

5V/3.3V 1:5 Clock Distribution

Features

3.3V and 5V power supply options

70fs_{RMS} typical additive phase jitter

Typical 30ps output-to-output skew

75kΩ internal input pull-down resistors

Available in 20-pin SOIC package

• Max. 50ps output-to-output skew

Synchronous enable/disable

Processor clock distribution

Fibre Channel clock distribution

Gigabit Ethernet clock distribution

SONET clock distribution

Multiplexed clock input

Applications

General Description

The SY100EL14V is a low-skew, 1:5 clock distribution chip designed explicitly for low-skew clock distribution applications. The device can be driven by either a differential or single-ended ECL or, if positive power supplies are used, PECL input signal. The EL14V is suitable for operation in systems operating with 3.3V to 5.0V supplies. If a single-ended input is to be used, the V_{BB} output should be connected to the /CLK input and bypassed to ground via a 0.01μ F capacitor. The V_{BB} output is designed to act as the switching reference for the input of the EL14V under single-ended input conditions. As a result, this pin can only source/sink up to 0.5mA of current.

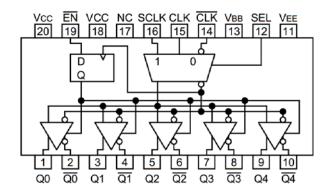

The EL14V features a multiplexed clock input to allow for the distribution of a lower speed scan or test clock along with the high speed system clock. When LOW (or left open and pulled LOW by the input pull-down resistor), the SEL pin will select the differential clock input.

The common enable (/EN) is synchronous, so that the outputs will only be enabled/disable when they are already in the LOW state. This avoids any chance of generating a runt clock pulse when the device is enabled/disabled as can happen with an asynchronous control. The internal flip-flop is clocked on the falling edge of the input clock. Therefore, all associated specification limits are referenced to the negative edge of the clock input.

When both differential inputs are left open, CLK input will pull down to V_{EE} and /CLK input will bias around $V_{CC}/2$.

Datasheets and support documentation are available on Micrel's web site at: www.micrel.com.

IIH	Input High Current				150	μA	
I _{EE}	Deven Oversky Overset	$T_A = -40^{\circ}C$ to $+25^{\circ}C$		32	40	mA	
	Power Supply Current	T _A = +85°C		34	42		
V _{BB}	Output Reference Voltage		V _{CC} – 1.380		V _{CC} – 1.260	V	

Notes:

4. Exceeding the absolute maximum ratings may damage the device.

5. The device is not guaranteed to function outside its operating ratings.

6. In PECL mode operation, $V_{IN}(max) = V_{CC}$.

7. Parametric values specified at 100EL14V series: -3.0V to -5.5V.

8. Devices are ESD sensitive. Handling precautions are recommended. Human body model, $1.5k\Omega$ in series with 100pF.

9. Specification for packaged product only

10. $V_{IN} = V_{IH}(max)$ or $V_{IL}(min)$.

11. $V_{IN} = V_{IL}(max)$.

AC Electrical Characteristics

$V_{EE} = V_{EE}$ (min) to V_{EE} (max); $V_{CC} = GND$, $T_A = -40^{\circ}C$ to +85°C, unless otherwise	se stated.

4			Carrier = 622MHz Integration Range: 12kHz to 20MHz		70		- fs _{RMS}
t _{JITTER}	Additive Jitter		Carrier = 156.25MHz Integration Range: 12kHz to 20MHz		155		

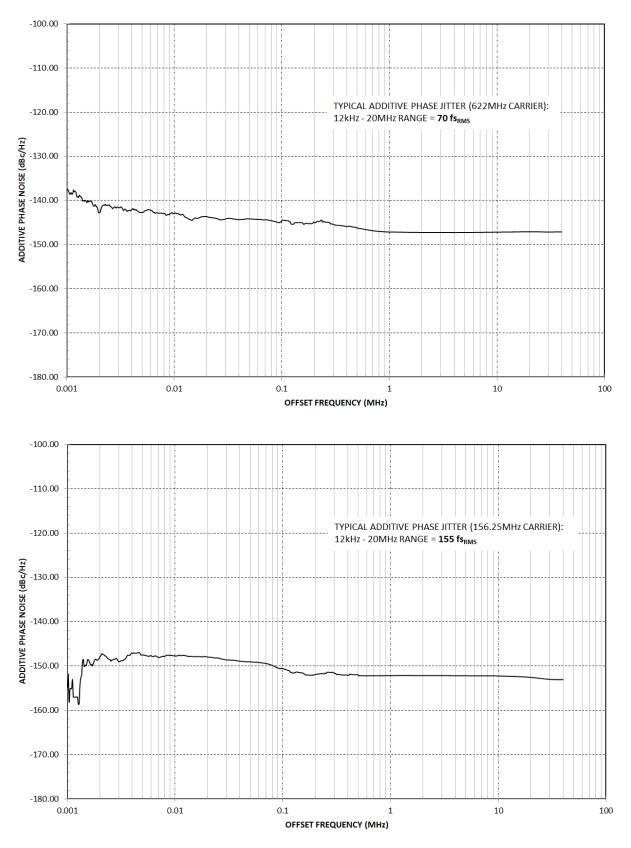

Notes:

12. Skews are specified for identical LOW-to-HIGH or HIGH-to-LOW transitions.

13. The V_{CMR} range is referenced to the most positive side of the differential input signal. Normal operation is obtained if the HIGH level falls within the specified range and the peak-to-peak voltage lies between $V_{PP}(min)$ and 1V. The lower end of the V_{CMR} range varies 1:1 with V_{EE} . The numbers in the specification table assume a nominal V_{EE} of 3.3V. For PECL operation, the $V_{CMR}(min)$ will be fixed at 3.3V – $|V_{CMR}(min)|$.

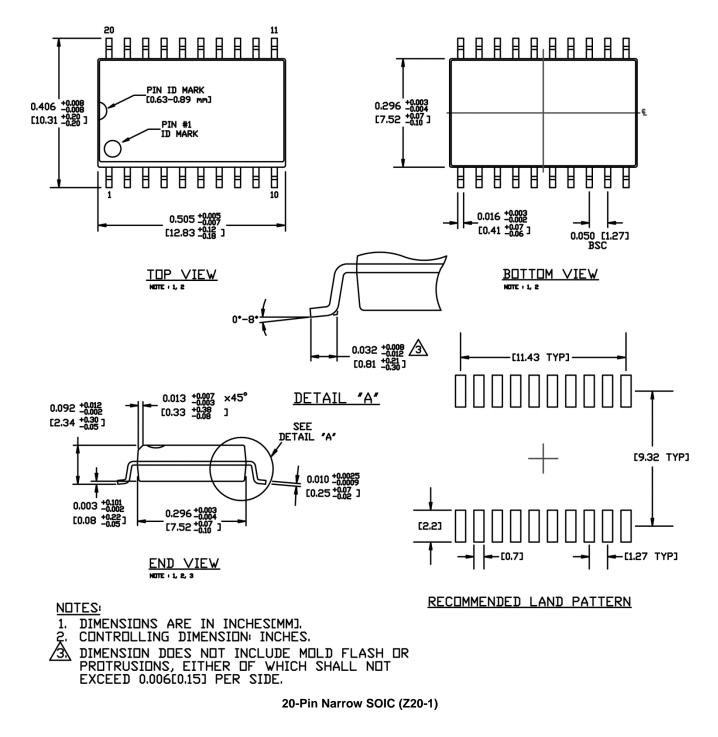

Additive Phase Noise

 $V_{CC} = +5V, T_A = 25^{\circ}.$

MICREL, INC. 2180 FORTUNE DRIVE SAN JOSE, CA 95131 USA TEL +1 (408) 944-0800 FAX +1 (408) 474-1000 WEB http://www.micrel.com

Micrel, Inc. is a leading global manufacturer of IC solutions for the worldwide high performance linear and power, LAN, and timing & communications markets. The Company's products include advanced mixed-signal, analog & power semiconductors; high-performance communication, clock management, MEMs-based clock oscillators & crystal-less clock generators, Ethernet switches, and physical layer transceiver ICs. Company customers include leading manufacturers of enterprise, consumer, industrial, mobile, telecommunications, automotive, and computer products. Corporation headquarters and state-of-the-art wafer fabrication facilities are located in San Jose, CA, with regional sales and support offices and advanced technology design centers situated throughout the Americas, Europe, and Asia. Additionally, the Company maintains an extensive network of distributors and reps worldwide.

Micrel makes no representations or warranties with respect to the accuracy or completeness of the information furnished in this datasheet.
