

USB-to-SPI Protocol Converter with GPIO (Host Mode)

Features:

Universal Serial Bus (USB)

- Supports Full-Speed USB (12 Mb/s)
- Human Interface Device (HID)
- 128-Byte Buffer to Handle Data Throughput:
 - 64-byte transmit
 - 64-byte receive
- Fully Configurable VID, PID Assignments and String Descriptor (factory programming also available)
- Bus Powered (factory default) or Self-Powered (can be selected through special USB commands)
- USB 2.0 Compliant

USB Driver and Software Support

- Uses Standard HID Drivers (built-in support on Windows® XP, Vista, 7, 8, 10, Linux and Mac OS®)
- Configuration Utility for Device's Power-up Configuration
- Utility for USB-SPI Communication, GPIO Manipulation and Miscellaneous Features Usage

SPI Host Peripheral

- Supports All Four SPI Modes (Mode 0, 1, 2, 3)
- Bit Rates from 1500 bps Up to 12 Mbps
- Configurable Delays for SPI Transactions:
 - Chip Select (assert) to 1st byte of data delay
 - Data to data delay
 - Data to Chip Select (de-assert) delay
- SPI Transactions Lengths of Up to 65535 Bytes Long
- Up to 8 Chip Select Lines – to be Used in Any Combination for a Given SPI Transaction (the Chip Select lines are shared between GPIOs and alternate function pins; certain GPs – up to 8 of them – can be assigned with the Chip Select functionality)

General Purpose Input/Output (GPIO) Pins

- Eight General Purpose I/O Pins
- One Input Only Pin

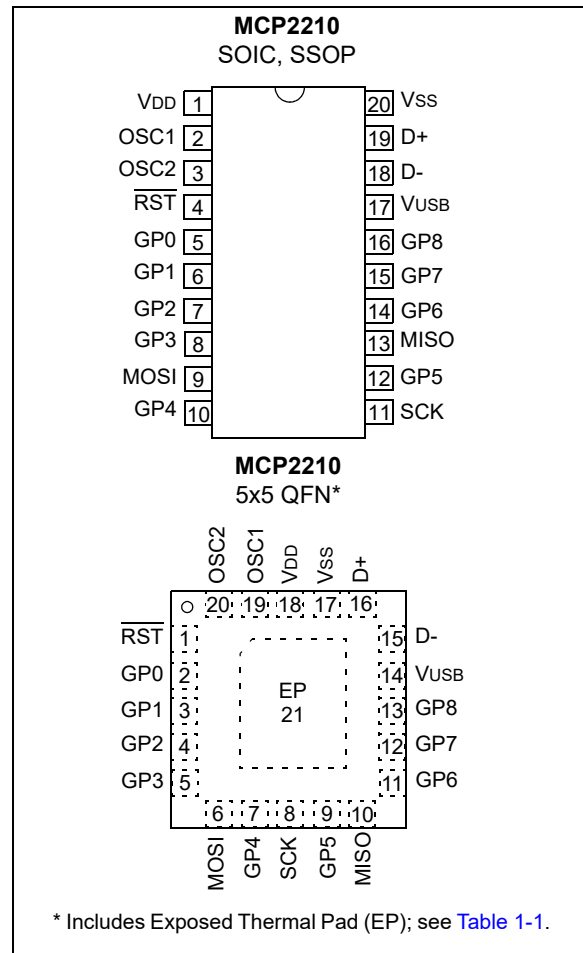

EEPROM

- 256 Bytes of User EEPROM (accessible through certain USB commands)

Package Types:

The device will be offered in the following packages:

- 20-lead QFN (5 x 5 mm)
- 20-lead SOIC
- 20-lead SSOP

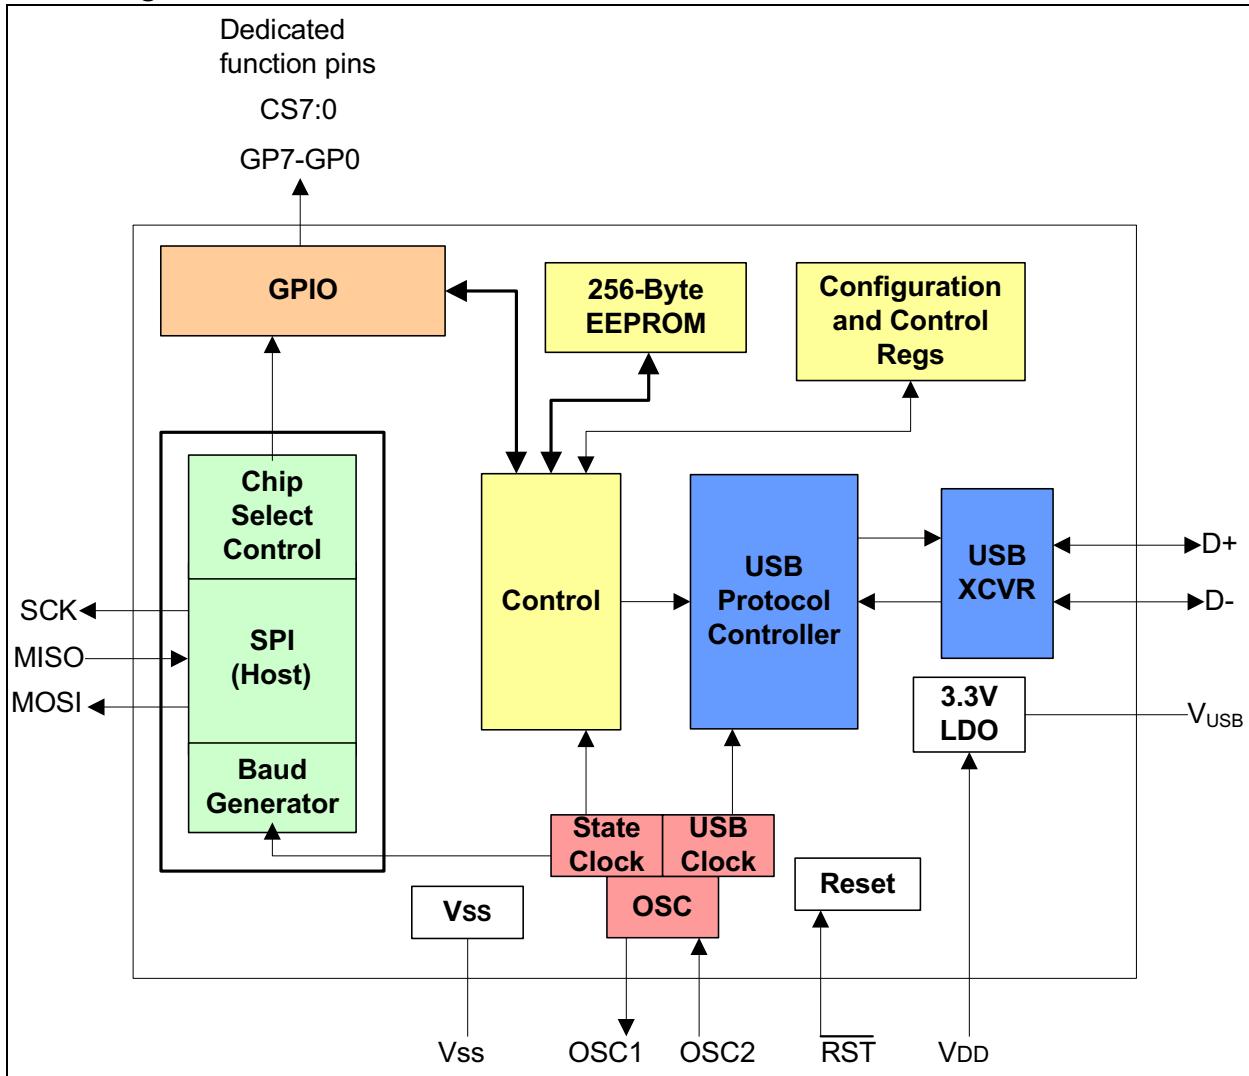

Other

- USB Activity LED Output
- SSPND Output Pin (to signal USB Suspend state)
- USBCFG Output Pin (indicates when the enumeration is completed)
- Operating Voltage: 3.3-5.5V
- Oscillator Input: 12 MHz
- Industrial Operating Temperature: -40°C to +85°C
- Passes Automotive AEC-Q100 Reliability Testing

MCP2210

Block Diagram

1.0 FUNCTIONAL DESCRIPTION

The MCP2210 device is a USB-to-SPI Host converter which enables USB connectivity in applications that have an SPI interface. The device reduces external components by integrating the USB termination resistors.

The MCP2210 also has 256 bytes of integrated user EEPROM.

The MCP2210 has nine general purpose input/output pins. Seven pins have alternate functions to indicate USB and communication status. See [Table 1-1](#) and [Section 1.6 “GP Module”](#) for details about the pin functions.

TABLE 1-1: PINOUT DESCRIPTION

MCP2210		Symbol	Type	Standard Function (GPIO)	Alternate Function 1 (Chip Selects)	Alternate Function 2 (dedicated functions)	Description
QFN	SOIC, SSOP						
1	4	RST	I	—	—	—	Reset input
2	5	GP0	I/O	GPIO0	CS0	—	General Purpose I/O
3	6	GP1	I/O	GPIO1	CS1	—	General Purpose I/O
4	7	GP2	I/O	GPIO2	CS2	USB Suspend	General Purpose I/O
5	8	GP3	I/O	GPIO3	CS3	SPI Transfer Traffic LED	General Purpose I/O
6	9	MOSI	O	—	—	—	SPI Host output
7	10	GP4	I/O	GPIO4	CS4	USB Low Power	General Purpose I/O
8	11	SCK	O	—	—	—	SPI Clock output

20	3	OSC2	O	—	—	—	Oscillator output

MCP2210

1.1 Supported Operating Systems

The following operating systems are supported:

- Windows XP/Vista/7/8/8.1/10
- Linux
- Mac OS

1.1.1 ENUMERATION

The MCP2210 will enumerate as a USB device after Power-on Reset (POR). The device enumerates as a Human Interface Device (HID) only.

1.1.1.1 Human Interface Device (HID)

The MCP2210 enumerates as an HID, so the device can be configured and all the other functionalities can be controlled. A DLL package that facilitates I/O control through a custom interface is supplied by Microchip and is available on the product landing page.

1.2 Control Module

The control module is the heart of the MCP2210. All other modules are tied together and controlled via the control module. The control module manages the data transfers between the USB and the SPI, as well as command requests generated by the USB host controller, and commands for controlling the function of the SPI and I/O.

1.2.1 SPI INTERFACE

The control module interfaces to the SPI and USB modules.

1.2.2 INTERFACING TO THE DEVICE

The MCP2210 can be accessed for reading and writing via USB host commands. The device cannot be accessed and controlled via the SPI interface.

1.3 SPI Module

The MCP2210 SPI module provides the MOSI, MISO and SCK signals to the outside world. The module has the ability to control the GP pins (as Chip Select) only if these pins are configured for Chip Select operation.

1.3.1 SPI MODULE FEATURES

The SPI module has the following configurable features:

- Bit rates
- Delays
- Chip Select pin assignments (up to 8 Chip Select lines)

All the above features are available for customization using certain USB commands.

1.3.2 SPI MODULE POWER-UP CONFIGURATION

Default parameters:

- 1 Mbit
- 4 bytes to transfer per SPI transaction
- GP1 as Chip Select line

1.4 USB Protocol Controller

The USB controller in the MCP2210 is full-speed USB 2.0 compliant.

- HID only device used for:
 - SPI transfers
 - I/O control
 - EEPROM access
 - Chip configuration manipulation
- 128-byte buffer to handle data for SPI transfers
 - 64-byte transmit
 - 64-byte receive
- Fully configurable VID, PID assignments, string descriptors (stored on-chip) and chip power-up settings (default chip settings and SPI transfer parameters)
- Bus powered or self-powered

1.4.1 DESCRIPTORS

The string descriptors are stored internally in the MCP2210 and they can be changed so when the chip enumerates, the host gets the customer's own product and manufacturer names. They can be customized to the user's needs by using the Microchip provided configuration utility or a custom built application that will send the proper USB commands for storing the new descriptors into the chip.

1.4.2 USB EVENTS

The MCP2210 provides support for signaling important USB-related events such as:

- USB Suspend and Resume – these states are signaled on the GP2, if the pin is configured for its dedicated function
 - USB Suspend mode is entered when a suspend signaling event is detected on the USB bus
 - USB Resume is signaled when one of the following events is occurring:
 - a) Resume signaling is detected or generated
 - b) A USB Reset signal is detected
 - c) A device Reset occurs
- USB device enumerated successfully (this state is signaled if the GP4 is configured for its dedicated function)
- USB Low-Power mode

1.5 USB Transceiver

The MCP2210 has a built-in, USB 2.0, full-speed transceiver internally connected to the USB module.

The USB transceiver obtains power from the VUSB pin, which is internally connected to a 3.3V internal regulator. The best electrical signal quality is obtained when VUSB is locally bypassed with a high-quality ceramic capacitor.

The internal 3.3V regulator draws power from the VDD pin. In certain scenarios, where VDD is lower than 3.3V+ internal LDO dropout, the VUSB pin must be tied to an external regulated 3.3V. This will allow the USB transceiver to work correctly, while the I/O voltage in the rest of the system can be lower than 3.3V. As an example, in a system where the MCP2210 is used and the I/O required is of 2.2V, the VDD of the chip will be tied to the 2.2V digital power rail, while the VUSB pin must be connected to a regulated 3.3V power supply.

1.5.1 INTERNAL PULL-UP RESISTORS

The MCP2210 device has built-in pull-up resistors designed to meet the requirements for full-speed USB.

1.5.2 MCP2210 POWER OPTIONS

The following are the main power options for the MCP2210:

- USB Bus Powered (5V)
- Self Powered (from 3.3V to 5V), while the VUSB pin is supplied with 3.3V (regulated). If the VDD is powered with 5V, then the VUSB will be powered by the internal regulator and the VUSB pin will need only a decoupling capacitor

1.5.2.1 Internal Power Supply Details

MCP2210 offers various options for power supply. To meet the required USB signaling levels, MCP2210 device incorporates an internal LDO used solely by the USB transceiver, in order to present the correct D+ / D- voltage levels.

Figure 1-1 shows the internal connections of the USB transceiver LDO in relation with the VDD power supply rail. The output of the USB transceiver LDO is tied to the VUSB line.

A capacitor connected to the VUSB pin is required if the USB transceiver LDO provides the 3.3V supply to the transceiver.

FIGURE 1-1: MCP2210 INTERNAL POWER SUPPLY DETAILS

The provided VDD voltage has a direct influence on the voltage levels present on the GPIO and SPI module pins (GP8-GP0, MOSI, MISO and SCK). When VDD is 5V, all of these pins will have a logical '1' around 5V with the variations specified in [Section 4.1 "DC Characteristics"](#).

For applications that require a 3.3V logical '1' level, VDD must be connected to a power supply providing the 3.3V voltage. In this case, the internal USB transceiver LDO cannot provide the required 3.3V power. It is necessary to also connect the VUSB pin of the MCP2210 to the 3.3V power supply rail. This way, the USB transceiver is powered up directly from the 3.3V power supply.

1.5.2.2 USB Bus Powered (5V)

In Bus Power Only mode, the entire power for the application is drawn from the USB (see [Figure 1-2](#)). This is effectively the simplest power method for the device.

FIGURE 1-2: BUS POWER ONLY

MCP2210

In order to meet the inrush current requirements of the USB 2.0 specifications, the total effective capacitance appearing across VBUS and ground must be no more than 10 μF . If it is more than 10 μF , some kind of inrush limiting is required. For more details on Inrush Current Limiting, see the current *Universal Serial Bus Specification*.

According to the USB 2.0 specification, all USB devices must also support a Low-Power Suspend mode. In the USB Suspend mode, devices must consume no more than 500 μA (or 2.5 mA for high powered devices that are remote wake-up capable) from the 5V VBUS line of the USB cable.

The host signals the USB device to enter Suspend mode by stopping all USB traffic to that device for more than 3 ms.

The USB bus provides a 5V voltage. However, the USB transceiver requires 3.3V for the signaling (on D+ and D- lines).

During USB Suspend mode, the D+ or D- pull-up resistor must remain active, which will consume some of the allowed suspend current budget (500 μA /2.5 mA).

The VUSB pin is required to have an external bypass capacitor. It is recommended that the capacitor be a ceramic cap, between 0.22 and 0.47 μF .

Figure 1-3 shows a circuit where the MCP2210 internal LDO is used to provide 3.3V to the USB transceiver.

The voltage on the VDD affects the voltage levels onto the GP and SPI module pins (GP8-GP0, MOSI, MISO and SCK). With VDD at 5V, these pins will have a logic '1' of 5V with the variations specified in Section 4.1 "DC Characteristics".

FIGURE 1-3: TYPICAL POWER SUPPLY OPTION USING THE 5V PROVIDED BY THE USB

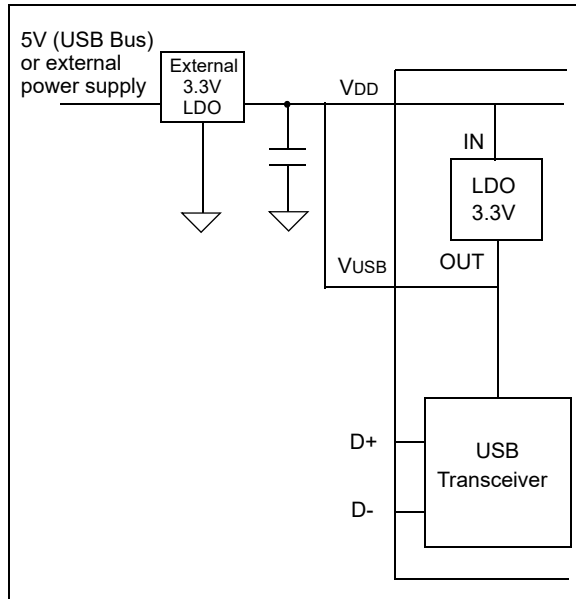

1.5.2.3 3.3V – Self Powered

Typically, many embedded applications are using 3.3V or lower power supplies. When such an option is available in the target system, MCP2210 can be powered up (VDD) from the existing power supply rail. The typical connections for MCP2210 powered from 3.3V rail are shown in Figure 1-4.

In this example MCP2210 has both VDD and VUSB lines tied to the 3.3V rail. These tied connections disable the internal USB transceiver LDO of the MCP2210 to regulate the power supply on VUSB pin. Another consequence is that the '1' logical level on the GP and SPI pins will be at the 3.3V level, in accordance with the variations specified in Section 4.1 "DC Characteristics".

FIGURE 1-4: USING AN EXTERNALLY PROVIDED 3.3V POWER SUPPLY

1.6 GP Module

The GP module features eight I/O lines and one input line.

1.6.1 CONFIGURABLE PIN FUNCTIONS

The pins can be configured as:

- GPIO – individually configurable, general purpose input or output
- Chip Select pins – used by the SPI module
- Alternate function pins – used for miscellaneous features such as:
 - $\overline{\text{SSPND}}$ – USB Suspend and Resume states
 - $\overline{\text{USBCFG}}$ – indicates USB configuration status
 - $\overline{\text{LOWPWR}}$ – signals when the host does not accept the requirements (presented during enumeration) and the chip is not configured. In this mode, the whole system powered from the USB host should draw up to 100 mA.
 - External Interrupt Input – used to count external events
 - SPI bus Release Request – used to request SPI bus access from the MCP2210
 - SPI bus Release Acknowledge – used to acknowledge when the MCP2210 has released the SPI bus
 - LED – indicates SPI traffic led

1.6.1.1 GPIO Pins Function

The GP7-0 pins (if enabled for GPIO functionality) can be used as digital inputs/outputs. The GP8 pin can be used only as a digital input.

These pins can be read (both inputs and outputs) and written (only the outputs).

1.6.1.2 Chip Select Pins Function

The GP pins (if enabled for the Chip Select functionality) are controlled by the SPI module. Their Idle/Active value is determined by the SPI transfer parameters.

1.6.1.3 $\overline{\text{SSPND}}$ Pin Function

The GP2 pin (if enabled for this functionality) reflects the USB state (Suspend/Resume). The pin is active 'low' when the Suspend state has been issued by the USB host.

Likewise, the pin drives 'high' after the Resume state is achieved.

This pin allows the application to go into Low-Power mode when USB communication is suspended, and switches to a full active state when USB activity is resumed.

1.6.1.4 $\overline{\text{USBCFG}}$ Pin Function

The GP5 pin (if enabled for this functionality) starts out 'high' during power-up or after Reset, and goes 'low' after the device successfully configures to the USB. The pin will go 'high' when in Suspend mode and 'low' when the USB resumes.

1.6.1.5 $\overline{\text{LOWPWR}}$ Pin Function

The GP4 pin (if enabled for this functionality) starts out 'low' during power-up or after Reset, and goes 'high' after the device successfully configures to the USB. The pin will go 'low' when in Suspend mode and 'high' when the USB resumes.

1.6.1.6 External Interrupt Input Pin Function

The GP4 pin (if enabled for this functionality) is used as an interrupt input pin and it will count interrupt events such as:

- Falling edges
- Rising edges
- Low-logic pulses
- High-logic pulses

1.6.1.7 SPI Bus Release Request Pin Function

The GP8 pin (if enabled for this functionality) is used by an external device to request the MCP2210 to release the SPI bus. This way, more than one SPI host can have access to the SPI client chips on the bus. When this pin is driven 'low', the MCP2210 will examine the request and, based on the conditions and internal logic, it might release the SPI bus. If there is an ongoing SPI transfer taking place at the moment when an external device requests the bus, MCP2210 will release it after the transfer is completed or if the USB host cancels the current SPI transfer.

1.6.1.8 SPI Bus Release Acknowledge Pin Function

The GP7 pin (if enabled for this functionality) is used by the MCP2210 to signal back if the SPI bus was released. When a SPI bus release request is registered by the MCP2210, based on the condition and internal logic, the chip might release the bus. The bus is released immediately if there is no SPI transfer taking place, or it will do so after the current SPI transfer is finished or cancelled by the USB host.

1.6.1.9 LED Pin Function

The GP3 pin (if enabled for this functionality) is used as an SPI traffic indication. When an SPI transfer is taking place (active state for this pin), this pin will be driven 'low'. When there is no SPI traffic taking place, the pin is in its inactive state or logic 'high'.

MCP2210

1.7 EEPROM Module

The EEPROM module is a 256-byte array of nonvolatile memory. The memory locations are accessed for read/write operations solely via USB host commands. The memory cells for data EEPROM are rated to endure thousands of erase/write cycles, up to 100K for EEPROM.

Data retention without refresh is conservatively estimated to be greater than 40 years.

1.8 Reset/POR

1.8.1 RESET PIN

The $\overline{\text{RST}}$ pin provides a method for triggering an external Reset of the device. A Reset is generated by holding the pin low. MCP2210 has a noise filter in the Reset path which detects and ignores small pulses.

1.8.2 POR

A POR pulse is generated on-chip whenever VDD rises above a certain threshold. This allows the device to start in the initialized state when VDD is adequate for operation.

To take advantage of the POR circuitry, tie the $\overline{\text{RST}}$ pin through a resistor (1 k Ω to 10 k Ω) to VDD. This will eliminate external RC components usually needed to create a POR delay.

When the device starts normal operation (i.e., exits the Reset condition), the device operating parameters (voltage, frequency, temperature, etc.) must be met to ensure operation. If these conditions are not achieved, the device must be held in Reset until the operating conditions are met.

1.9 Oscillator

The input clock must be 12 MHz to provide the proper frequency for the USB module. USB full-speed is nominally 12 Mb/s. The clock input accuracy is $\pm 0.25\%$ (2,500 ppm maximum).

FIGURE 1-5: QUARTZ CRYSTAL OPERATION

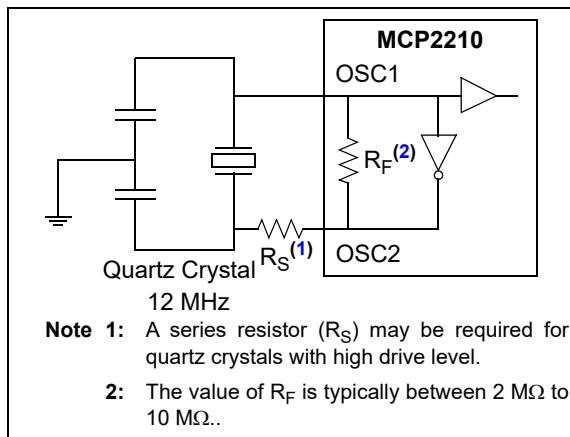

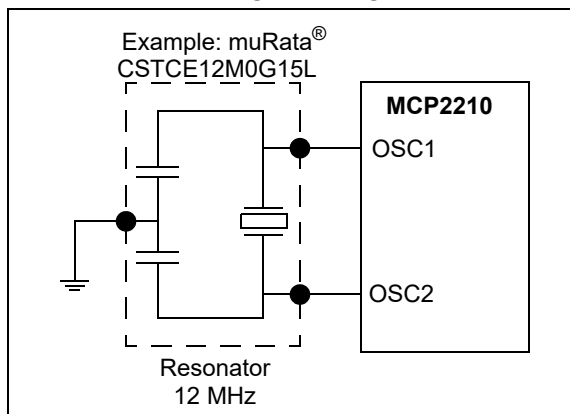

FIGURE 1-6: CERAMIC RESONATOR OPERATION

2.0 MCP2210 FUNCTIONAL DESCRIPTION

The MCP2210 uses NVRAM to store relevant chip settings. These settings are loaded by the chip during the power-up process and they are used for GP designation and SPI transfers.

The NVRAM settings at power-up (or Reset) are loaded into the RAM portion of the chip and they can be altered through certain USB commands. This is very useful since it allows dynamic reconfiguring of the GPs or SPI transfer parameters. A practical example to illustrate this mechanism is a system which uses at least two SPI client chips and the GPs in the MCP2210 for various GPIO purposes. The default SPI settings might be ok for one of the SPI client chips, but not for the 2nd. At first, the PC application will make an SPI transfer to the first chip, using the NVRAM copy of the SPI settings. Then, by sending a certain USB command, the SPI transfer settings residing in RAM will be altered in order to fit the SPI transfer requirements of the second chip.

Also, if the altered SPI transfer settings are needed to be the default power-up (or Reset) settings for SPI, the user can send a series of USB commands in order to store the current (RAM) SPI settings into NVRAM. In this way, these new settings will be the power-up default SPI settings.

The NVRAM settings and EEPROM contents can be protected by password access means, or they can be permanently locked without any possible further modification.

2.1 MCP2210 NVRAM Settings

The chip settings that can be stored in the NVRAM area are as follows:

- SPI transfer parameters:
 - SPI bit rate
 - SPI mode
 - Idle Chip Select values
 - Active Chip Select values
 - SPI transfer configurable delays
 - Number of bytes to read/write for the given SPI transfer
- GP designation:
 - GPIO
 - Chip Select
 - Dedicated function
- GPIO default direction (applies only to those GPs designated as GPIOs)
- GPIO default output value (applies only to those GPs designated as output GPIOs)

- Chip mode flags:
 - Remote wake-up capability
 - External Interrupt Pin mode (applies only when GP6 is designated for this function)
 - SPI bus release enable/disable – enable/disable the release of the SPI bus when there is no SPI transfer (useful when more than one SPI host on the bus)
- NVRAM Access mode:
 - Full access (no protection – factory default)
 - Password protection
 - Permanently locked
- Password (relevant when password protection mechanism is active)

The specified settings are loaded at power-up or Reset moments, and they can be altered through certain USB commands.

When a NVRAM conditional access method is already in place, such as password protection, the NVRAM settings modification is permitted only when the user has supplied the correct password for the chip. The RAM settings can be altered even when a password protection or permanent lock mechanism are in place. This allows the user to communicate with various SPI client chips without knowing the password, but it will not allow the modification of the power-up default settings in NVRAM.

2.2 SPI Transfers

The MCP2210 device provides advanced SPI communication features such as configurable delays and multiple Chip Select support.

The configurable delays are related to certain aspects of the SPI transfer:

- The delay between the assertion of Chip Select(s) and the first data byte (Figure 2-1)

FIGURE 2-1: CHIP SELECT TO DATA DELAY

MCP2210

- The delay between subsequent data bytes (Figure 2-2)

FIGURE 2-2: DATA-TO-DATA DELAY

- The delay between the end of the last byte (of the SPI transfer) and the de-assertion of the Chip Select(s)

FIGURE 2-3: DATA TO CHIP SELECT DELAY

For a particular SPI transfer, the user can choose any number (out of the available ones) of Chip Select pins. The SPI transfer parameters contain two fields where the user will specify the Chip Select values when the SPI transfer is active/idle. This mechanism allows the user to specify any combination of Chip Select values for the Idle mode and some other combination for the Active mode (SPI transfer active).

3.0 USB COMMANDS/RESPONSES DESCRIPTION

MCP2210 implements the HID interface for all the device-provided functionalities. The chip uses a command/response mechanism for the USB engine. This means that for every USB command sent (by the USB host) to the MCP2210, it will always reply with a response packet.

The MCP2210 USB commands can be grouped by their provided features as follows:

- [NVRAM Settings](#)
 - Read/Write NVRAM related parameters
 - Send access password
- [Read/Write RAM Settings](#) (copied from NVRAM at power-up or Reset):
 - Read/Write (volatile – RAM stored settings) SPI transfer settings
 - Read/Write (volatile – RAM stored settings) chip settings
 - Read/Write (volatile – RAM stored settings) GPIO direction
 - Read/Write (volatile – RAM stored settings) GPIO output values
- [Read/Write EEPROM Memory](#)
- [External Interrupt Pin \(GP6\) Event Status](#)
- [SPI Data Transfer](#):
 - Read/Write SPI transfer data
 - Cancels the ongoing SPI transfer
 - SPI bus release manipulation
- [Chip Status](#) and Unsupported commands

3.1 NVRAM Settings

The commands in this category are related to the NVRAM settings manipulation.

3.1.1 SET CHIP SETTINGS POWER-UP DEFAULT

TABLE 3-1: COMMAND STRUCTURE

4	Bit Rate (Byte 3) – 32-bit value (Byte 0, Byte 1, Byte 2, Byte 3) <u>Example:</u> Bit rate = 12,000,000 bps = 00B7 1B00 - This byte = 0x00 (Note 1)
5	Bit Rate (Byte 2) – 32-bit value (Byte 0, Byte 1, Byte 2, Byte 3) <u>Example:</u> Bit rate = 12,000,000 bps = 00B7 1B00 - This byte = 0x1B
6	Bit Rate (Byte 1) – 32-bit value (Byte 0, Byte 1, Byte 2, Byte 3) <u>Example:</u> Bit rate = 12,000,000 bps = 00B7 1B00 - This byte = 0xB7
7	Bit Rate (Byte 0) – 32-bit value (Byte 0, Byte 1, Byte 2, Byte 3) <u>Example:</u> Bit rate = 12,000,000 bps = 00B7 1B00 - This byte = 0x00
8	Idle Chip Select Value – 16-bit value (low byte): • MSB – – – – – – – LSB CS7 CS6 CS5 CS4 CS3 CS2 CS1 CS0
9	Idle Chip Select Value – 16-bit value (high byte): • MSB – – – – – – – LSB x x x x x x x x
10	Active Chip Select Value – 16-bit value (low byte): • MSB – – – – – – – LSB CS7 CS6 CS5 CS4 CS3 CS2 CS1 CS0
11	Active Chip Select Value – 16-bit value (high byte): • MSB – – – – – – – LSB x x x x x x x x
12	Chip Select to Data Delay (quanta of 100 μ s) – 16-bit value (low byte) <u>Example:</u> If a 500 μ s delay between the CS being asserted and the first byte of data is required, the value will be 0x0005. - Fill this byte position with: 0x05
13	Chip Select to Data Delay (quanta of 100 μ s) – 16-bit value (high byte) <u>Example:</u> If a 500 μ s delay between the CS being asserted and the first byte of data is required, the value will be 0x0005. - Fill this byte position with: 0x00
14	Last Data Byte to CS (de-asserted) delay (quanta of 100 μ s) – 16-bit value (low byte) <u>Example:</u> If a 500 μ s delay between the last data byte sent and the CS being de-asserted is required, the value will be 0x0005. - Fill this byte position with: 0x05
15	Last Data Byte to CS (de-asserted) delay (quanta of 100 μ s) – 16-bit value (high byte) <u>Example:</u> If a 500 μ s delay between the last data byte sent and the CS being de-asserted is required, the value will be 0x0005. - Fill this byte position with: 0x00

Note 1: The open interval of bit rates between 3 Mbps and 12 Mbps will be automatically limited to 3 Mbps.

MCP2210

TABLE 3-4: COMMAND STRUCTURE (CONTINUED)

Byte Index	Meaning
16	Delay Between Subsequent Data Bytes (quanta of 100 μ s) – 16-bit value (low byte) <u>Example:</u> If a 500 μ s delay between two consecutive data bytes is required, the value will be 0x0005. - Fill this byte position with: 0x05
17	Delay Between Subsequent Data Bytes (quanta of 100 μ s) – 16-bit value (high byte) <u>Example:</u> If 500 μ s delay between two consecutive data bytes is required, the value will be 0x0005. - Fill this byte position with: 0x00
18	Bytes to Transfer per SPI Transaction – 16-bit value (low byte) <u>Example:</u> If an SPI transaction of 1250 bytes long is required, the corresponding hex value will be 0x04E2. - Fill this byte position with: 0xE2
19	Bytes to Transfer per SPI Transaction – 16-bit value (high byte) <u>Example:</u> If an SPI transaction of 1250 bytes long is required, the corresponding hex value will be 0x04E2. - Fill this byte position with: 0x04
20	SPI Mode <ul style="list-style-type: none"> • 0x00 – SPI mode 0 • 0x01 – SPI mode 1 • 0x02 – SPI mode 2 • 0x03 – SPI mode 3
21 - 63	Reserved – fill with 0x00

Note 1: The open interval of bit rates between 3 Mbps and 12 Mbps will be automatically limited to 3 Mbps.

3.1.2.1 Responses

TABLE 3-5: RESPONSE 1 STRUCTURE

Byte Index	Meaning
0	0x60 – Set Chip NVRAM Parameters – echoes back the given command code
1	0xFB – Blocked Access – Access password has not been provided or the settings are permanently locked.
2-63	Don't Care

TABLE 3-6: RESPONSE 2 STRUCTURE

Byte Index	Meaning
0	0x60 – Set Chip NVRAM Parameters – echoes back the given command code
1	0xF8 – USB Transfer in Progress – settings not written
2	0x10 – Sub-command Echoed Back – set SPI power-up transfer settings
3-63	Don't Care

TABLE 3-7: RESPONSE 3 STRUCTURE

Byte Index	Meaning
0	0x60 – Set Chip NVRAM Parameters – echoes back the given command code
1	0x00 – Command Completed Successfully – settings written
2	0x10 – Sub-command Echoed Back for Set SPI Power-up Transfer Settings code
3-63	Don't Care

FIGURE 3-2: SET SPI POWER-UP TRANSFER SETTINGS LOGIC FLOW

Byte Index	Meaning
0	0x50 – READ EEPROM Memory – command code
1	EEPROM Memory Address to be read
2	0x00 – Reserved
3-63	0x00 – Reserved

3.3.1.1 Responses

TABLE 3-51: RESPONSE 1 STRUCTURE

Byte Index	Meaning
0	0x50 – READ EEPROM Memory – echoes back the given command code
1	0x00 – Command Completed Successfully
2	EEPROM Memory Address
3	EEPROM Memory content at the requested address
4-63	Don't Care

FIGURE 3-20: READ EEPROM MEMORY LOGIC FLOW

3.3.2 WRITE EEPROM MEMORY

TABLE 3-52: COMMAND STRUCTURE

Byte Index	Meaning
0	0x51 – WRITE EEPROM Memory – command code
1	EEPROM Memory Address to be written
2	The value to be written to at the given address
3-63	0x00 – Reserved

3.3.2.1 Responses

TABLE 3-53: RESPONSE 1 STRUCTURE

Byte Index	Meaning
0	0x51 – WRITE EEPROM Memory – echoes back the given command code
1	0x00 – Command Completed Successfully
2	Don't Care
3-63	Don't Care

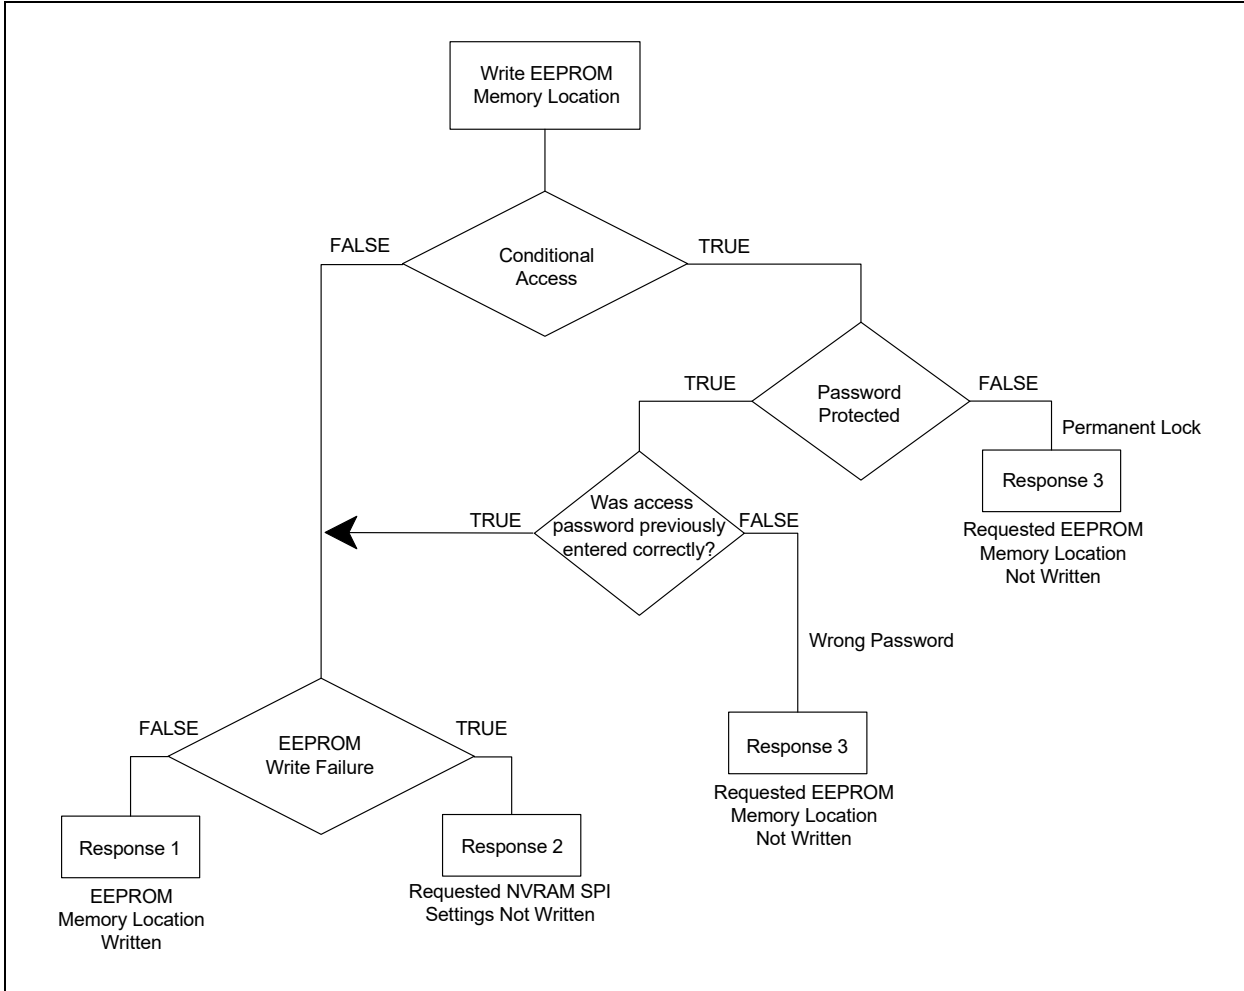

TABLE 3-54: RESPONSE 2 STRUCTURE

Byte Index	Meaning
0	0x51 – WRITE EEPROM Memory – echoes back the given command code
1	0xFA – EEPROM Write Failure
2	Don't Care
3-63	Don't Care

TABLE 3-55: RESPONSE 3 STRUCTURE

Byte Index	Meaning
0	0x51 – WRITE EEPROM Memory – echoes back the given command code
1	0xFB – EEPROM is password protected or permanently locked
2	Don't Care
3-63	Don't Care

FIGURE 3-21: WRITE EEPROM MEMORY LOGIC FLOW

3.4 External Interrupt Pin (GP6) Event Status

The External Interrupt pin event status command is used by the USB host to query the external interrupt events recorded by the MCP2210. In order to have the MCP2210 record the number of external interrupt events, GP6 must be configured to have its dedicated function active.

3.4.1 GET (VM) THE CURRENT NUMBER OF EVENTS FROM THE INTERRUPT PIN

TABLE 3-56: COMMAND STRUCTURE

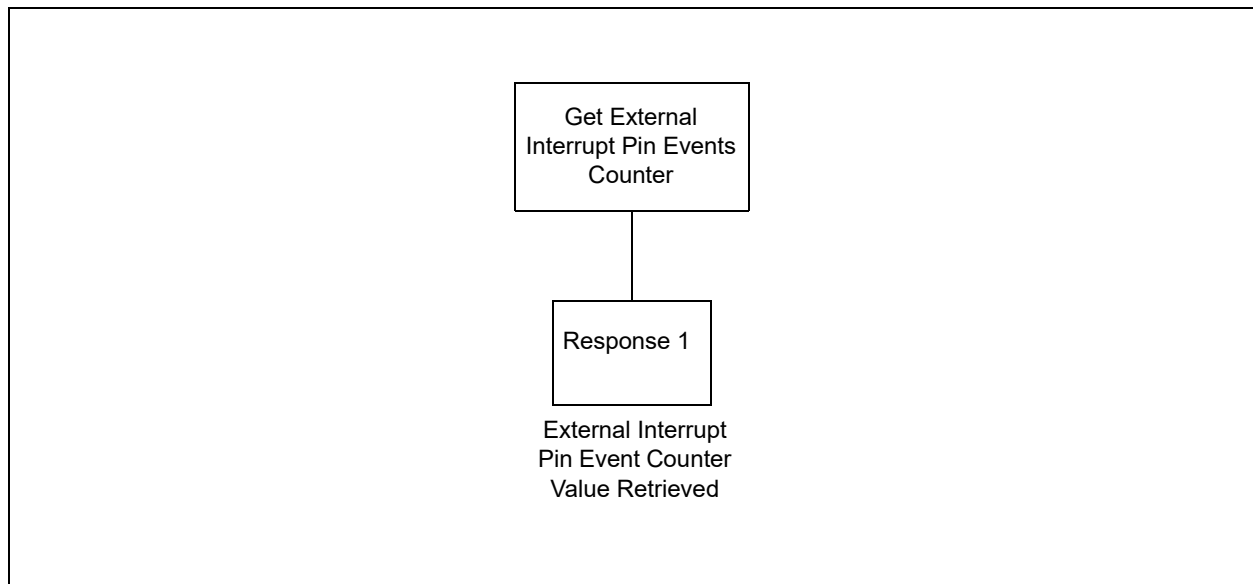

Byte Index	Meaning
0	0x12 – Get (VM) the Current Number of Events From the Interrupt Pin
1	Reset or Not the Event Counter <ul style="list-style-type: none"> • 0x00 – reads, then resets the event counter • Any other value – the event counter is read, however, the counter is not reset
2-63	0x00 - Reserved

3.4.1.1 Responses

TABLE 3-57: RESPONSE 1 STRUCTURE

Byte Index	Meaning
0	0x12 – Get (VM) the Current Number of Events from the Interrupt Pin – echoes back the given command code
1	0x00 – Command Completed Successfully
2	Don't Care
3	Don't Care
4	Interrupt Event Counter – 16-bit value (low byte)
5	Interrupt Event Counter – 16-bit value (high byte)
63-63	Don't Care

FIGURE 3-22: GET (VM) THE CURRENT NUMBER OF EVENTS FROM THE INTERRUPT PIN LOGIC FLOW

3.5 SPI Data Transfer

The set of commands/responses described in this section relates to the SPI data transfer functionality.

3.5.1 TRANSFER SPI DATA

TABLE 3-58: COMMAND STRUCTURE

Byte Index	Meaning
0	0x42 – Transfer SPI Data – command code
1	The number of bytes to be transferred in this packet (from 0 to 60 inclusively)
2	0x00 – Reserved
3	0x00 – Reserved
4-63	The SPI Data to be sent on the data transfer

3.5.1.1 Responses

TABLE 3-59: RESPONSE 1 STRUCTURE

Byte Index	Meaning
0	0x42 – Transfer SPI Data – echoes back the given command code
1	0xF7 – SPI Data Not Accepted – SPI bus not available (the external owner has control over it)
2	Don't Care
3-63	Don't Care

TABLE 3-60: RESPONSES 2 STRUCTURE

Byte Index	Meaning
0	0x42 – Transfer SPI Data – echoes back the given command code
1	0x00 – SPI Data accepted – Command Completed Successfully – SPI data accepted
2	How many SPI received data bytes the chip is sending back to the host
3	SPI Transfer Engine Status <ul style="list-style-type: none">• 0x20 – SPI transfer started – no data to receive
4-63	SPI Received Data Bytes. The number of data bytes is specified at byte index 2

TABLE 3-61: RESPONSE 3 STRUCTURE

Byte Index	Meaning
0	0x42 – Transfer SPI Data – echoes back the given command code
1	0xF8 – SPI Data Not Accepted – SPI transfer in progress – cannot accept any data for the moment
2	Don't Care
3-63	Don't Care

TABLE 3-62: RESPONSE 4 STRUCTURE

Byte Index	Meaning
0	0x42 – Transfer SPI Data – echoes back the given command code
1	0x00 – SPI Data accepted – Command Completed Successfully – SPI data accepted
2	How many SPI received data bytes the chip is sending back to the host
3	0x30 – SPI Transfer Engine Status : SPI transfer not finished; received data available
4-63	SPI received data bytes . The number of data bytes is specified at byte index 2

TABLE 3-63: RESPONSE 5 STRUCTURE

Byte Index	Meaning
0	0x42 – Transfer SPI Data – echoes back the given command code
1	0x00 – SPI Data accepted – Command Completed Successfully – SPI data accepted
2	How many SPI received data bytes the chip is sending back to the host
3	0x10 – SPI Transfer Engine Status : SPI transfer finished – no more data to send
4-63	SPI received data bytes . The number of data bytes is specified at byte index 2

FIGURE 3-23: TRANSFER SPI DATA LOGIC FLOW

3.5.2 CANCEL THE CURRENT SPI TRANSFER

TABLE 3-64: COMMAND STRUCTURE

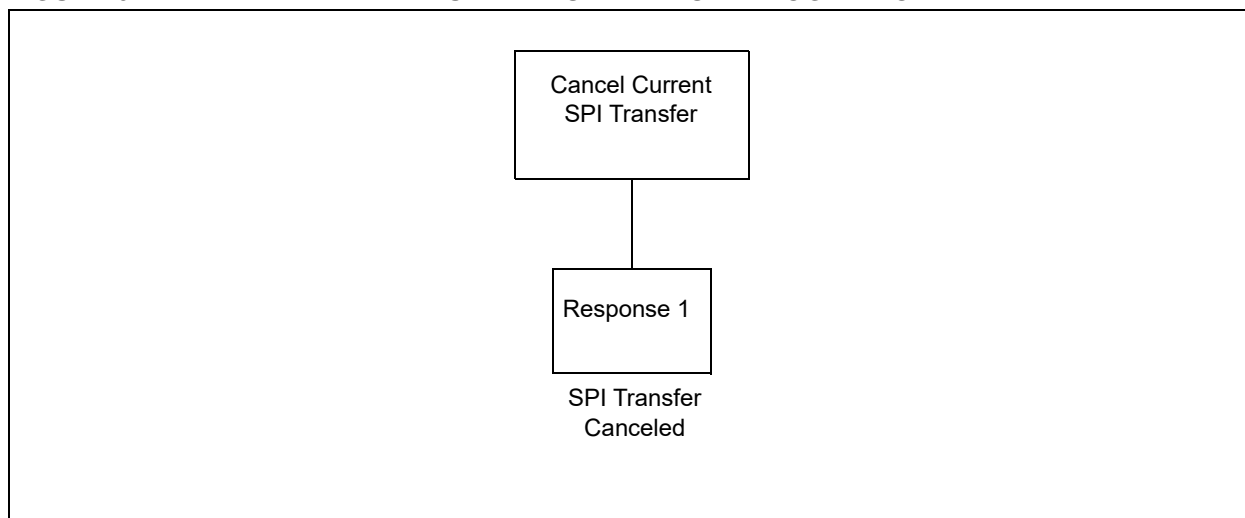

Byte Index	Meaning
0	0x11 – CANCEL the current SPI transfer – command code
1	0x00 – Reserved
2	0x00 – Reserved
3-63	0x00 – Reserved

3.5.2.1 Responses

TABLE 3-65: RESPONSE 1 STRUCTURE

Byte Index	Meaning
0	0x11 – CANCEL the current SPI transfer – echoes back the given command code
1	0x00 – Command Completed Successfully
2	SPI Bus Release External Request Status <ul style="list-style-type: none">• 0x01 – No External Request for SPI Bus Release• 0x00 – Pending External Request for SPI Bus Release
3	SPI Bus Current Owner <ul style="list-style-type: none">• 0x00 – No Owner• 0x01 – USB Bridge• 0x02 – External Host
4	Attempted Password Accesses – informs the USB host on how many times the NVRAM password was tried
5	Password Guessed <ul style="list-style-type: none">• 0x00 – Password Not Guessed• 0x01 – Password Guessed
6-63	Don't Care

FIGURE 3-24: CANCEL THE CURRENT SPI TRANSFER LOGIC FLOW

3.5.3 REQUEST SPI BUS RELEASE

TABLE 3-66: COMMAND STRUCTURE

Byte Index	Meaning
0	0x80 – Request SPI bus Release – command code
1	The value of the SPI Bus Release ACK pin (only if GP7 is assigned to this dedicated function)
2	0x00 – Reserved
3-63	0x00 – Reserved

3.5.3.1 Responses

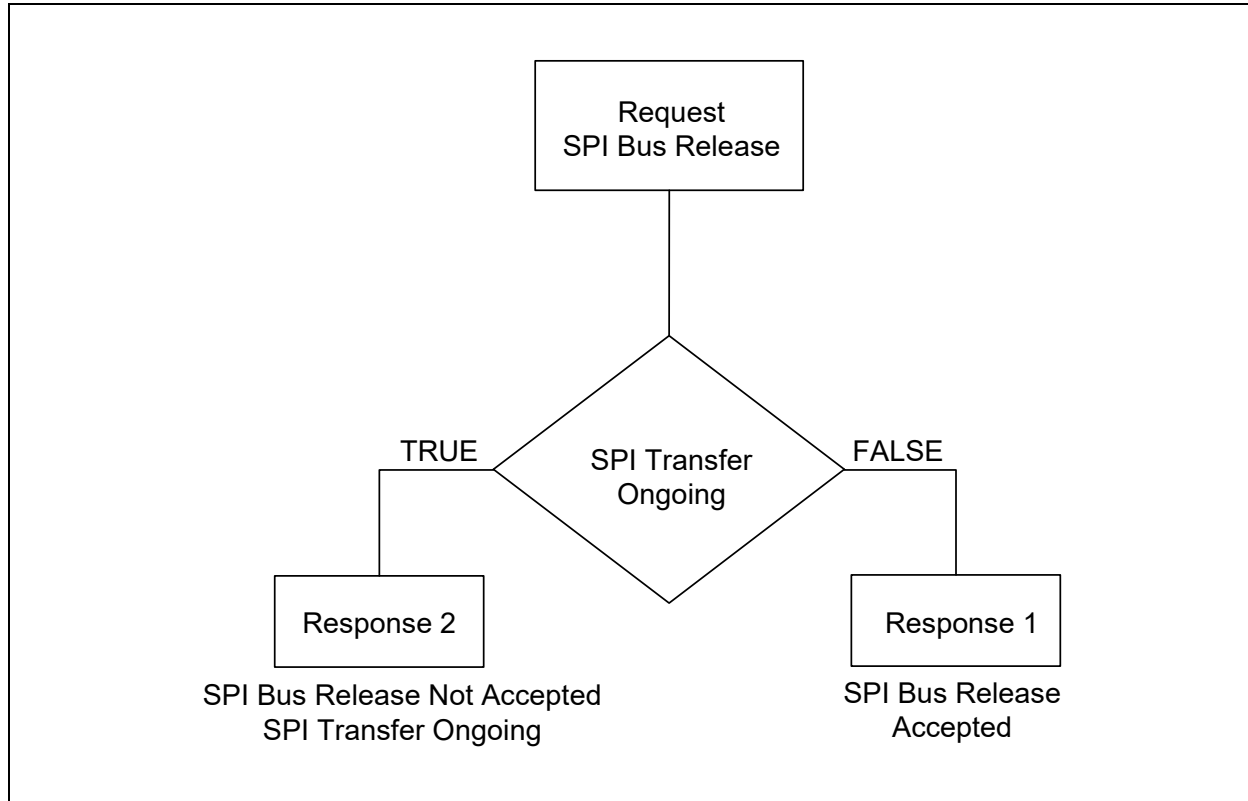

TABLE 3-67: RESPONSE 1 STRUCTURE

Byte Index	Meaning
0	0x80 – Request SPI bus Release – echoes back the given command code
1	0x00 – Command Completed Successfully – SPI bus released
2	Don't Care
3-63	Don't Care

TABLE 3-68: RESPONSES 2 STRUCTURE

Byte Index	Meaning
0	0x80 – Request SPI bus Release – echoes back the given command code
1	0xF8 – SPI Bus Not Released – SPI transfer in process
2	Don't Care
3-63	Don't Care

FIGURE 3-25: REQUEST SPI BUS RELEASE LOGIC FLOW

3.6 Chip Status

The chip status command is used to retrieve status information regarding the state of the SPI transfer engine.

3.6.1 GET MCP2210 STATUS

TABLE 3-69: COMMAND STRUCTURE

Byte Index	Meaning
0	0x10 – Get MCP2210 Status – command code
1	0x00 – Reserved
2	0x00 – Reserved
3-63	0x00 – Reserved

3.6.1.1 Responses

TABLE 3-70: RESPONSE 1 STRUCTURE

Byte Index	Meaning
0	0x10 – Get MCP2210 Status – echoes back the given command code
1	0x00 – Command Completed Successfully
2	SPI Bus Release External Request Status <ul style="list-style-type: none"> • 0x01 – No External Request for SPI Bus Release • 0x00 – Pending External Request for SPI Bus Release
3	SPI Bus Current Owner <ul style="list-style-type: none"> • 0x00 – No Owner • 0x01 – USB Bridge • 0x02 – External Host
4	Attempted Password Accesses – informs the USB host on how many times the NVRAM password was tried
5	Password Guessed <ul style="list-style-type: none"> • 0x00 – Password Not Guessed • 0x01 – Password Guessed
6-63	Don't Care

3.6.2 UNSUPPORTED COMMAND CODES

TABLE 3-71: COMMAND STRUCTURE

Byte Index	Meaning
0	Unsupported Command Code
1	Don't Care
2-63	Don't Care

3.6.2.1 Responses

TABLE 3-72: RESPONSE 1 STRUCTURE

Byte Index	Meaning
0	Unsupported Command Code Sent – echoes back the given command code
1	0xF9 – Unknown Command – No effect
2-63	Don't Care

4.0 ELECTRICAL CHARACTERISTICS

Absolute Maximum Ratings (†)

Ambient temperature under bias	-40°C to +85°C
Storage temperature	-65°C to +150°C
Voltage on VDD with respect to VSS	-0.3V to +6.0V
Voltage on $\overline{\text{MCLR}}$ with respect to Vss	-0.3V to +9.0V
Voltage on VUSB pin with respect to VSS	-0.3V to +4.0V
Voltage on D+ and D- pins with respect to VSS	-0.3V to (VUSB + 0.3V)
Voltage on all other pins with respect to VSS	-0.3V to (VDD + 0.3V)
Total power dissipation ⁽¹⁾	800 mW
Maximum current out of VSS pin	95 mA
Maximum current into VDD pin	95 mA
Clamp current, I _K (V _{PIN} < 0 or V _{PIN} > VDD).....	± 20 mA
Maximum output current sunk by any I/O pin.....	25 mA
Maximum output current sourced by any I/O pin	25 mA
Maximum current sunk by all ports	90 mA
Maximum current sourced by all ports	90 mA

Note 1: Power dissipation is calculated as follows: $P_{DIS} = V_{DD} \times \{I_{DD} - \sum I_{OH}\} + \sum \{(V_{DD} - V_{OH}) \times I_{OH}\} + \sum (V_{OL} \times I_{OL})$.

2: VUSB must always be $\leq V_{DD} + 0.3V$

† **NOTICE:** Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operation listings of this specification is not implied. Exposure above maximum rating conditions for extended periods may affect device reliability.

MCP2210

4.1 DC CHARACTERISTICS

DC Characteristics		Operating Conditions (unless otherwise indicated): 3.0V ≤ V _{DD} ≤ 5.5V at -40°C ≤ T _A ≤ +85°C (I-Temp)					
Param No.	Characteristic	Sym	Min	Typ	Max	Units	Conditions
D001	Supply Voltage	V _{DD}	3.3	—	5.5	V	
	Power-on Reset Release Voltage	V _{POR}		1.6		V	
	Power-on Reset Rearm Voltage			0.8		V	
D003	V _{DD} Rise Rate to Ensure Power-on Reset	SV _{DD}	0.05	—	—	V/ms	Design guidance only Not tested
D004	Supply Current	I _{DD}					
	V _{DD} = 3.0V		—	10	12	mA	F _{OSC} = 12 MHz, (330 nF on V _{USB})
	V _{DD} = 5.0V		—	13	15	mA	
D005	Standby current	I _{DDS}	—	9	—	μA	
Input Low Voltage							
D031	Schmitt Trigger (GP0–3, 6–8, MOSI, MISO, SCK)	V _{IL}	—	—	0.2 V _{DD}	V	3.0V ≤ V _{DD} ≤ 5.5V
	TTL (GP4, GP5)		—	—	0.8		4.5V ≤ V _{DD} ≤ 5.5V
Input High Voltage							
D041	Schmitt Trigger (GP0–3, 6–8, MOSI, MISO, SCK)	V _{IH}	0.8 V _{DD}	—	V _{DD}	V	3.0V ≤ V _{DD} ≤ 5.5V
	TTL (GP4, GP5)		2.0	—	V _{DD}		4.5V ≤ V _{DD} ≤ 5.5V
Input Leakage Current							
D060	GP0–8, MOSI, MISO, SCK	I _{IL}	—	±50	±100	nA	V _{SS} ≤ V _{PIN} ≤ V _{DD} , pin at Hi-Z
	RST			±50	±200		
	OSC1			±50	±100		
Output Low Voltage							
D080	GP0–7, MOSI, MISO, SCK	V _{OL}	—	—	0.6	V	I _{OL} = 8.0 mA, V _{DD} = 5.0V
			—	—	0.6		I _{OL} = 6.0 mA, V _{DD} = 3.3V
Output High Voltage							
D090	GP0–7, MOSI, MISO, SCK	V _{OH}	V _{DD} – 0.7	—	—	V	I _{OH} = -3.5 mA, V _{DD} = 5.0V
			V _{DD} – 0.7	—	—		I _{OH} = -3.0 mA, V _{DD} = 3.3V
Capacitive Loading Specs on Output Pins							
D101	OSC2	C _{OSC2}	—	—	15	pF	Note 1
D102	GP0–7, MOSI, MISO, SCK	C _{IO}	—	—	50	pF	Note 1

Note 1: This parameter is characterized, but not tested.

FIGURE 4-1: POR AND POR REARM WITH SLOW RISING V_{DD}

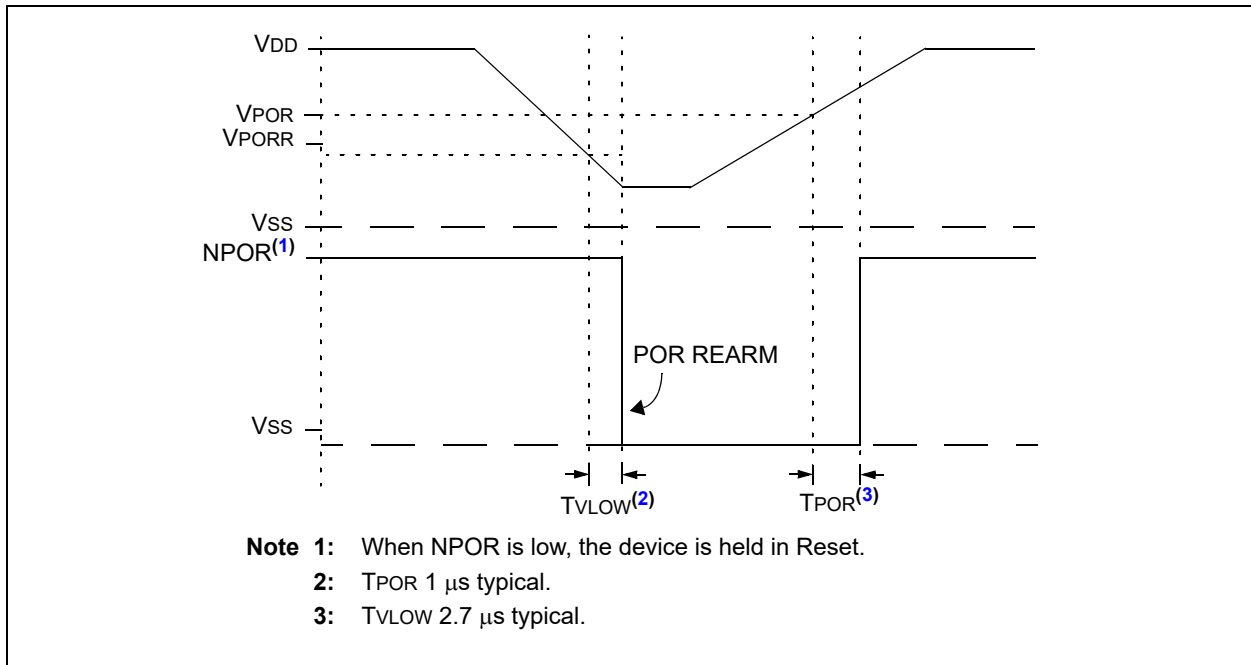

TABLE 4-1: USB MODULE SPECIFICATIONS

DC Characteristics		Operating Conditions (unless otherwise indicated): 3.0V \leq V _{DD} \leq 5.5V at -40°C \leq T _A \leq +85°C (I-Temp)					
Param No.	Characteristic	Sym	Min	Typ	Max	Units	Conditions
D313	USB Voltage	V _{USB}	3.0	—	3.6	V	Voltage on V _{USB} pin must be in this range for proper USB operation
D314	Input Leakage on Pin	I _{IL}	—	—	± 1	μ A	V _{SS} \leq V _{PIN} \leq V _{DD} pin at high-impedance
D315	Input Low Voltage for USB Buffer	V _{ILUSB}	—	—	0.8	V	For V _{USB} range
D316	Input High Voltage for USB Buffer	V _{IHUSB}	2.0	—	—	V	For V _{USB} range
D318	Differential Input Sensitivity	V _{DIFS}	—	—	0.2	V	The difference between D+ and D- must exceed this value while V _{CM} is met
D319	Differential Common Mode Range	V _{CM}	0.8	—	2.5	V	
D320	Driver Output Impedance ⁽¹⁾	Z _{OUT}	28	—	44	Ω	
D321	Voltage Output Low	V _{OL}	0.0	—	0.3	V	1.5 k Ω load connected to 3.6V
D322	Voltage Output High	V _{OH}	2.8	—	3.6	V	1.5 k Ω load connected to ground

Note 1: The D+ and D- signal lines have been built-in impedance matching resistors. No external resistors, capacitors or magnetic components are necessary on the D+/D- signal paths between the MCP2210 family device and the USB cable.

MCP2210

TABLE 4-2: THERMAL CONSIDERATIONS

Standard Operating Conditions (unless otherwise stated)					
Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ (I-Temp)					
Param No.	Sym	Characteristic	Typ	Units	Conditions
TH01	θ_{JA}	Thermal Resistance Junction to Ambient	85.2	$^{\circ}\text{C}/\text{W}$	20-pin SOIC package
			108.1	$^{\circ}\text{C}/\text{W}$	20-pin SSOP package
			36.1	$^{\circ}\text{C}/\text{W}$	20-pin QFN 5x5 mm package
TH02	θ_{JC}	Thermal Resistance Junction to Case	24	$^{\circ}\text{C}/\text{W}$	20-pin SOIC package
			24	$^{\circ}\text{C}/\text{W}$	20-pin SSOP package
			1.7	$^{\circ}\text{C}/\text{W}$	20-pin QFN 5x5 mm package
TH03	T_{JMAX}	Maximum Junction Temperature	150	$^{\circ}\text{C}$	
TH04	PD	Power Dissipation	—	W	$PD = P_{INTERNAL} + P_{I/O}$
TH05	$P_{INTERNAL}$	Internal Power Dissipation	—	W	$P_{INTERNAL} = I_{DD} \times V_{DD}^{(1)}$
TH06	$P_{I/O}$	I/O Power Dissipation	—	W	$P_{I/O} = \sum (I_{OL} * V_{OL}) + \sum (I_{OH} * (V_{DD} - V_{OH}))$
TH07	P_{DER}	Derated Power	—	W	$P_{DER} = P_{D_{MAX}} (T_J - T_A) / \theta_{JA}^{(2,3)}$

Note 1: I_{DD} is the current to run the chip alone without driving any load on the output pins.

2: T_A = Ambient Temperature.

3: T_J = Junction Temperature.

4.2 AC Characteristics

4.2.1 TIMING PARAMETER SYMBOLOGY

The timing parameter symbols have been created in one of the following formats:

1. TppS2ppS

2. TppS

<p>T</p> <p>F Frequency</p> <p>E Error</p>	<p>T Time</p>
--	--------------------

Lowercase letters (pp) and their meanings:

<p>pp</p> <p>io Input or Output pin</p> <p>rx Receive</p> <p>bitclk RX/TX BITCLK</p> <p>drt Device Reset Timer</p>	<p>osc Oscillator</p> <p>tx Transmit</p> <p>RST Reset</p>
---	--

Uppercase letters and their meanings:

<p>S</p> <p>F Fall</p> <p>H High</p> <p>I Invalid (high-impedance)</p> <p>L Low</p>	<p>P Period</p> <p>R Rise</p> <p>V Valid</p> <p>Z High-impedance</p>
---	--

4.2.2 TIMING CONDITIONS

The operating temperature and voltage specified in [Table 4-3](#) apply to all timing specifications unless otherwise noted. [Figure 4-2](#) specifies the load conditions for the timing specifications.

TABLE 4-3: TEMPERATURE AND VOLTAGE SPECIFICATIONS – AC

AC CHARACTERISTICS	<p>Standard Operating Conditions (unless otherwise stated)</p> <p>Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$</p> <p>Operating voltage V_{DD} range as described in DC spec, Section 4.1 “DC Characteristics”.</p>
---------------------------	---

FIGURE 4-2: LOAD CONDITIONS FOR DEVICE TIMING SPECIFICATIONS

MCP2210

4.2.3 TIMING DIAGRAMS AND SPECIFICATIONS

TABLE 4-4: RESET, OSCILLATOR START-UP TIMER AND POWER-UP TIMER PARAMETERS

Standard Operating Conditions (unless otherwise stated) Operating Temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$							
Param No.	Sym	Characteristic	Min	Typ [†]	Max	Units	Conditions
30	TRST	$\overline{\text{MCLR}}$ Pulse Width (low)	2	—	—	μs	
31	TPWRT	Power-up timer	40	65	140	ms	
32	TOST	Oscillator start-up time	—	1024	—	TOST	

* These parameters are characterized but not tested.

† Data in "Typ" column is at 5V, 25°C unless otherwise stated. These parameters are for design guidance only and are not tested.

5.0 PACKAGING INFORMATION

5.1 Package Marking Information

20-Lead 5x5 QFN

Example

20-Lead SOIC

Example

20-Lead SSOP

Example

Legend:	XX...X	Customer-specific information
	Y	Year code (last digit of calendar year)
	YY	Year code (last 2 digits of calendar year)
	WW	Week code (week of January 1 is week '01')
	NNN	Alphanumeric traceability code
	(e3)	Pb-free JEDEC designator for Matte Tin (Sn)
	*	This package is Pb-free. The Pb-free JEDEC designator ((e3)) can be found on the outer packaging for this package.

Note: In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information.

Lead Width	b		0.22	–	0.38

Notes:

- Pin 1 visual index feature may vary, but must be located within the hatched area.
- Dimensions D and E1 do not include mold flash or protrusions. Mold flash or protrusions shall not exceed 0.20 mm per side.
- Dimensioning and tolerancing per ASME Y14.5M.

BSC: Basic Dimension. Theoretically exact value shown without tolerances.

REF: Reference Dimension, usually without tolerance, for information purposes only.

Microchip Technology Drawing C04-072B

20-Lead Plastic Shrink Small Outline (SS) - 5.30 mm Body [SSOP]

Note: For the most current package drawings, please see the Microchip Packaging Specification located at <http://www.microchip.com/packaging>

RECOMMENDED LAND PATTERN

Dimension Limits	Units	MILLIMETERS		
		MIN	NOM	MAX
Contact Pitch	E	0.65 BSC		
Contact Pad Spacing	C		7.20	
Contact Pad Width (X20)	X1			0.45
Contact Pad Length (X20)	Y1			1.75
Distance Between Pads	G	0.20		

Notes:

1. Dimensioning and tolerancing per ASME Y14.5M
BSC: Basic Dimension. Theoretically exact value shown without tolerances.

Microchip Technology Drawing No. C04-2072B

MCP2210

NOTES:

APPENDIX A: REVISION HISTORY

Revision C (September 2021)

- Removed all references to the GP8 pin chip-select (CS) function or output function. The GP8 pin is input-only.
- Updated [Section “Features:”](#), [“Block Diagram”](#), [Table 1-1](#), [Section 1.3 “SPI Module”](#), [Section 1.6 “GP Module”](#), [Table 3-1](#), [Table 3-4](#), [Table 3-18](#), [Table 3-20](#), [Table 3-34](#), [Table 3-35](#), [Table 3-36](#), [Table 3-39](#), [Table 3-40](#), [Table 3-43](#), [Table 3-44](#), [Table 3-48](#), [Table 3-49](#), and [Section 4.1 “DC Characteristics”](#) to correctly describe GP8 as input-only functionality.
- Updated [“Block Diagram”](#) and [Figure 3-23](#) to reflect Microchip terminology. The SPI standard uses the terminology “Master” and “Slave”. The equivalent Microchip terminology used in this document is “Host” and “Client” respectively.
- Updated [Section “Product Identification System”](#) for clarity.
- Minor typographical errors.

Revision B (July 2021)

- Updated [Section 1.1, Supported Operating Systems](#).
- Updated [Table 3-4](#).
- The SPI standard uses the terminology “Master” and “Slave”. The equivalent Microchip terminology used in this document is “Host” and “Client” respectively.
- Minor typographical errors.

Revision A (December 2011)

- Original Release of this Document.

MCP2210

NOTES:

PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

<u>PART NO.</u>	<u>X⁽¹⁾</u>	<u>-X</u>	<u>/XX</u>	<u>XXX</u>	
Device	Tape and Reel	Temperature Range	Package	Qualification	
Device:	MCP2210:	USB to SPI Protocol Converter with GPIO			
Tape and Reel	(Blank) = Standard Packaging (tube)				
Option:	T	= Tape and Reel			
Temperature Range:	I	= -40°C to +85°C (Industrial)			
Package:	MQ	= Plastic Quad Flat, No Lead Package 5x5x0.9 mm Body (QFN), 20-Lead			
	SO	= Plastic Small Outline - Wide, 7.50 mm Body (SO), 20-Lead			
	SS	= Plastic Shrink Small Outline - 5.30 mm Body (SS) 20-Lead			
Qualification:	(Blank) = Standard Qualification				
	VAO	= Automotive AEC-Q100 Qualified			

Examples:	
a) MCP2210-I/MQ:	Industrial temperature, 20LD QFN Package.
b) MCP2210T-I/MQ:	Tape and Reel, Industrial temperature, 20LD QFN Package.
c) MCP2210-I/SO:	Industrial temperature, 20LD SOIC Package.
d) MCP2210T-I/SO:	Tape and Reel, Industrial temperature, 20LD SOIC Package.
e) MCP2210-I/SS:	Industrial temperature, 20LD SSOP Package.
f) MCP2210T-I/SS:	Tape and Reel, Industrial temperature, 20LD SSOP Package.
g) MCP2210-I/SSVAO:	Industrial temperature, 20LD SSOP Package, Automotive Qualified.

Note 1:
Tape and Reel identifier only appears in the catalog part number description. This identifier is used for ordering purposes and is not printed on the device package. Check with your Microchip Sales Office for package availability with the Tape and Reel option.

MCP2210

NOTES:

Note the following details of the code protection feature on Microchip products:

- Microchip products meet the specifications contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is secure when used in the intended manner, within operating specifications, and under normal conditions.
- Microchip values and aggressively protects its intellectual property rights. Attempts to breach the code protection features of Microchip product is strictly prohibited and may violate the Digital Millennium Copyright Act.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of its code. Code protection does not mean that we are guaranteeing the product is “unbreakable”. Code protection is constantly evolving. Microchip is committed to continuously improving the code protection features of our products.

This publication and the information herein may be used only with Microchip products, including to design, test, and integrate Microchip products with your application. Use of this information in any other manner violates these terms. Information regarding device applications is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. Contact your local Microchip sales office for additional support or, obtain additional support at <https://www.microchip.com/en-us/support/design-help/client-support-services>.

THIS INFORMATION IS PROVIDED BY MICROCHIP "AS IS". MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION INCLUDING BUT NOT LIMITED TO ANY IMPLIED WARRANTIES OF NON-INFRINGEMENT, MERCHANTABILITY, AND FITNESS FOR A PARTICULAR PURPOSE, OR WARRANTIES RELATED TO ITS CONDITION, QUALITY, OR PERFORMANCE.

IN NO EVENT WILL MICROCHIP BE LIABLE FOR ANY INDIRECT, SPECIAL, PUNITIVE, INCIDENTAL, OR CONSEQUENTIAL LOSS, DAMAGE, COST, OR EXPENSE OF ANY KIND WHATSOEVER RELATED TO THE INFORMATION OR ITS USE, HOWEVER CAUSED, EVEN IF MICROCHIP HAS BEEN ADVISED OF THE POSSIBILITY OR THE DAMAGES ARE FORESEEABLE. TO THE FULLEST EXTENT ALLOWED BY LAW, MICROCHIP'S TOTAL LIABILITY ON ALL CLAIMS IN ANY WAY RELATED TO THE INFORMATION OR ITS USE WILL NOT EXCEED THE AMOUNT OF FEES, IF ANY, THAT YOU HAVE PAID DIRECTLY TO MICROCHIP FOR THE INFORMATION.

Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.
