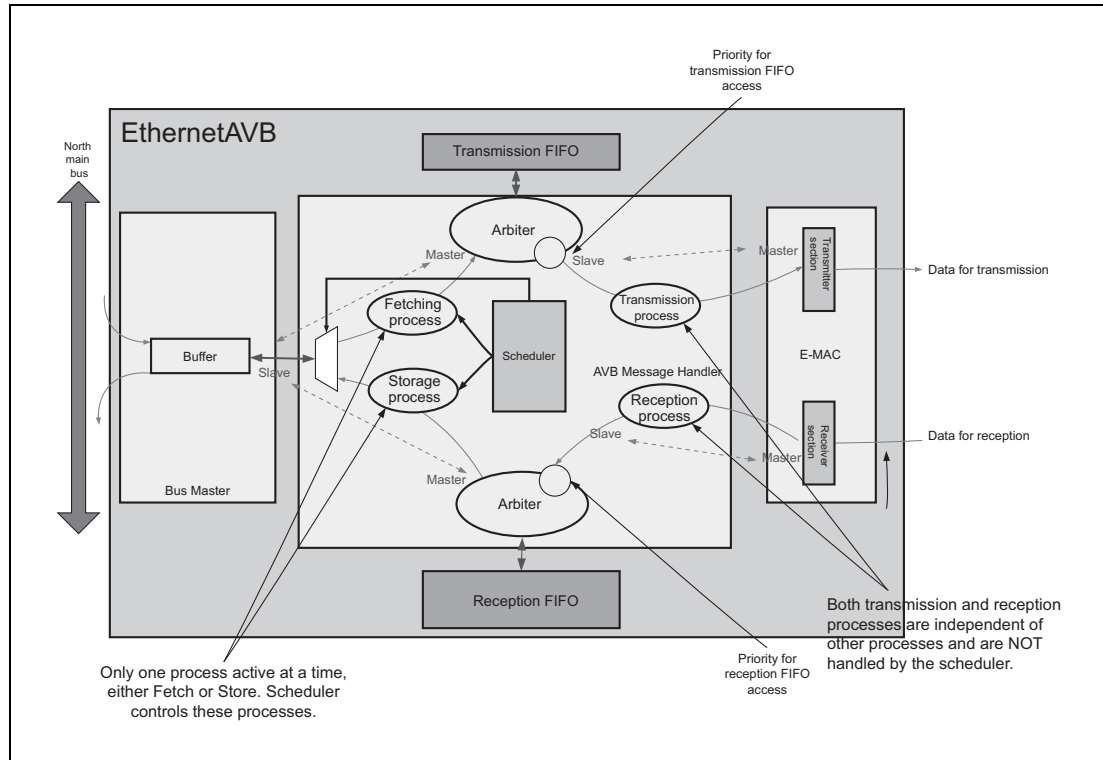

Figure 45.12 Schematic View of EthernetAVB Operations in Transmission and Reception

Storing and fetching are alternately performed. When the number of frames held by the reception FIFO reaches the warning level, storing takes precedence over fetching.

(1) Relationship between Transmission Queue Numbers and Traffic Classes

In fetching, the relationships between the transmission queues and traffic classes are fixed, so the priority specified by the transmit queue priority bits in the transmit configuration register (TGC.TQP) has no effect.

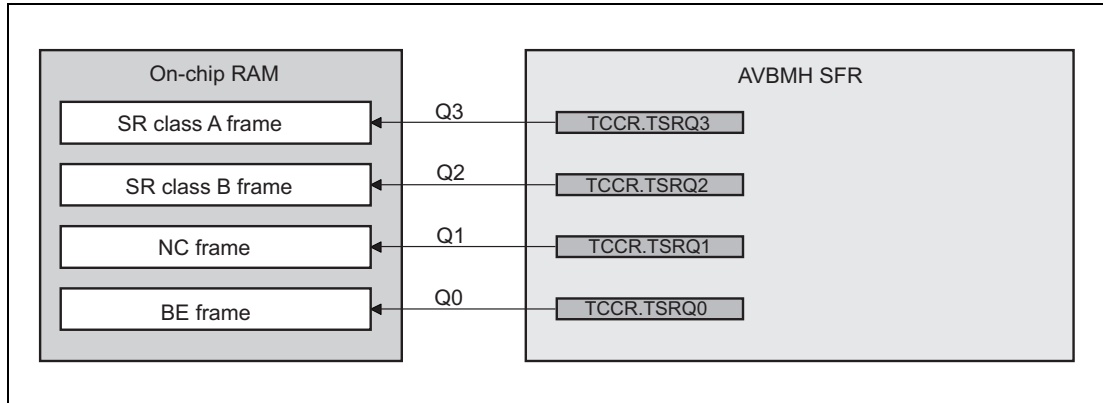

Figure 45.13 Class Associations of Queues for the Scheduler

In fetching, the credit values for stream classes A and B are not taken into account. Behavior depends on the setting of the transfer FIFO size configuration bits in the transfer configuration registers (TGC.TBDt).

When the transmit queue priority bits in the transmit configuration register (TGC.TQP) are B'00 or B'01, the priority order is Q3 → Q2 → Q1 → Q0.

When the transmit queue priority bits in the transmit configuration register (TGC.TQP) are B'11, the priority order is Q1 → Q3 → Q2 → Q0.

45.3.2.3 Checking Integrity

The EthernetAVB is capable of detecting and identifying errors produced in the processing of Ethernet frames and in the transfer of frame data for transmission and reception.

(1) Items for Monitoring in Both Reception and Transmission

(a) Errors in access to the on-chip RAM for reading of descriptors

- The error type bits (ESR.ET) are set to B'0000, and the queue number being processed is set to the error queue number bits (ESR.EQN).
- The same descriptor may be processed again because the current descriptor address (CDARq.CDA) was not changed.
- If this problem occurs in a divided frame, the sequence may be broken.

In reception

- The received frame will be lost.
- The same problem will occur for the next frame of data received for the same queue.

In transmission

- The transmit start request bit in the transmit configuration control register (TCCR.TSRQt) is set to 0.
- The frame will be lost from the transmission FIFO.

(b) Illegal configuration of a descriptor

- The error type bits (ESR.ET) are set to B'0010, and the queue number being processed is set to the error queue number bits (ESR.EQN).
- The same descriptor may be processed again because the current descriptor address (CDARq.CDA) was not changed.
- If this problem occurs in a divided frame, the sequence may be broken.

In reception

- The received frame will be lost.
- The same problem will occur for the next frame of data received for the same queue.

In transmission

- The transmit start request bit in the transmit configuration control register (TCCR.TSRQt) is set to 0.
- The frame will be lost from the transmission FIFO.

(c) Errors in access to the on-chip RAM for writing of descriptors

- The error type bits (ESR.ET) are set to B'0001, and the queue number being processed is set to the error queue number bits (ESR.EQN).
- As in the case where no error occurs, the current descriptor address (CDARq.CDA) and the transmit start request bit in the transmit configuration control register (TCCR.TSRQt) are updated.

- As DESCR.DT was not updated, hardware and software synchronization may have been lost.

(2) Items for Monitoring in Reception

(a) Errors in access to the on-chip RAM for writing of data or time stamps

- The error type bits (ESR.ET) are set to B'0101, and the queue number being processed is set to the error queue number bits (ESR.EQN).
- As in the case where no error occurs, the current descriptor address (CDARq.CDA) is updated.
- DESCR.EI is set to 1 to indicate error detection.
- This problem occurring in a divided frame may break the descriptor sequence, making the queue unusable.

(b) Overflow of the Reception FIFO

- The reception FIFO full interrupt status bit (RIS2.RFFF) is set to 1.
 - The received frames are all invalidated. The frames stored in the reception FIFO must be discarded according to the following procedure.
1. Stop reception and enter configuration mode according to the flow shown in **Figure 45.7, Flow for Transitions of Operating Mode (from Operation Mode to Configuration Mode)**.
 2. Discard all the unprocessed received data stored in the on-chip RAM.

(3) Items for Monitoring in Transmission

(a) Errors in Access for Reading Data from the on-chip RAM

- The error type bits (ESR.ET) are set to B'0100, and the queue number being processed is set to the error queue number bits (ESR.EQN).
- Data that have already been fetched are discarded from the transmission FIFO.
- When an error of this type occurs during processing of an FSINGLE or FEND descriptor:
As in the case where no error occurs, the current descriptor address (CDARq.CDA) and the transmit start bit in the transmit configuration control register (TCCR.TSRQt) are updated. Fetching resumes after the error frame.
- When an error of this type occurs during processing of an FSTART or FMID descriptor:
 - The current descriptor address (CDARq.CDA) is not updated.
 - The transmit start bit in the transmit configuration control register (TCCR.TSRQt) is set to 0.

(b) Overflow of the Transmission FIFO

- The error type bits (ESR.ET) are set to B'1010, and the queue number being processed is set to the error queue number bits (ESR.EQN).
- As in the case where no error occurs, the current descriptor address (CDARq.CDA) and the transmit start bit in the transmit configuration control register (TCCR.TSRQt) are updated. Fetching resumes after the error frame.
- The frame will be discarded from the FIFO.

(c) Frame size error during transmission

- The error type bits (ESR.ET) are set to B'1001, and the queue number being processed is set to the error queue number bits (ESR.EQN).
- As in the case where no error occurs, the current descriptor address (CDARq.CDA) and the transmit start bit in the transmit configuration control register (TCCR.TSRQt) are updated. Fetching resumes after the error frame.

A transmit frame size error is detected when the size setting in one or more (in the case of a divided frame) descriptors for frame transmission is more than 1996 bytes. Such frames are cut out and transmitted.

45.3.3 Descriptors

45.3.3.1 Data Representation in On-chip RAM

The AVB-DMAC transfers data for transmission and received data to and from the application software via the on-chip RAM.

Control structures referred to as descriptors and the frame data referred to as descriptor data area are allocated to the on-chip RAM. Dividing into a control area and data area allows the flexible allocation of frame data to the on-chip RAM.

Figure 45.14 shows an example of the memory maps for descriptors and the descriptor data area in the on-chip RAM.

A descriptor consists of its type (DESCR.DT), which controls the descriptor functions, a descriptor pointer (DESCR.DPTR) indicating the start address for storage of the frame data in the descriptor area, and the data size field (DESCR.DS), indicating the amount of frame data. Post-processing interrupt generation can be set up for each descriptor. Enabling and disabling of the interrupt is controlled by the descriptor interrupt enable bits (DESCR.DIE).

The descriptor may also hold information related to content. This information does not affect general descriptor functions. It provides information other than the frame data proper, such as on the state of reception.

For details, see section 45.3.4.2, Setting Up Reception Descriptors, and section 45.3.5.2, Setting Up Transmission Descriptors.

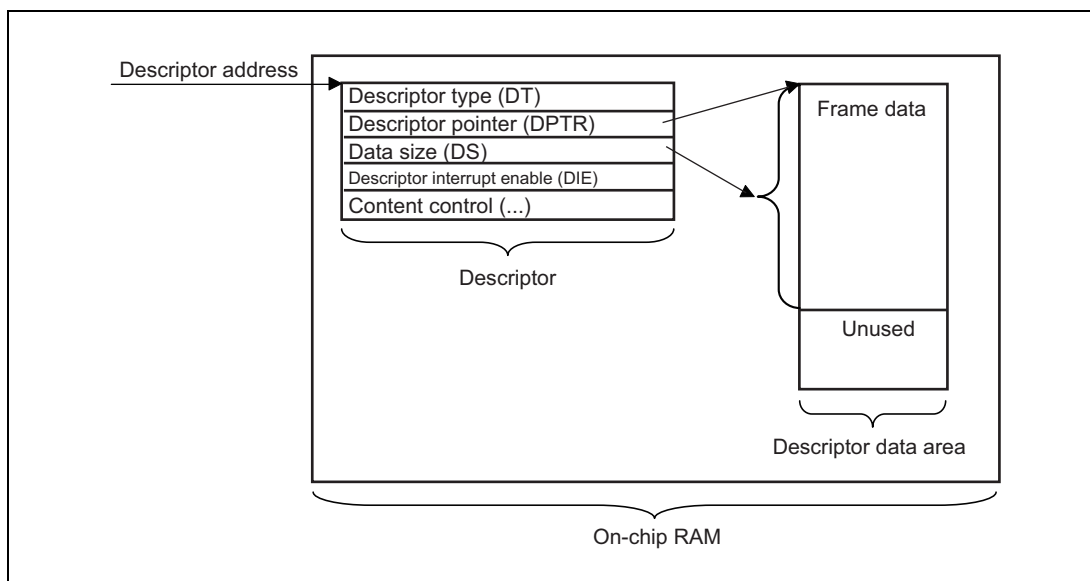

Figure 45.14 Example of On-chip RAM Memory Map

The descriptor must be aligned with a 32-bit boundary in the on-chip RAM.

Descriptors are generally configured of 64 bits, but are configured of 160 bits when reception and storage of gPTP time stamps is enabled.

The frame data must also be aligned with a 32-bit boundary in the on-chip RAM.

The amount of data in the frame is defined by the data size bits (DESCR.DS). In reception, these bits indicate the upper limit on the size of frames to be received. If the data size is not aligned with a 32-bit boundary, the bytes to the next 32-bit boundary in the data area will be an unused area.

45.3.3.2 Using Descriptor Chains in Queues

Transmission and reception descriptors in the on-chip RAM are grouped into queues. Each queue handles frames so that they are transmitted in order of priority and received separately. A queue is capable of controlling one or more frames. Accordingly, multiple descriptors can be assigned to one queue. A combination of multiple descriptors is referred to as a descriptor chain.

For a descriptor chain, the three general descriptor types listed below are defined. For details on these descriptor types, see section 45.3.3.6, Descriptor Type.

- Descriptors that define frame data
- Descriptors that control the descriptor chain itself (e.g. LINK, EOS).
- Descriptors that arbitrate access by hardware or software

Figure 45.15 shows the two basic topologies for descriptor chains. In the simplified examples in the figure, all descriptors allocated to the chain are stored in the array.

- For a linear descriptor chain, the last descriptor in the array is a control descriptor indicating the end of the descriptors (e.g. EEMPTY).
- For a cyclic descriptor chain, the last descriptor in the array is a control descriptor that returns to the first descriptor in the array (e.g. LINK).

Figure 45.15 Outline of the Basic Descriptor Chains

The relationship between queues and descriptor chains is defined by the base addresses of chains. A queue is connected to one descriptor chain over one round of processing. There is also a method of switching to a different chain while in operation mode.

There are no restrictions on the number of link descriptors and their locations within the chain. The last descriptor of a designed chain determines the topology.

Which chain structure is to be used or which topology is suitable depends on the application. A description of how to design descriptor chains to suit various applications is given in section 45.3.4.2, Setting Up Reception Descriptors. Procedure for Setting Reception Descriptors, and section 45.3.5.2, Setting Up Transmission Descriptors.

45.3.3.3 Descriptor Base Address Table

The base address table in the on-chip RAM contains the address of the first descriptor of all chains to be handled by the respective queues.

Entries 0 to 3 are used to access transmission queues 0 to 3. Subsequent entries are used to access reception queues. Entry 4 thus corresponds to reception queue 0.

The configuration of entries in the base address table is the same as the configuration of link descriptors. We recommend using the descriptor type (DESCR.DT) LINKFIX. Processing of this link descriptor does not change it, so it does not require updating. The first descriptor of a chain performs hardware and software synchronization. If the application requires hardware and software synchronization for the base addresses, use the descriptor type (DESCR.DT) LINK.

The CPU is only capable of using LINKFIX and LINK as descriptor types (DESCR.DT) of descriptors in the base address table.

Set the location of the base address table in the on-chip RAM in the descriptor base address table register (DBAT).

Figure 45.16 shows an example of a base address table for controlling four transmission and three reception queues. The boxes to the right of the table represent descriptor chains with the desired topologies.

Figure 45.16 Example of a Base Address Table for Reception and Transmission Queues

CAUTION

The size of the descriptors in the base address table is always eight bytes even if the queue itself includes extended descriptors.

45.3.3.4 Descriptor Chain Processing

When a descriptor is currently being processed or the queue for a descriptor is active, the current descriptor is a descriptor to be processed. The current descriptor address for use by a queue q can be checked in the current descriptor address register q (CDAR q).

Current descriptors are:

- set in the descriptor base table address bits (DBAT.TA) $+8*q$ for all q queues when the operating mode shifts to operation mode.
- set in the descriptor base table address bits (DBAT.TA) $+8*q$ when a base address load request is issued for a queue q by setting the corresponding bit (DLR.LBA q) in the descriptor base address load request register (DLR).
- set in DESC.RPTR for a link descriptor (LINK, LINKFIX) to be processed.
- incremented by the size of the descriptors (8 bytes for normal descriptors and 20 bytes for extended descriptors) after a descriptor has been processed. In this case, the AVB-DMAC updates the descriptor type and informs the CPU that the descriptor has been processed.

In other cases (for illegal descriptor processing and so on), the current descriptor address register q (CDAR q) is not updated.

45.3.3.5 Descriptor Interrupts

A descriptor is able to issue a descriptor interrupt on completion of its processing. The setting of the descriptor interrupt enable bits (DESCR.DIE) in each descriptor can disable the descriptor interrupts or select the specific descriptor interrupt to be generated.

The descriptor interrupt is a common resource that is shared between reception and transmission queues.

Figure 45.17 illustrates the way in which the AVB-DMAC generates descriptor interrupts (or sets bits in the descriptor interrupt status register (DIS.DPFi)). Processing of a descriptor with the value i in the descriptor interrupt enable bits (DESCR.DIE) leads to the corresponding bit in the descriptor interrupt status register (DIS.DPFi) being set.

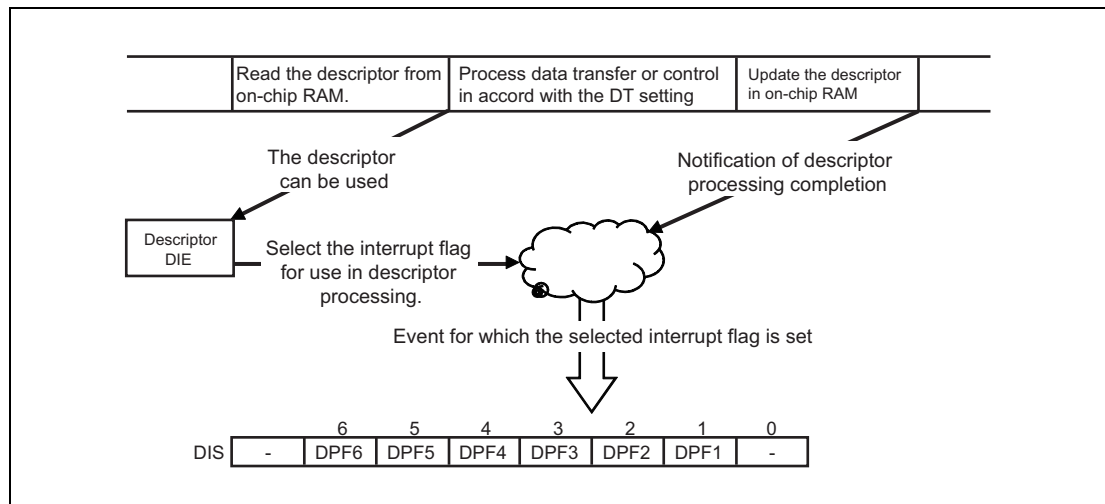

Figure 45.17 Method of Descriptor Interrupt Generation

45.3.3.6 Descriptor Type

The descriptor types (indicated by the DESCR.DT bits) supported by the AVB-DMAC fall into the following three categories.

- Definitions of frame data
- Control of descriptor chains
- Hardware and software arbitration

Table 45.71 is a summary of the descriptor types available for the AVB-DMAC. Entries under “Name” are the names of the descriptor types and the values under “DT” are the corresponding values to be set in the descriptor type field (DESCR.DT). A given descriptor may be handled differently according to whether it is in a transmission or reception queue, so the transmission and reception columns list the scopes of control and processing of the descriptor types.

The abbreviations defined below are used in the transmission and reception columns.

Definition of SW:

- The descriptor is processed by software.
- Software has access to and may modify the descriptor and descriptor data area.
- This descriptor cannot be changed by hardware (AVB-DMAC).

Definition of HW:

- The descriptor is processed by hardware (AVB-DMAC).
- Software must modify neither the descriptor nor the descriptor data area.
- Hardware (AVB-DMAC) processes this descriptor and subsequently changes the descriptor type.

Invalid:

This descriptor type is not used in transfer in the given direction (transmission or reception).

Do not write this value to the descriptor type (DESCR.DT) field for transfer in the given direction.

Hardware does not process these descriptor types in the cases listed as invalid. The current descriptor address (CDARq.CDA) will not be changed when processing of a queue for the given direction arrives at a descriptor with this type setting.

Table 45.71 Summary of Descriptor Types

Name	DT	Description	Reception	Transmission
Frame data				
FSTART	5	Frame Start The descriptor points to valid data for a frame. The frame starts with the given data and continues with that indicated by the next descriptor.	SW	HW
FMID	4	Frame Middle The descriptor points to valid data for a frame. The frame started with a previous descriptor and continues to the data indicated by the next descriptor.	SW	HW
FEND	6	Frame End The descriptor points to valid data for a frame. The frame continues from the previous descriptor and ends with the data indicated by in this descriptor.	SW	HW
FSINGLE	7	Frame Single The descriptor points to valid data for a complete frame.	SW	HW
Chain control				
LINK	8	Link Defines the descriptor in the next chain.	HW	HW
LINKFIX	9	Fixed Link Defines the descriptor in the next chain. Unlike the case of Link, it is not rewritten by hardware after descriptor processing.	SW	SW
EOS	10	End Of Set Controls division of the chain.	HW	HW
HW/SW arbitration				
FEMPTY	12	Frame Empty A descriptor related to frame data but not containing valid data for a frame	HW	SW
FEMPTY_IS	13	Frame Empty Incremental Start A descriptor related to frame data but not containing valid data for a frame DESCR.DPTR sets the base address of an "incremental data area" in the on-chip RAM.	HW	Invalid
FEMPTY_IC	14	Frame Empty Incremental Continue A descriptor related to frame data but not containing valid data for a frame Data indicated by the pointer are for storage in an incremental data area in the on-chip RAM.	HW	Invalid
FEMPTY_ND	15	Frame Empty No Data Storage A descriptor related to frame data but not containing valid data for a frame The descriptor is processed in the same way as FEMPTY but data are not stored in the on-chip RAM.	HW	Invalid
LEEMPTY	2	Link Empty A link descriptor for processing by the AVB-DMAC	SW	SW
EEMPTY	3	EOS Empty An EOS descriptor for processing by the AVB-DMAC	SW	SW
DT0	0	Reserved	Invalid	Invalid
DT1	1	Reserved	Invalid	Invalid
DT11	11	Reserved	Invalid	Invalid

(1) Layout of General Descriptors in the On-chip RAM

The AVB-DMAC updates processed descriptors in the on-chip RAM. The field to be changed in a descriptor being updated depends upon whether the direction is transmission or reception and the queue mode. Other fields will not be changed. There are no restrictions on the values set in unused descriptor fields (indicated by “—” in the figure).

(2) Frame Data Descriptors

The allocation of bits in the frame data descriptors (FSTART, FMID, FEND, and FSINGLE) is shown below.

- Normal descriptor (usable in both reception and transmission)

- Extended descriptor (usable only in reception)

Table 45.72 Contents of Frame Data Descriptors (DESCR)

Bit Name	Function
DT[3:0]	Descriptor Type 5: FSTART 4: FMID 6: FEND 7: FSINGLE For details, see section 45.3.4.2, Setting Up Reception Descriptors, and section 45.3.5.2, Setting Up Transmission Descriptors.
DIE[3:0]	Descriptor Interrupt Enable B'0000: Descriptor interrupt is disabled. B'0001 to B'1111: The corresponding descriptor interrupt is generated (DIS.DPFi).
—	Content Control For details, see section 45.3.4.2, Setting Up Reception Descriptors, and section 45.3.5.2, Setting Up Transmission Descriptors.
DS[11:0]	Data Size Size of the data area/frame data for the descriptor (in bytes) The specifiable data lengths are as follows (when a frame is divided into parts, the total size of the frame should be within the ranges below). Transmission: $1 \leq DS \leq 1996$ Reception: $1 \leq DS \leq 2000$
DPTR[31:0]	Descriptor Pointer Pointer to the data area for the descriptor Register an address on a 32-bit boundary.
TS[79:0]	Time Stamp Time stamp of the received frame (only available in extended descriptors)

CAUTION

Register an address aligned with a 32-bit boundary as the descriptor pointer (DESCR.DPTR). H'0000 is written to the reserved bits in an extended descriptor (bits 31 to 16 in DESCR) when the time stamp is stored.

(3) Hardware/Software Arbitration Descriptors (Only for Reception)

The allocation of bits in the descriptors for hardware/software arbitration (FEMPTY, FEMPTY_IS, FEMPTY_IC, and FEMPTY_ND) is shown below.

- Normal descriptor

**Table 45.73 Contents of Hardware/Software Arbitration Descriptors (DESCR)**

Bit Name	Function
DT[3:0]	Descriptor Type 12: FEMPTY 13: FEMPTY_IS 14: FEMPTY_IC 15: FEMPTY_ND For details, see Table 45.71, Summary of Descriptor Types .
DIE[3:0]	Descriptor Interrupt Enable B'0000: Descriptor interrupt is disabled. B'0001 to B'1111: The corresponding descriptor interrupt is generated (DIS.DPFi).
—	Content Control For details, see section 45.3.4.2, Setting Up Reception Descriptors, and section 45.3.5.2, Setting Up Transmission Descriptors.
DS[11:0]	Data Size Size of the data area/frame data for the descriptor (in bytes)
DPTR[31:0]	Descriptor Pointer Pointer to the data area for the descriptor Register an address on a 32-bit boundary.

CAUTIONS

Register an address aligned with a 32-bit boundary as the descriptor pointer (DESCR.DPTR). When an extended descriptor is used, a 12-byte unused area is added.

In an FEMPTY descriptor, the descriptor type (DT), descriptor interrupt enable (DIE), data size (DS), and descriptor pointer (DPTR) fields are used.

In an FEMPTY_IS descriptor, the descriptor type (DT), descriptor interrupt enable (DIE), and descriptor pointer (DPTR) fields are used.

In an FEMPTY_IC descriptor, the descriptor type (DT) and descriptor interrupt enable (DIE) are used.

In an FEMPTY_ND descriptor, the descriptor type (DT), descriptor interrupt enable (DIE), and data size (DS) are used.

(4) Link Descriptors

The allocation of bits in the link descriptors (LINK and LINKFIX) is shown below.

- Normal descriptor

Table 45.74 Contents of Link Descriptors (DESCR)

Bit Name	Function
DT[3:0]	Descriptor Type 8: LINK 9: LINKFIX For details, see Table 45.71, Summary of Descriptor Types .
DIE[3:0]	Descriptor Interrupt Enable B'0000: Descriptor interrupt is disabled. B'0001 to B'1111: The corresponding descriptor interrupt is generated (DIS.DPFi).
—	Content Control For details, see section 45.3.4.2, Setting Up Reception Descriptors, and section 45.3.5.2, Setting Up Transmission Descriptors.
DPTR[31:0]	Descriptor Pointer Pointer to the data area for the next descriptor Register an address on a 32-bit boundary.

CAUTION

Register an address aligned with a 32-bit boundary as the descriptor pointer (DESCR.DPTR).
When an extended descriptor is used, a 12-byte unused area is added.

(5) Other Descriptors

The allocation of bits in the other descriptors (EOS, FEMPTY (only for transmission), LEMPTY, and EEMPTY) is shown below.

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
+0	DT[3:0]				DIE[3:0]				—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
+4	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 45.75 Contents of Other Descriptors (DESCR)

Bit Name	Function
DT[3:0]	Descriptor Type 10: EOS 12: FEMPTY (only for transmission) 2: LEMPTY 3: EEMPTY For details, see Table 45.71, Summary of Descriptor Types .
DIE[3:0]	Descriptor Interrupt Enable B'0000: Descriptor interrupt is disabled. B'0001 to B'1111: The corresponding descriptor interrupt is generated (DIS.DPFi).

CAUTION

When an extended descriptor is used, a 12-byte unused area is added.

(6) How to Use Frame Data Descriptors

The descriptor data area size field (DESCR.DS) can specify up to 2048 bytes of Ethernet frame data per data area. Settings higher than 2048 (bytes) cannot be made.

In general, Ethernet frames are not of uniform length. The AVB-DMAC is capable of dividing frame data into multiple descriptors in order to minimize the memory capacity for frame data. This function allows processing of frames that are longer than the limit for descriptor data areas. Division can also be applied to frames on the basis of their data structures.

To handle both frames divided up into multiple data areas and descriptors for complete single frames, four types (DESCR.DT) FSTART, FEND, FMID, and FSINGLE are defined.

Figure 45.18 shows the mapping of frame data by frame data descriptors. The descriptor data areas are allocated to the on-chip RAM. For frames that require division into four or more data areas, additional FMID descriptors can be added as required.

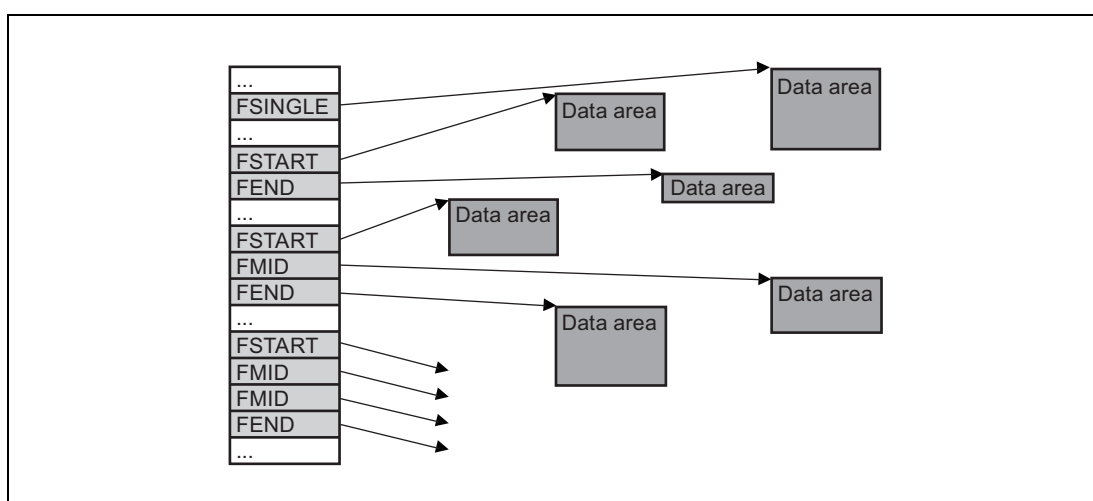

Figure 45.18 Mapping of Frame Data

For reception, set the descriptor data areas to the maximum size (i.e. give DESCR.DS its maximum value). The AVB-DMAC will store received frame data in the given area. If a received frame has more data than the maximum size, the AVB-DMAC will divide the data up.

For transmission, set the frame data size to the actual data size. The AVB-DMAC modifies the descriptor type (DESCR.DT) to FEMPTY after processing the relevant descriptor. The data size (DESCR.DS) and descriptor pointer (DESCR.PTR) fields retain their settings.

A descriptor data area including unused space produces an empty space between data areas. In reception, an "incremental data area" can be used to prevent empty spaces. For incremental data areas, see section 45.3.4.3 (2) Incremental Data Areas.

As well as reducing the memory capacity taken up by the descriptor area in the on-chip RAM, division into frames can be used to identify different sections of data (e.g. for separating a header and data).

(7) How to Use Chain Control Descriptors

(a) Link Descriptors

The link descriptors can be used to set up cyclic descriptor chains (for details, see section 45.3.3.2, Using Descriptor Chains in Queues).

After a LINK descriptor is processed, its descriptor type (DESCR.DT) is changed to LEMPTY. The descriptor pointer (DESCR.PTR) retains its setting.

After processing of a LINKFIX descriptor, the descriptor type (DESCR.DT) is not updated. Software can change the descriptor type (DESCR.DT), descriptor interrupt enable (DESCR.DIE), and descriptor pointer (DESCR.DPTR). Take care, however, to check the current descriptor address register (CDARq.CDA) before changing the descriptor pointer (DESCR.DPTR).

(b) EOS Descriptor

Use the EOS descriptor to divide a descriptor chain into various segments. The queue can continue even after an EOS descriptor.

In transmission, the response to an EOS descriptor is clearing of the transmit start request bit in the transmit configuration control register (TCCR.TSRQq) to 0.

In reception, the response is generation of a receive queue full interrupt (RIS2.QFFr), although if the frame currently being received is being divided for storage (received data being stored in FMID- or FEND-type frames), the data are not completely stored.

(8) How to Use Hardware and Software Arbitration Descriptors

In hardware processing of descriptors, the empty descriptor types (FEMPTY, LEMPTY, and EEMPTY) are defined to distinguish various descriptors. For software, they can be used to initiate checking for empty spaces, etc.

(a) FEMPTY, FEMPTY_IS, FEMPTY_IC, and FEMPTY_ND

These descriptor types (DESCR.DT) are used for descriptors that do not contain effective data. Of these, only FEMPTY is used in transmission.

These descriptor pointers (DESCR.DPTR) indicate the descriptor data area.

(b) LEMPTY

This descriptor type (DESCR.DT) is assigned to LINK descriptors after they have been processed.

The descriptor pointer (DESCR.DPTR) of an LEMPTY descriptor still points to the linked descriptor.

(c) EEMPTY

This descriptor type (DESCR.DT) is assigned to EOS descriptors after they have been processed.

The descriptor pointer (DESCR.DPTR) of an EEMPTY descriptor is not used, and thus points to nothing.

(9) Relationship between Descriptor Access by Hardware and Software

In the EthernetAVB, the allocation of descriptor types (DESCR.DT) to the on-chip RAM can be used. This makes it possible to minimize access to the EthernetAVB registers via the CPU, leading to higher performance.

- Each descriptor type in the set is exclusively for processing by hardware or software, depending on the direction of transfer (see Table 45.71).
- Software must not change a descriptor assigned to hardware processing (the hardware does not change descriptors assigned to software processing).

In the case of software processing, the software must process the information in the descriptor and the corresponding frame data before changing the descriptor type. If a descriptor type for hardware is set in DESCR.DT, the software should not change any part of the descriptor or of the corresponding frame data.

45.3.3.7 Optimization of Bus Performance when Using Descriptors

The following items are recommended as ways to ensure the optimal use of data structures in the on-chip RAM.

They are not requirements, but using a different approach may increase the load on the system bus within the LSI chip.

- Register descriptors with 64-bit alignment (this does not apply to extended descriptors).
- While in operation mode, use LINKFIX instead of LINK whenever a descriptor need not be changed. Hardware modifies the descriptor type (DESCR.DT) fields of LINK descriptors.
- Restrict frame data to a maximum size of 128 bytes.
- Minimize parallelism of processing to the descriptor chains.
This helps in arranging the different segments exclusively for access by software or hardware by dividing the chains so as to be allocated to different on-chip RAM pages.
- Minimize the number of divided frames. This can reduce the overhead of descriptor handling.

45.3.4 Control in Reception

The point of the AVB-DMAC is to transfer data between the E-MAC and on-chip RAM without intervention by the CPU.

Create descriptors that define the amounts of frame data to be stored and the locations. After the E-MAC receives a frame, it stores the received frame data and the conditions of reception as the MAC state. If the descriptor is extended, the time stamp is also stored. For a description of how to set up descriptors for use in reception, see section 45.3.4.2, Setting Up Reception Descriptors.

The AVB-DMAC filters received frames to separate them into various classifications (separation filtering). More specifically, this is done to separate received frames into the various reception queues and to set the priorities of different classes of received frames. For more on separation filtering, see section 45.3.4.1 (1) Separation Filtering.

Figure 45.19 shows the reception data bus and the selection of queues for use in reception.

Each frame received from the E-MAC is stored in the reception FIFO; in parallel with this, the frame is analyzed to identify its type and the target queue number. After the E-MAC completes reception, the target queue number is generated and stored in the reception FIFO. A reception flag is applied to each reception queue in the on-chip RAM, and the unread frame counter (UFC) is also applied to each reception queue.

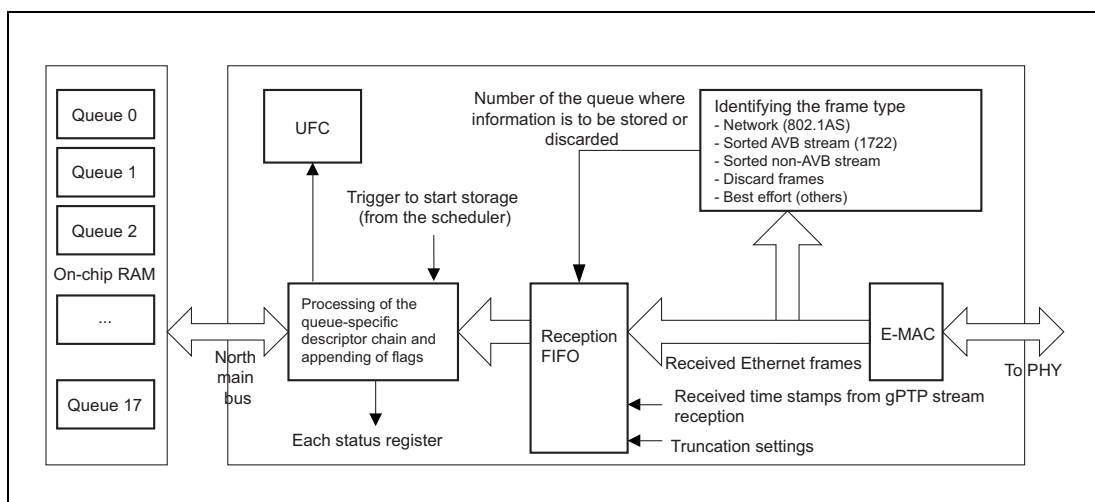

Figure 45.19 Mechanism of General Reception Queue Selection

45.3.4.1 Reception Queues

The AVB-DMAC applies its separation filtering mechanism to select the reception queue for storing a received frame. The AVB-DMAC stores all received frames in the on-chip RAM.

There are two conditions for the AVB-DMAC to discard a received frame.

- Detection of an error during reception by the E-MAC
 - Whether error frames are discarded or stored in reception queue 0 (best effort) can be set by the error frame enable bit in the receive configuration register (RCR.EFFS). If error frames are to be stored (RCR.EFFE = 1), they are always stored in queue 0 (best effort). In this case, parameters of each queue (e.g. truncation) may not match. If the storage of time stamps for reception queue 0 (best effort) is enabled (the time stamp enable bit in the receive configuration register RCR.ETS0 = 1), time stamps are stored even for error frames.
- Non-matching determination conditions of the separation filter
 - Whether non-matching frames are discarded or stored in reception queue 0 (best effort) can be set by the stream filtering select bit in the receive configuration register (RCR.ESF).

The flowchart in Figure 45.20 shows how the AVB-DMAC selects the reception queue in accord with the frame type, including judgment by the separation filter. Selection of the queue starts when the E-MAC completes frame reception. The result is storage of the frame in the proper queue or the frame being discarded.

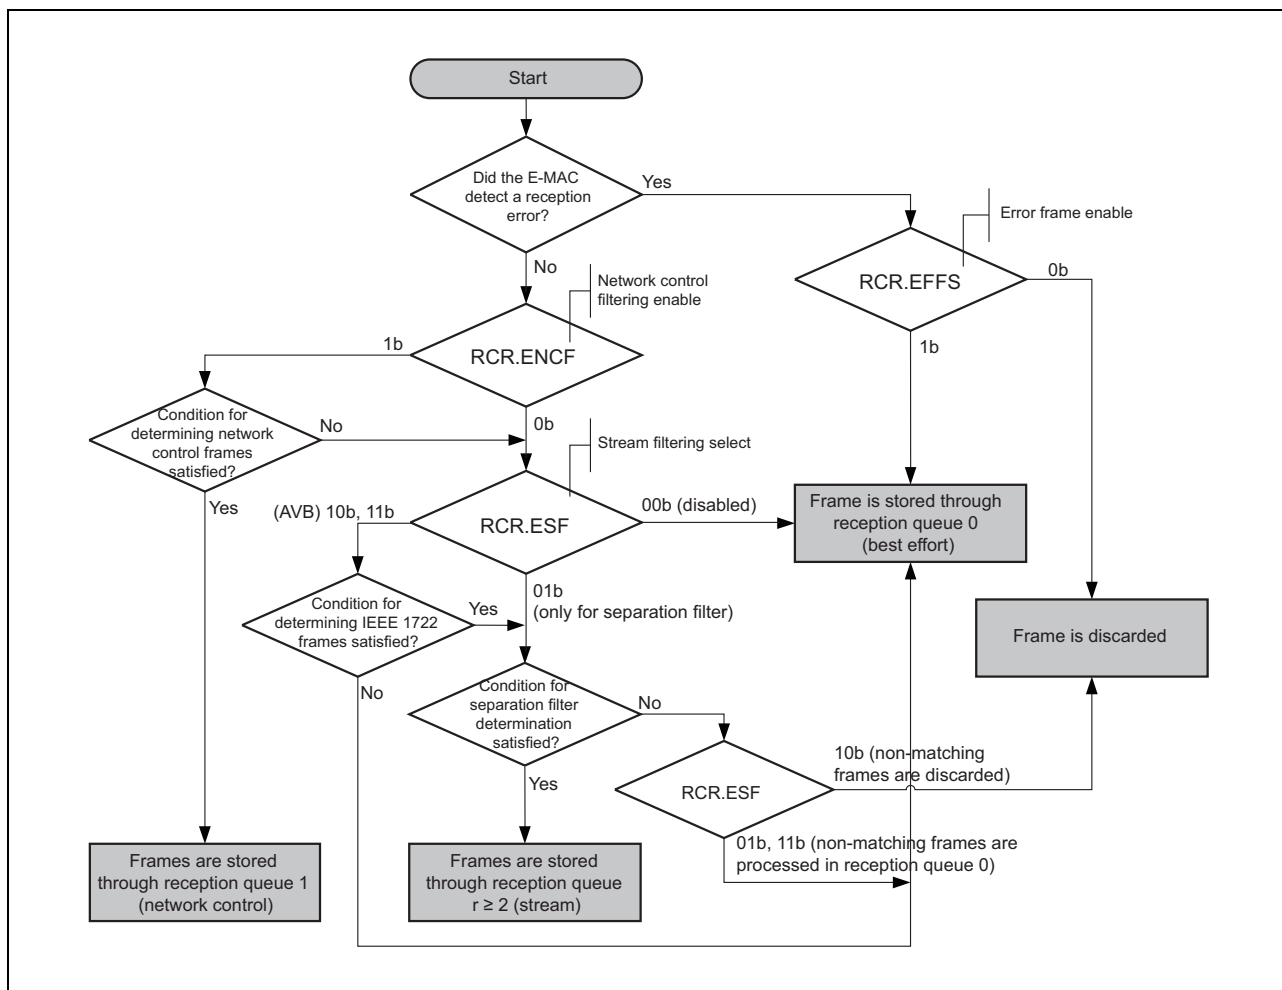

Figure 45.20 Flow of Reception Queue Selection

Notes on the description of entries in the flowchart

- “Condition for determining network control frames”
The Ethernet destination address (DA) is 01:80:C2:00:00:0E, and
The Ethernet type (ET) is 88:F7.
- “Condition for determining IEEE 1722 frames”
The Ethernet destination address (DA) is in the range from 91:E0:F0:00:00:00 to 91:E0:F0:00:FE:FF,
The VLAN tagged TPID (tag protocol identifier) field (VL) is 81:00, and
The Ethernet type (ET) is 22:F0.
- “Condition for separation filter determination”
See section 45.3.4.1 (1) Separation Filtering.

Figure 45.21 shows the allocation of data in Ethernet frames used for determination of Network Control frame and IEEE1722 frame. The preambles of Ethernet frames are not taken into account.

Data bytes	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19
Network type	DA1	DA2	DA3	DA4	DA5	DA6	SA1	SA2	SA3	SA4	SA5	SA6	ET1	ET2
Stream type	DA1	DA2	DA3	DA4	DA5	DA6	SA1	SA2	SA3	SA4	SA5	SA6	VL1	VL2	-	-	ET1	ET2

Figure 45.21 Data Allocation of Ethernet Frames Used in Frame Determination

(1) Separation Filtering

Separation filtering involves the checking of 64 bits (eight successive bytes) in received Ethernet frames. The setting for the first byte (i.e. the setting of the separation filter offset configuration register (SFO.FBP)), selects the part of frames to be used in separation filtering. There is also a common filter mask (set in the separation filter mask configuration register (SFMi.CFM)) that can filter less than the number of bytes and mask particular bits.

Examples

To use only the first byte from the top in separation filter, set separation filter mask configuration register 0 (SFM0.CFM) to H'0000 00FF and separation filter mask configuration register 1 (SFM1.CFM) to H'0000 0000.

To use seven bytes from the top in separation filter, set separation filter mask configuration register 0 (SFM0.CFM) to H'FFFF FFFF and separation filter mask configuration register 1 (SFM1.CFM) to H'00FF FFFF.

CAUTION

If bits are set to 0 in the separation filter mask, in order to match with the pattern, the bits at the corresponding positions of the pattern must also be set to 0. Only when "the received frame data & the separation filter mask register (SFMi.CFM) = the separation filter pattern register (SFPI.FPs)", it is judged that the bits match with the pattern.

Figure 45.22 shows separation filtering. The selected data from a received frame (Rx_Frame[63:0]) are masked by the common filter mask. This value is compared with all filter patterns. The AVB-DMAC selects the queue having the smallest queue number from among the matched filter patterns.

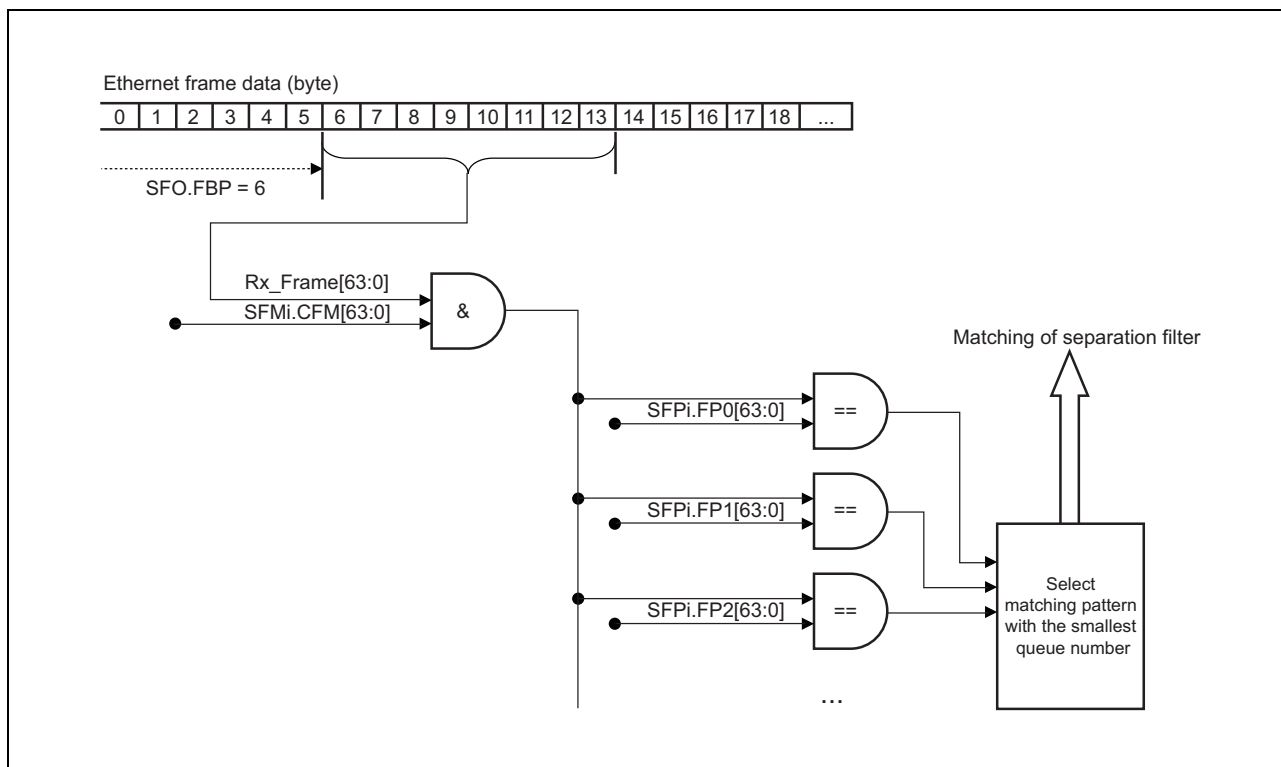

Figure 45.22 Overview of Separation Filtering (when SFO.FBP = 6)

(a) Restrictions on Number of Filters Used

The AVB-DMAC always checks all the separation filter patterns. When it is not necessary to use all the reception queues, providing a special pattern can prevent data from being stored in the unused reception queue.

Example 1:

Setting a value other than H'FFFF_FFFF_FFFF_FFFF to the separation filter mask register (SFMi.CFM) and setting H'FFFF_FFFF_FFFF_FFFF to the separation filter pattern register (SFPI.FPs) can prevent pattern matching in the unused reception queue.

Example 2:

Setting H'FFFF_FFFF_FFFF_FFFF to the separation filter mask register (SFMi.CFM) and setting the value identical to the pattern in reception queue 2 to the separation filter pattern register (SFPI.FPs) selects, upon a pattern matching, reception queue 2, which has a smaller queue number, thus preventing the unused reception queue from being used.

(2) Separating Streams

The AVB-DMAC applies separation filtering to sort frames received in streams. An AVB network has a concept of “Talker” and “Listener”. A Talker is an end station that generates one or more streams. A Listener is an end station that has the role of being a sink for at least one stream. The various A/V streams are identified by 8-byte stream IDs.

The number of end stations within an AVB network and their roles differ with the application.

The stream ID is a specific pattern of the AVB network for identifying one stream. Figure 45.23 shows the bit allocation of bits in IEEE1722 Ethernet frames and stream ID fields.

Figure 45.23 IEEE 1722 Frame Layout and Stream ID

The IEEE 1722 standard stipulates that the stream ID field starts from the 22nd byte (not counting the preamble). Accordingly, set the separation filter offset (SFO.FBP) to 22 in separations on IEEE 1722 streams. Set the separation filter mask (SFMi) and separation filter pattern (SFPi) in accord with the specification of the application in which the chip is being used.

Example: In the example of a stream ID shown in Figure 45.23, the representative application divides the field into the talker source address and the unique stream ID. The unique ID is used to differentiate between multiple streams from the same talker. Based on this, there are two settings for separation filter masking:

- To divide various streams into individual queues, set SFM0.CFM to H'FFFF FFFF and SFM1.CFM to H'FFFF FFFF.
- To divide streams for each talker into individual queues, set SFM0.CFM to H'FFFF FFFF and SFM1.CFM to H'0000 FFFF. This excludes the unique ID from the filter condition.

45.3.4.2 Setting Up Reception Descriptors

For reception, the descriptor as described in section 45.3.3, Descriptors is used.

This section describes specific operations that are especially required in handling reception queues.

(1) Reception Descriptor Type

The type of a descriptor is defined by the descriptor type (DESCR.DT) field.

Table 45.76 shows the descriptor types used in reception. In the table, entries in the write-back column indicate how the AVB-DMAC changes the DESCR.DT field upon completion of descriptor processing.

Table 45.76 Descriptor Types in Reception

Descriptor Type (DESCR.DT)	Operation	Write-back
Frame Start (FSTART)	There is no storage space in a reception queue: The RIS2.QFFr bit indicates that queue r is full and the received frame is not stored. Descriptor processing proceeds again in response to further reception.	Not changed
Frame Middle (FMID)	Same as FSTART	Not changed
Frame End (FEND)	Same as FSTART	Not changed
Frame Single (FSINGLE)	Same as FSTART	Not changed
Link (LINK)	Processing proceeds to the descriptor specified by DESCR.DPTR.	LEMPY
Fixed Link (LINKFIX)	Same as LINK	Not changed
End Of Set (EOS)	In the case of a divided frame (received frame being stored in FMID or FEND), storing of frames is stopped and the frame is lost. RIS2.QFFr indicates that the frame has been lost. If this happens at the start of a frame (received frame being stored in FSTART or FSINGLE), storing of frames starts from the next descriptor. In either case, processing shifts to the next descriptor in the chain.	EEMPTY
Frame Empty (FEMPTY)	Used to store received data. Up to DESCR.DS bytes are stored in the descriptor data area. For details, see section 45.3.4.3 (1) Storing Frame Data in the Descriptor Data Area.	FSTART, FMID, FEND, or FSINGLE
Frame Empty Incremental Start (FEMPTY_IS)	Used to store received data. The remaining frame data are all stored in the descriptor's data area. DESCR.DPTR indicates the base address of the incremental data area. For details, see section 45.3.4.3 (2) Incremental Data Areas.	FEND or FSINGLE
Frame Empty Incremental Continue (FEMPTY_IC)	Used to store received data. The remaining bytes of frame data are all stored in the descriptor's data area. DESCR.DPTR is undefined, but the address after processing of previous incremental data becomes the base address. For details, see section 45.3.4.3 (2) Incremental Data Areas.	FEND or FSINGLE
Frame Empty No Data storage (FEMPTY_ND)	Used to store received data. DESCR.DS bytes of spaces are secured in the reception FIFO but not stored. After processing, DESCR.DS is written back as 0. For details, see section 45.3.4.3 (2) Incremental Data Areas	FSTART, FMID, FEND or FSINGLE
Link Empty (LEMPY)	Same as FSTART	Not changed
EOS Empty (EEMPTY)	Same as FSTART	Not changed

If a reception FIFO read error occurs when FEMPTY_ND is used, it is not reflected in DESCR.EI and queue error interrupt status bit (EIS.QEF).

Therefore, to detect a reception FIFO error also for unnecessary data, FEMPTY should be used.

(2) Configuration of Reception Frame Data Descriptors

Figure 45.24 shows the configuration of descriptors for use with reception queues. The reception-specific fields are the same whether the descriptor is normal or extended. The reception-specific fields (DESCR.MSC, DESCR.PS, DESCR.EI, and DESCR.TR) are described in Table 45.77.

For the other fields and the descriptor types, see section 45.3.3.6, Descriptor Type.

Figure 45.24 Configuration of Descriptor for a Received Frame

Table 45.77 Configuration of a Received Descriptor

Bit Name	Function
MSC	<p>MAC Status Code</p> <p>These bits indicate errors in reception detected by the E-MAC. These bits are set to the same value between the frames divided by the descriptor. Details of the bits are as follows.</p> <p>MSC[7]: Received frame has a multicast address.</p> <p>MSC[6]: Reserved</p> <p>MSC[5]: Reserved</p> <p>MSC[4]: Received frame has residual bits.</p> <p>MSC[3]: Received frame is too long.</p> <p>MSC[2]: Received frame is too short</p> <p>MSC[1]: Error in frame reception</p> <p>MSC[0]: Received frame has a CRC error.</p>
PS	<p>Padding Selection</p> <p>These bits specify whether frame data are to be padded when stored in the incremental data area.</p> <p>Insertion of padding data is in accord with the settings in the receive padding configuration register (RPC).</p> <p>B'00: Padding is not to be inserted.</p> <p>B'01: Padding data may be inserted. This depends on the RPC settings.</p> <p>B'10: Setting prohibited.</p> <p>B'11: Setting prohibited.</p>
EI	<p>Error Indication</p> <p>This bit indicates the detection of an error in frame data while a frame was being stored.</p> <p>The bit is set to 1 for a descriptor in which an error has been detected. If the descriptor is for a divided frame, the frame data is discarded.</p> <p>0: No error</p> <p>1: Error is detected</p>
TR	<p>Truncation Indication</p> <p>This bit indicates whether frame data received from the E-MAC have been truncated before being stored in the on-chip RAM.</p> <p>These bits are set to the same value between the frames divided by the descriptor.</p> <p>0: Data have not been truncated.</p> <p>1: Data have been truncated.</p>

CAUTION

The RCR.EFFS bit specifies whether or not frames with errors detected by the E-MAC are to be stored in the on-chip RAM. When the storing of error frames is disabled, error codes are not written to DESCR.MSC.

45.3.4.3 Reception Processing

After initialization, the AVB-DMAC is able to select the proper reception queue and store received frames in the data area in the on-chip RAM as indicated by the descriptor. The AVB-DMAC continues to store received data in the on-chip RAM as long as space is available for descriptors and data areas.

Received frames are classified and stored in the reception FIFO in accord with the algorithm described in section 45.3.4.1 (1) Separation Filtering. A frame will already have been sorted by separation filtering, truncated, or discarded based on reception by the MAC before being stored in the reception FIFO. The following data are stored in the reception FIFO.

- MAC status of received frames
- Length of received frames
- Time stamp of received frames
- Target reception queue
- Received frame data

If the reception FIFO contains even one frame, the scheduler allocates storing in the reception queue (see section 45.3.2.2, Scheduling Reception and Transmission).

If there is even one empty descriptor in a queue for which reception has started, the storage of frame data starts. Received frames for a queue that is already full (there is no empty frame descriptor or the unread frame counter stop level has been reached) are discarded from the reception FIFO. This ensures that one queue being full does not prevent the processing for data in the other queues.

(1) Storing Frame Data in the Descriptor Data Area

Frame data for storage are assumed to be in either of the two patterns described below.

- The data for an entire frame will fit in the descriptor data area.
 - In this case, the descriptor type (DESCR.DT) is FSINGLE.
- Frame data is bigger than the descriptor, so the frame data is divided and stored in the descriptor data area.
 - In this case, FSTART is written to the descriptor type (DESCR.DT) bits of the first of the frame data to arrive and FMID and FEND are written to the type bits of descriptors for subsequent data.

The descriptor type is updated by the AVB-DMAC in the last step of descriptor processing, so software can always access the descriptor written-back to DESCR.DT.

Software can write FEMPTYxxx directly to the descriptor type field after processing the stored frame data. Do not change the descriptor or any part of the descriptor data area after FEMPTYxxx is written to DESCR.DT.

(a) Single Frame

For a frame with an FSINGLE descriptor, all data for the frame are held at the position defined by DESCR.DPTR. DESCR.DS indicates the length of the received frame.

If DESCR.DS is bigger than the actual size of a received frame, the FEMPTY or FEMPTY_ND descriptor is stored in place of the FSINGLE descriptor.

Also, the FEMPTY_IS and FEMPTY_IC descriptors, which always hold the full frame data, are stored in place of the FSINGLE descriptor.

(b) Divided Frames

Divided frames can be processed in the same way as a single frame. A frame stored with divided descriptors must be recombined before use. DESCR.EI and DESCR.TS are only valid in the last descriptor of the sequence for a divided frame.

CAUTION

If the data area size setting in DESCR.DS is not a multiple of four bytes, only the number of bytes set in DESCR.DS is fetched from the reception FIFO and the remaining bytes are used by the next descriptor.

After a received frame is divided into different descriptors, each frame data is processed separately, and the descriptor type is assigned by software after processing. Accordingly, an error frame (FEMPTYxxx instead of FMID or FEND) may exist while a descriptor chain is being processed. In such a case, the CPU must postpone processing of the error frame until the corresponding descriptor has been processed.

(c) No Data

The application specification may lead to some types of received frames being unimportant (for example, when the application only requires stream data from the Ethernet frames). Storing frames in divided form makes separating out the unnecessary parts of Ethernet frames possible.

If part of a divided frame is not required, use the FEMPTY_ND descriptor so that unnecessary data is not stored in the on-chip RAM.

After processing an FEMPTY_ND descriptor, the AVB-DMAC sets DESCR.DS to 0. DESCR.DS = 0 is for the specific flag indicating that the FEMPTY_ND descriptor has been processed.

(2) Incremental Data Areas

Secure space for storing received data in the on-chip RAM. Even when all descriptor data areas of a chain are placed in the contiguous area of the on-chip RAM area, a received frame being shorter than the descriptor data area will lead to an empty space. Figure 45.25 shows an example of settings and the memory map.

In some cases, contiguous data arrangement may be effective (e.g. when received data are to be processed other than by hardware as the A/V codec module). When the length of frames differs for each received frame (e.g. when payloads vary between having one or two A/V packages), the use of a pointer in the descriptor produces empty spaces in the data area. This necessitates additional processing such as copying the frame data to remove the empty spaces.

Accordingly, and to prevent copying data, the AVB-DMAC supports an “incremental data area” function.

When incremental data areas are in use, different descriptors use a contiguous data area. The first descriptor (FEMPTY_IS) from the top defines the base address of the incremental data area and is used to, together with the subsequent descriptor (FEMPTY_IC) within the descriptor chain, hold received data. Figure 45.26 shows an example of settings and the memory map.

When an incremental data area is used, it is also possible to divide a frame into various descriptors in a way that reflects its structure (e.g. one descriptor for the Ethernet header and one for the data payload).

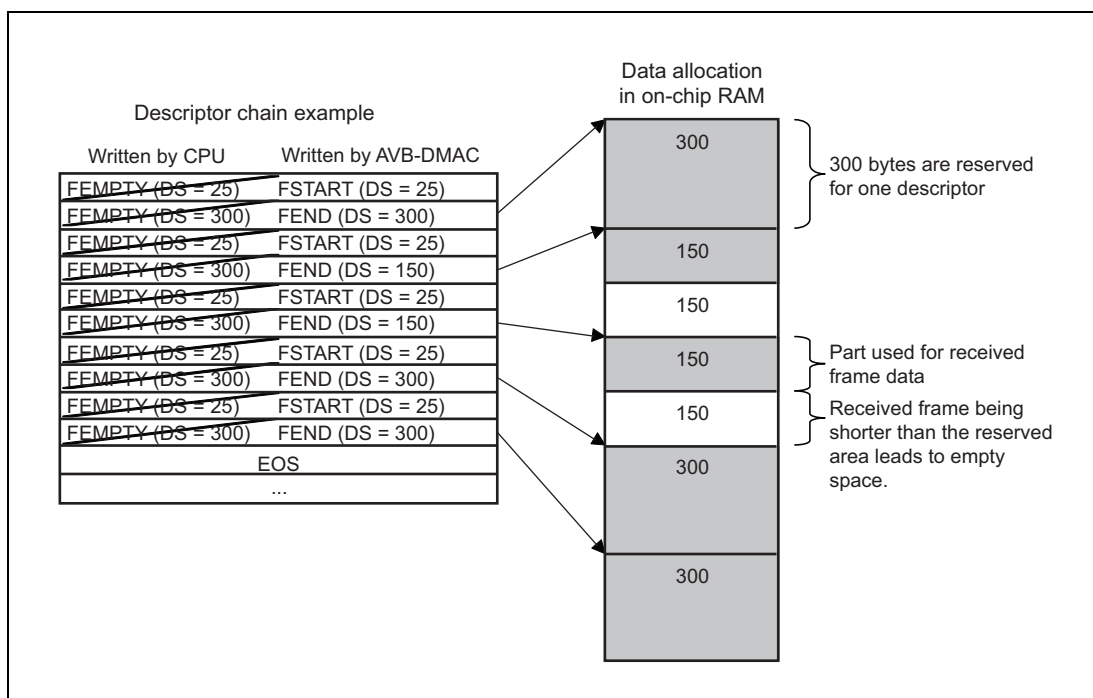

Figure 45.25 When Individual Descriptor Data Areas are Used

Figure 45.25 and Figure 45.26 show how control of the data storage areas by a descriptor chain varies according to whether incremental data areas are not in use or in use. The chains are configured for storing received frames consisting of a 25-byte header (in this example, stored in the on-chip RAM area outside the drawing range) and a 150- or 300-byte payload (whether one or two 150-byte data depending on the data source).

In Figure 45.25, an EOS descriptor is added as an example of a re-synchronization point. If a frame larger than 325 bytes is received, the frame will be divided into three descriptors, meaning that synchronization of the header and data sequences is lost. However, a frame is not divided across an EOS descriptor, so adding EOS descriptors can prevent the header and data sequences losing synchronization. While an incremental data area is in use, EOS descriptors are not required because the incremental descriptors always hold all data being processed.

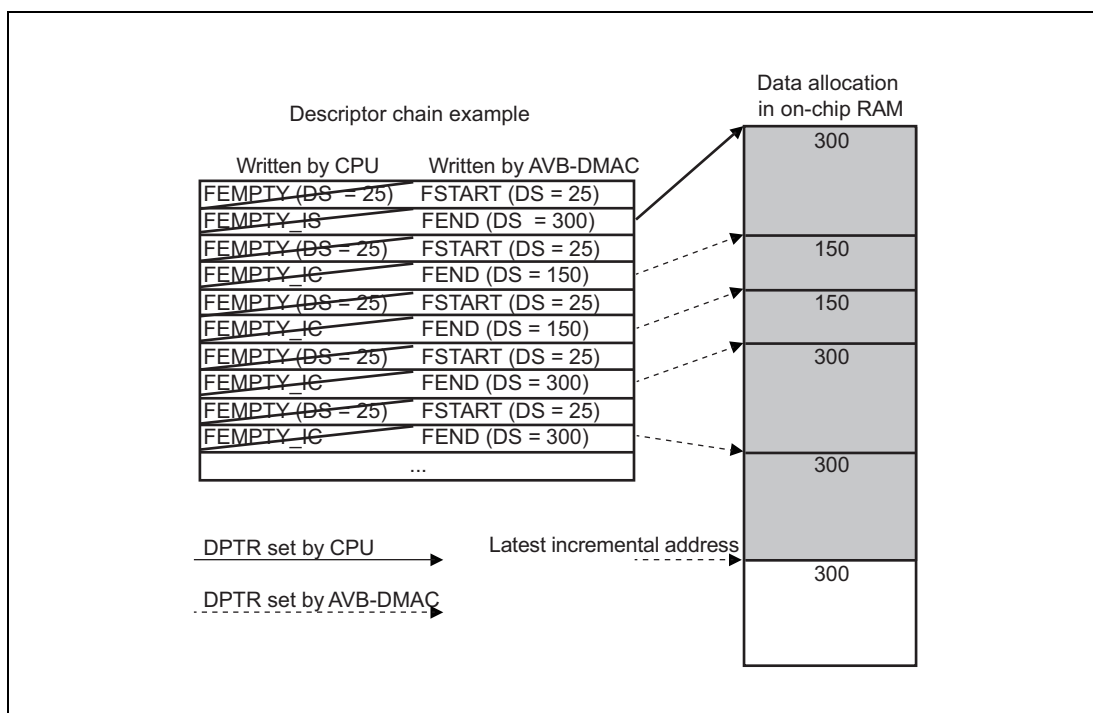

Figure 45.26 When Incremental Data Area is Used

As Figure 45.26 shows, when data are stored in an incremental data area, the descriptor pointers in the FEMPTY_IC descriptors (DESCR.DPTR) are updated. Accordingly, the FEND or FSINGLE descriptor written-back by the AVB-DMAC after processing is in the same format as the FEMPTY descriptor after processing.

Software captures contiguous received data, which has no empty spaces, from an incremental data area. The incremental data area must be aligned with a 4-byte boundary. Therefore, when the amount of received data for storage in an incremental data area is not a multiple of four bytes, from one to three bytes of empty space is placed at the end of the incremental data area. DESCR.DS can be read to check for such empty spaces.

For the normal descriptors (FEMPTY and FEMPTY_ND), controlling the amount of received data due to DESCR.DR is possible, but for the incremental descriptors (FEMPTY_IS and FEMPTY_IC), controlling the amount of received data to be stored is not possible. All received data are always stored in an incremental descriptor.

(a) Setting Up an Incremental Data Area

If a descriptor chain has N descriptors (one FEMPTY_IS and N-1 FEMPTY_IC), an area for storing N times of the maximum received data as the incremental data area must be secured.

As Figure 45.26 shows, DESCR.DPTR of an FEMPTY_IS descriptor indicates the base address of the incremental data area. The subsequent FEMPTY_IC descriptor in the chain indicates that data must be stored in the incremental data area.

(b) Processing an Incremental Data Area Based on Descriptors

Since data processing by the CPU is the same regardless of how the AVB-DMAC stores the data, data stored in an incremental data area do not require any special handling.

(c) Padding

Use padding for reception of frame data that are not aligned correctly. Padding can be set individually for each descriptor. Accordingly, in the reception of divided frames, padding can be set to only those frames that require it (e.g. A/V payload data.)

Padding can also be used to effectively use an incremental data area (e.g. to prevent inefficient access by aligning received data with 32-byte boundaries).

Padding can only be used in an incremental data area.

The value H'0000 0000 is always used in padding.

Padding is the addition of the number of words (from one to seven 32-bit words) set in the stored padding counter bit in the receive padding configuration register (RPC.PCNT). This padding is repeatedly inserted for each received data count set to the stored data counter bit (RPC.DCN) (from one to 255 32-bit words). When the stored data counter (RPC.DCNT) reaches 0, however, padding is not repeated.

The first word of padding is always inserted at the position specified by DESCR.DPTR. When divided frames are in use, a padding word can be inserted in accord with each descriptor (e.g. the first descriptor handles a 42-byte header data and the second descriptor holds padded payload data in an incremental data area).

The next figure shows a general example of how padding is inserted and an example of setting up padding. In the figure, A indicates frame data received from the E-MAC, while B indicates frame data stored in the descriptor data area (32-bit word units).

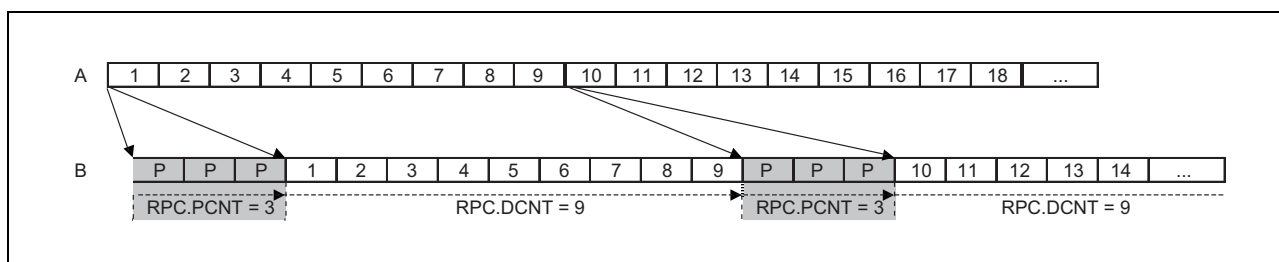

Figure 45.27 Example of a Padding Setting

Both padding and received frame data are counted in the descriptor size (DESCR.DS).

(3) Support for Reception Time Stamps

Capturing reception time stamps is essential for IEEE 802.1AS time synchronization. Other types of received frames may also require that a reception time stamp be appended; this depends on the application. The AVB-DMAC supplies reception time stamps based on the gPTP timer by storing time stamps that have been captured when the start frame delimiter (SFD) for a received frame in the last frame data descriptor (FEND or FSINGLE). For the gPTP timer, see section 45.3.7.1, gPTP Timer.

When time stamps are to be stored, use extended descriptors for the entire reception queue.

Furthermore, time stamps are always stored for reception queue 1 (network control). Time stamps for reception queue 0 (best effort) and reception queue r ($r \geq 2$; for stream data) can be selected by the time stamp enable bits in the receive configuration register (RCR.ETS0 or RCR.ETS2).

45.3.4.4 Unread Frame Counters

Each reception queue has an unread frame counter (UFCVi). Use the unread frame counter configuration bits in the receive queue configuration register (RQCi.UFCCr) to select from among the four stop levels for each unread frame counter. The 0 setting disables the stop functions. For how to set this up, see Figure 45.28.

Operations of the AVB-DMAC (hardware) and CPU (software) drive an unread frame counter (UFC) in the following ways.

- The hardware indicates that it has added a new frame to the descriptor chain for the queue (this increments the counter).
- Software indicates how many frames from the descriptor chain it has processed by writing to the corresponding bits of the unread frame counter decrement register for the queue (this decrements the register by the number written).

The unread frame counter is based on the number of frames stored in the on-chip RAM and is only incremented by one even when a received frame is divided into different descriptors. Data failure in a descriptor chain requires care because this may fail in synchronization of the unread frame counter as described in section 45.3.4.4 (1) Loss of Unread Frame (UFC) Synchronization.

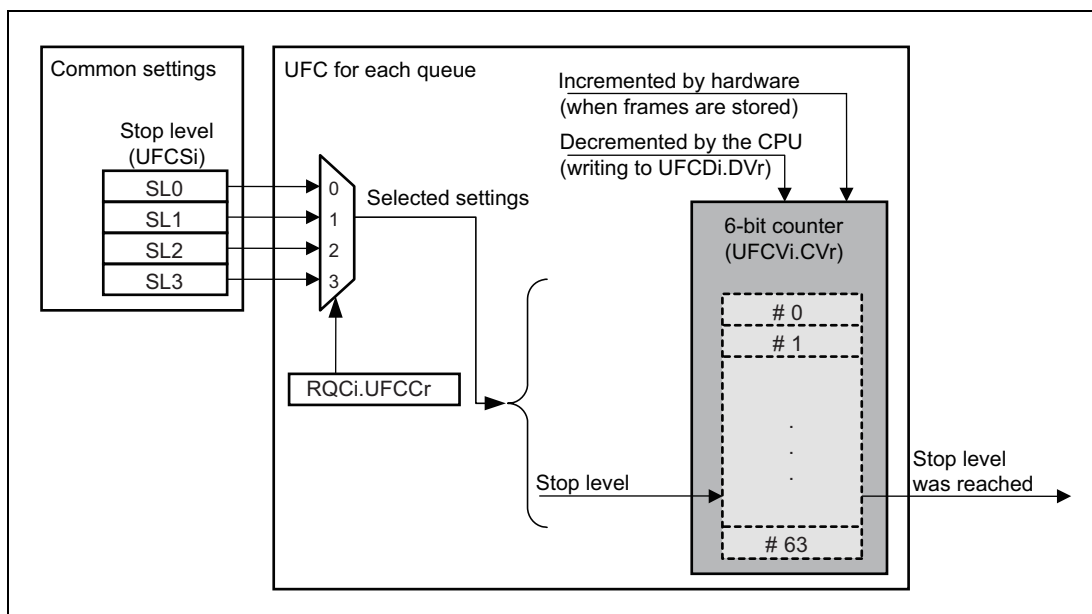

Figure 45.28 Overview of an Unread Frame Counter

Unless synchronization of hardware and software is lost, the current unread frame counter value (UFCVi.CVr) indicates the number of unread frames in the queue.

When the stop level has been reached, received frames are not stored in the descriptor chain. Setting 0 as the stop level disables the stop function. Otherwise, further received frames for the queue are discarded once its unread frame counter reaches the stop level. Activation of the unread frame counter stop function is indicating by setting of the receive queue full interrupt flag in the receive interrupt status register 2 (RIS2.QFFr).

Set the unread frame counter stop level configuration register (UFCS) for each reception queue that will use the unread frame counter function while the current operating mode is configuration mode.

(1) Loss of Unread Frame (UFC) Synchronization

The unread frame counters do not recognize failure to store a frame in the on-chip RAM. In other words, the AVB-DMAC increments the counter for a queue each time it captures a frame for that queue from the reception FIFO whether or not it succeeds in storing the frame normally in the descriptor chain.

In general, synchronization of hardware and software may be lost under the following conditions.

- An unread frame counter reaching its maximum value
When the value of a counter in an unread frame counter register i (UFCVi) ($i = 0$ to 4) reaches 63, synchronization for the corresponding queue can be lost.
It can only be judged that a loss of synchronization has not occurred when the stop level is set to 63.
- A queue not having enough space for a descriptor or the associated data
In this case, the corresponding receive queue full interrupt flag (RIS2.QFFr) in receive interrupt status register 2 (RIS2) is set.
If an unread frame counter reaches its stop level, the receive queue full interrupt flag (RIS2.QFFr) in the receive interrupt status register 2 (RIS2) is set.
- A problem occurring during access to memory

The result of a failure in synchronization is the unread frame counter indicating that the corresponding descriptor chain contains more available frames than it actually does. To retrieve the correct starting point for operations, use the descriptor base address load request (DLR.LBAq) for the given queue.

45.3.5 Transmission Control

Areas in the on-chip RAM for storing transmission descriptors must also be secured (for descriptors, see section 45.3.3, Descriptors).

The AVB-DMAC fetches data from the on-chip RAM in accord with the procedure the descriptor describes. The descriptor also retains tag information once the frame has been fetched for transmission. The tag information is used to maintain the relationships between state information and time stamps for the software and the AVB-DMAC. The status and time stamp information for transmitted frames remains accessible after their transmission is completed.

45.3.5.1 Transmission Modes

The AVB-DMAC has two modes of transmission.

- AVB transmission mode
This mode is selected by the priority level setting for the transmission queue in the transmit configuration register (setting of the TGC.TQP[1:0] bits) being B'01 or B'11.
- Non-AVB transmission mode
This mode is selected by the priority level setting for the transmission queue in the transmit configuration register (setting of the TGC.TQP[1:0] bits) being B'00.

(1) AVB Transmission Mode

AVB transmission supports the control of traffic through the output port to implement various traffic classes.

(a) Support for Traffic Classes and Associated Priority

When transmission is in AVB transmission mode, streams of traffic are transmitted in accord with the part of the AVB specification called Forwarding and Queuing for Time Sensitive Streams (FQTSS; for details on this, see the IEEE 802.1Q standard).

In the AVB specification, at least one queue for a reserving stream under the Stream Reservation Protocol (SR stream) and at least one queue for a non-SR stream are present, and the queues for reserved traffic according to the SRP have highest priority.

The AVB-DMAC supports four traffic classes: SR class A, SR class B, network control (NC) traffic (gPTP frames), and best effort (BE) traffic. Allocating a specific queue to network control (NC) frames ensures the control of synchronization.

The AVB-DMAC realizes compliance with the AVB standards by handling queues with the following architecture (in terms of traffic classes).

- Four transmission queues (Q3, Q2, Q1, and Q0) are available.
- Q3 and Q2 are for SR streams (one each for class A and class B).
- Q1 is for low-bandwidth network control (NC) traffic (gPTP frames)
- Q0 is for other types of traffic (MSRPDU*¹, MVRPDU*², best effort (BE), etc.)

CAUTIONS

1. MSRPDU: Multiple Stream Registration Protocol Data Unit
2. MVRPDU: Multiple VLAN Registration Protocol Data Unit

Fetching from queues proceeds in order of priority of the above traffic types. Three systems of priority are available through the setting of the transmit queue priority bits in the transmit configuration register (TGC.TQP[1:0]). In the default priority scheme, which is called AVB mode 1 (selected by TGC.TQP[1:0] = B'01), operation of the AVB-DMAC is fully in accord with the AVB specification. AVB mode 2 (transmit queue priority bits (TGC.TQP[1:0] = B'11) is an alternative priority scheme and varies from the AVB specification. Using this scheme thus requires more care.

Table 45.78 Default and Alternative Priority Orders in AVB Transmission Mode

Priority Schemes (AVB Mode)	Priority Order of Queues
AVB mode 1	Q3 (SR class A) > Q2 (SR class B) > Q1 (NC) > Q0 (BE)
AVB mode 2	Q1 (NC) > Q3 (SR class A) > Q2 (SR class B) > Q0 (BE)

(b) Transmission Selecting Algorithm and CBS

The algorithm the AVB-DMAC applies to select frames for transmission is in accord with the IEEE 802.1Q standard. For AVB mode, the CBS (credit-based shaping) algorithm is applied to the class A and class B SR queues (Q3 and Q2). Use of the CBS enables correct handling of the priorities of transmission from the SR queues. For the CBS algorithm, see section 45.3.6, CBS (Credit-Based Shaping).

When the following conditions are both satisfied, transmission from an SR queue (Q3 or Q2) proceeds at the specified time.

- The queue contains at least one frame ready for transmission.
- The queue has credit.
- Unless an SR queue satisfies the above conditions, a higher priority queue is not present (not ready for transmission).

A non-SR queue (Q1 or Q0) is selected if the conditions below both hold.

- The queue contains at least one frame ready for transmission.
- As well as the above condition, a higher priority queue is not present (not ready for transmission).

Figure 45.29 and Figure 45.30 are flowcharts of selection for transmission in AVB mode 1 and AVB mode 2.

Figure 45.29 Flow of Selection for Transmission in AVB Mode 1

Figure 45.30 Flow of Selection for Transmission in AVB Mode 2

(2) Non-AVB Transmission Mode

In non-AVB transmission mode, an absolute priority scheme is used. The SR class is not supported and the CBS algorithm is not used.

In non-AVB transmission mode (when the transmit queue priority bits in the transmit configuration register (TGC.TQP[1:0]) are B'00), data is fetched for transmission in a strict order of priority ($Q3 > Q2 > Q1 > Q0$).

Figure 45.31 shows the flow of selection in non-AVB transmission mode.

Figure 45.31 Flow of Selection for Transmission in Non-AVB Mode

(3) Setting the Size of the Transmission FIFO

The transmission FIFO is made up of 124 clusters. Each cluster can hold up to 128 bytes.

The size of the part of the transmission FIFO for use by each of the four transmission queues can be set by the corresponding transmit queue configuration q bits in the transmit control register (TGC.TBD q). The maximum number of clusters required can be determined from the maximum length of frames for transmission from the queue q .

Even if queue t already contains data of the frame size specified by TGC.TBD t , the AVB-DMAC fetches the next frame to queue t after the E-MAC starts transfer data from queue t . Therefore, a frame data area of the total of maximum frame sizes set for each transmission queue plus an area for 1 frame must be secured for a cluster.

General Usage Examples:

Q0: Frames containing up to 1500 bytes $\rightarrow 1500/128 = 11.7 \rightarrow 12$ clusters

Q1: Frames containing up to 1024 bytes $\rightarrow 1024/128 = 8.0 \rightarrow 8$ clusters

Q3: Frames containing up to 1996 bytes $\rightarrow 1996/128 = 15.6 \rightarrow 16$ clusters

Q4: Frames containing up to 1996 bytes $\rightarrow 1996/128 = 15.6 \rightarrow 16$ clusters

When the depth of all transmission queues is 2, only the following number of clusters is required.

$$2 * (12 + 8 + 16 + 16) + 16 = 2 * 52 + 16 = 120$$

Adjust the frame length of each queue so that the number of clusters to be used is no greater than 124.

45.3.5.2 Setting Up Transmission Descriptors

(1) Transmission Descriptor Type

The type of a descriptor is defined by the descriptor type (DESCR.DT) field.

Table 45.79 shows the descriptor types used in transmission. In the table, entries in the write-back column indicate how the AVB-DMAC changes the DESCR.DT field upon completion of descriptor processing.

Table 45.79 Descriptor Types in Transmission

Descriptor Type (DESCR.DT)	Operation	Write-back
Frame Start (FSTART)	The AVB-DMAC fetches the first of the data for the divided frame and proceeds to the next descriptor.	FEMPTY
Frame Middle (FMID)	The AVB-DMAC fetches the second or subsequent data for the divided frame and proceeds to the next descriptor.	FEMPTY
Frame End (FEND)	The AVB-DMAC fetches the last of the data for the divided frame. When the frame of data that has been fetched to the transmission FIFO is ready for transmission by the E-MAC, the AVB-DMAC proceeds to the next descriptor.	FEMPTY
Frame Single (FSINGLE)	The AVB-DMAC fetches the frame of data. When the frame of data that has been fetched to the transmission FIFO is ready for transmission by the E-MAC, the AVB-DMAC proceeds to the next descriptor.	FEMPTY
Link (LINK)	Processing proceeds to the descriptor specified by DESCR.DPTR.	LEEMPTY
Fixed Link (LINKFIX)	Same as LINK	Not changed
End Of Set (EOS)	Clears the transmit start request bit (TCCR.TSRQt), which stops transmission queue. When the TCCR.TSRQt is again set to 1 (a new transmission start request is issued), processing proceeds to the next descriptor.	EEMPTY
Frame Empty (FEMPTY)	Clears the transmit start request bit (TCCR.TSRQt), which stops transmission queue. When the TCCR.TSRQt is again set to 1 (a new transmission start request is issued), processes this descriptor again.	Not changed
Link Empty (LEEMPTY)	Same as FEMPTY	Not changed
EOS Empty (EEMPTY)	Same as FEMPTY	Not changed

(2) Configuration of Transmission Frame Data Descriptors

Figure 45.32 shows the configuration of descriptors for use with transmission queues. The transmission-specific fields (DESCR.TSR and DESCR.TAG) are described in Table 45.80.

For the other fields and the descriptor types, see section 45.3.3.6, Descriptor Type.

Figure 45.32 Configuration of Descriptor for a Transmitted Frame

Table 45.80 Configuration of a Transmission Descriptor

Bit Name	Function
TSR	<p>Time Stamp Store Request</p> <p>This bit specifies whether the transmission time stamp together with tag information is to be stored within the EthernetAVB module.</p> <p>0: The time stamp status FIFO within the EthernetAVB module does not retain a transmission time stamp.</p> <p>1: The time stamp status FIFO within the EthernetAVB module retains a transmission time stamp.</p> <p>Only control this bit while the current DESCR.DT is FEND or FSINGLE.</p>
TAG	<p>Frame Tag</p> <p>This TAG field is used to associate each frame data status with a time stamp. Frame TAG is not required but is recommended.</p> <p>Only control this bit while the current DESCR.DT is FEND or FSINGLE.</p>

For the time stamp FIFO function, see section 45.3.5.4, Time Stamping in Transmission.

45.3.5.3 Transmission

(1) Transmitting Frames

Setting the transmit start request bit in the transmit configuration control register (TCCR.TSRQt) starts the transfer of frames from the corresponding transmission queue.

The descriptor in the current descriptor address for the queue (CDARq.CDA) is read first.

If this descriptor is a descriptor for frame transmission (FSINGLE, etc.), the AVB-DMAC fetches the frame data from the data area indicated by the descriptor, writes FEMPTY back to the descriptor type (DESCR.DT) bits to indicate completion of this processing, then proceeds to processing of the next descriptor.

If the descriptor is not for transmission, processing is as dictated by the given descriptor (for these descriptors, see the descriptions in section 45.3.3, Descriptors).

If a base address load request is issued for a descriptor chain while it is being processed (by setting 1 in the LBAq bit for transmission queue q that is currently being processed in the descriptor base address load request register, DLR), processing proceeds to the new descriptor chain (descriptor base table address bits (DBAT.TA) + 8*q). Loading the base address does not interrupt frame fetching, but note that frames that have not been fetched from the old chain remain where they are.

Figure 45.33 shows descriptor processing during transmission. “Fxxx” in the figure indicates the frame data descriptors (FSTART, FMID, FEND, FSINGLE).

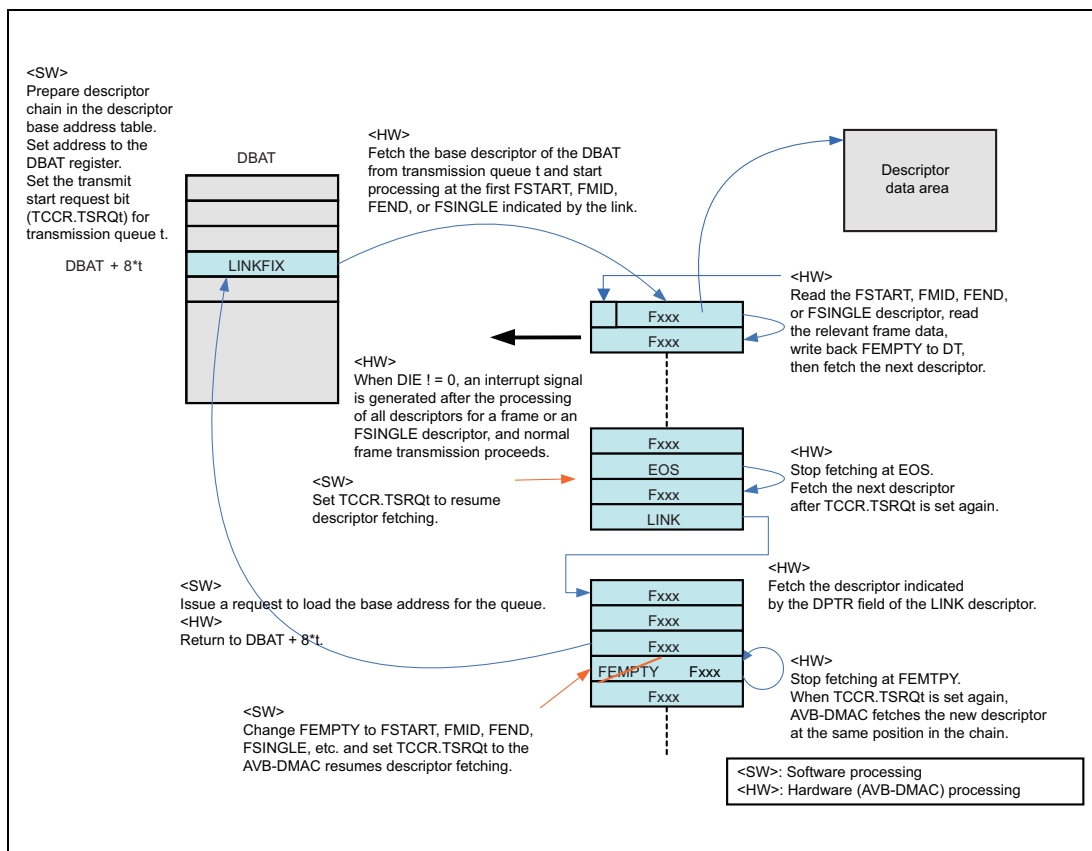

Figure 45.33 Descriptor Processing During Transmission

(2) Examples of Descriptor Usage

(a) Immediate Frame Transmission

Immediate frame transmission is a method in which fetching by the AVB-DMAC starts whenever software adds data to a queue. FEMPTY descriptors are used as stop points to keep the hardware and software in synchronization.

As preparation in transmission, software creates descriptor chains that have FEMPTY descriptors.

Figure 45.34 shows the flow for subsequent process.

Figure 45.34 Software Flow for Immediate Frame Transmission

When processing a divided frame, change the types of descriptors in the backward direction, i.e., from FEND to FSTART. This guarantees all the descriptors including frame data to be ready when the AVB-DMAC starts fetching divided frames.

Figure 45.35 shows software and AVB-DMAC operations for divided frame transmission. In the figure, software and hardware independently perform processing. This allows software to prepare the descriptor for frame $n + 1$ even when the AVB-DMAC is currently fetching frame n .

Figure 45.35 Software and AVB-DMAC Operation Examples for Immediate Frame Transmission (divided frames)

(b) Frame Set Transmission with Switching of the Active Descriptor Chain

This method is used when data are transmitted with a delay for software control to secure bandwidth or for other reasons, rather than immediately transmitted. EOS descriptors are used for the stop points.

As preparation in transmission, software creates descriptor chains that have FEMPTY descriptors.

Figure 45.36 shows the flow for subsequent process.

In the first task, software creates and adds a transmission frame to the descriptor chain, which is followed by EOS descriptor insertion.

In the second task, software processes the transmission trigger for the transmission descriptor prepared. This guarantees transmission of a frame set per trigger.

No particular operation is necessary for synchronization between two tasks. If not enough frame sets are prepared when the transmit start request bit in the transmit configuration control register (TCCR.TSRQt) is set, only the prepared frame sets are transmitted. If nothing is prepared in the queue, only clearance of a transmission request is performed.

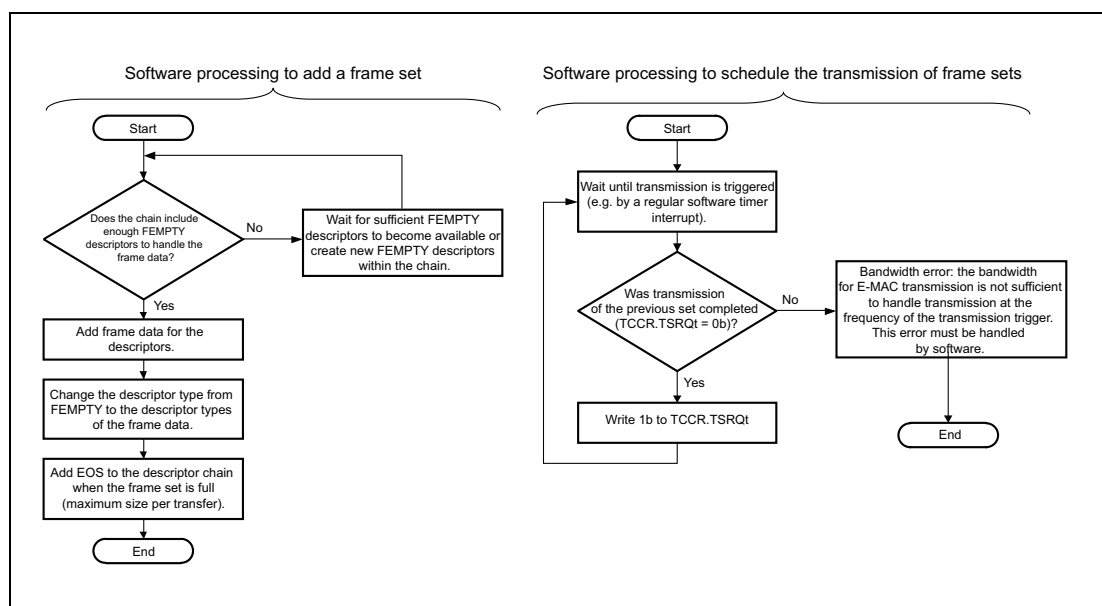

Figure 45.36 Software Flow for Frame Set Transmission with Switching of the Active Descriptor Chain

In a given time, the AVB-DMAC does not use the descriptor chain area currently being updated by software; therefore, descriptor types for a divided frame can be changed in any order.

Figure 45.37 shows software and AVB-DMAC operation examples in this method.

Figure 45.37 SW and AVB-DMAC Operation Examples for Frame Set Transmission with Switching of the Active Descriptor Chain

(c) Frame Set Transmission Using a Shadow Descriptor Chain

This method is used when data are transmitted with a delay for software control to secure bandwidth or for other reasons, rather than immediately transmitted. Two or more descriptor chains are used. The chains are classified as active or shadow chains. Software prepares frame data in shadow chain and descriptor while hardware processes active chain. EOS or FEMPTY descriptors are used for the stop points.

As preparation in transmission, software creates a shadow descriptor chain that has a FEMPTY descriptor, and creates a frame data descriptor in an active chain. Software then sets the transmit start request bit (TCCR.TSRQt) to start transmission of the active chain. During active chain transmission, software can prepare frame data for the shadow chain.

Figure 45.38 shows the flow for software implementing this method.

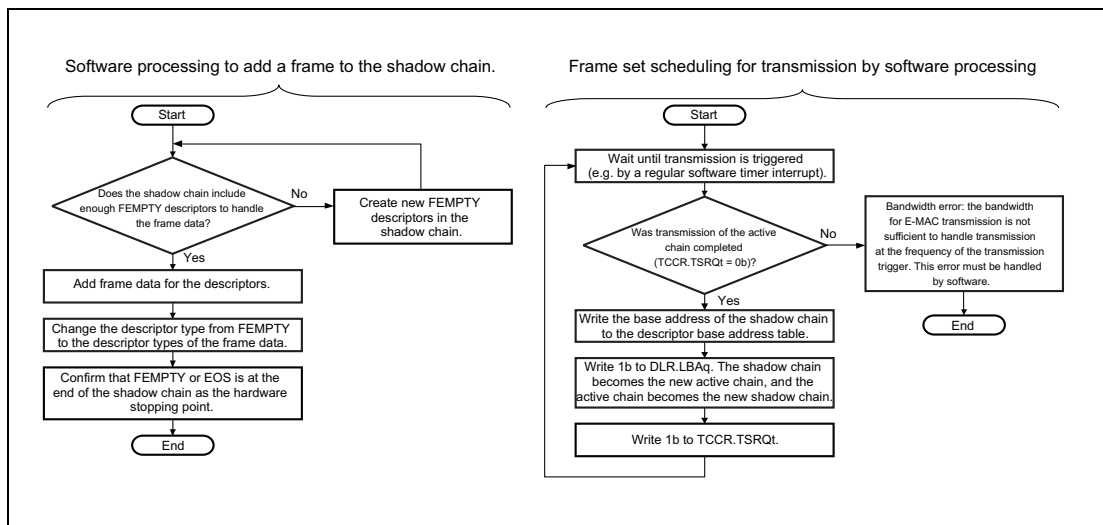

Figure 45.38 Software Flow for Frame Set Transmission Using the Shadow Descriptor Chain

Figure 45.39 shows software and AVB-DMAC operation examples in this method.

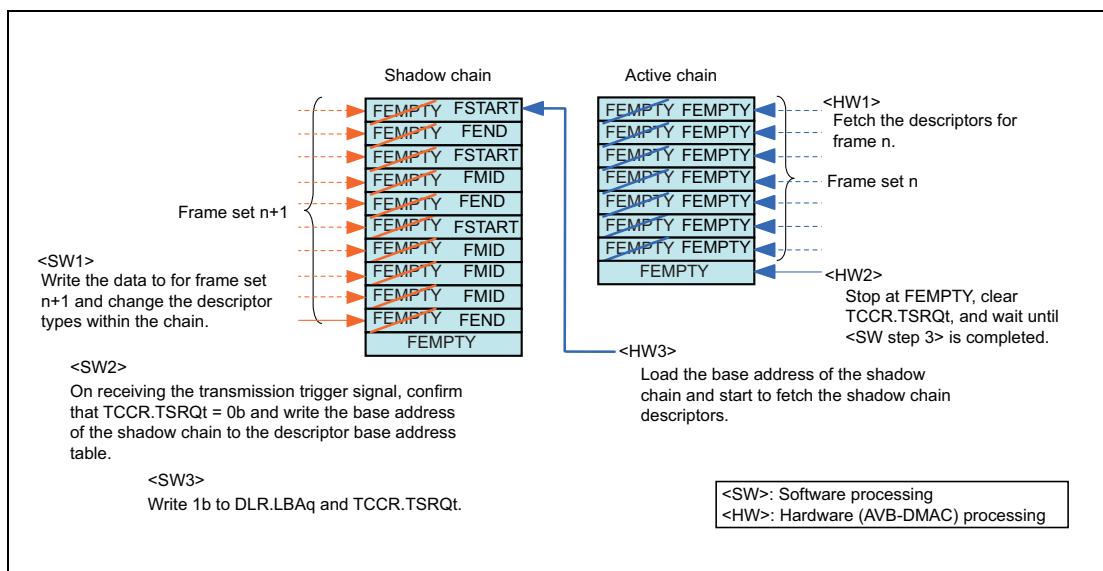

Figure 45.39 SW and AVB-DMAC Operation Examples for Frame Set Transmission Using the Shadow Descriptor Chain

45.3.5.4 Time Stamping in Transmission

Transmission time stamps are important in performing timing and synchronization processing of the IEEE 802.1AS standard. Reference to the transmission time stamps can also be useful to other applications and so on. The AVB-DMAC supplies the time-stamp values based on the gPTP timer by storing the time stamps captured at the same time as sending of the Start of Frame Delimiter (SFD) for transmitted frames.

When the time stamp storage request field (DESCR.TSR) is set to 1, selecting storage of a time stamp, the tag number defined in the tag field (DESCR.TAG) of the last descriptor in a set (FEND) or of an FSINGLE descriptor for the frame being transmitted is stored with the time stamp. This eases identification and association. The time-stamp FIFO is accessible at any time.

The method of using this function is described below:

1. Create descriptor and frame data in the on-chip RAM for the frame requiring time stamping. Write the tag number of the frame to the frame tag field (DESCR.TAG) and set the time stamp storage request field (DESCR.TSR) to 1.
2. The AVB-DMAC fetches and analyzes the descriptor. When the time stamp storage request field (DESCR.TSR) is 1, the AVB-DMAC recognizes that transmitting this frame also requires storage of the time stamp.
3. The AVB-DMAC fetches the frame data and stores the frame data in the transmission FIFO for scheduling.
4. Under the control of priority settings according to credit-based shaping (CBS) or another scheme, the transmission scheduler decides it is time to transmit frame.
5. The EthernetAVB starts transmission of frame.
6. The gPTP time stamp is captured at the start of sending the frame delimiter (SFD) for transmission and stored with the tag frame field (DESCR, TAG) in the time-stamp FIFO upon completion of the frame transmission. When the time stamp update interrupt is enabled, update of time stamp is notified by an interrupt.
7. The time stamp can now be acquired from the time-stamp FIFO.

Use the time-stamp FIFO for the timing and synchronization of frames with IEEE 802.1AS compliance.

Time stamping can also be used with other frames, but take care not to allow the time-stamp FIFO to overflow. When the time-stamp FIFO is full, further time stamps in subsequent transmissions are not stored.

Figure 45.40 shows software flow in time-stamp FIFO operation. The time stamp FIFO update interrupt status bit (TIS.TFUF) and the time stamp FIFO warning interrupt status bit (TIS.TFWF) are used for the start flag of the START block in the figure.

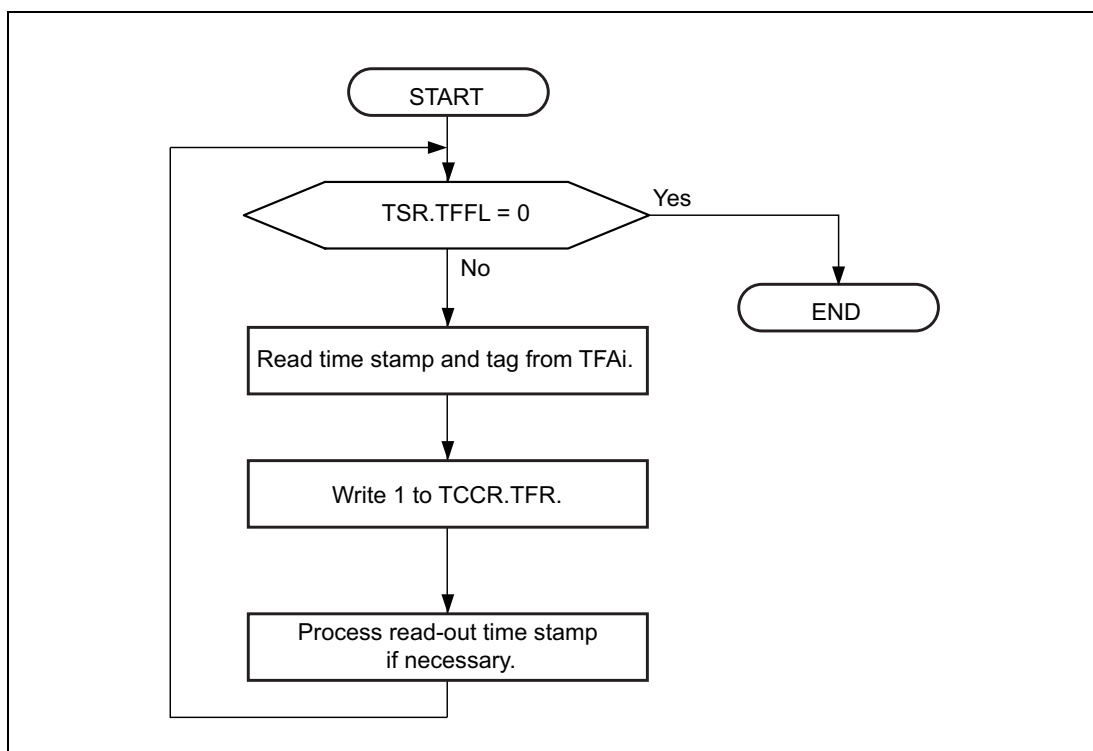

Figure 45.40 Flow of Transmission Time Stamping

When all the entries in the time-stamp FIFO are released, the time stamp FIFO update interrupt status bit (TIS.TFUF) and time stamp FIFO warning interrupt status bit (TIS.TFWF) are cleared by the AVB-DMAC. Therefore, clearing the interrupt flags is not necessary.

When multiple frames are transmitted with time stamps but from different queues, the order of storage in the time-stamp FIFO buffer depends on the order of frames in transmission.

45.3.6 CBS (Credit-Based Shaping)

In AVB transmission mode (i.e. when the transmit queue priority field in the transmit configuration register (TGC.TQP) is B'01 or B'11), transmission queues Q3 and Q2 are respectively assigned to class A and class B stream traffic and the CBS (Credit Based Shaping) algorithm is used to select the transmission queues in order to satisfy the Forwarding and Queuing for Time Sensitive Streams (FQTSS) specification (see section 8.6.8 or section 34 in IEEE 802.1Q).

The CBS algorithm is based on the concept of transmission credit for each queue. Credit can be thought of as the degree to which a queue has the “right” to transmit at a given time. In addition, in AVB transmission mode as specified in IEEE 802.1Q, queues that are subject to the CBS algorithm are able to transmit when the following conditions are met.

- At least one frame is stored in the queue.
- The credit for the queue is 0 or a positive value.

The credit for a transmission queue is incremented while one or more frames from the queue are present in the transmission FIFO but transmission of these frames is not proceeding. This state is indicated by the transmission process status bit for queue t in the AVB-DMAC status register (CSR.TPOt) being clear (0). The credit is decremented while transmission of a frame from the queue is in progress. This mechanism is used to control transmission so that the amount of data for transmission for each queue does not exceed the specified maximum bandwidths.

IEEE 802.1Q defines the following parameters for queues under the control of the CBS algorithm.

portTransmitRate: Maximum transmission data rate of an external port. The E-MAC determines this parameter.

bandwidthFraction: Maximum fraction of portTransmitRate that can be used for a queue.

idleSlope: Rate of change of credit for a queue when transmission of frames from the queue is not proceeding so the credit value (in bits per second) is increasing. idleSlope is also equal to the maximum fraction of the total bandwidth (portTransmitRate) that is available to the given queue under a specified condition (frames from the queue can be placed in a continuous stream. See Annex L of IEEE 802.Q.

$$\text{idleSlope} = \text{bandwidthFraction} * \text{portTransmitRate}$$

sendSlope: Rate of change of credit (in bits per second) for a queue while transmission of a frame from the queue is in progress so the credit value is decreasing.
 The value of sendSlope is defined as follows:

$$\text{sendSlope} = \text{idleSlope} - \text{portTransmitRate}$$

Furthermore, the values below are used to define individual traffic classes (or queues for the classes) under control of the algorithm. See Annex L of IEEE 802.Q.

maxFrameSize: Maximum size of frames (in bits) of the corresponding traffic class that can be transmitted from a port

maxInterferenceSize: Maximum burst size (in bits) by which delays for the corresponding traffic class can be allowed

hiCredit: Maximum credit value (positive number). Can be calculated by using the following equation: $\text{hiCredit} = \text{maxInterferenceSize} * (\text{idleSlope} / \text{portTransmitRate})$

loCredit: Minimum credit value (negative number). Can be calculated by using the following equation: $\text{loCredit} = \text{maxFrameSize} * (\text{sendSlope} / \text{portTransmitRate})$

Figure 45.41 shows how the CBS algorithm works and the meaning of the above parameters. When there is no frame to be transmitted in the queue in the transmit-enabled state, the credit value is 0 (after Frame 0 transmission in the figure).

Figure 45.41 CBS (Credit-Based Shaping) Operation

Figure 45.42 shows the operation of CBS (Credit Based Shaping) in the AVB-DMAC.

Figure 45.42 CBS (Credit-Based Shaping) Operation in the AVB-DMAC

The CBS operation in the AVB-DMAC is based on “credit counters” for the respective traffic classes (SR class A and class B). The following parameters apply for these classes.

CBS increment value (CIV): Signed positive number

The credit is incremented by this amount every internal bus clock cycle while a frame from the queue is pending but transmission has not started (idleSlope).

CBS decrement value (CDV): Signed negative number

The credit is decremented by this amount every internal bus clock cycle while transmission of a frame from the queue is proceeding (sendSlope).

The CBS increment value (CIV) and CBS decrement value (CDV) are defined as follows.

$$\text{CIV} = \text{idleSlope} * \text{Mfactor}$$

$$\text{CDV} = \text{sendSlope} * \text{Mfactor}$$

Mfactor is a multiplier factor to ensure accuracy for CIV and CDV. CIV and CDV are finally calculated by using the following equations.

$$\text{CIV} = (\text{portTransmitRate}/B\phi) * \text{bwFraction} * \text{Mfactor}$$

$$\text{CDV} = (\text{portTransmitRate}/B\phi) * (\text{bwFraction} - 1) * \text{Mfactor}$$

The credit counters are driven by the internal bus clock ($B\phi$), so calculating the slope parameters for CBS requires $(1/B\phi)$.

Mfactor must be calculated for the CBS parameters. All queues for the same class must have the same CBS parameters. Mfactor for a certain class can be changed during operation, unless transmission is pending for that class (i.e. the transmit process status bit in the AVB-DMAC status register (CSR.TPOt) = 0). At that time, the credit counter values for class are 0. Note that the credit value will

not match a new incrementation or decrementation parameter if Mfactor is changed while the credit counter value is non-zero. Mfactor configuration register is not present in the AVB-DMAC.

Set the CIV and CDV parameters in the CBS increment value registers (CIVRc) and the CBS decrement value registers (CDVRc). They should be dynamically updated when streams are registered and erased in accord with IEEE 802.1Qat.

Although the credit counters operate with the internal bus clock ($B\phi$), a transmission clock is used in frame transmission. Therefore, time lags occur when frame transmission starts and ends.

For this reason, an extra credit is stored after a frame is transmitted. The maximum value of the credit to be stored is the credit value incremented for one cycle of the $B\phi$ clock and equals the Tx port transmission rate in Mbps * $B\phi$.

Bandwidth needs to be secured by software taking this into account.

The AVB-DMAC also has CBS upper limit registers (CULc) (the upper limit registers for classes A and B) and CBS lower limit registers (CLLc) (the lower limit registers for classes A and B). Multiply the upper limit (hiCredit) and the lower limit (loCredit) by Mfactor for each class as defined above so that the resulting values agree with the credit values.

$$CUL = \text{hiCredit} * \text{Mfactor} = \text{maxInterferenceSize} * \text{bwFraction} * \text{Mfactor}$$

$$CLL = \text{loCredit} * \text{Mfactor} = \text{maxFrameSize} * (\text{bwFraction} - 1) * \text{Mfactor}$$

Example:

Assume that portTransmitRate = 100 Mbps, $B\phi$ = 130 MHz and bwFraction = 3%. Then idleSlope and sendSlope represented as one bit vs. cycles of the peripheral bus clock are as follows.

$$\text{idleSlope} = (\text{portTransmitRate}/B\phi) * \text{bwFraction} = 100/130 \text{ (Mbps/MHz)} * 3\% = 0.023 \text{ (bit}/B\phi)$$

$$\text{sendSlope} = \text{idleSlope} - (\text{portTransmitRate} / B\phi) = -0.746 \text{ (bit}/B\phi)$$

Let Mfactor be 100, then CIV and CDV parameters are determined as follows.

$$\text{CIV} = \text{idleSlope} * \text{Mfactor} = 23$$

$$\text{CDV} = \text{sendSlope} * \text{Mfactor} = -74.6$$

45.3.6.1 Restrictions on CIV, CDV and Mfactor

The maximum value (the minimum value for negative numbers) up to which the credit counter will not overflow determines the maximum values of CIV and CDV that can be set in the CBS registers. This maximum credit value is equivalent to the worst case of the hiCredit value, and the maximum values for class A and class B are calculated as follows.

<Conditions>

- Class A maximum value (hiCredit_max_classA)
 $\text{classA bwFraction} \cong 100\%$
 Maintaining the proper relations in the transmission priority order requires waiting for a period equivalent to the one maximum sized frame.
 $\text{hiCredit_max_classA} \cong \text{maxInterferenceSize for class A} = \text{Waiting for a period equivalent to one maximum sized frame} = \text{header} + \text{maximum size payload} + \text{CRC (2000 bytes)} + \text{preamble (8 bytes)} + \text{IFG (12 bytes)} + \text{processing_delay} (\cong 80 \text{ bytes}) \cong 2100 \text{ bytes}$
- Class B maximum value (hiCredit_max_classB)
 $\text{classB bwFraction} \cong 100\%$
 Maintaining the proper relations in the transmission priority order requires waiting for a period equivalent to the respective one maximum sized frame in the class A transmission queue and other transmission queues.
 $\text{hiCredit_max_classB} \cong \text{maxInterferenceSize for class B} = \text{Waiting for a period equivalent to two maximum sized frames} = 2 * \text{hiCredit_max_classA} \cong 4200 \text{ bytes}$

In bit units, calculated as follows:

$$\text{hiCredit_max_classA} = 16800$$

$$\text{hiCredit_max_classB} = 33600$$

The 32-bit signed counter can handle from -2^{31} to $2^{31}-1$, so the specifiable maximum values of Mfactor without overflow are:

$$\text{Mfactor_max_classA} = 2^{31}-1 / \text{hiCredit_max_classA} \cong 127826 \text{ and}$$

$$\text{Mfactor_max_classB} = 2^{31}-1 / \text{hiCredit_max_classB} \cong 63913.$$

A high degree of accuracy can be achieved even with a low bandwidth. In class B, bandwidthFraction = 0.05% and the bandwidth error < 0.1%.

The maximum value of CIV is calculated from the following equation.

$$\text{CIV} = \text{idleSlope} \times \text{Mfactor} = (\text{portTransmitRate} / \text{B}\phi) * \text{bandwidthFraction} \times \text{Mfactor}$$

When Mfactor is the maximum value and bandwidthFraction is the maximum value (up to 100%):

$$\text{CIV_max_classA} = (\text{portTransmitRate} / \text{B}\phi) * \text{Mfactor_max_classA} \text{ and}$$

$$\text{CIV_max_classB} = (\text{portTransmitRate} / \text{B}\phi) * \text{Mfactor_max_classB}.$$

The maximum values when portTransmitRate = 100 Mbps and Bφ = 130 MHz are as follows:

$$\text{CIV_max_classA} \cong 98328$$

$$\text{CIV_max_classB} \cong 49164$$

Table 45.81 shows examples of values for portTransmitRate and internal bus clock frequency. The values in this table are just the results of calculation, so when actually setting values, the CIV values must be limited so that the 32-bit credit counter will not overflow. In the AVB-DMAC, the CIV parameters are implemented as 16 bits + a sign bit, so $CIV \leq 65535$ should be applied to both class A and class B.

Table 45.81 Example of Maximum Values for Class A and Class B CIV Parameters

portTransmitRate	B ϕ [MHz]	CIV_max_classA	CIV_max_classB
100 Mbps	100	127826	63913
100 Mbps	125	102260	51130
100 Mbps	133	96109	48054

45.3.6.2 Credit Incrementation (IFGs)

In the CBS credit counter in the AVB-DMAC, the inter-frame gap (IFG) after a frame is transmitted is not treated as part of frame transmission. During an IFG, the credit is incremented for all SR queues that have pending frames or negative credit. Figure 45.43 illustrates credit operations during IFGs.

Figure 45.43 Credit Operations during IFGs

The IFG need not be included in calculation of the bandwidth for the specified SR class when deciding the `idleSlope`, `sendSlope`, and `CIV` and `CDV` parameters. However, IFG must also be included in the calculation in order to confirm that the total bandwidth allocated to all SR classes does not exceed 100% of `portTransmitRate`.

45.3.6.3 CBS Setting Example

The case of a class A 48-kHz stereo audio stream among Ethernet frames is described as an example.

After every class A measurement interval (125 μ s), 80 octets consisting of two sets of six 32-bit samples plus a 32-octet header are stored as audio data within a frame. The IEEE 802.3 also imposes a 42-octet media-specific frame overhead (an 8-octet preamble, 14-octet IEEE 802.3 header, 4-octet IEEE 802.1Q priority/VID Tag, 4-octet CRC, and 12-octet IFG) are also added. Accordingly, the total frame size is $80 + 42 = 122$, and one such frame is transmitted after every class measurement interval.

This represents a total bandwidth of about 7.8 Mbits per second ($122 \text{ octets} \times 8 \text{ bits per octet} \times 8000 \text{ frames per second}$) for this class. The E-MAC runs at 100 Mbps (`portTransmitRate`), so the allocation of the total bandwidth to each class A queue corresponds to 7.8%. If other traffic classes are to share the total transmission bandwidth, checking that the total allocation of bandwidth with this 7.8% allocation does not exceed 100% of `portTransmitRate` is required.

To obtain the CIV and CDV parameters for a given class, the IFG must not be taken into account in calculation of the frame size. For this case, therefore, we obtain the total bandwidth for the class = about 7.04 Mbps ($110 \text{ octets} \times 8 \text{ bits per octet} \times 8000 \text{ frames per second}$) = 7.04% of `portTransmitRate`.

Figure 45.44 Example of CBS Settings

In this setting example, operating frequency and so on in each section are as follows:

- the E-MAC runs at 100 Mbps, so `portTransmitRate` = 100 Mbps and
- high-speed internal bus clock (operating clock for the credit counter) frequency = 133 MHz,

securing a bandwidth of 7.04 Mbits/sec for class A requires configuring the CBS parameters as follows.

- $\text{bandwidthFraction} = 7.04\%$
- $\text{idleSlope} = (\text{portTransmitRate} / B\phi) * \text{bandwidthFraction} \cong 0.05293 \text{ bits per } B\phi$
- $\text{sendSlope} = \text{idleSlope} - (\text{portTransmitRate} / B\phi) \cong -0.69895 \text{ bits per } B\phi$

When `Mfactor` = 10000, the parameters are as follows.

- $\text{CIV} = \text{idleSlope} \times \text{Mfactor} = 529 \text{ bits per } B\phi$

- $CDV = \text{sendSlope} \times \text{Mfactor} = -6989 \text{ bits per } B\phi$

These are the final values for setting in the CIVR1 and CDVR1 registers.

45.3.7 IEEE802.1: gPTP

45.3.7.1 gPTP Timer

An 84-bit timer is provided to support the gPTP function. Figure 45.45 shows the overview of the timer.

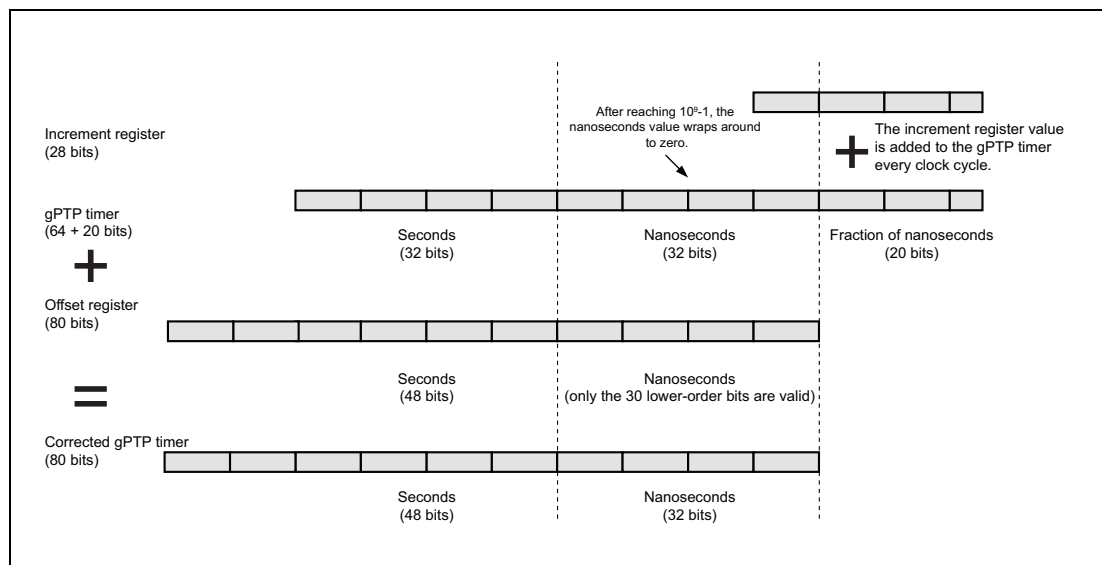

Figure 45.45 gPTP Timer

The higher-order 32 bits indicate seconds. For the next 32 bits indicate nanoseconds. The lower-order 20 bits indicate fractional nanoseconds. Software can only read the 32 higher-order bits, indicating seconds, and the subsequent 32-bits, indicating nanoseconds. The 20 lower-order 20 bits, representing less than 1 ns, are provided within the AVB-DMAC to maintain accuracy in time measurement, and cannot be referenced.

The timer can be reset by setting the timer control request bits in the gPTP configuration control register (GCCR.TCR[1:0]) to B'01. These bits are set to B'00 on completion of normal resetting of the timer.

After the timer starts, the value in the gPTP timer increment value bit (GTI.TIV) is added to the value of the gPTP timer every clock cycle. When the value of the nanosecond part reaches $10^9 - 1$, it returns to 0 when the next 1 nanosecond is counted. The fractional nanosecond value is represented by 20 bits and can be adjusted in precision of $1/2^{20}$ ($1/1048576$) nanosecond.

Before setting a value in the gPTP timer increment value bit (GTI.TIV), set the timer increment value setting request bit in the gPTP configuration control register (GCCR.LTI) to 1. If this bit is not set to 1, new values that are written will not be reflected in the register. This bit returns to 0 after the setting is completed.

An offset to the gPTP timer is also available. If this is required, set the value in the timer offset value bit (GTO.TOV). Before setting a value in this register, set the timer offset value setting request bit in the gPTP configuration control register (GCCR.LTO) to 1. If this bit is not set to 1, new values that are written will not be reflected in the register. This bit returns to 0 after the setting is completed. Set the value from 0 to $10^9 - 1$ to the timer offset value bits (GTO0.TOV[31:0]) in the nanoseconds portion. When adding an offset, take care that the calculation result with the offset added does not exceed 80 bits.

The value of the gPTP timer can be read from the gPTP timer capture value bit (GCTi.CTV) by setting the timer control request bits in the gPTP timer control register (GCCR.TCR[1:0]) to B'11. Set the timer capture source select bits in the gPTP configuration control register (TCCR.TCSS) to select the timer value for capture as the value of the gPTP timer, the corrected value of the gPTP timer (value with the offset added), or the AVTP presentation time. Setting the timer control request bits in the gPTP configuration control register (GCCR.TCR[1:0]) to B'11 initiates the capture. Once normal capture of the timer is complete, the value of the timer control request bits in the gPTP configuration control register (GCCR.TCR[1:0]) returns to B'00.

The timer for gPTP operates as a free-running timer but can be synchronized with the Grandmaster clock.

The timer clock source can be selected from the internal bus clock and Ethernet transmission clock by setting the gPTP clock select bits (CCC.CSEL[1:0]).

45.3.7.2 Free-Running Operation

The IEEE 802.1 AS standard does not prescribe the adjustment of local clocks to the Grandmaster clock. To avoid negative effects from the correction procedure, we recommend the use of a free-running timer.

As a free-running timer, the timer counts the local clock based on the local time. The gPTP timer increment value bit (GTI.TIV) is set to 1 ns (the setting value = H'0010 0000) and the timer offset value bit (GTOi.TOV) is set to 0. The ratio information captured at the time of the gPTP delay measurement and synchronization procedures is used to correct the frequency ratio to that of the Grandmaster clock. The Grandmaster clock can be calculated from the local clock by using the information collected during the gPTP measurement and synchronization procedures.

45.3.7.3 Synchronization with the Grandmaster Clock

In situations requiring physical synchronization of the local clock with the Grandmaster clock, the fractional nanoseconds value (the 20 lower-order bits of the gPTP timer) is used to make the adjustment. Specifically, the increment value is finely adjusted to correct for deviations of the clock frequency from that of the Grandmaster clock.

Use the timer offset value bit (GTOi.TOV) to correct for offsets for comparing with the absolute time and so on from start-up. The sum of the timer value and the offset register is the corrected gPTP timer value.

Set the value from 0 to $10^9 - 1$ to the timer offset value bits (GTOi.TOV[31:0]) for setting the nanoseconds portion of the offset.

The following equation gives a method of calculating the increment (GTI.TIV) from the frequency of the gPTP clock and its deviation from that of the Grandmaster clock. Variable d is the deviation ($d = 10^{-6}$ for 1 ppm).

$$GTI.TIV = \text{round} \left(\frac{2^{20} \text{ GHz}}{f_{GPTP}} * (1 + d) \right)$$

After adjusting for the current deviation of clock frequency, re-set the gPTP timer increment register (GTI.TIV).

After calculating the new offset value, re-set the timer offset configuration register (GTOi.TOV).

- Sample setting 1

When $f_{GPTP} = 100 \text{ MHz} \pm 0 \text{ ppm}$ (device used is guaranteed by the Grandmaster clock)

gPTP is updated every 10 ns.

Set the gPTP timer increment value bits (GTI.TIV) to H'00A0_0000.

- Sample setting 2

When $f_{\text{GPTP}} = 100 \text{ MHz} - 10 \text{ ppm}$

gPTP is updated every 10 ns.

Set the gPTP timer increment value bits (GTI.TIV) to H'00A0_0069 (10485864.8576 before rounded off). Rounding off the value causes a frequency error less than 1 ppm.

45.3.7.4 Support Provided by the gPTP Timer in Transmission and Reception

The timer value described above is used in the time-stamp values captured when start frame delimiters are detected in reception and generated in transmission.

Captured time stamp values for received frames are stored in the corresponding descriptors. Those for transmitted frames are stored with tag information in the time-stamp FIFO. The time stamp values are thus correlated with both transmitted and received frames.

Note that the use of corrected gPTP timer values can introduce an error due to the offset correction in the gPTP synchronization procedure.

Errors due to SFD notification and the interface between the timer modules must also be taken into account. Although SFDs for transmission and reception are detected in synchronization with the transmission and reception clocks, respectively, the gPTP operates with a gPTP clock. Therefore, an error of $\pm 1 \text{ GTI.TIV} + 1 \text{ B}\phi$ is generated.

45.3.8 Support for IEEE 1722

For IEEE 1722, the following two functions are supported.

- Output and capture of values in the IEEE 1722 AVTP (Audio/Video Transport Protocol) presentation time format
- Comparison of IEEE 1722 AVTP presentation time stamps

The 32-bit AVTP time stamp field of IEEE 1722 frames holds the AVTP presentation time when the AVTP time-stamp enable bit in the frame is 1. The AVTP time stamp field is generated from the pPTP timer and is given as seconds (gPTP_seconds) and nanoseconds (gPTP_nanoseconds) according to the following equation.

$$\text{AVTP time stamp} = (\text{gPTP_seconds} * 10^9 + \text{gPTP_nanoseconds}) \text{ modulo } 2^{32}$$

The AVTP presentation time can be read from the gPTP timer capture value bit (GCTi.CTV). Set the timer capture source select bits in the gPTP configuration control register (TCCR.TCSS) to select the timer value for capture as the AVTP presentation time. Setting the timer control request bits in the gPTP configuration control register (GCCR.TCR[1:0]) to B'11 initiates the capture. The value stored as the capturing result is obtained by adding the maximum transit time defined in the maximum transit time bits (GMTT.MTTV) to the corrected gPTP timer value. The AVTP presentation time wraps around approximately every four seconds.

CAUTION

The AVTP presentation time captured in GCTi.CTV is only valid when the corrected gPTP timer value is in synchronization with the Grandmaster clock. That is, the timer increment and timer offset values for the corrected gPTP timer value must be adjusted by the synchronization procedure so that the corrected gPTP clock is adjusted to match the time kept by the Grandmaster clock.

45.3.9 Flow Control

The E-MAC supports flow control for full-duplex operation in compliance with the IEEE 802.3 standards. This flow control is applicable to both reception and transmission. In regard to the transmission of PAUSE frames, flow control operates in the following ways.

(1) Automatic PAUSE Frame Transmission

For the received frames, PAUSE frames are automatically transmitted when the amount of data having been written in the reception FIFO reaches the value specified by the receive FIFO caution level bits in the receive configuration register (RCR.RFCL). The TIME parameter contained in the PAUSE frame can be specified by the automatic PAUSE frame register (APR). If the maximum count of PAUSE frame retransmission times is not specified, PAUSE frames are automatically transmitted repeatedly until the data is read from the reception FIFO and the remaining data amount becomes smaller than the value specified by the RCR.RFCL. As the maximum count of PAUSE frame retransmission times, any value from 1 to 65535 can be specified by the PAUSE frame retransmission count register (TPAUSER). In this case, PAUSE frames are automatically transmitted repeatedly until the remaining data amount becomes smaller than the value specified by the RCR.RFCL or the count of retransmission times reaches the value specified by the TPAUSER. The retransmit counter is cleared to 0 when the next PAUSE frame is transmitted once the data amount in the reception FIFO becomes smaller than the value specified by the RCR.RFCL.

Automatic PAUSE frame transmission is enabled when the operating mode bit for flow control in transmission in the E-MAC mode register (ECMR.TXF) is 1.

(2) Manual PAUSE Frame Transmission

PAUSE frames can also be transmitted in response to software operations. Writing a timer value to the manual PAUSE frame register (MPR) starts the transmission of a PAUSE frame. This only causes the transmission of one PAUSE frame.

(3) PAUSE Frame Reception

After reception of a PAUSE frame, transmission of the next frame does not proceed until the time indicated by the Timer value elapses. However, transmission of a frame currently being transmitted continues. PAUSE frames are only received while the operating mode for flow control in reception bit in the E-MAC mode register (ECMR.RXF) is set to 1. The number of received PAUSE frames is counted.

(4) 0 TIME PAUSE Frame Control

The setting of the PAUSE frame usage with TIME = 0 enable bit in the E-MAC mode register (ECMR.ZPF) enables or disables the transmission of PAUSE frames with the TIME parameter value 0. The setting of the PAUSE frame reception with time = 0 bit in the E-MAC mode register (ECMR.RZPF) enables or disables the reception of PAUSE frames with the TIME parameter value 0.

- Operation for transmission

When the 0-time PAUSE frame control is enabled, PAUSE frame with the TIME parameter value 0 is transmitted when the capacity of the reception FIFO is less than the value of the receive FIFO caution level bits in the receive configuration register (RCR.RFCR) while the time indicated by the TIME parameter value has not elapsed.

When the 0-time PAUSE frame control is disabled, PAUSE frames with the TIME parameter value 0 are not transmitted.

- Operation for reception

When the 0-time PAUSE frame reception is enabled, frame transmission wait state is released when PAUSE frame with the TIME parameter value 0 is received.

When the 0-time PAUSE frame reception is disabled, received PAUSE frames with the TIME parameter value 0 are discarded.

45.3.10 Interrupts

The EthernetAVB module has four interrupts: three interrupts from the AVB-DMAC and one interrupt from the E-MAC. The three interrupts from the AVB-DMAC are generated when the AVB-DMAC is placed in operation mode, and the one interrupt from the E-MAC is generated when the AVB-DMAC is placed in configuration, operation, or standby mode.

Table 45.82 is a list of the interrupts.

Table 45.82 EthernetAVB Interrupts

Interrupt Source Name	Remarks
AVB_DATA	Transmit/receive data management interrupt
AVB_ERROR	Error management interrupt
AVB_MANAGE	Other management (FIFO caution level, etc.) interrupt
AVB_MAC	E-MAC interrupt

The AVB-DMAC related interrupts include descriptor interrupts (15 sources), error interrupts (5 sources), reception interrupts (37 sources), transmission interrupts (2 sources), and gPTP interrupts (3 sources). From the CPU's perspective, each appears as one of the above four interrupt sources.

The states of an AVB-DMAC-related interrupt sources can be checked in the following registers.

- Descriptor interrupt status register (DIS)
- Error interrupt status register (EIS)
- Receive interrupt status register (RISi)
- Transmit interrupt status register (TIS)
- gPTP interrupt status register (GIS)

The interrupts are controlled by the corresponding interrupt enable bits. However, the status flags operate independently of the settings of the enable bits.

The states of grouped interrupts can be checked by reading the interrupt summary status register (ISS) and the queue full error interrupt status bit in the error interrupt status register (EIS.QFS).

45.3.10.1 Transmit/Receive Data Management Interrupt

The management interrupt for transmission and reception is conveyed when the interrupt conditions corresponding to the following sources are satisfied.

- Receive frame interrupt in the receive interrupt status register 0 (RIS0.FRFR)
- Descriptor interrupt in the descriptor interrupt status register (DIS.DPFi)

45.3.10.2 Error Management Interrupt

The error management interrupt is conveyed when interrupt conditions corresponding to the following sources are satisfied.

- Time stamp FIFO full error interrupt in the error interrupt status register (EIS.TFFF)
- CBS limitation value error interrupts in the error interrupt status register (EIS.CULF1, EIS.CULF0, EIS.CLLF1, EIS.CLLF0)
- Receive FIFO full interrupt in the receive interrupt status register 2 (RIS2.RFFF)
- Receive queue full interrupt in the receive interrupt status register 2 (RIS2.QFFr)

45.3.10.3 Other Management (FIFO Warning, etc.) Interrupts

The other management (FIFO warning, etc.) interrupt is conveyed when interrupt conditions corresponding to the following sources are satisfied.

- (1) Reception related interrupt
Receive FIFO warning interrupt in the receive interrupt status register 1 (RIS1.RFWF)
- (2) Transmission related interrupts
Time stamp FIFO warning interrupt in the transmit interrupt status register (TIS.TSWF)
Time stamp FIFO update interrupt in the transmit interrupt status register (TIS.TSUF)
- (3) gPTP related interrupts
Presentation time match interrupt in the gPTP interrupt status register (GIS.PTMF)

45.3.10.4 E-MAC Interrupt

The E-MAC interrupt is conveyed when the following E-MAC interrupt sources are generated.

- PAUSE frame retransmit retry over interrupt in the E-MAC status register (ECSR.PFROI)
- Illegal carrier detection interrupt in the E-MAC status register (ECSR.ICD)

45.3.12 Connection to PHY-LSI

45.3.12.1 MII Frame Transmission/Reception Timing

Each MII frame transmission/reception timing is shown in Figure 45.60 to Figure 45.63.

Figure 45.60 MII Frame Transmit Timing (Normal Transmission)

Figure 45.61 MII Frame Receive Timing (Normal Reception)

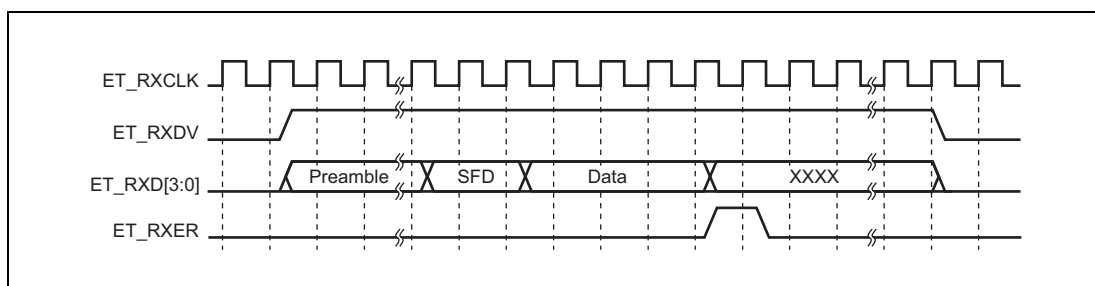

Figure 45.62 MII Frame Receive Timing (Reception Error (1))

Figure 45.63 MII Fane Receive Timing (Reception Error (2))

45.3.12.2 Accessing MII Registers

MII registers in the PHY-LSI are accessed via PIR in this LSI. PIR is used as a serial interface conforming to the MII frame format specified in IEEE802.3u.

(1) MII Management Frame Format

Figure 45.64 shows the format of an MII management frame. To access an MII register, a management frame is implemented by the program in accordance with the procedures shown in MII Register Access Procedure.

Access Type	MII Management Frame							
Item	PRE	ST	OP	PHYAD	REGAD	TA	DATA	IDLE
Number of bits	32	2	2	5	5	2	16	
Read	1..1	01	10	00001	RRRRR	Z0	D..D	
Write	1..1	01	01	00001	RRRRR	10	D..D	X

[Legend]

PRE: 32 consecutive 1s

ST: Write of 01 indicating start of frame

OP: Write of code indicating access type

PHYAD: Write of 0001 if the PHY-LSI address is 1 (sequential write starting with the MSB).
This bit changes depending on the PHY-LSI address.

REGAD: Write of 000q if the register address is 1 (sequential write starting with the MSB).
This bit changes depending on the PHY-LSI register address.

TA: Time for switching data transmission source on MII interface
(a) Write: 10 written
(b) Read: Bus release (notation: Z0) performed

DATA: 16-bit data. Sequential write or read from MSB
(a) Write: 16-bit data write
(b) Read: 16-bit data read

IDLE: Wait time until next MII management format input
(a) Write: Independent bus release (notation: X) performed
(d) Read: Bus already released in TA: control unnecessary

Figure 45.64 MII Management Frame Format

(2) MII Register Access Procedure

The program accesses MII registers via PIR. Access is implemented by a combination of 1-bit-unit data write, 1-bit-unit data read, bus release, and independent bus release. Figure 45.65 to Figure 45.68 show the MII register access timing. The timing will differ depending on the PHY-LSI type.

45.3.13 Usage Notes

45.3.13.1 Checksum Calculation of Ethernet Frames

This LSI is capable of calculating the checksum data of the received frames. Only the data fields of the Ethernet frames are subject to checksum calculation. Specifically, a data field follows the length/type field and is followed by the CRC field. Figure 45.69 shows schematics indicating which parts of the Ethernet frames are calculated. Calculation involves 16-bit addition only; it does not involve bit inversion. Note that when the checksum data is valid, the CRC data (4 bytes) is not transferred as a receive frame, and the checksum data (sum data) is added automatically. Figure 45.70 shows schematics of Ethernet frames to which the checksum data has been added.

CAUTION

Also for the frames with VLANtag inserted, the 15th byte from the top and the following bytes before the CRC field are subject to calculation.

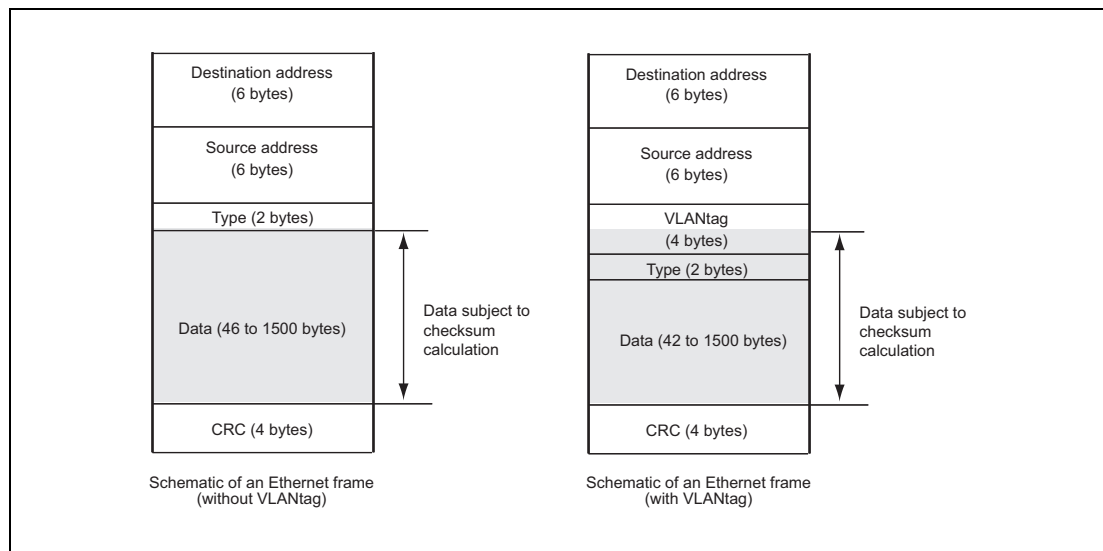

Figure 45.69 Data Subject to Checksum Calculation

Figure 45.70 Data after Checksum Data Addition

Note 1. Retained on internal power-on reset by the watchdog timer.

Note 2. Flag processing continues.

Note 3. Counting up continues.

Note 4. Transfer can proceed.

Note 5. The value of RTCEN bit is retained.

Note 6. The GAIN0 bit is initialized when the realtime clock is not using the EXTAL pin.

Note 7. Access to these registers from the I/O area (SLV6) is not possible while $\overline{\text{TRST}}$ is asserted.

Note 8. Initialized on assertion of TRST.

Note 9. Retained in FAKE debug mode.

Note 10. An internal power-on reset by the watchdog timer does not initialize PM6[0], PMC6[0], PFC6[0], PFCE6[0], and PFC6AE6[0].

Note 11. RZ/A1L only

Note 12. RZ/A1LU only

47. Electrical Characteristics

47.1 Absolute Maximum Ratings

Table 47.1 Absolute Maximum Ratings

Item	Symbol	Value	Unit	
Power supply voltage (I/O)	PV _{CC}	-0.3 to 4.2	V	
Power supply voltage (Internal)	V _{CC}	-0.3 to 1.6	V	
PLL power supply voltage	PLL _{VCC}	-0.3 to 1.6	V	
Analog power supply voltage	AV _{CC}	-0.3 to 4.2	V	
Analog reference voltage	AV _{ref}	-0.3 to AV _{CC} +0.3	V	
USB transceiver analog power supply voltage (I/O)	USBAP _{VCC}	-0.3 to 4.2	V	
USB transceiver digital power supply voltage (I/O) Note: Products in BGA packages do not have this pin.	USBDP _{VCC}	-0.3 to 4.2	V	
USB transceiver analog power supply voltage (internal)	USBA _{VCC}	-0.3 to 1.6	V	
USB transceiver digital power supply voltage (internal) Note: Products in BGA packages do not have this pin.	USBD _{VCC}	-0.3 to 1.6	V	
Power supply for USB 480 MHz (internal) Note: Products in BGA packages do not have this pin.	USB _{UVCC}	-0.3 to 1.6	V	
Input voltage	VBUS	V _{in}	-0.3 to 5.5	V
	Other input pins	V _{in}	-0.3- to 3.3-V power supply (PV _{CC} , AV _{CC} , USBAP _{VCC} , USBDP _{VCC}) +0.3	V
Operating temperature	T _{opr}	-40 to +85	°C	
Storage temperature	T _{stg}	-55 to +125	°C	

Caution: Permanent damage to the LSI may result if absolute maximum ratings are exceeded.

47.2 Power-On/Power-Off Sequence

The 1.2-V power supply (V_{CC}, PLL_{VCC}, USBA_{VCC}, USBD_{VCC}, and USB_{UVCC}) and 3.3-V power supply (PV_{CC}, AV_{CC}, USBAP_{VCC}, and USBDP_{VCC}) can be turned on and off in any order.

When turning on the power, be sure to drive both the $\overline{\text{TRST}}$ and $\overline{\text{RES}}$ pins low; otherwise, the output pins and input/output pins output undefined levels, resulting in system malfunction.

When turning off the power, drive the $\overline{\text{TRST}}$ and $\overline{\text{RES}}$ pins low if the undefined output may cause a problem.

47.3 DC Characteristics

- Conditions used to obtain DC characteristics (2) in Table 47.2 other than current consumption
 $V_{CC} = USBDV_{CC} = USBUV_{CC} = 1.10$ to 1.26 V, $PV_{CC} = USBDPV_{CC} = 3.0$ to 3.6 V, $PLL_{VCC} = 1.10$ to 1.26 V,
 $AV_{CC} = 3.0$ to 3.6 V, $USBAPV_{CC} = 3.0$ to 3.6 V, $USBAV_{CC} = 1.10$ to 1.26 V,
 $V_{SS} = AV_{SS} = USBDV_{SS} = USBAV_{SS} = USBDPV_{SS} = USBAPV_{SS} = USBUV_{SS} = 0$ V,
 $T_a = -40$ to 85 °C
- Conditions used to obtain DC characteristics (2) in Table 47.2 for current consumption
 $V_{CC} = USBDV_{CC} = USBUV_{CC} = 1.18$ V, $PV_{CC} = USBDPV_{CC} = 3.3$ V, $PLL_{VCC} = 1.18$ V, $AV_{CC} = 3.3$ V,
 $USBAPV_{CC} = 3.3$ V, $USBAV_{CC} = 1.18$ V,
 $V_{SS} = AV_{SS} = USBDV_{SS} = USBAV_{SS} = USBDPV_{SS} = USBAPV_{SS} = USBUV_{SS} = 0$ V, $AV_{ref} = 3.3$ V, $VBUS = 5.0$ V,
 $T_a = -40$ to 85 °C
 $I\phi = 400.00$ MHz, $B\phi = 133.33$ MHz, $P1\phi = 66.67$ MHz, $P0\phi = 33.33$ MHz

Note: Products in BGA packages do not have $USBDV_{CC}$, $USBUV_{CC}$, $USBDPV_{CC}$, $USBDV_{SS}$, $USBAV_{SS}$, $USBDPV_{SS}$, $USBAPV_{SS}$, and $USBUV_{SS}$ pins.

Table 47.2 DC Characteristics (1) [Common Items]

Item		Symbol	Min.	Typ.	Max.	Unit	Test Conditions
Power supply voltage		PV_{CC}	3.0	3.3	3.6	V	
		V_{CC}	1.10	1.18	1.26	V	
PLL power supply voltage		PLL_{VCC}	1.10	1.18	1.26	V	
Analog power supply voltage		AV_{CC}	3.0	3.3	3.6	V	
USB power supply voltage		$USBAPV_{CC}$	3.0	3.3	3.6	V	
Note: Products in BGA packages do not have $USBDPV_{CC}$, $USBDV_{CC}$, and $USBUV_{CC}$ pins.		$USBAPV_{CC}$	3.0	3.3	3.6	V	
		$USBAV_{CC}$	1.10	1.18	1.26	V	
		$USBDV_{CC}$ $USBUV_{CC}$					
Input leakage current	All input pins	$ I_{in} $	—	—	1.0	μ A	$V_{in} = 0.5$ to $PV_{CC} - 0.5$ V
Three-state leakage current	All input/output pins, all output pins (except P1_0 to P1_7) (off state)	$ I_{ST} $	—	—	1.0	μ A	$V_{in} = 0.5$ to $PV_{CC} - 0.5$ V
	P1_0 to P1_7		—	—	10	μ A	
Input capacitance	all input/output pins, all input pins	C_{in}	—	—	10	pF	

Table 47.2 DC Characteristics (2) [Current Consumption]

Item	Power Supply	Symbol	Typ.	Max.	Unit	Test Conditions
Current consumption in normal operation	V _{CC}	I _{CC}	—	492	mA	
	PLL _{VCC}	PLL _I CC	—	8	mA	
	PV _{CC}	PI _{CC}	70*1*2	—	mA	
	AV _{CC}	AI _{CC}	—	4	mA	During A/D conversion
	AV _{ref}	AI _{ref}	—	1	mA	During A/D conversion
	USBAV _{CC}	UA _I CC	—	6	mA	When the USB host/function is in use.
	USBDV _{CC} + USBUV _{CC}	UDI _{CC} *3	—	20	mA	In USB high-speed operation (2ch)
	USBAPV _{CC}	UAPI _{CC}	—	4	mA	When the USB host/function is in use.
	USBDPV _{CC}	UDPI _{CC} *4	70*1*2	—	mA	In USB high-speed operation (2ch)
	VBUS	VI _{CC}	—	10	μA	
Current consumption in sleep mode	V _{CC}	I _{sleep}	—	300	mA	
	For the other power supply, the current consumption is the same as in normal operation.					
Current consumption in software standby mode	V _{CC} + PLL _{VCC} + USBAV _{CC} + USBDV _{CC} + USBUV _{CC}	I _{sstby}	32	120	mA	Ta > 50 °C
			20	26	μA	
			8	10	μA	
	PV _{CC} + AV _{CC} + AV _{ref} + USBAPV _{CC} + USBDPV _{CC}	PI _{sstby}	13	55	mA	Ta ≤ 50 °C
			17	20	μA	
			8	10	μA	
VBUS	VI _{sstby}	8	10	μA		

Table 47.2 DC Characteristics (2) [Current Consumption]

Item		Power Supply	Symbol	Typ.	Max.	Unit	Test Conditions	
Current consumption in deep standby mode	Ta > 50 °C	V _{CC} + PLL _{VCC} + USB _{AVCC} + USB _{DVCC} + USB _{UVCC}	I _{dstby}	27	119	μA	RAM 0 Kbytes retained, RTC_X1 selected	
				32	137	μA	RAM 16 Kbytes retained, RTC_X1 selected	
				37	155	μA	RAM 32 Kbytes retained, RTC_X1 selected	
				42	191	μA	RAM 64 Kbytes retained, RTC_X1 selected	
				62	263	μA	RAM 128 Kbytes retained, RTC_X1 selected	
	When the EXTAL 13 MHz is selected, 5 μA and 7 μA are added to the "Typ." and "Max." values above, respectively.							
	Ta ≤ 50 °C	V _{CC} + PLL _{VCC} + USB _{AVCC} + USB _{DVCC} + USB _{UVCC}	I _{dstby}		17	54	μA	RAM 0 Kbytes retained, RTC_X1 selected
					21	71	μA	RAM 16 Kbytes retained, RTC_X1 selected
					25	88	μA	RAM 32 Kbytes retained, RTC_X1 selected
					33	122	μA	RAM 64 Kbytes retained, RTC_X1 selected
					49	190	μA	RAM 128 Kbytes retained, RTC_X1 selected
	When the EXTAL 13 MHz is selected, 5 μA and 7 μA are added to the "Typ." and "Max." values above, respectively.							
	Ta > 50 °C	P _{VCC} + A _{VCC} + A _{Vref} + USB _{APVCC} + USB _{DPVCC}	P _{Idstby}		13	15	μA	RTC is not operating
					20	25	μA	RTC_X1 selected
				1	—	mA	EXTAL 13 MHz selected, small gain*1	
V _{BUS}				V _{Idstby}	8	10	μA	
Ta ≤ 50 °C				P _{VCC} + A _{VCC} + A _{Vref} + USB _{APVCC} + USB _{DPVCC}	P _{Idstby}		12	13
		19	23			μA	RTC_X1 selected	
		1	—			mA	EXTAL 13 MHz selected, small gain*1	
	V _{BUS}	V _{Idstby}	8			10	μA	

Note 1. Reference value. The actual operating current greatly depends on the system (such as slow rising/falling edges caused by IO load and toggle frequency). Be sure to determine the value using the actual system.

Note 2. The sum of P_{Icc} and UD_PI_{cc} must be equal to or lower than 150 mA.

Note 3. In the products in BGA packages, UD_II_{cc} is added to I_{cc}.

Note 4. In the products in BGA packages, UD_PI_{cc} is added to P_{Icc}.

Table 47.2 DC Characteristics (3) [Except I²C Bus Interface, and USB 2.0 Host/Function Module-Related Pins]

Item	Symbol	Min.	Typ.	Max.	Unit	Test Conditions	
Input high voltage*	V _{IH}	2.2	—	PV _{CC} + 0.3	V		
Input low voltage*	V _{IL}	-0.3	—	0.8	V		
Schmitt trigger input characteristics	V _{T+}	PV _{CC} × 0.665	—	—	V		
	V _{T-}	—	—	0.8	V		
	V _{T+} - V _{T-}	0.2	—	—	V		
Output high voltage	V _{OH}	PV _{CC} - 0.5	—	—	V	I _{OH} = -2.0 mA	
Output low voltage	V _{OL}	—	—	0.4	V	I _{OL} = 2.0 mA	
RAM standby voltage	Software standby mode (large-capacity on-chip RAM)	V _{RAMS}	0.85	—	—	V	Measured with V _{CC} as parameter
	Deep standby mode (only the on-chip RAM for data retention)	V _{RAMD}	1.10	—	—	V	

Note: * Values for the input of data for boundary scanning through pins TMS, TCK, JP0_0, JP0_1, P5_0 to P5_15, and P6_0 to P6_15.

Table 47.2 DC Characteristics (4) [I²C Bus Interface Related Pins*]

Item	Symbol	Min.	Typ.	Max.	Unit	Test Conditions
Input high voltage	V _{IH}	PV _{CC} × 0.7	—	PV _{CC} + 0.3	V	
Input low voltage	V _{IL}	-0.3	—	PV _{CC} × 0.3	V	
Schmitt trigger input characteristics	V _{IH} - V _{IL}	PV _{CC} × 0.05	—	—	V	
Output low voltage	V _{OL}	—	—	0.4	V	I _{OL} = 3.0 mA

Note: * The P1_0 to P1_7 pins are open-drain pins.

Table 47.2 DC Characteristics (5) [USB 2.0 Host/Function Module-Related Pins*]

Item	Symbol	Min.	Typ.	Max.	Unit	Test Conditions
Reference resistance	R _{REF}	5.6 kΩ ± 1%	5.6 kΩ ± 1%	5.6 kΩ ± 1%		
Input high voltage (VBUS1, VBUS0)	V _{IH}	4.02	—	5.25	V	
Input low voltage (VBUS1, VBUS0)	V _{IL}	-0.3	—	0.5	V	
Input high voltage (USB_X1)	V _{IH}	PV _{CC} - 0.5	—	PV _{CC} + 0.3	V	
Input low voltage (USB_X1)	V _{IL}	-0.3	—	0.5	V	

Note: * REFRIN, VBUS1, VBUS0, USB_X1, and USB_X2 pins

Table 47.2 DC Characteristics (6) [USB 2.0 Host/Function Module-Related Pins* (Low-Speed, Full-Speed, and High-Speed Common Items)]

Item	Symbol	Min.	Typ.	Max.	Unit	Test Conditions
DP pull-up resistance (when function is selected)	R _{pu}	0.900	—	1.575	kΩ	In idle mode
		1.425	—	3.090	kΩ	In transmit/receive mode
DP and DM pull-down resistance (when host is selected)	R _{pd}	14.25	—	24.80	kΩ	

Note: * DP1, DP0, DM1, and DM pins

Table 47.2 DC Characteristics (7) [USB 2.0 Host/Function Module-Related Pins* (Low-Speed and Full-Speed)]

Item	Symbol	Min.	Typ.	Max.	Unit	Test Conditions
Input high voltage	V _{IH}	2.0	—	—	V	
Input low voltage	V _{IL}	—	—	0.8	V	
Differential input sensitivity	V _{DI}	0.2	—	—	V	(DP) – (DM)
Differential common mode range	V _{CM}	0.8	—	2.5	V	
Output high voltage	V _{OH}	2.8	—	3.6	V	I _{OH} = –200 μA
Output low voltage	V _{OL}	0.0	—	0.3	V	I _{OL} = 2 mA
Output signal crossover voltage	V _{CRS}	1.3	—	2.0	V	C _L = 50 pF (full-speed) C _L = 200 to 600 pF (low-speed)

Note: * DP1, DP0, DM1, and DM pins

Table 47.2 DC Characteristics (8) [USB 2.0 Host/Function Module-Related Pins* (High-Speed)]

Item	Symbol	Min.	Typ.	Max.	Unit	Test Conditions
Squelch detection threshold voltage (differential voltage)	V _{HSSQ}	100	—	150	mV	
Common mode voltage range	V _{HSCM}	–50	—	500	mV	
Idle state	V _{HSOI}	–10.0	—	10.0	mV	
Output high voltage	V _{HSOH}	360	—	440	mV	
Output low voltage	V _{HSOL}	–10.0	—	10.0	mV	
Chirp J output voltage (difference)	V _{CHIRPJ}	700	—	1100	mV	
Chirp K output voltage (difference)	V _{CHIRPK}	–900	—	–500	mV	

Note: * DP1, DP0, DM1, and DM pins

Table 47.3 Permissible Output Currents

Item		Symbol	Min.	Typ.	Max.	Unit
Permissible output low current (per pin)	P1_0 to P1_7	I _{OL}	—	—	10	mA
	Output pins other than above		—	—	2	mA
Permissible output high current (per pin)		–I _{OH}	—	—	2	mA
Permissible output current (total)		ΣI _O	—	—	150	mA

Caution: To protect the LSI's reliability, do not exceed the output current values in Table 47.3.

47.4 AC Characteristics

Signals input to this LSI are basically handled as signals in synchronization with a clock. The setup and hold times for input pins must be followed.

Conditions for AC characteristics: $V_{CC} = USBDV_{CC} = USBUV_{CC} = 1.10$ to 1.26 V, $PV_{CC} = USBDPV_{CC} = 3.0$ to 3.6 V, $PLL_{V_{CC}} = 1.10$ to 1.26 V, $AV_{CC} = 3.0$ to 3.6 V, $USBAPV_{CC} = 3.0$ to 3.6 V, $USBAV_{CC} = 1.10$ to 1.26 V, $V_{SS} = AV_{SS} = USBDV_{SS} = USBAV_{SS} = USBDPV_{SS} = USBAPV_{SS} = USBUV_{SS} = 0$ V, $T_a = -40$ to 85 °C

Note: Products in BGA packages do not have $USBDV_{CC}$, $USBUV_{CC}$, $USBDPV_{CC}$, $USBDV_{SS}$, $USBAV_{SS}$, $USBDPV_{SS}$, $USBAPV_{SS}$, and $USBUV_{SS}$ pins.

Table 47.4 Operating Frequency

Item	Symbol	Min.	Max.	Unit	Remarks
Operating frequency	CPU clock ($I\phi$)	f	100.00	400.00	MHz
	Internal bus clock ($B\phi$)		100.00	133.33	MHz
	Peripheral clock 1 ($P1\phi$)		50.00	66.67	MHz
	Peripheral clock 0 ($P0\phi$)		25.00	33.33	MHz

47.4.1 Clock Timing

Table 47.5 Clock Timing

Item	Symbol	Min.	Max.	Unit	Figure
EXTAL clock input frequency (when the clock is supplied to USB 2.0 host/function module)	f_{EX}	12MHz \pm 100ppm			Figure 47.1
EXTAL clock input frequency (when the clock isn't supplied to USB 2.0 host/function module)		10.00	13.33	MHz	
EXTAL clock input cycle time (when the clock isn't supplied to USB 2.0 host/function module)	t_{EXcyc}	75.00	100.00	ns	
AUDIO_X1 clock input frequency (crystal resonator connected)	f_{EX}	10.00	50.00	MHz	
AUDIO_X1 clock input cycle time (crystal resonator connected)	t_{EXcyc}	20.00	100.00	ns	
AUDIO_X1, AUDIO_CLK clock input frequency (external clock input)	f_{EX}	1.00	50.00	MHz	
AUDIO_X1, AUDIO_CLK clock input cycle time (external clock input)	t_{EXcyc}	20.00	1000.00	ns	
USB_X1 clock input frequency (when the 48-MHz clock is supplied to USB 2.0 host/function module and high-speed transfer function is used)	f_{EX}	48 MHz \pm 100 ppm			
USB_X1 clock input frequency (when the 48-MHz clock is supplied to USB 2.0 host/function module, high-speed transfer function is not used, and host controller function is used)		48 MHz \pm 500 ppm			
USB_X1 clock input frequency (when the 48-MHz clock is supplied to USB 2.0 host/function module, high-speed transfer function is not used, and host controller function is not used)		48 MHz \pm 2500 ppm			
EXTAL, AUDIO_X1, AUDIO_CLK, USB_X1 clock input low pulse width	t_{EXL}	0.4	0.6	t_{EXcyc}	
EXTAL, AUDIO_X1, AUDIO_CLK, USB_X1 clock input high pulse width	t_{EXH}	0.4	0.6	t_{EXcyc}	

Table 47.5 Clock Timing

Item	Symbol	Min.	Max.	Unit	Figure
EXTAL, AUDIO_X1, AUDIO_CLK, USB_X1 clock input rise time	t_{EXr}	—	4	ns	Figure 47.1
EXTAL, AUDIO_X1, AUDIO_CLK, USB_X1 clock input fall time	t_{EXf}	—	4	ns	
CKIO clock output frequency	f_{OP}	50.00	66.67	MHz	
CKIO clock output cycle time	t_{cyc}	15.00	20.00	ns	Figure 47.2 (1) and Figure 47.2 (2)
CKIO clock output low pulse width 1	t_{CKOL1}	$t_{cyc}/2 - t_{CKOr1}$	—	ns	Figure 47.2 (1)
CKIO clock output high pulse width 1	t_{CKOH1}	$t_{cyc}/2 - t_{CKOr1}$	—	ns	
CKIO clock output rise time 1	t_{CKOr1}	—	3	ns	
CKIO clock output fall time 1	t_{CKOf1}	—	3	ns

Multiplexed address delay time	t _{MAD}	—	12	ns	Figure 47.12
Multiplexed address hold time	t _{MAH}	1	—	ns	Figure 47.12
Address setup time for $\overline{\text{AH}}$	t _{AVVH}	1/2t _{cyc} - 2	—	ns	Figure 47.12
DACK, TEND delay time	t _{DACD}	Refer to the direct memory access controller timing		ns	Figure 47.8 to Figure 47.29

Note 1. The maximum value (fmax) of CKIO (external bus clock) depends on the number of wait cycles and the system configuration of your board.

Note 2. 1/2 t_{cyc} indicated in minimum and maximum values for the item of delay, setup, and hold times represents a half cycle from the rising edge with a clock. That is, 1/2 t_{cyc} describes a reference of the falling edge with a clock.

Note 3. Values when SDRAM is used.

47.4.11 I²C Bus Interface TimingTable 47.15 I²C Bus Interface Timing

Item	Symbol	I/O	Standard mode (Sm)		Fast mode (Fm)		Unit
			Min.	Max.	Min.	Max.	
SCL clock frequency	f _{CLK}	I/O	0	100	0	400	kHz
Bus free time (between stop and start condition)	t _{BUF}	I/O	4.7	-	1.3	-	μs
Hold time*1	t _{HD:STA}	I/O	4.0	-	0.6	-	μs
Low period of SCL clock	t _{LOW}	I/O	4.7	-	1.3	-	μs
High period of SCL clock	t _{HIGH}	I/O	4.0	-	0.6	-	μs
Setup time for start/restart condition	t _{SU:STA}	I/O	4.7	-	0.6	-	μs
Data hold time (I ² C bus device)	t _{HD:DAT}	I/O	0*2	-	0*2	-	μs
Data setup time	t _{SU:DAT}	I/O	250	-	100*3	-	ns
SDA and SCL signal rise time	t _r	Input	-	1000	20	300	ns
SDA and SCL signal fall time*3	t _f	Input	-	300	20 × (PV _{CC} /5.5V)	300	ns
		Output	-	250	20 × (PV _{CC} /5.5V)	250	ns
Setup time for STOP condition	t _{SU:STO}	I/O	4.0	-	0.6	-	μs
Capacitive load for each bus line	C _b	-	-	400*4	-	400*4	pF
Pulse width of spikes that must be suppressed by the input filter	t _{SP}	Input	-	-	0	50*5	ns

In the above table and subsequently, SCL and SDA refer to the RIICnSCL and RIICnSDA signals, respectively.

Note 1. The first clock pulse is generated on the SCL line after the start condition has been issued and the hold time has elapsed.

Note 2. This module requires a minimum of 300 ns hold time internally for the SDA signal to handle the period over which the falling edge of SCL has not reached a defined level (time until the SCL signal reaches V_{IL} (max.) from V_{IH} (min.)).

Note 3. The fast-mode I²C bus device can be used in the standard mode I²C bus system. In this case, the minimum value of the data setup time (t_{SU:DAT} 250 [ns]) must be satisfied.

If the system does not extend the low period of SCL clock (t_{LOW}), this condition is automatically satisfied. If the system extends the low period of SCL clock (t_{LOW}), transmit the subsequent data bit to the SDA line before the SCL line is released (t_{rmax.} + t_{SU:DAT} = 1000 + 250 = 1250 [ns]: (standard mode I²C bus specification)).

Note 4. Total capacitance of one bus line. The allowable maximum bus capacitance may differ from this specification, depending on the actual operating voltage and frequency of an application. For techniques to cope with a large bus capacitance, see the I²C bus specification provided by NXP Semiconductors.

Note 5. Noise is removed by the analog and digital input filters. The level of noise reduction of the digital input filter is determined by the period of internal reference clock (IICφ) and the NF[1:0] bits in RIICnMR3. For details, refer to section 18, I²C Bus Interface.

Offset error	12-bit	—	—	± 8.0	LSB
	10-bit	—	—	± 2.0	LSB
Full-scale error	12-bit	—	—	± 8.0	LSB
	10-bit	—	—	± 2.0	LSB
Absolute accuracy	12-bit	—	—	± 11.0	LSB
	10-bit	—	—	± 5.0	LSB

48. States and Handling of Pins

This section describes pin states in each operating mode and how to handle pins.

48.1 Pin States

Table 48.1 shows the pin states in each operating mode.

As for the input/output functions, input buffers are listed on the upper column and output buffers on the lower column.

Table 48.1 Pin States

Pin Function			Pin State						
Type	Pin Name		Normal State (Other than States at Right)	Power-On Reset ¹	Pin State Retained ²		Power-Down State		
					EBUSKEEPE ³ (Other than States at Right)		Power-On Reset ⁴	Deep Standby Mode	Software Standby Mode

[Legend]

- I: Input
- O: Output
- H: High-level output
- L: Low-level output
- Z: High-impedance
- : Condition under which the pin function is not selectable

- Note 1. Indicates the power-on reset by low-level input to the $\overline{\text{RES}}$ pin. The pin states after a power-on reset by the watchdog timer overflow is the same as the initial pin states at normal operation (see section 41, Ports).
- Note 2. After the chip has been released from deep standby mode by the input on pins for canceling the standby mode such as NMI or by the realtime clock alarm interrupt, the pins retain the state until the IOKEEP bit in the deep standby cancel source flag register (DSFR) is cleared (see section 42, Power-Down Modes).
- Note 3. The EBUSKEEPE bit in deep standby control register (DSTCR) (see section 42, Power-Down Modes).
- Note 4. This LSI enters the power-on reset state for a certain period after recovery from deep standby control mode (see section 42, Power-Down Modes).
- Note 5. Depends on the setting of the RCKSEL bit in the realtime clock control register 5 (RCR5) (see section 13, Realtime Clock).
- Note 6. When pins for the connection with a crystal resonator are not used, the input pins (EXTAL, RTC_X1, AUDIO_X1, and USB_X1) must be fixed (pull-up/down resistor, power supply, or ground.) and the output pins (XTAL, RTC_X2, AUDIO_X2, and USB_X2) must be open.
- Note 7. Depends on the setting of the CKOEN bit in the frequency control register (FRQCR) of the clock pulse generator (see section 6, Clock Pulse Generator).
- Note 8. Depends on the setting of the PIPCnm bit in the port IP control register (PIPCn) of the general I/O ports.
- Note 9. Depends on the setting of the HIZ bit in the standby control register 2 (STBCR2) (see section 42, Power-Down Modes).
- Note 10. Depends on the setting of the HIZMEM bit in the common control register (CMNCR) of the bus state controller (see section 8, Bus State Controller).
- Note 11. Depends on the setting of the HIZCNT bit in the common control register (CMNCR) of the bus state controller (see section 8, Bus State Controller).
- Note 12. Depends on the setting of the corresponding bit in the deep standby cancel source select register (DSSSR) and the RCKSEL bit in the realtime clock control register 5 (RCR5) (see section 42, Power-Down Modes).
- Note 13. Depends on the setting of the RTCEN bit in the realtime clock control register 2 (RCR2) and the RCKSEL bit in the realtime clock control register 5 (RCR5) (see section 13, Realtime Clock).
- Note 14. O in serial wire debug (SWD) mode. In modes other than serial wire debug (SWD), Z when the TAP controller is neither the Shift-DR nor Shift-IR state.
- Note 15. When this is an output, the output is fixed to either the High or Low level. There is no oscillation.
- Note 16. RZ/A1L only
- Note 17. RZ/A1LU only

48.2 Treatment of Unused Pins

How unused pins are to be handled is indicated below.

Table 48.2 Handling of Unused Pins (Except for Debugger Interface Pins)

Pin Name	Handling
NMI	Fix this pin at a high level (pull up or connect to a power supply).
DP1, DP0, DM1, DM0, VBUS1, VBUS0	- Connect these pins to USBDPVss (QFP package). - Connect them to Vss (BGA package).
REFRIN	Connect this pin, via a $5.6\text{ k}\Omega \pm 20\%$ resistor, to USBAPVcc.
1.18-V power dedicated to the USB (USBAPVcc, USBDVcc, USBUVcc)	Supply power at 1.18 V. Note: Products in BGA packages do not have pins USBDVcc and USBUVcc.
3.3-V power dedicated to the USB (USBAPVcc, USBDPVcc)	Supply power at 3.3 V. Note: Products in BGA packages do not have the USBDPVcc pin.
Dedicated USB ground (USBAPVss, USBDPVss, USBAPVss, USBDVss, USBUVss)	Connect to ground. Note: Products in BGA packages do not have the dedicated USB ground pins.
AVref	Connect this pin to AVcc.
Dedicated A/D power (AVcc)	Supply power at 3.3 V.
Dedicated A/D ground (AVss)	Connect to ground.
Dedicated input pins other than those listed above	Fix the level on the pins (pull them up or down, or connect them to the power supply or ground level)*2.
Input/output pins other than those listed above	Make the input-pin settings and then fix the level (pull them up or down)*2; alternatively, make the output-pin settings and leave the pins open-circuit.
Dedicated output pins	Open-circuit

Note 1. We recommend that the values of pull-up or pull-down resistors are in the range from $4.7\text{ k}\Omega$ to $100\text{ k}\Omega$.

Note 2. By setting the ports in accord with section 41, Ports, setting of a fixed level can be made unnecessary for some pins. For details, see section 41.3.12, Port Input Buffer Control Register (PIBCn/JPIBC0).

Table 48.3 Handling of Debugger Interface Pins (when Emulator is not Used)

Pin	Handling
BSCANP	Fix this pin at a low level (pull down or connect to the ground level).
$\overline{\text{TRST}}^*3$	Fix this pin at a low level (pull down or connect to the ground level). Or connect to another pin which operates in the same manner as the RES pin
TCK, TMS, TDI	Fix the level on the pins (pull them up or down, or connect them to the power supply or ground level).
TDO	Open-circuit

Note 1. When using the emulator, handle these pins as described in the manual for the emulator.

Note 2. We recommend that the values of pull-up or pull-down resistors are in the range from $4.7\text{ k}\Omega$ to $100\text{ k}\Omega$.

Note 3. If the pin is not fixed to the low level, whether an emulator is or is not in use, the specifications in Table 43.13, Reset Signal Setting, or $\overline{\text{RES}}$ input rise time (t_{RSr}) or $\overline{\text{RES}}$ negating hold time (t_{RSNH}) in Table 47.6, Control Signal Timing, must be satisfied.

48.3 Handling of Pins in Deep Standby Mode

How pins are to be handled in deep standby mode is indicated below.

For the states of pins in deep standby mode, refer to the corresponding items under section 48.1, Pin States. Handling of unused pins as described under section 48.2, Treatment of Unused Pins, also applies in deep standby mode.

Table 48.4 Handling of Pins in Deep Standby Mode

Pin	Handling
1.2-V power (Vcc, USBDVcc, USBUVcc, USBAVcc, PLLVcc)	Supply power at 1.2 V. Note: Products in BGA packages do not have pins USBDVcc and USBUVcc.
3.3-V power (PVcc, AVcc, USBDPVcc, USBAPVcc)	Supply power at 3.3 V. Note: Products in BGA packages do not have the USBDPVcc pin.
Ground (Vss, USBDVss, USBUVss, USBAVss, AVss, USBDPVss, USBAPVss)	Connect to ground. Note: Products in BGA packages do not have the USBDVss, USBAVss, USBUVss, USBDPVss, and USBAPVss pins.
VBUS1, VBUS0	Fix the level on this pin (pull it up or down, or connect it to the power supply or ground level) or open circuit. However, note that current as indicated in table 45.2, DC Characteristics (2) [Current Consumption] will be drawn by the pin fixed to the high level.
REFRIN	Connect this pin to USBAPVss via 5.6 kΩ ± 1 % resistor (QFP package). Connect this pin to Vss via 5.6 kΩ ± 1% resistor (BGA package).
DP1, DP0, DM1, DM0	Fix the level on the pins (pull them up or down, or connect them to the power supply or ground level) or open circuit.
EXTAL, RTC_X1, AUDIO_X1, USB_X1	Connect the pins to the crystal oscillator or the clock-input signal, or to a fixed level (pull them up or down, or connect them to the power supply or ground level)
XTAL, RTC_X2, AUDIO_X2, USB_X2	Connect the pins to the crystal oscillator or open circuit.
Dedicated input pins other than those listed above	Fix the level on the pins (pull them up or down, or connect them to the power supply or ground level).
Input/output pins (other than those listed above) in the input state	Fix the level on the pins (pull them up or down).
Input/output pins (other than those listed above) in the high-impedance state	Fix the level on the pins (pull them up or down) or open circuit.
Input/output pins (other than those listed above) in the output state	Open-circuit
Dedicated output pins other than those listed above	Open-circuit

Note: We recommend that the values of pull-up or pull-down resistors are in the range from 4.7 kΩ to 100 kΩ.

Revision History	RZ/A1L Group, RZ/A1LU Group, RZ/A1LC Group User's Manual: Hardware
------------------	--

Rev.	Date	Description	
		Page	Summary
1.00	Aug 30, 2013	—	First edition, issued
2.00	May 25, 2015	All	Erroneous pin names, register names, and bit names corrected
		1. Overview	
		1-2 to 1-6	Table 1.1 RZ/A1L Features: Specification of CPU, IEBus™ controller, and capture engine unit corrected
		1-9	Figure 1.1 Pin Assignment of the 176-pin BGA (Upper Perspective View) corrected
		1-10	Figure 1.2 Pin Assignment of the 176-pin QFP (Top View) corrected
		1-11	Figure 1.3 Pin Assignment of the 208-pin QFP (Top View) corrected
		1-14, 1-16, 1-17	Table 1.3 Pin Functions: Note added to TIOC0A, TIOC0B, TIOC0C, and TIOC0D, function of TIOC4A, TIOC4B, TIOC4C, and TIOC4D corrected, function of REFRIN corrected, function of A/D converter corrected, and name of the symbol of general I/O port corrected
		1-18, 1-19, 1-21	Table 1.4 List of Pins: I/O of D31 to D0 corrected (I/O corrected to I(s)/O), I/O of WAIT corrected (O corrected to I(s)), symbol of Port function/dedicated function corrected (VBUSIN1 corrected to VBUS1, VBUSIN0 corrected to VBUS0)
		1-22	Figure 1.4 (2) Simplified Circuit Diagram (TTL AND Input Buffer) corrected
		2. CPU	
		2-1	2.1 Features: Note 2 added
		4. Secondary Cache	
		4-1	Table 4.1 Setting Values of Configuration Signals: Setting value of ASSOCIATIVITY corrected and note 2 corrected
		5. LSI Internal Bus	
		5-2	Figure 5.2 North Main Bus Configuration corrected (write buffer added)
		5-7	Table 5.5 Address Map: "Upper" in the area name deleted
		5-12	5.8 AXI Protocol Control Signal: Body corrected
		5-13	5.9 Write Buffers: Body corrected
		6. Clock Pulse Generator	
		6-3	(1) Crystal Oscillator: Description corrected
		6-5	Table 6.2 Input/Output Clock Frequency: Pin name corrected (MD_CLK0 → MD_CLK)
		6-7	6.4.1 Frequency Control Register (FRQCR): Description of CKOEN[1:0] bits corrected (Table 6.6 corrected to Table 6.7)
		6-15 to 6-19	6.10 Clock Signals: Newly added
		7. Interrupt Controller	
		7-1	7.1 Features: Body corrected and ARM PrimeCell® generic interrupt controller (PL390) added
		7-3	7.3 Register Descriptions: Body corrected
		7-3, 7-12	Table 7.2 Register Configuration: Superscript "**3" added to the initial value of the interrupt controller type register Table 7.2 Register Configuration: Note 1 corrected and Note 3 added
		7-15	7.3.3 IRQ Interrupt Request Register (IRQRR): Description of bits IRQ7F to IRQ0F corrected
		7-16	7.4 Interrupt Sources: Erroneous description corrected
		7-16	7.4.1 NMI Interrupt: Body corrected
		7-16	7.4.2 IRQ Interrupts: Body corrected
		7-17	7.4.3 On-Chip Peripheral Module Interrupts: Body corrected
		7-17	7.4.4 Pin Interrupts: Body corrected
		7-18	7.5 Interrupt IDs: Body corrected
		7-25	Table 7.3 List of Interrupt IDs: Entry under "ICDICFRn" for interrupt ID 240 corrected
		7-28	Table 7.3 List of Interrupt IDs: Request source names of LIN interface corrected
		7-35	7.6.1 Initial Settings: Body corrected
		7-37	7.6.2 Flow of Interrupt Operations: Body corrected
		7-39	7.8.3 Notes on Reading Interrupt ID Values from Interrupt Acknowledge Register (ICCIAR): Body corrected

Rev.	Date	Description	
		Page	Summary
2.00	May 25, 2015	8. Bus State Controller	
		8-1	8.1 Features: Erroneous description of item 10 corrected
		8-4	Table 8.2 Address Map: Space of H'40000000 to H'407FFFFF corrected (Other → CS0 mirror)
		8-7	8.4.1 Common Control Register (CMNCR): Erroneous description of bits 28 and 24 corrected
		8-11	8.4.3 CSn Space Wait Control Register (CSnWCR) (n = 0 to 5): Description of HW[1:0] bits corrected
		8-34	8.4.10 Timeout Enable Register (TOENR): Erroneous description of CS5TOEN to CS0TOEN bits corrected
		8-77	Table 8.17 Relationship between Bus Width, Access Size, and Number of Bursts: Erroneous description in note 1 corrected
		8-78	8.5.8 SRAM Interface with Byte Selection: Body corrected
		8-86	Figure 8.40 Idle Cycle Conditions corrected
		9. Direct Memory Access Controller	
		9-2	9.3 Register Configuration: Register name corrected (into TC) in (e) DMA Register Set
		9-15	9.4.7 Channel Status Register n (CHSTAT_n): Description of the DER bit corrected
		9-22	9.4.9 Channel Configuration Register n (CHCFG_n): Description of bits 2 to 0 corrected
		9-23	9.4.11 Channel Extension Register n (CHEXT_n): DPR[2:0] and SPR[2:0] bits added, and notes corrected
		9-25	9.4.14 DMA Control Register (DCTRL_0_7, DCTRL_8_15): LWPR and LDPR bits added
		9-32	9.4.25 DMA Extension Resource Selectors 0 to 7 (DMARS0 to DMARS7): Bit 14 of DMARS2 corrected
		9-34	9.5.1 Transfer Flow: Body corrected
		9-34	9.5.2 DMA Transfer Requests: Body in (1) Auto-Request Mode corrected
		9-34	9.5.2 DMA Transfer Requests: Body in (2) External Request Mode corrected
		9-37	Table 9.4 On-Chip Peripheral Module Requests: Setting of AM[2:0] for the serial sound interface channels 0 to 3 corrected
		9-44	Figure 9.5 Register Mode Setting Example 2 corrected
		9-47	9.6.3 Link Mode: Body of <Explanation of the link mode flow>, 8. Link end analysis in (1) Operation Flow corrected
		9-57	9.7.5 DMA Acknowledge Output Function: Erroneous description corrected
		9-68, 9-69	9.8.2 Setting Example 2 (Register Mode/Software Request) changed
		9-70, 9-71	9.8.3 Setting Example 3 (Register Mode/Continuous Execution) changed
		9-73	Table 9.29 Descriptor Setting changed
		9-76	9.9.1 Divided Output of DACK0 and TEND0: Erroneous description corrected
		9-77	9.9.3 Atomic Access (ARLOCK[1:0] and AWLOCK[1:0]) added
		10. Multi-Function Timer Pulse Unit 2	
		10-1	10.1 Features: The number of interrupt sources corrected (28 corrected to 25)
		10-5	Table 10.2 Pin Configuration: Note corrected
		10-12	Table 10.10 Setting of Operation Mode by Bits MD0 to MD3: Description corrected
		10-31	10.3.4 Timer Interrupt Enable Register (TIER): Description of TTGE and TTGE2 bits corrected
		10-36	10.3.6 Timer Buffer Operation Transfer Mode Register (TBTM): Description added to description of TTSE, TTSEB, and TTSA bits
		10-46	10.3.17 Timer Output Control Register 1 (TOCR1): Note 2 corrected
		10-54	10.3.23 Timer Cycle Data Register (TCDR): Body corrected
		10-55	10.3.25 Timer Interrupt Skipping Set Register (TITCR): Note corrected
		10-57	10.3.26 Timer Interrupt Skipping Counter (TICNT): Body corrected and description of 4VCNT[2:0] bits corrected
		10-60	10.3.29 Timer Waveform Control Register (TWCR): Note corrected
		10-89	Figure 10.35 Procedure for Selecting Reset-Synchronized PWM Mode: Description of [6] and note corrected
		10-94	Figure 10.38 Example of Complementary PWM Mode Setting Procedure: Description of [9] corrected
		10-126	Figure 10.73 Example of Procedure for Specifying A/D Converter Start Request Delaying Function: Description of [2] corrected
		10-154	10.8.2 Reset Start Operation: Body corrected
		11. OS Timer	
		11-1	Table 11.2 Register Base Addresses corrected

Rev.	Date	Description			
		Page	Summary		
2.00	May 25, 2015	11-2	11.2.1 Registers Overview: Table corrected		
		11-5	Table 11.8 OSTMnTS register contents: Function of the OSTMnTS bit corrected (0: This setting has no effect.)		
		11-6	Table 11.9 OSTMnTT register contents: Function of the OSTMnTT bit corrected (0: This setting has no effect.)		
		11-7	11.3.1 Block Diagram added, and Figure 11.1 Block Diagram of OSTM added		
		11-8	11.3.3 Generation of Interrupt Request: Body corrected, and Figure 11.2 Generating an Interrupt when Counting Starts (in Interval Timer Mode) added		
		11-9	11.3.4 Starting and Stopping the Timer: Description of Initializing deleted		
		11-9 to 11-11	11.3.5.1 Basic Operation in Interval Timer Mode: Body corrected, Figure 11.3 Timing Diagram of OSTM in Interval Timer Mode added, and Figure 11.4 Timing Diagram of Forced Restart in Interval Timer Mode added		
		11-12	11.3.5.2 Operation when OSTMnCMP = 0000 0000 _H : Body corrected, and Figure 11.5 Timing Diagram when OSTMnCMP = 0000 0000 _H in Interval Timer Mode added		
		11-13, 11-14	11.3.6.1 Basic Operation in Free-Running Comparison Mode: Body corrected, Figure 11.6 Timing Diagram of OSTM in Free-Run Compare Mode added, and Table 11.11 OSTMTINT Generation Timing added		
		11-14, 11-15	11.3.6.2 Operation when OSTMnCMP = 0000 0000 _H added, and Figure 11.7 Timing Diagram when OSTMnCMP = 0000 0000 _H in Free-Run Compare Mode added		
		12. Watchdog Timer			
		12-1	12.1 Features: Body corrected		
		12-5	12.3.3 Watchdog Reset Control/Status Register (WRCSR): Bit 5 corrected		
		12-6	Figure 12.2 Writing to WTCNT and WTCSR: Addresses corrected		
		12-6	12.3.4 (2) Writing to WRCSR: Body corrected		
		12-6	Figure 12.3 Writing to WRCSR: Addresses corrected		
		12-8	12.4.1 Canceling Software Standby Mode: Body corrected		
		12-8	12.4.2 Using Watchdog Timer Mode: Body corrected		
		14. Serial Communication Interface with FIFO			
		14-19	14.3.9 FIFO Control Register (SCFCR): Description of MCE bit corrected		
		15. Serial Communications Interface			
		15-1	Table 15.1 Specifications of SCI: Specifications in "Clock source" under "Asynchronous mode" corrected		
		15-2	Table 15.2 Input and Output Pins of the SCIs: Note corrected		
		15-65	Table 15.18 Pin Configuration corrected		
		16. Renesas Serial Peripheral Interface			
		16-3	16.2 Input/Output Pins: Note corrected (RSPCK)		
		16-8	16.3.4 Status Register (SPSR): Note added to the description of TEND bit		
		16-28	Figure 16.10 MSB First Transfer (8-Bit Data): Note corrected		
		17. SPI Multi I/O Bus Controller			
		17-9	17.4.3 (1) Bit Rate: Calculation formula added		
		17-9	Table 17.3 Relationship between SPBR[7:0] and BRDV[1:0] Settings: Description corrected		
		18. I ² C Bus Interface			
		18-1	18.1.2 Register Base Addresses: Body corrected		
		18-1	Table 18.3 Register Base Address corrected		
		18-2	18.1.3 External I/O Signals: Title corrected		
		18-2	Table 18.4 RIICn Pin Configuration corrected		
		18-3	18.2.1 Functional Overview, Issuing and detecting conditions: Body corrected		
		18-4	18.2.1 Functional Overview, Noise removal: Body corrected		
		18-6	Figure 18.2 Connections to the External Circuit by the I/O Pins (I ² C Bus Configuration Example): Description corrected		
		18-7 to 18-38	Bit position of each register corrected		
		18-8	18.3.1 RIICnCR1 - I ² C Bus Control Register 1: Body of IICRST Bit (I ² C Bus Interface Internal Reset) corrected		
		18-9	Table 18.6 RIIC Resets corrected		
		18-9	18.3.1 RIICnCR1 - I ² C Bus Control Register 1: Body of ICE Bit (I ² C Bus Interface Enable) corrected		
		18-11, 18-12	18.3.2 RIICnCR2 - I ² C Bus Control Register 2: Body and cautions of RS Bit (Restart Condition Issuance Request) and body of TRS Bit (Transmit/Receive Mode) corrected		

Rev.	Date	Description	
		Page	Summary
2.00	May 25, 2015	18-14	Table 18.8 RIICnMR1 register contents: Note 1 corrected
		18-17	18.3.4 RIICnMR2 - I ² C Bus Mode Register 2: Note 1 of SDDL[2:0] Bits (SDA Output Delay Setup Counter) corrected (fm → Fm)
		18-19	18.3.5 RIICnMR3 - I ² C Bus Mode Register 3: Body of NF[1:0] Bits (Noise Filter Stage Selection) corrected
		18-19	18.3.5 RIICnMR3 - I ² C Bus Mode Register 3: Body of ACKBT Bit (Transmit Acknowledge) corrected
		18-20	18.3.5 RIICnMR3 - I ² C Bus Mode Register 3: Name and body of SMBE Bit (SMBus Select) corrected
		18-29	18.3.9 RIICnSR1 - I ² C Bus Status Register 1: Body of DID Flag (Device-ID Address Detection) and HOA Flag (Host Address Detection) corrected
		18-31, 18-33	18.3.10 RIICnSR2 - I ² C Bus Status Register 2: Body of TMOF Flag (Timeout), AL Flag (Arbitration-Lost), and RDRF Flag (Receive Data Full) corrected
		18-35	Table 18.17 RIICnSARy register contents: Function of SVA[9:1] bits corrected
		18-36	18.3.11 RIICnSARy - I ² C Slave Address Register y (y = 0 to 2): Name of SVA[9:1] Bits (7-Bit Address/10-Bit Address Upper Bits) corrected
		18-37	18.3.12 RIICnBRL - I ² C Bus Bit Rate Low-Level Register: Note 1 corrected ((Sm), (Fm))
		18-38, 18-39	18.3.13 RIICnBRH - I ² C Bus Bit Rate High-Level Register: Description corrected
		18-39, 18-40	Table 18.20 Minimum Specifiable Value for RIICnBRL and RIICnBRH: Title and description corrected
		18-40	Table 18.21 Examples of RIICnBRH/RIICnBRL Settings for Transfer Rate (when RIICnFER.SCLE = 1 and RIICnFER.NFE = 0) corrected
		18-40	Table 18.22 Examples of RIICnBRH/RIICnBRL Settings for Transfer Rate (when RIICnFER.SCLE = 1, RIICnFER.NFE = 1, and Number of NF Stages = 4) corrected
		18-41	18.3.14 RIICnDRT - I ² C Bus Transmit Data Register: Body corrected
		18-45	18.5.1 Communication Data Format: Body corrected
		18-45	Figure 18.3 I ² C Bus Format corrected
		18-45	18.5.1 Communication Data Format: Description of A# added
		18-47, 18-48	18.5.3 Master Transmit Operation: Description of (3), (5), and (7) corrected, and caution added
		18-52	18.5.4 Master Receive Operation: Body corrected
		18-54	Figure 18.10 Example Flowchart for the Master Reception of 3 or More Bytes (7-Bit Address Format): Title corrected
		18-56	Figure 18.13 Master Receive Operation Timing (3) (when RDRFS = 0): Level of TRS and TDRE corrected
		18-57	Figure 18.14 Example Flowchart for the Master Reception of 1 or 2 Bytes (7-Bit Address Format) added
		18-58	18.5.5 Slave Transmit Operation: Description of (7) corrected and caution added
		18-59	Figure 18.15 Example of Slave Transmission Flowchart corrected
		18-64	18.6 SCL Synchronization Circuit: Body corrected
		18-65	Figure 18.22 SDA Output Delay Facility corrected
		18-66	18.8 Digital Noise-Filter Circuits: Body corrected
		18-69	18.9.2 Detection of the General Call Address: Body corrected
		18-70	18.9.3 Device-ID Address Detection: Body corrected
		18-71	Figure 18.28 AASy/DID Flag Set/Clear Timing during Reception of Device-ID corrected
		18-74	Figure 18.31 Suspension of Data Transfer when NACK is Received (NACKE = 1) corrected
		18-79	18.11.2 Function to Detect Loss of Arbitration during NACK Transmission (NALE Bit): Body corrected
		18-80	18.11.3 Slave Arbitration-Lost Detection (SALE Bit): Body corrected
		18-82	Figure 18.37 Start Condition/Restart Condition Issue Timing (ST and RS Bits) corrected
		18-83	Figure 18.38 Stop Condition Issue Timing (SP Bit): Erroneous description corrected (IICφ)
		18-84	18.13.1 Timeout Function: Body and description of <1> to <3> corrected
		18-87	18.13.3 RIIC Reset and Internal Reset: Reference section corrected
		18-88	18.14 SMBus Operation: Body corrected
		18-90	18.15 Reset Function of RIIC: Title corrected
18-90, 18-91	Table 18.24 RIIC Reset Functions: Title of the table and description corrected		

Rev.	Date	Description	
		Page	Summary
2.00	May 25, 2015	19. Serial Sound Interface	
		19-39	19.5.3 Limits on TDM mode and WS Continue Mode: Body corrected
		21. CAN Interface	
		21-2	21.1.2 Register addresses: Body corrected
		21-2	Table 21.4 Register base address corrected
		21-8	Table 21.10 List of RS-CAN Module Registers (2/12): Name of transmit/receive FIFO buffer receive interrupt flag status register and transmit/receive FIFO buffer transmission interrupt flag status register corrected
		21-18	Table 21.11 Transmit Buffer p Allocated to Each Channel: CANn corrected to CANm
		21-19	Table 21.12 Transmit/Receive FIFO Buffer k Allocated to Each Channel: CANn corrected to CANm
		21-24	21.3.2 RSCAN0CmCTR - Channel Control Register (m = 0 or 1): Erroneous description of OLIE bit corrected (OLF corrected to OVLf)
		21-26	Table 21.17 RSCAN0CmSTS register contents: Function of TEC[7:0] bits corrected
		21-26	Table 21.17 RSCAN0CmSTS register contents: Function of REC[7:0] bits corrected
		21-27	21.3.3 RSCAN0CmSTS - Channel Status Register (m = 0 or 1): Body of EPSTS flag corrected
		21-52	21.3.18 RSCAN0RMNDy - Receive Buffer New Data Register y (y = 0): Body of RMNSq Flags (q = 0 to 31) corrected
		21-53	21.3.21 RSCAN0RMIDq - Receive Buffer ID Register (q = 0 to 31): Name of RMIDE bit corrected
		21-87	21.3.43 RSCAN0TMCp - Transmit Buffer Control Register (p = 0 to 31): Body corrected
		21-102	Table 21.74 RSCAN0TXQSTSm register contents: Function of bits 31 to 3 corrected
		21-122	21.5.2.1 Channel Stop Mode: Body corrected (GSLPR bit corrected to CSLPR bit)
		21-142	Figure 21.16 CAN Setting Procedure after the this LSI is Reset corrected
		21-164	21.11 Notes on the RS-CAN Module: Description corrected
		22. IEBus Controller	
		22-3	22.2.1 Function overview: Description of effective transmission speed corrected
		22-50	Table 22-29 Received control data and data written to the IEBBnDR register: Function of 5H corrected
		22-76	Note 1 corrected
		22-92	(c) Slave status transmission request processing flow example: Title corrected
		22-100	Figure 22-45 Master transmission (FIFO mode): Description corrected
		22-102	Figure 22-47 Master reception (FIFO mode): Description corrected
		22-106	Figure 22-51 Slave transmission (FIFO mode): When the control bit 3H or 7H is received: Description corrected
		22-107	Figure 22-52 Slave transmission (FIFO mode): When the control bit 0H or 6H is received (or when 4H or 5H is received from the locked master while the unit is locked): Reference section corrected
		22-111	22.7.1 (3) Effective transmission speed: Description corrected
		22-112	Table 22-56 Transfer rate and maximum number of transfer bytes in each communication mode: Effective transfer rate corrected
		22-119	Table 22-60 Control field ACK signal response conditions (when the received control data is 0H, 3H, 4H, 5H, 6H, or 7H): Title corrected (H → 0H)
		22-123	22.7.6 (9) (b) Last acknowledge bit of the control field: Body corrected
		22-125	Figure 22-62 Slave status bit configuration: Note b) corrected
		24. CD-ROM Decoder	
		24-6	Table 24.1 Register Configuration: Access size of CD-ROM decoder stream data input register corrected (R: 16, W: 16, 32)
		25. LIN Interface	
		—	LIN slave mode deleted
		25-1	25. LIN Interface: Body corrected
		25-1	25.1 Features: Title corrected
		25-1	25.1.2 Register Addresses: Body corrected
		25-1	Table 25.2 Register Base Addresses corrected
		25-2	Table 25.4 RLIN3n Interrupt and DMA Requests corrected
		25-3	25.2 Function: Body corrected
		25-4	Table 25.6 LIN Interface Specifications corrected (prohibition of the frame separated mode setting added)
		25-5	Figure 25.1 LIN Interface Block Diagram: n = 0, 1 deleted

Rev.	Date	Description	
		Page	Summary
2.00	May 25, 2015	25-6	Table 25.7 List of LIN Interface Registers corrected (LIN master and LIN slave deleted)
		25-7 to 25-32	25.3.1 LIN Master Related Registers: Address and bit position of each register corrected
		25-7	Table 25.8 RL3nLWBR register contents: Functions of LPRS[2:0] and LWBR0 bits corrected
		25-7	25.3.1.1 RL3nLWBR - LIN Wake-up Baud Rate Select Register: Description of NSPB[3:0] bits (bit sampling count select bits) and LWBR0 bit (wake-up baud rate select bit) corrected
		25-8	Table 25.9 RL3nLBRP0 register contents: Function corrected (setting range corrected)
		25-8	25.3.1.2 RL3nLBRP0 — LIN Baud Rate Prescaler 0 Register: Body corrected
		25-8	Table 25.10 RL3nLBRP1 register contents: Function corrected (setting range corrected)
		25-9	Table 25.11 RL3nLSTC register contents: Function of reserved bits corrected
		25-9	25.3.1.4 RL3nLSTC - LIN Self-Test Control Register: Body corrected
		25-10, 25-11	25.3.1.5 RL3nLMD - LIN Mode Register: Description of LCKS[1:0] bits (LIN system clock select bits) corrected
		25-14	25.3.1.8 RL3nLWUP - LIN Wake-up Configuration Register: Description of WUTL[3:0] bits (wake-up transmission low level width select bits) corrected
		25-15	Table 25.16 RL3nLIE register contents: Function of SHIE, ERRIE, FRCIE, and FTCIE bits corrected
		25-15, 25-16	25.3.1.9 RL3nLIE - LIN Interrupt Enable Register: Description of SHIE bit (successful header transmission interrupt enable bit), ERRIE bit (error detection interrupt request enable bit), FRCIE bit (successful frame/wake-up reception interrupt request enable bit), and FTCIE bit (successful frame/wake-up transmission interrupt request enable bit) corrected
		25-18	25.3.1.10 RL3nLEDE - LIN Error Detection Enable Register: Description of PBERE bit (physical bus error detection enable bit) corrected
		25-19	25.3.1.11 RL3nLCUC - LIN Control Register: Description of OM1 bit (LIN mode select bit) corrected
		25-20	25.3.1.12 RL3nLTRC - LIN Transmission Control Register: Description of RTS bit (response transmission/reception start bit) and FTS bit (frame transmission/wake-up transmission/reception start bit) corrected
		25-20	Table 25.19 RL3nLTRC register contents: Note added (prohibition of the frame separated mode setting) in the RTS bit function
		25-22, 25-23	25.3.1.14 RL3nLST - LIN Status Register: Body and description of HTRC flag (successful header transmission flag), D1RC flag (successful data 1 reception flag), ERR flag (error detection flag), FRC flag (successful frame/wake-up reception flag) and FTC flag (successful frame/wake-up transmission flag) corrected
		25-24, 25-25	25.3.1.15 RL3nLEST - LIN Error Status Register: Body and description of RPER flag (response preparation error flag), CSER flag (checksum error flag), FER flag (framing error flag), FTER flag (timeout error flag), PBER flag (physical bus error flag), and BER flag (bit error flag) corrected
		25-26 to 25-28	25.3.1.16 RL3nLDFC - LIN Data Field Configuration Register: Description of LSS bit (transmission/reception continuation select bit), FSM bit (frame separate mode select bit), RFT bit (response field communication direction select bit), and RFDL[3:0] bits (response field length select bits) corrected
		25-26	Table 25.23 RL3nLDFC register contents: Note added (prohibition of the frame separated mode setting) in the FSM bit function
		25-29	25.3.1.17 RL3nLIDB — LIN ID Buffer Register: Body corrected
		25-30	25.3.1.18 RL3nLCBR - LIN Checksum Buffer Register: Access and body corrected
		25-32	25.3.1.19 RL3nLDBRm - LIN Data Buffer m Register (m = 1 to 8): Description of For transmission of response data of 9 bytes or more corrected
		25-34	Table 25.28 Transition Condition of Each Mode corrected
		25-38	Table 25.30 Transition Conditions of Operation Modes corrected
		25-40	Table 25.32 Processing in Response Transmission corrected
		25-41	Table 25.33 Processing in Response Reception corrected
		25-42	25.7.2.1 Data Transmission: Body corrected
		25-42	Figure 25.7 Example of Data Transmission Timing (LIN Master Mode) corrected
		25-43	Figure 25.8 Example of Data Reception Timing corrected
		25-46	25.7.3.3 Multi-Byte Response Transmission/Reception Function: Body corrected
25-47	25.7.4.1 Wake-up Transmission: Body corrected		
25-48	25.7.4.2 Wake-up Reception: Body corrected		
25-48	25.7.4.3 Wakeup Collision added		
25-49	Table 25.34 Types of Statuses in LIN Master Mode corrected		
25-50, 25-51	Table 25.35 Types of Error Statuses in LIN Master Mode corrected		
25-50	25.7.6.1 LIN Master Mode (1) Types of Error Statuses: Body corrected		

Rev.	Date	Description	
		Page	Summary
2.00	May 25, 2015	25-53	Figure 25.14 Connection in LIN Reset Mode and LIN Mode and Figure 25.15 Connection in LIN Self-Test Mode: n = 0, 1 deleted
		25-54	25.8.1 Change to LIN Self-Test Mode: Description corrected
		25-55, 25-56	25.8.2 Transmission in LIN Master Self-Test Mode: Description corrected
		25-56, 25-57	25.8.3 Reception in LIN Master Self-Test Mode: Description corrected
		25-58	25.9 Baud Rate Generator: Body corrected
		25-58	Figure 25.16 Block Diagram of Baud Rate Generation in LIN Master Mode corrected
		25-58	25.9.1 LIN Master Mode: Title and body corrected
		—	Table 25.36 Examples of Baud Rate (19200, 10417, 9600, and 2400 bps) Generation in LIN Master Mode deleted
		25-59	25.9.2 Noise Filter: Body corrected
		25-59	Figure 25.17 Configuration of Noise Filter corrected
		25-59	Figure 25.18 Example of Noise Filter Circuit corrected
		25-60	Figure 25.19 Determination of Received Data when Noise Filter is Used corrected
		26. Ethernet Controller	
		26-15	26.3.9 CRC Error Frame Receive Counter Register (CEFCR) corrected
		26-15	26.3.10 Frame Receive Error Counter Register (FRECR) corrected
		26-16	26.3.11 Too-Short Frame Receive Counter Register (TSFRCR) corrected
		26-16	26.3.12 Too-Long Frame Receive Counter Register (TLFRCR) corrected
		26-17	26.3.13 Residual-Bit Frame Receive Counter Register (RFCR) corrected
		26-17	26.3.14 Multicast Address Frame Receive Counter Register (MAFCR) corrected
		26-55	26.4.1 (1) (b) Transmit Descriptor 1 (TD1): Description of TDL[15:0] bits corrected
		26-55	26.4.1 (1) (c) Transmit Descriptor 2 (TD2): Body corrected and description of TBA[31:0] bits corrected
		26-58	26.4.1 (2) (a) Receive Descriptor 0 (RD0): Description of RCSE bit corrected (Table 26.4 corrected to Table 26.3)
		26-59	26.4.1 (2) (b) Receive Descriptor 0 (RD0): Description of RBL[15:0] bits corrected
		26-60	Figure 26.5 Relationship between Transmit Descriptor and Transmit Buffer corrected
		27. A/D Converter	
		27-19	Table 27.5 A/D Conversion Time (Single Mode) corrected
		27-22	27.6 Definitions of A/D Conversion Accuracy: Body corrected
		27-23	27.7.1 Module Standby Mode Setting: Body corrected
		28. USB2.0 Host/Function Module	
		—	Erroneous description corrected: Dx FIFO corrected to Dn FIFO, DEVADDx corrected to DEVADDn, PIPExCTR corrected to PIPEnCTR, PIPExTRE corrected to PIPEnTRE, PIPExTRN corrected to PIPEnTRN, PIPExCFG corrected to PIPECFG
		28-3	Table 28.1 Pin Configuration: Function of REFRIN corrected
		28-11	28.3.1 System Configuration Control Register (SYSCFG0): Description of UCKSEL bit corrected
		28-18, 28-19	28.3.6 DMA _n -FIFO Bus Configuration Registers (D0FBCFG, D1FBCFG): Description of DFACC[1:0] and TENDE bits corrected
		28-20	28.3.7 FIFO Port Registers (CFIFO, D0FIFO, D1FIFO): Description of FIFOPORT[31:0] bits corrected
		28-23	28.3.8 (1) CFIFOSEL: Description of MBW[1:0], BIGEND, ISEL, and CURPIPE[3:0] bits corrected
		28-24, 28-25	29.3.8 (2) D0FIFOSEL, D1FIFOSEL: Description of DREQE and MBW[1:0] bits corrected
		28-44, 28-45	28.3.28 DCP Configuration Register (DCPCFG): Description of bits 7 and 8 added
		28-46	Table 28.10 Relationship between Transfer Mode Settings by CNTMD Bit and Timings at which Reading Data or Transmitting Data from FIFO Buffer is Enabled added
		28-53	28.3.32 Pipe Configuration Register (PIPECFG): Description of TYPE[1:0] bits corrected
		28-56	Table 28.11 Relationship between Transfer Mode Settings by CNTMD Bit and Timings at which Reading Data or Transmitting Data from FIFO Buffer is Enabled added
		28-70	28.3.37 PIPE _n Transaction Counter Enable Registers (PIPE _n TRE) (n = 1 to 5, 9, and A to F): Description of TREN _B bit corrected
		28-89	Table 28.19 Pipe Setting Items: Remarks of CNTMD and SHTNAK bits corrected

Rev.	Date	Description	
		Page	Summary
2.00	May 25, 2015	28-96	Table 28.19 Relationship between Transfer Mode Settings by CNTMD Bit and Timings at which Reading Data or Transmitting Data from FIFO Buffer is Enabled deleted
		28-97	Table 28.21 FIFO Port Function Settings: Function of DREQE bit corrected
		28-98	Figure 28.6 Procedure for Pipe Switching during Access to the FIFO Port corrected
		30. Video Display Controller 5 (2): Input Controller	
		30-17	Table 30.14 Timing of Delay for Output of Vertical Synchronization Signal corrected
		30-41, 30-42	The order of 30.2.9, 30.2.10, and 30.2.11 changed
		31. Video Display Controller 5 (3): Scaler	
		31-23	Table 31.20 Settings for Field Determination Signal Control corrected
		31-26	Table 31.25 Frame Buffer Writing Mode Setting corrected
		31-27	Table 31.30 Frame Buffer Writing Control: Description corrected
		31-34	Table 31.37 Field Specification for Frame Buffer Reading corrected
		31-36	Table 31.38 Frame Buffer Control corrected
		31-51	31.2.17 Vertical Scaling Register (SC0_SCL0_DS6): Note corrected
		31-64	31.2.33 Frame Sub-Sampling Register (SC0_SCL1_WR5): Description of SC0_RES_WENB bit corrected
		31-71, 31-72	31.2.45 Pointer Buffer and Field Information Register (SC0_SCL1_PBUF_FLD): Description corrected
		31-74	31.2.49 Frame Buffer Control Register 1 (Graphics 0) (GR0_FLM1): Description of GR0_FLM_SEL [1:0] bits corrected
		31-76	31.2.51 Frame Buffer Control Register 3 (Graphics 0) (GR0_FLM3): Description of GR0_FLD_NXT bit corrected
		31-88	31.3.1 Scaling Setting Example for 525i Video Input and VGA-Size (640 x 480) Video Output: Title corrected
		31-88	Table 31.40 Input and Output Angles for 525i Video Input and VGA-Size (640 x 480) Video Output: Title corrected and output signal corrected (640 x 480)
		31-88	(2) Horizontal Scaling (Horizontal Scale Down, Scaling Filter: 2-Tap Linear): Body corrected
		31-88	(3) Horizontal Scaling (Horizontal Scale Up, Scaling Filter: 2-Tap Linear) deleted
		31-88	(3) Vertical Scaling (Vertical Scale Up, Scaling Filter: 2-Tap Linear): Body corrected
		34. Video Display Controller 5 (7): Output Controller	
		34-6, 34-7	Table 34.5 Gamma Correction: Description corrected
		34-34 to 34-41	34.2.4 Area Setting Register G1 in Gamma Correction Block (GAM_G_AREA1) to 34.2.11 Area Setting Register G8 in Gamma Correction Block (GAM_G_AREA8): Description corrected
		34-45 to 34-52	34.2.14 Area Setting Register B1 in Gamma Correction Block (GAM_B_AREA1) to 34.2.21 Area Setting Register B8 in Gamma Correction Block (GAM_B_AREA8): Description corrected
		34-56 to 34-63	34.2.24 Area Setting Register R1 in Gamma Correction Block (GAM_R_AREA1) to 34.2.31 Area Setting Register R8 in Gamma Correction Block (GAM_R_AREA8): Description corrected
		36. Capture Engine Unit	
		36-2	Table 36.1 Functional Overview of CEU corrected
		36-7	36.4.1 Capture Start Register (CAPSR): Note added
		36-13	36.4.3 Capture Interface Control Register (CAMCR): Description of JPG[1:0] bits corrected and note added to body
		36-18	36.4.6 Capture Interface Width Register (CAPWR): Description of VWDTH[11:0] and HWDTH[12:0] bits corrected
		36-36	36.4.17 Capture Bundle Destination Size Register (CBDSR): Description of CBVS[22:0] corrected
		36-36	36.4.17 (a) Image capture and data synchronous fetch: Body corrected
		36-49	Figure 36.47 Operating Status during Capturing: Erroneous description corrected (CSPSR.CE corrected to CAPSR.CE)
		36-59	Table 36.11 Restrictions on CEU Input/Output Functions corrected
		37. SCUX	
		37-2	Figure 37.1 Block Diagram of SCUX corrected (MTU2 added)
		37-3	Table 37.1 Pin Configuration: Function corrected
		37-15	37.3.9 FFD0_n FIFO Download Boot Register (FFDBR_FFD0_n) (n = 0, 1, 2, 3): Description of BOOT bit corrected
		37-16	37.3.10 FFD0_n FIFO Download Event Mask Register (DEVMR_FFD0_n) (n = 0, 1, 2, 3): Description of DEVMRQ bit corrected

Rev.	Date	Description	
		Page	Summary
2.00	May 25, 2015	37-22	37.3.17 FFU0_n FIFO Upload Event Clear Register (UEVCR_FFU0_n) (n = 0, 1, 2, 3): Description of UEVCUF, UEVCOF, and UEVCOL bits corrected
		37-70	37.3.68 FFD0_n Timing Select Register (FDTSELn_CIM) (n = 0, 1, 2, 3): Description of MTUSEL bit added and description of SCKSEL bit corrected
		37-71	Figure 37.4 Configuration Diagram of Input Timing Signal Selector corrected
		37-72	37.3.69 FFU0_n Timing Select Register (FDTSELn_CIM) (n = 0, 1, 2, 3): Description of MTUSEL bit added and description of SCKSEL bit corrected
		37-73	Figure 37.5 Configuration Diagram of Output Timing Signal Selector corrected
		37-87	Figure 37.7 Initial Setting Procedure of SCUX (2) corrected
		37-87	Figure 37.8 Initial Setting Procedure of SCUX (3) corrected
		37-88	Figure 37.9 Transfer Start Procedure and Stop Procedure of SCUX (1) corrected
		37-90	Figure 37.11 Transfer Start Procedure and Stop Procedure of SCUX (3) corrected
		37-95	37.4.5 Data Transfer Route: Body corrected
		37-101 to 37-103	Table 37.18 Input/Output Timing Setting (1) to Table 37.20 Input/Output Timing Setting (3) corrected, and notes corrected
		37-109	Figure 37.16 Volume Ramp Operation: Note added to description of operation (2)
		37-112, 37-113	Figure 37.20 Volume Ramp Operation for 4-System Data corrected, and note added to description of operation (2)
		41. Ports	
		41-1	41.1.2 Port group index n: Body corrected
		41-2	Table 41.3 Pin Function Configuration Overview corrected, note deleted, and caution added
		41-3	41.2.2 Pin Data Input/Output: Body corrected
		41-3	Table 41.4 PPRn.PPRnm Bit Read Values corrected, and note changed to caution
		41-4	41.3.1 Port Register (Pn): Body corrected
		41-5	41.3.2 Port Set and Reset Register (PSRn): Body corrected
		41-5	41.3.3 Port Pin Read Register (PPRn/JPPR0): Body corrected and function of PPRn[15:0] bits corrected
		41-6	41.3.4 Port Mode Register (PMn): Caution added and note corrected
		41-7	Table 41.6 Alternative Mode Selection corrected and note changed to caution
		41-8	41.3.8 Port NOT Register (PNOTn): Function of PNOTn[15:0] bits corrected
		41-9	41.3.9 Port Mode Set and Reset Register (PMSRn): Body corrected
		41-10	41.3.10 Port Mode Control Set and Reset Register (PMCSRn/JPMCSR0): Body corrected
		41-10	41.3.11 Port Function Control Additional Expansion Register (PFCAEn): Caution corrected
		41-11	41.3.12 Port Input Buffer Control Register (PIBCn): Title and body corrected, and description added to note
		41-11	41.3.13 Port Bidirection Control Register (PBDCn/JPBDC0): Title and body corrected, and note deleted
		41-12	Table 41.7 Alternative Functions for Which the PIPCn.PIPCnm Bit Should be Set to 0 corrected
		41-13	41.3.15 Serial Sound Interface Noise Canceler Control Register (SNCR): Bits 4 to 6 corrected
		41-14	Table 41.8 Number and Function of Ports: Pin name corrected
		41-14	41.5 JTAG Port 0 (JP0): Note changed to caution
		41-14	Table 41.10 Control Registers (JP0) corrected and note changed to caution
		41-15	Table 41.11 Pin Function (P0) corrected and note changed to caution
		41-15	Table 41.12 Control Registers (P0): Note changed to caution
		41-16	Table 41.13 Pin Function (P1) corrected and note changed to caution
		41-16	Table 41.14 Control Registers (P1) corrected and note changed to caution
		41-17	Table 41.16 Control Registers (P2): Note changed to caution
		41-18	Table 41.17 Pin Function (P3) corrected
		41-18	Table 41.18 Control Registers (P3) corrected and note changed to caution
41-19	Table 41.20 Control Registers (P4): Note changed to caution		
41-20	Table 41.22 Control Registers (P5) corrected and note changed to caution		
41-22	Table 41.24 Control Registers (P6) corrected and caution added		
41-23	Table 41.25 Pin Function (P7) corrected		

Rev.	Date	Description			
		Page	Summary		
2.00	May 25, 2015	41-23	Table 41.26 Control Registers (P7): Note changed to caution		
		41-24	Table 41.28 Control Registers (P8) corrected		
		41-25	Table 41.30 Control Registers (P9): Note changed to caution		
		41-27	Figure 41.2 Example Flow of Port Settings (in Port Mode) (a): Title corrected		
		41-28	Figure 41.3 Example Flow of Port Settings (in Software I/O Control Alternative Mode) (b): Title corrected and note changed to caution		
		41-29	Figure 41.4 Example Flow of Port Settings (in Direct I/O Control Alternative Mode) (c) corrected and title corrected		
		42. Power-Down Modes			
		42-1	Figure 42.1 Transitions between Processing States corrected		
		42-2	Table 42.1 States of Power-Down Modes: Transition Conditions corrected and note 6 added		
		42-4	42.2.1 Standby Control Register 1 (STBCR1): Description of STBY and DEEP bits corrected		
		42-5	42.2.2 Standby Control Register 2 (STBCR2): Description of HIZ bit corrected		
		42-10	42.2.7 Standby Control Register 7 (STBCR7): Erroneous description of MSTP74 bit corrected		
		42-12	42.2.9 Standby Control Register 9 (STBCR9): Description of MSTP93 bit corrected		
		42-13	42.2.10 Standby Control Register 10 (STBCR10): Note 1 deleted		
		42-23	42.2.20 Standby Acknowledge Register 1 (STBACK1): Title corrected and note 1 corrected		
		42-24	42.2.21 Standby Acknowledge Register 2 (STBACK2): Note 1 corrected		
		42-30	42.2.26 Deep Standby Cancel Source Flag Register (DSFR): Body corrected		
		42-32	42.3.1 (1) Transition to Sleep Mode: Body corrected and not added		
		42-32	42.3.1 (2) Canceling Sleep Mode: Body corrected		
		42-33	42.3.2 (1) Transition to Software Standby Mode: Description corrected		
		42-35	42.3.3 Software Standby Mode Application Example: Note added		
		42-36	42.3.4 (1) Transition to Deep Standby Mode: Body corrected		
		42-37	Figure 42.3 Flowchart of Transition to Deep Standby Mode corrected		
		42-38	Figure 42.4 Flowchart of Canceling Deep Standby Mode: Description corrected		
		42-40	42.3.5 Module Standby Function: Body corrected		
		42-41	42.3.6 Software Reset added		
		43. Debugger Interface			
		43-7 to 43-10	Table 43.10 Correspondence between Pins of this LSI and Boundary Scan Registers corrected		
		43-12	43.4 ICE Registers: Body corrected		
		44. List of Registers			
		44-2	Table 44.1 Register Addresses: Frequency control register 2 deleted		
		44-31	Table 44.1 Register Addresses: Access size of CD-ROM decoder stream data input register (STRMDIN0) corrected (16 (R/W), 32 (W))		
		44-28	Table 44.1 Register Addresses: Register name of transmit/receive FIFO buffer receive interrupt flag status register and transmit/receive FIFO buffer transmit interrupt flag status register corrected		
		44-3, 44-4, 44-51, 44-52, 44-53, 44-61	Table 44.1 Register Addresses: Interrupt clear-enable registers 17 and 18, Interrupt set-pending registers 17 and 18, Port register_10, Port register_11, Port set/reset register_10, Port set/reset register_11, Port pin read register_10, Port pin read register_11, Port mode register_10, Port mode register_11, Port mode control register_10, Port mode control register_11, Port function control register_10, Port function control register_11, Port function control expansion register_10, Port function control expansion register_11, Port NOT register_10, Port NOT register_11, Port mode set/reset register_10, Port mode set/reset register_11, Port mode control set/reset register_10, Port mode control set/reset register_11, Port function control additional expansion register_10, Port function control additional expansion register_11, Port input buffer control register_10, Port input buffer control register_11, Port bi-direction control register_10, Port bi-direction control register_11, Port IP control register_10, Port IP control register_11, and BSID register deleted		
		44-69, 44-79, 44-88, 44-96, 44-97, 44-120, 44-121	Table 44.2 Register Bits: Registers of bus state controller corrected, DCTRL_0_7 and DCTRL_8_15 registers corrected, RIICxMR1, RIIC0SER, RIIC1SER, RIIC2SER, and RIIC3SER registers of I2C bus interface corrected, CEFCR0, FRECR0, TSFRCR0, TLFRCR0, RFCR0, and MAFRCR0 registers of Ethernet controller corrected, and DPCPCFG_0 and DPCPCFG_1 registers of USB2.0 host/function module corrected		

Rev.	Date	Description			
		Page	Summary		
2.00	May 25, 2015	44-66, 44-120, 44-207	Table 44.2 Register Bits: FRQCR2 register of clock pulse generator, all registers of LIN interface LIN slave, and BSID register of debugger interface deleted		
		44-208, 44-209	Table 44.3 Register States: Register name (FRQCR2) deleted, module name of CAN interface corrected ((RS-CAN) deleted), and note 11 added		
		45. Electrical Characteristics			
		45-5	Table 45.2 DC Characteristics (3) [Except I ² C Bus Interface, and USB 2.0 Host/Function Module-Related Pins]: Note corrected		
		45-8	Table 45.5 Clock Timing: Description of real time clock oscillation settling time (trosc) corrected		
		45-9	Figure 45.3 Power-On Oscillation Settling Time corrected		
		45-18	Title of figure 45.13 corrected		
		45-19	Title of figure 45.14 corrected		
		45-43	Figure 45.41 Clock Timing corrected		
		45-44	Figure 45.42 Transmission and Reception Timing (Master, CPHA = 0) corrected		
		45-44	Figure 45.43 Transmission and Reception Timing (Master, CPHA = 1) corrected		
		45-44	Figure 45.44 Transmission and Reception Timing (Slave, CPHA = 0) corrected		
		45-45	Figure 45.45 Transmission and Reception Timing (Slave, CPHA = 1) corrected		
		45-46	Table 45.14 SPI Multi I/O Bus Controller Timing corrected		
		45-46	Figure 45.47 Transmission and Reception Timing (CPHAT = 0, CPHAR = 0) corrected		
		45-47	Figure 45.48 Transmission and Reception Timing (CPHAT = 1, CPHAR = 1) corrected		
		45-61	Table 45.25 Capture Engine Unit Module Signal Timing corrected		
		45-61	Figure 45.74 Capture Engine Unit Module Signal Timing corrected		
		46. States and Handling of Pins			
		46-1	Table 46.1 Pin States corrected (clock and bus state controller)		
		46-8	Figure 46.1 Example of Externally Allocated Capacitors in the Products in 208-Pin QFP Packages corrected		
		46-9	Figure 46.2 Example of Externally Allocated Capacitors in the Products in 176-Pin QFP Packages corrected		
		Appendix			
		Appendix-1	Figure A.1 Dimensions of 176-Pin BGA Package corrected		
		3.00	Nov 30, 2016	All	RZ/A1LU and RZ/A1LC specification added
				1. Overview	
				1-1	1.1 Features of This LSI: Body corrected
1-2, 1-4, 1-5, 1-6, 1-7, 1-8	Table 1.1 Features of RZ/A1L, RZ/A1LU, and RZ/A1LC: Title corrected. Items of media local bus, IEBus™ controller, and CD-ROM decoder corrected. Items and specification of LIN interface corrected. EthernetAVB (RZ/A1LU only) and JPEG codec unit (RZ/A1LU only) added. Specification of on-chip RAM and package corrected.				
1-9	Table 1.2 Product Lineup: RZ/A1LU and RZ/A1LC group added				
1-15, 1-16	Table 1.3 Pin Functions: Symbol within the classification of "Renesas serial peripheral interface" corrected. Classification of media local bus, IEBus™ controller, LIN interface, and Ethernet controller corrected. EthernetAVB (RZ/A1LU only) added.				
1-19 to 1-23	Table 1.4 List of Pins: Table corrected, function 8 added, and notes 1 to 4 added				
2. CPU					
2-2	Table 2.1 Cortex-A9 Configuration Signal Settings: Error corrected				
3. Boot Mode					
3-4	Figure 3.1 Control Signals Output to the Serial Flash Memory Through SPI Communication Conversion corrected				
5. LSI Internal Bus					
5-2	Figure 5.2 North Main Bus Configuration: Notes 1 and 2 added				
5-3, 5-4	Table 5.2 List of Peripheral Buses: Description of IEBus controller, LIN interface, media local bus, and CD-ROM decoder corrected. Description of JPEG codec unit (RZ/A1LU only) added to peripheral bus 4. Description of EthernetAVB (RZ/A1LU only) added to peripheral bus 6.				

Rev.	Date	Description	
		Page	Summary
3.00	Nov 30, 2016	5-5	Figure 5.3 South Main Bus Configuration: EthernetAVB added, and notes 1 and 2 added
		5-7, 5-8, 5-9	Table 5.5 Address Map: "Area" of address 0x6020_0000 to 0x602F_FFFF and address 0x2020_0000 to 0x202F_FFFF corrected. Note 5 corrected.
		5-10	Figure 5.4 Address Remapping corrected
		5-10	5.5.2 Operation: Body corrected
		5-12	5.8.1 (3) Protection unit information (ARPROT[2:0], AWPROT[2:0]): Note added
		5-13	5.8.5 (4) Atomic access (ARLOCK[1:0], AWLOCK[1:0]): Note added
		5-14	Table 5.6 Register Configuration: Register name of AXI bus control register 5 corrected
		5-15	5.10.1 Remap Register (RMPR): Description of bit 1 (AXI128) corrected
		5-16	5.10.2 AXI Bus Control Register 0 (AXIBUSCTL0): Body corrected, description of bits 27 to 24 (JCUARCACHE[3:0]) and bits 19 to 16 (JCUAWCACHE[3:0]) added, and note added
		5-17	5.10.4 AXI Bus Control Register 5 (AXIBUSCTL5): Body corrected
		5-20	5.10.7 AXI Bus Response Error Interrupt Control Register 0 (AXIRERRCTL0): Description of bit 28 (JCURERREN) added, and note added
		5-22	5.10.9 AXI Bus Response Error Status Register 0 (AXIRERRST0): Description of bits 31 and 30 (JCURRESP[1:0]) and bits 29 and 28 (JCUBRESP[1:0]) added, and note added
		5-24	5.10.11 AXI Bus Response Error Clear Register 0 (AXIRERRCLR0): Description of bit 30 (JCURRESPCLR) and bit 28 (JCUBRESPCLR) added, and note added
		6. Clock Pulse Generator	
		6-3	6.1 (7) SSCG Circuit: Body corrected
		6-5	6.3 Clock Mode: Body corrected
		6-5	Table 6.3 Settable Frequency Ranges corrected
		6-12	6.7.1 Oscillation Stabilizing Time of the On-chip Crystal Oscillator: Body corrected
		6-12	6.7.2 Oscillation Stabilizing Time of the PLL circuit: Body corrected
		6-16	Figure 6.6 Audio and USB Clock Signals corrected
		6-16	Figure 6.7 Video Image Clock Signals corrected
		6-17	Figure 6.8 Clock Signals for Other Modules corrected
		6-18	Figure 6.9 Distribution of Internal Clock Signals (1) corrected
		6-19	Figure 6.10 Distribution of Internal Clock Signals (2) corrected
		7. Interrupt Controller	
		7-2	Figure 7.1 Block Diagram corrected
		7-17	7.4.3 On-Chip Peripheral Module Interrupts: Body corrected
		7-22, 7-28, 7-29	Table 7.3 List of Interrupt IDs: Module column of IEBus™ controller, CD-ROM decoder, media local bus, and LIN interface channel 0 corrected. JPEG codec unit (RZ/A1LU only) assigned to interrupt ID 126 and 127. EthernetAVB (RZ/A1LU only) assigned to interrupt ID 355 to 358.
		8. Bus State Controller	
		8-5	Table 8.3 Initial States by Areas in Boot Modes 0 and 1 to 3: Note 1 corrected
		8-87	8.5.11 (3) On-Chip Peripheral Module Access: Body corrected
		9. Direct Memory Access Controller	
		9-1	9.1 Features, Transfer requests: Body corrected
		9-31	9.4.25 DMA Extension Resource Selectors 0 to 7 (DMARS0 to DMARS7): Body corrected
		9-36 to 9-38	Table 9.4 On-Chip Peripheral Module Requests: "DMA Transfer Request Source" of IEBus™ controller, CD-ROM decoder, media local bus, and LIN interface channel 0 corrected
		10. Multi-Function Timer Pulse Unit 2	
		10-44, 10-68, 10-88, 10-95, 10-111, 10-147, 10-149, 10-152, 10-153	TCNT0, TCNT1, TCNT2, TCNT3, and TCNT4 have been respectively changed to TCNT_0, TCNT_1, TCNT_2, TCNT_3, and TCNT_4.
		10-104	Figure 10.44 Example of Initial Output in Complementary PWM Mode (1) corrected

Rev.	Date	Description	
		Page	Summary
3.00	Nov 30, 2016	10-105	Figure 10.45 Example of Initial Output in Complementary PWM Mode (2) corrected
		12. Watchdog Timer	
		12-1	Error in the body corrected
		12-8	12.4.1 Canceling Software Standby Mode: Body corrected
		13. Realtime Clock	
		13-16	13.4.1 Initial Settings of Registers after Power-On and Oscillation Stabilization Time: Body corrected
		14. Serial Communication Interface with FIFO	
		14-13	14.3.7 Serial Status Register (SCFSR): Description of bit 1 (RDF) corrected
		14-19	14.3.9 FIFO Control Register (SCFCR): Description of bits 10 to 8 (RSTRG[2:0]), bits 7 and 6 (RTRG[1:0]), and bits 5 and 4 (TTRG[1:0]) corrected
		14-33, 14-38	14.4.2 (3) Transmitting and Receiving Data: Body corrected
		15. Serial Communications Interface	
		15-4	15.2.2 Receive Data Register (RDR): Body corrected
		16. Renesas Serial Peripheral Interface	
		16-10	16.3.5 Data Register (SPDR): Body corrected
		16-12	16.3.9 Data Control Register (SPDCR): Description of bits 6 and 5 (SPLW1, SPLW0) corrected, and Note added
		17. SPI Multi I/O Bus Controller	
		17-1	17.1 Features, Serial Flash Memory Interface: Body corrected
		17-2	Figure 17.1 Block Diagram corrected
		17-4	Table 17.2 Register Configuration corrected
		17-5, 17-6	17.4.1 Common Control Register (CMNCR): Description of bits 23 and 22 (MOIIO3[1:0]), bits 21 and 20 (MOIIO2[1:0]), bits 19 and 18 (MOIIO1[1:0]), bits 17 and 16 (MOIIO0[1:0]), bits 15 and 14 (IO3FV[1:0]), bits 13 and 12 (IO2FV[1:0]), bits 9 and 8 (IO0FV[1:0]), bit 6 (CPHAT), and bit 5 (CPHAR) corrected
		17-22	17.4.14 SPI Mode Read Data Register 0 (SMRDR0): Description of bits 31 to 0 (RDATA0[31:0]) corrected
		17-22	17.4.15 SPI Mode Read Data Register 1 (SMRDR1): Description of bits 31 to 0 (RDATA1[31:0]) corrected
		17-23	17.4.16 SPI Mode Write Data Register 0 (SMWDR0): Description of bits 31 to 0 (WDATA0[31:0]) corrected
		17-23	17.4.17 SPI Mode Write Data Register 1 (SMWDR1): Description of bits 31 to 0 (WDATA1[31:0]) corrected
		17-25	17.4.19 SPI AC Input Characteristics Adjustment Register (CKDLY) (RZ/A1LU only) added
		17-27	17.4.21 Data Read DDR Enable Register (DRDREN) (RZ/A1LU only) added
		17-29	17.4.23 SPI Mode DDR Enable Register (SMDREN) (RZ/A1LU only) added
		17-30	17.4.24 SPI AC Output Characteristics Adjustment Register (SPODLY) (RZ/A1LU only) added
		17-32	17.5.3 32-bit Serial Flash Addresses: Error in note corrected (RBE bit in DRCR = 1)
		17-34	17.5.6 External Address Space Read Mode: Body corrected
		17-38	Figure 17.12 Example of Initial Setting Flow in External Address Space Read Mode corrected
		17-40	17.5.8 SPI Operating Mode: Body corrected
		17-41	Figure 17.16 Example of Initial Setting Flow in SPI Operating Mode corrected
		17-42	Figure 17.17 Example of a Data Transfer Setting Flow in SPI Operating Mode corrected
		17-43	17.5.9 (3) Data Transmission and Reception Timing: Body corrected
		17-43	Figure 17.18 SDR Transfer Format: Title corrected
		17-44	Figure 17.19 DDR Transfer Format (RZ/A1LU only) added
		17-45	Table 17.5 Data Registers: Error corrected (DRDMCR, SMDMCR)
		17-45	17.5.10 (2) Data Enable: Body corrected
		17-46	Figure 17.20 Data and Enable corrected
		17-50	Table 17.7 Pin Status (2) corrected
		17-51	Table 17.8 Pin Status (3) corrected
		18. I ² C Bus Interface	
		18-37	18.3.12 RIICnBRL — I ² C Bus Bit Rate Low-Level Register: Body corrected
		18-38, 18-39	18.3.13 RIICnBRH — I ² C Bus Bit Rate High-Level Register: Calculation formulae of frequency and duty cycle corrected, and note 1 added
		18-46	Figure 18.5 Example of RIIC Initialization Flowchart: Note 1 corrected

		18-72	18.9.4 Host Address Detection: Body corrected		
		18-74	18.10.2 NACK Reception Transfer Suspension Function: Body corrected		
		18-74	Figure 18.31 Suspension of Data Transfer when NACK is Received (NACKE = 1) corrected		
		18-88	18.14 SMBus Operation: Body corrected		
		19. Serial Sound Interface			
		19-21	19.3.12 FC Status Register (SSIFCSR): Error in the table corrected		
		20. Media Local Bus			
		20-1	Description added		
		21. CAN Interface			
		21-6	Figure 21.1 RS-CAN Module Block Diagram corrected		
		22. IEBus Controller			
		22-1	Description added		
		22-1	22.1 IEBB Features: Body corrected		
		22-5	22.3.1 IEBBn register overview: Body corrected		
		22-30	22.3.2 (14) IEBBnTMS - IEBBn transfer mode setting register: Body corrected		
		24. CD-ROM Decoder			
		24-1	Description added		
		24-46	24.6.8 Note on Software Reset added		
		25. LIN Interface			
		25-1	Description added		
		25-12	Table 25.13 RLN3nLBFC register contents: Error in the function column of bits 5 and 4 (BDT[1:0]) corrected		
		25-13	Table 25.14 RLN3nLSC register contents: Error of the function column of bits 5 and 4 (IBS[1:0]) corrected		
		25-36	25.6 LIN Reset Mode: Body corrected		
		26. Ethernet Controller			
		26-2	Figure 26.1 Configuration of ETHER corrected		
		26-57, 26-58	26.4.1 (2) Receive Descriptor, (a) Receive Descriptor 0 (RD0): Description of bits 29 and 28 (RFP[1:0]) and bits 25 to 16 (RFS[9:0]) corrected		
		26-59	26.4.1 (2) Receive Descriptor, (b) Receive Descriptor 1 (RD1): Description of bits 31 to 16 (RBL[15:0]) corrected		
		26-61	26.4.1 (3) Descriptor and Transmit/Receive Buffer, (b) Reception: Body corrected		
		26-61	Figure 26.6 Relationship between Receive Descriptor and Receive Buffer corrected		
		26-69	Figure 26.11 Sample Reception Flowchart (Single-Frame/Single-Descriptor): Title and figure corrected		
		26-70	26.4.3 (2) Reception Error Processing, (b) Receive FIFO Overflow: Error in the body corrected		
		26-74	Table 26.5 List of ETHER Interrupts: Error in "Register and Bit" corrected (EESR0.TC)		
		26-84	26.6.3 Software Reset added		
		27. A/D Converter			
		27-25	Figure 27.9 Example of Analog Input Circuit: Note deleted		
		27-25	Table 27.8 Analog Input Pin Ratings: Note added		
		30. Video Display Controller 5 (2): Input Controller			
		30-24	Table 30.19 YCbCr/RGB Signal Reception Timing corrected		
		31. Video Display Controller 5 (3): Scaler			
		31-1	Figure 31.1 Functional Block Diagram of Scaler 0 corrected		
		31-9	31.1.4 (2) Generating a Full-Screen Enable Signal: Body corrected		
		31-27	Table 31.29 Frame Buffer Transfer Mode: Description corrected		
		31-61	31.2.29 Writing Mode Register (SC0_SCL1_WR1): Description of bit 0 (SC0_RES_BST_MD) corrected		
		31-74	31.2.49 Frame Buffer Control Register 1 (Graphics 0) (GR0_FLM1): Note corrected		
		33. Video Display Controller 5 (5): Image Synthesizer			
33-22	33.1.14 Alpha Blending Calculation: Body corrected				

Rev.	Date	Description	
		Page	Summary
3.00	Nov 30, 2016	33-27	Table 33.28 CLUT Table Configuration: Abbreviation corrected
		34. Video Display Controller 5 (7): Output Controller	
		34-4	34.1.6 (2) Offset calculation formulas for each area: Calculation formula corrected
		34-34	34.2.4 Area Setting Register G1 in Gamma Correction Block (GAM_G_AREA1): Error corrected
		34-35	34.2.5 Area Setting Register G2 in Gamma Correction Block (GAM_G_AREA2): Error corrected
		34-45	34.2.14 Area Setting Register B1 in Gamma Correction Block (GAM_B_AREA1): Error corrected
		34-46	34.2.15 Area Setting Register B2 in Gamma Correction Block (GAM_B_AREA2): Error corrected
		34-56	34.2.24 Area Setting Register R1 in Gamma Correction Block (GAM_R_AREA1): Error corrected
		34-57	34.2.25 Area Setting Register R2 in Gamma Correction Block (GAM_R_AREA2): Error corrected
		36. Capture Engine Unit	
		36-2	Table 36.1 Functional Overview of CEU: The description of "Binary data" within the classification of "Connectable camera" corrected
		36-5	Figure 36.2 Register Plane Switching Timing (VD Polarity is High-Active in Data Enable Fetch Mode): Title corrected
		36-7	Body corrected
		36-12 to 36-13	36.4.3 Capture Interface Control Register (CAMCR): Body corrected. Description of bit 27 (VDSEL), bit 26 (HDSEL), bit 25 (FLDSEL), and bit 24 (DSEL) added. Description of bits 5 and 4 (JPG[1:0]) and bit 1 (VDPOL) corrected. Note added.
		36-14	Body corrected
		36-15	Figure 36.14 Relationship between the VIO_VD and VIO_HD signals and the VD Interrupt when VD and HD are High-Active (in Image Capture Mode or Data Synchronous Fetch Mode): Title corrected
		36-15	Figure 36.15 Relationship between the VIO_VD and VIO_HD signals and the VD Interrupt when VD and HD are High-Active (in Image Capture Mode or Data Synchronous Fetch Mode) added
		36-47	36.4.22 Capture Event Flag Clear Register (CETCR): Description of bit 9 (VD) corrected
		36-59	36.5.1 (1) Clock Frequency: Body corrected
		36-60	36.5.4 Software Reset added
		37. SCUX	
		37-3	Table 37.1 Pin Configuration: Note 1 added to MLB_CLK
		37-70	37.3.68 FFD0_n Timing Select Register (FDTSELn_CIM) (n = 0, 1, 2, 3): Description of bits 3 to 0 (SCKSEL) corrected
		37-71	Figure 37.4 Configuration Diagram of Input Timing Signal Selector corrected
		37-72	37.3.69 FFU0_n Timing Select Register (FDTSELn_CIM) (n = 0, 1, 2, 3): Description of bits 3 to 0 (SCKSEL) corrected
		37-73	Figure 37.5 Configuration Diagram of Output Timing Signal Selector corrected
		37-114	37.5 Usage Note added
		38. SD Host Interface	
		38-1 to 38-56	Some specifications that don't require an NDA have been disclosed.
		39. MMC Host Interface	
		39-42	39.8.3 Software Reset added
		40. On-Chip RAM	
		40-1	40.1 Features: Body corrected
		40-1	Table 40.1 Address Spaces of On-Chip Large-Capacity RAM: Note added
		41. Ports	
		41-12	Table 41.7 Alternative Functions for Which the PIPc.n.PIPcn.m Bit Should be Set to 0: SSITxD4 deleted
		41-13	41.3.15 Serial Sound Interface Noise Canceler Control Register (SNCR): Body corrected, description of bit 6 (ETSEL) added, and note added
		41-17	Table 41.15 Pin Function (P2): Table corrected, and note added
		41-19	Table 41.19 Pin Function (P4): Table corrected, and note added
		41-20	Table 41.21 Pin Function (P5): Table corrected, and note added
		41-21	Table 41.23 Pin Function (P6): Table corrected, and notes 1 to 3 added
		41-23	Table 41.25 Pin Function (P7): Table corrected, and notes 1 and 2 added

Rev.	Date	Description	
		Page	Summary
3.00	Nov 30, 2016	42. Power-Down Modes	
		42-3	Table 42.2 Register Configuration corrected
		42-6	42.2.3 Standby Control Register 3 (STBCR3): Note 1 added to bit 7 (MSTP37) and bit 5 (MSTP35)
		42-9	42.2.6 Standby Control Register 6 (STBCR6): Description of bit 1 (MSTP61) added, and note 2 added to bit 1 (MSTP61)
		42-11	42.2.8 Standby Control Register 8 (STBCR8): Description of bit 2 (MSTP82) added, note 2 added to bit 3 (MSTP83), and note 3 added to bit 2 (MSTP82)
		42-13	42.2.10 Standby Control Register 10 (STBCR10): Note 1 added to bit 2 (MSTP102)
		42-15	42.2.12 Standby Control Register 12 (STBCR12): Note added
		42-17	42.2.14 Software Reset Control Register 2 (SWRSTCR2) added
		42-22	42.2.19 Standby Request Register 1 (STBREQ1): Description of bit 3 (STBRQ13) and bit 2 (STBRQ12) added, and note 2 added to bit 3 (STBRQ13) and bit 2 (STBRQ12)
		42-23	42.2.20 Standby Request Register 2 (STBREQ2): Note 2 added to bit 7 (STBRQ27)
		42-24	42.2.21 Standby Acknowledge Register 1 (STBACK1): Description of bit 3 (STBAK13) and bit 2 (STBAK12) added, and note 2 added to bit 3 (STBAK13) and bit 2 (STBAK12)
		42-25	42.2.22 Standby Acknowledge Register 2 (STBACK2): Note 2 added to bit 7 (STBAK27)
		42-34	42.3.2 (1) Transition to Software Standby Mode: Body corrected
		42-36	42.3.4 (1) Transition to Deep Standby Mode: Body corrected
		42-39	42.3.4 (2) Canceling Deep Standby Mode: Body corrected
		42-41	42.3.5 (1) Transition to Module Standby Function: Body corrected
		43-42	42.3.6 Software Reset: Body corrected
		42-42	42.3.7 Adjustment of XTAL Crystal Oscillator Gain: Body corrected
		42-43	42.4.3 Usage Notes Applying when the USB_X1 Pin is not to be Used added
		43. Debugger Interface	
		43-5	Table 43.7 Pin Configuration: Function of the test data output (pin name: TDO) corrected, and note corrected
		43-6	Table 43.8 List of Registers of Boundary-Scan TAP Controller: Initial value of ID register (BSID) corrected, and notes 1 and 2 added
		43-11	43.3.4 ID Register (BSID): Initial value and description of bits 31 to 0 (DID[31:0]) corrected, and notes 1 and 2 added
		43-15	Table 43.12 Reset Signal Setting: Note 2 corrected, and note 3 added
		44. JPEG Codec Unit	
		44-1 to 44-46	Added
		45. EthernetAVB	
		45-1 to 45-198	Added
		46. List of Registers	
		46-1 to 46-66	Table 46.1 Register Addresses: Register addresses of SD host interface, JPEG codec unit, and EthernetAVB added. Notes 1 and 2 added.
		46-67 to 46-227	Table 46.2 Register Bits: Bits of SD host interface, JPEG codec unit, and EthernetAVB added. Notes 1 to 6 added.
		46-228, 46-229	Table 46.3 Register States: Register states of SD host interface, JPEG codec unit, and EthernetAVB added. Notes 12 and 13 added.
		47. Electrical Characteristics	
		47-8	Table 47.5 Clock Timing: Table corrected, and note added
		47-9	Figure 47.3 Power-On Oscillation Settling Time corrected
		47-9	Figure 47.4 Oscillation Settling Time on Return from Standby (Return by Reset) corrected
		47-10	Figure 47.5 Oscillation Settling Time on Return from Standby (Return by NMI or IRQ) corrected
		47-10	Figure 47.6 On-chip Oscillation Circuit Oscillation Settling Time: Title and figure corrected
		47-11	Table 47.6 Control Signal Timing: Table corrected, and notes 1 and 2 added
		47-11	Figure 47.7 (1) Reset Input Timing 1: Title corrected
		47-11	Figure 47.7 (3) Reset Input Timing 2 added

Rev.	Date	Description

		47-47	Table 47.14 SPI Multi I/O Bus Controller Timing: Table corrected, and note 2 added		
		47-48	Figure 47.47 SDR Transfer Format Transmission and Reception Timing (CPHAT = 0, CPHAR = 0): Title and figure corrected		
		47-48	Figure 47.48 SDR Transfer Format Transmission and Reception Timing (CPHAT = 1, CPHAR = 1): Title and figure corrected		
		47-49	Figure 47.49 DDR Transfer Format Transmission and Reception Timing (CPHAT = 0, CPHAR = 0) (RZ/A1LU only) added		
		47-49	Figure 47.50 DDR Transfer Format Transmission and Reception Timing (CPHAT = 1, CPHAR = 1) (RZ/A1LU only) added		
		47-49	Figure 47.51 Timing for Switching the Buffers on and off (CPHAT = 0, CPHAR = 0) corrected		
		47-49	Figure 47.52 Timing for Switching the Buffers on and off (CPHAT = 1, CPHAR = 1) corrected		
		47-51	Table 47.16 Serial Sound Interface Timing: Table corrected, and note added		
		47-54	47.4.13 Media Local Bus Timing: Description added		
		47-56	47.4.15 Ethernet Controller and EthernetAVB Timing: Title corrected, and description added		
		47-56	Table 47.19 Ethernet Controller and EthernetAVB Timing: Title and table corrected, and note added		
		47-57	Figure 47.65 gPTP Timer External Clock Timing added		
		47-58	Figure 47.66 Timer Capture Signal Timing added		
		47-62	Table 47.24 Video Display Controller 5 Timing: Table corrected, and notes 1 and 2 added		
		47-64	Table 47.25 Capture Engine Unit Module Signal Timing corrected		
		47-65	Figure 47.78 (1) Capture Engine Unit Module Signal Timing when Data is Captured at the Rising Edges of VIO_CLK : Title and figure corrected		
		47-65	Figure 47.78 (2) Capture Engine Unit Module Signal Timing when Data is Captured at the Falling Edges of VIO_CLK (RZ/A1LU and RZ/A1LC Only) added		
		47-69	47.4.23 AC Characteristics Measurement Conditions: Body corrected		
		48. States and Handling of Pins			
		48-2, 48-3, 48-4, 48-5	Table 48.1 Pin States: Table corrected, [Legend] corrected, notes 2 and 14 corrected, and notes 16 and 17 added		
		48-6	Table 48.2 Handling of Unused Pins (Except for Debugger Interface Pins): Note 2 added		
		48-6	Table 48.3 Handling of Debugger Interface Pins (when Emulator is not Used): Note 3 added		
		4.00	Mar 19, 2018	All	Trademarks of Arm changed
				1. Overview	
				1-3	Table 1.1 Features of RZ/A1L, RZ/A1LU, and RZ/A1LC: Specification of SPI multi I/O bus controller corrected
				1-4	Table 1.1 Features of RZ/A1L, RZ/A1LU, and RZ/A1LC: Specification of media local bus (RZ/A1L only) corrected
1-8	Table 1.1 Features of RZ/A1L, RZ/A1LU, and RZ/A1LC: "233-pin BGA" added to specification of Package				
1-9	Table 1.2 Product Lineup: R7S721031VCBG and R7S721031VLBG added to the RZ/A1LU group				
1-13	Figure 1.4 Pin Assignment of the 233-pin BGA (Upper Perspective View): Newly added				
1-16	Table 1.3 Pin Functions: I/O column of the RTS2 to RTS0 and CTS2 to CTS0 pins in the serial communication interface with FIFO corrected				
1-19	Table 1.3 Pin Functions: Symbol of capture engine unit corrected				
1-20 to 1-24	Table 1.4 List of Pins: Column "233 BGA" and note on pins to which the PVcc, Vcc, and Vss functions can be allocated on 233-pin BGA products added				
2. CPU					
2-2	Table 2.1 Cortex-A9 Configuration Signal Settings: Setting value of CLUSTERID signal corrected				
6. Clock Pulse Generator					
6-20	6.11 Usage Note added and 6.11.1 Notes on the SSCG added				
7. Interrupt Controller					
7-36	Figure 7.2 Flow of Initial Settings: Description corrected				
7-40	7.8.2 Notes on Selecting IRQ Interrupt Pin Functions: Body corrected				
7-41	7.8.4 Notes on Using IRQ Pins as Triggers for Release from Standby when Software Standby is in Use: Newly added				

Rev.	Date	Description		
		Page	Summary	
4.00	Mar 19, 2018	8. Bus State Controller		
		8-27	8.4.4 SDRAM Control Register (SDCR): Description of bit 10 (RMODE) corrected	
		16. Renesas Serial Peripheral Interface		
		16-12	Table 16.3 Relationship between SPBR and BRDV1 and BRDV0 Settings: Note 1 added	
		18. I ² C Bus Interface		
		18-40	Table 18.21 Examples of RIICnBRH/RIICnBRL Settings for Transfer Rate (when RIICnFER.SCLE = 1 and RIICnFER.NFE = 0): Description corrected	
			Table 18.22 Examples of RIICnBRH/RIICnBRL Settings for Transfer Rate (when RIICnFER.SCLE = 1, RIICnFER.NFE = 1, and Number of NF Stages = 4): Description corrected	
		20. Media Local Bus		
		20-1	20.1 Features: Body corrected	
		20-2	20.3 Register Description: Body corrected	
		20-2	Table 20.2 Register Configuration: Note 1 corrected	
		25. LIN Interface		
		25-31	25.3.1.19 RLN3nLDBRm — LIN Data Buffer m Register (m = 1 to 8): Description under "For response reception" corrected	
		26. Ethernet Controller		
		26-4	Table 26.2 Register Configuration: CAM entry table specification enable register (common), CAM entry table POST 1 register, CAM entry table POST 2 register, CAM entry table POST 3 register, and CAM entry table POST 4 register added	
		26-22	26.3.21 CAM Entry Table Specification Enable Register (Common) (TSU_FWSLC): Newly added	
		26-27	26.3.25 CAM Entry Table POST 1 Register (TSU_POST1): Newly added	
		26-28	26.3.26 CAM Entry Table POST 2 Register (TSU_POST2): Newly added	
		26-29	26.3.27 CAM Entry Table POST 3 Register (TSU_POST3): Newly added	
		26-30	26.3.28 CAM Entry Table POST 4 Register (TSU_POST4): Newly added	
		26-66	26.4.1 (2) (b) Receive Descriptor 1 (RD1): Descriptions of bits 31 to 16 (RBL[15:0]) and bits 15 to 0 (RDL[15:0]) corrected	
		26-93	Figure 26.23 Data Subject to Checksum Calculation and Figure 26.24 Data after Checksum Data Addition: Corrected	
		29. Video Display Controller 5 (1): Overview		
		29-1	Table 29.1 Features of Video Display Controller 5: Function of operating frequency corrected	
		31. Video Display Controller 5 (3): Scaler		
		31-23	Table 31.22 Control of Interrupt on Specified Image Line before Scaling-down, and Reading of Current Image line before Scaling-down: Description of the SC_RES_LINE[10:0] bits of the SC_SCL0_INT register corrected	
		31-46	31.2.11 Interrupt Control Register (SC0_SCL0_INT): Description of bits 10 to 0 (SC0_RES_LINE[10:0]) corrected	
		33. Video Display Controller 5 (5): Image Synthesizer		
		33-22	33.1.15 CLUT Table: Body corrected	
		33-23	33.1.16 Multiplication Processing with Current Alpha at Alpha Blending in Rectangular Area: Body corrected	
		35. Video Display Controller 5 (8): System Controller		
		35-1	Table 35.1 Interrupt Signals: Function of the INT_STA 9 bit of the S0_WLINE request source corrected	
		35-2	Table 35.2 Interrupt Clear/Hold Settings: Description of the INT_STA9 bit of the SYSCNT_INT2 register corrected	
		35-3	Table 35.3 Interrupt Output On/Off Settings: Description of the INT_OUT9_ON bit of the SYSCNT_INT5 register corrected	
		35-9	35.2.2 Interrupt Control Register 2 (SYSCNT_INT2): Description of bit 4 (INT_STA9) corrected	
		35-11	35.2.4 Interrupt Control Register 5 (SYSCNT_INT5): Description of bit 4 (INT_OUT9_ON) corrected	
		37. SCUx		
		37-66	37.3.65 DMA Transfer Register for FFD0_n (DMATDn_CIM) (n = 0, 1, 2, 3): Body corrected	
		37-67	37.3.66 DMA Transfer Register for FFU0_n (DMATUn_CIM) (n = 0, 1, 2, 3): Body corrected	
		42. Power-Down Modes		
		42-21	42.2.18 CPU Status Register (CPUSTS): Description of bit 7 to 5 and bit 3 to 0 corrected	
		42-24	42.2.21 Standby Acknowledge Register 1 (STBACK1): Descriptions of bits 7, 6, 4, and 1 corrected	
42-25	42.2.22 Standby Acknowledge Register 2 (STBACK2): Description of bits 4 to 0 corrected			

Rev.	Date	Description

		18-86	18.13.2 Extra SCL Clock Cycle Output Function: Body corrected		
		18-86	Figure 18.40 Extra SCL Clock Cycle Output Function (CLO Bit): Corrected		
		25. LIN Interface			
		25-52	25.8 LIN Self-Test Mode: Body corrected		
		25-55	25.8.2 Transmission in LIN Master Self-Test Mode Settings for the baud rate, noise filter, and interrupt output related registers: The setting of the RLN3nLWBR register was corrected and *1 was deleted.		
		25-55	25.8.2 Transmission in LIN Master Self-Test Mode Settings for the interrupt enable and error enable related registers: *2 was added to the setting of the RLN3nLIE register.		
		25-55	25.8.2 Transmission in LIN Master Self-Test Mode: Note 1 was corrected.		
		25-56	25.8.3 Reception in LIN Master Self-Test Mode Settings for the baud rate, noise filter, and interrupt output related registers: The setting of the RLN3nLWBR register was corrected and *1 was deleted.		
		25-56	25.8.3 Reception in LIN Master Self-Test Mode Settings for the interrupt enable and error enable related registers: *2 was added to the setting of the RLN3nLIE register.		
		25-56	25.8.3 Reception in LIN Master Self-Test Mode: Note 1 was corrected.		
		29. Video Display Controller 5 (1): Overview			
		29-1	Table 29.1 Features of Video Display Controller 5 Input video image specification: The specification of the 8-bit input conforming to ITU-R BT.656 extended standard was corrected.		
		29-3	Figure 29.1 Video Display Controller 5 Former Stage Block Diagram: Note (*) was added.		
		29-3	Figure 29.2 Video Display Controller 5 Middle Stage Block Diagram: Note (*) was added.		
		30. Video Display Controller 5 (2): Input Controller			
		30-33	Table 30.27 Register Configuration of Input Controller: The table title was corrected.		
		30-33	Table 30.28 Register Configuration of Image Quality Adjustment Block: The table title was corrected.		
		31. Video Display Controller 5 (3): Scaler			
		31-19	Table 31.16 Horizontal Scale Up Control: The description for the SC_SCL0_US4 register was corrected.		
		31-20	Table 31.17 Vertical Scale Up Control: The description for the SC_SCL0_US4 register was corrected.		
		31-56	31.2.22 Scaling-Up Control Block Input Size Register (SC0_SCL0_US4) Bit function table: The descriptions for the SC0_RES_IN_VW[10:0] and SC0_RES_IN_HW[10:0] bits were corrected.		
		32. Video Display Controller 5 (4): Image Quality Improver			
		32-11, 32-12	Table 32.10 Image Quality Improver Register Configuration: The table title was corrected.		
		34. Video Display Controller 5 (7): Output Controller			
		34-26 to 34-29	Table 34.23 Gamma Correction Block Register Configuration: The table title was corrected.		
		34-29	Table 34.24 TCON Block Register Configuration: The table title was corrected.		
		34-30	Table 34.25 Output Controller Register Configuration: The table title was corrected.		
		37. SCUX			
		37-95	Table 37.12 Data Transfer Routes (1) Route SSIF → SRC → FFU: The module names from No. 5 through 8 were corrected.		
		38. SD Host Interface			
		38-1	The description regarding non-disclosure agreement was deleted.		
		(Rev.4.00)	38.1.4 SD Card Hardware Interface: Deleted		
		38-7	38.2.3 Data STOP Register (SD_STOP) Bit function table: The description for the STP bit was corrected.		
		38-20	38.2.16 SDIO Mode Control Register (SDIO_MODE) Bit function table: The description for the IOABT bit was corrected.		
		38-27	Figure 38.5 The figure title was corrected to Reading from SD_BUF0.		
		(Rev.4.00)	38.3.1 SD I/F, (2) Command Issue Timing within the Command Sequence: Deleted		

Rev.	Date	Description	
		Page	Summary
5.00	Mar 19, 2020	(Rev.4.00)	38.3.1 SD I/F, (3) SDIO Interrupt: Deleted
		(Rev.4.00)	38.4.1 Card Detect: Deleted
		38-34	38.4.1 Command without Data Transfer, (2) Operation Example: Deleted
		38-36	38.4.2 Single Block Read, (2) Operation Example: Deleted
		38-38	38.4.3 Single Block Write, (2) Operation Example: Deleted
		38-40	38.4.4 Multiple Block Read, (2) Operation Example: Deleted
		38-42	38.4.5 Multiple Block Write, (2) Operation Example: Deleted
		38-44	38.4.6 IO_RW_DIRECT Command (CMD52), (2) Operation Example: Deleted
		38-46	38.4.7 IO_RW_EXTENDED Command (CMD53/Multiple Block Read), (2) Operation Example: Deleted
		38-48	38.4.8 IO_RW_EXTENDED Command (CMD53/Multiple Block Write), (2) Operation Example: Deleted
		(Rev.4.00)	38.6 Electrical Characteristics: Deleted
		43. Debugger Interface	
		43-7	43.3.3 Boundary Scan Register (SDBSR): Body corrected
		43-7 to 47-10	Table 43.10 Correspondence between the Pins of the RZ/A1L and RZ/A1LC Group Products and the Boundary Scan Register Bits: The table title was corrected.
		43-11 to 43-14	Table 43.11 Correspondence between the Pins of the RZ/A1LU Group Products and the Boundary Scan Register Bits: Added
		46. List of Registers	
		46-103, 46-104	Table 58.2 Register Bits: I ² C bus interface RIIC0SER, RIIC1SER, RIIC2SER, and RIIC3SER registers: The names of bits 2 to 0 were corrected.
		47. Electrical Characteristics	
		47-2	Table 47.2 DC Characteristics (1) [Common Items]: The description of Three-state leakage current was corrected.
		47-3	Table 47.2 DC Characteristics (2) [Current Consumption]: The typical values of Current consumption in normal operation were corrected.
47-5	Table 47.2 DC Characteristics (4) [I ² C Bus Interface Related Pins*]: Note was corrected.		
6.00	Jan 29, 2021	3. Boot Mode	
		3-1	3. Boot Mode: Body corrected and note 1 added
		6. Clock Pulse Generator	
		6-15	Figure 6.5 Clock Signals for the System and Realtime Clock: Description of peripheral clocks 0C and 1C added
		9. Direct Memory Access Controller	
		9-36	Table 9.4 On-Chip Peripheral Module Requests: Setting of the TM bit in the CHCFG_n register for the A/D converter corrected
		9-38	Table 9.4 On-Chip Peripheral Module Requests: DMA transfer request signals of I ² C bus interface channels 0 to 3 corrected
		26. Ethernet Controller	
		26-64	26.4.1 Descriptors and Descriptor List, (a) Receive Descriptor 0 (RD0): Description of bit 27 (RFE) corrected
		27. A/D Converter	
27-21	27.5 Interrupt Sources and DMA Transfer Request, (a) ADI Interrupt: Body corrected
