Dual Processor Supervisors with Watchdog ADM13305

## FEATURES

## Dual supervisory circuits

Supply voltage range of 2.7 V to 5.5 V
Pretrimmed threshold options: $1.8 \mathrm{~V}, \mathbf{2 . 5} \mathrm{~V}, \mathbf{3 . 3} \mathrm{~V}$, and 5 V
Adjustable 0.6 V voltage reference
Maximum supply current of $40 \mu \mathrm{~A}$
140 ms (minimum) reset timeout
Watchdog timer with $1.6 \mathbf{~ s e c}$ (typical) timeout
RESET valid from $V_{D D} \geq 1.1 \mathrm{~V}$
Push-pull RESET and $\overline{\text { RESET }}$ outputs
8-lead, narrow body SOIC package
Temperature range: $-\mathbf{4 0 ^ { \circ }} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$

## APPLICATIONS

## Supervising DSPs/microcontrollers

Industrial and portable equipment
Wireless systems
Notebook/desktop computers

## GENERAL DESCRIPTION

The ADM13305 is a dual voltage supervisor designed to monitor two supplies and provide a reset signal to DSP and microprocessor-based systems.
There are five models available, all of which feature a combination of internally pretrimmed undervoltage threshold options for monitoring $1.8 \mathrm{~V}, 2.5 \mathrm{~V}, 3.3 \mathrm{~V}$, and 5 V supplies. There is also an adjustable input option with an undervoltage threshold voltage of 0.6 V .

The ADM13305-18, ADM13305-25, and ADM13305-33 models have two internally fixed thresholds. The ADM13305-4 and ADM13305-5 offer one internally fixed threshold and one externally programmable threshold via a resistor string. See the Ordering Guide for a list of all available options.
During power-up, $\overline{\operatorname{RESET}}$ is asserted when the supply voltage exceeds 1.1 V . The device then monitors the SENSEv input pins and holds the $\overline{\text { RESET }}$ output low as long as either of the SENSEv inputs remains below the rising threshold voltage, $\mathrm{V}_{\mathrm{IT}}+$.

Once the supplies monitored at the SENSEv inputs rise above their associated thresholds, the reset signal remains low for the reset timeout period before deasserting. Subsequently, if a voltage monitored by the SENSEv pins falls below its associated falling threshold, $\mathrm{V}_{\text {IT }}$, the $\overline{\mathrm{RESET}}$ output asserts. The ADM13305 features both an active high RESET and an active low $\overline{\text { RESET }}$ output.

Rev. 0

FUNCTIONAL BLOCK DIAGRAMS

Figure 1.

Figure 2. .

As well as providing power-on reset signals, an on-chip watchdog timer can reset the microprocessor if it fails to strobe within the preset timeout period. A reset signal can also be asserted by an external push button through the manual reset input pin.
The ADM13305 is available in an 8-lead, narrow body SOIC package. The device operates over the extended industrial temperature range of $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$.

## ADM13305

## ABSOLUTE MAXIMUM RATINGS

Table 8.

| Parameter | Rating |
| :--- | :--- |
| Supply Voltage Range, $\mathrm{V}_{\mathrm{DD}}$ | -0.3 V to +6 V |
| $\overline{\mathrm{MR}, \mathrm{WDI}}$ | -0.3 V to $\mathrm{V}_{\mathrm{DD}}+0.3 \mathrm{~V}$ |
| SENSE1, SENSE2 | $\left(\mathrm{V}_{\mathrm{DD}}+0.3 \mathrm{~V}\right) \mathrm{V}_{\mathrm{I}} / \mathrm{V}_{\text {REF }}$ |
| RESET, RESET | -0.3 V to +6 V |
| Maximum Low Output Current | 5 mA |
| Maximum High Output Current | -5 mA |
| Input Clamp Current $\left(\mathrm{V}_{1}<0 \mathrm{~V}, \mathrm{~V}_{\mathrm{I}}>\mathrm{V}_{\mathrm{DD}}\right)$ | $\pm 20 \mathrm{~mA}$ |
| Output Clamp Current $\left(\mathrm{V}_{\mathrm{O}}<0 \mathrm{~V}, \mathrm{~V}_{\mathrm{O}}>\mathrm{V}_{\mathrm{DD}}\right)$ | $\pm 20 \mathrm{~mA}$ |
| Operating Temperature Range | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ |
| Storage Temperature Range | $-65^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$ |
| Lead Temperature |  |
| $\quad$ Soldering (10 sec) | $300^{\circ} \mathrm{C}$ |
| Vapor Phase ( 60 sec$)$ | $215^{\circ} \mathrm{C}$ |
| $\quad$ Infrared (15 sec) | $220^{\circ} \mathrm{C}$ |

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

THERMAL RESISTANCE
Table 9.

| Package Type | $\boldsymbol{\theta}_{\text {JA }}$ | Unit |
| :--- | :--- | :--- |
| 8-Lead SOIC_N (R-8) | 206 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |

## ESD CAUTION

|  | ESD (electrostatic discharge) sensitive device. <br> Charged devices and circuit boards can discharge <br> without detection. Although this product features <br> patented or proprietary protection circuitry, damage <br> may occur on devices subjected to high energy ESD. <br> Therefore, proper ESD precautions should be taken to <br> avoid performance degradation or loss of functionality. |

## ADM13305

## THEORY OF OPERATION

The ADM13305 is a dual voltage supervisor designed to monitor two supplies and provide a reset signal to DSP and microprocessor-based systems.
There are five models available, all of which feature a combination of internally pretrimmed undervoltage threshold options for monitoring $1.8 \mathrm{~V}, 2.5 \mathrm{~V}, 3.3 \mathrm{~V}$, and 5 V supplies. There is also an adjustable input option with an undervoltage threshold of 0.6 V .
The ADM13305-18, ADM13305-25, and ADM13305-33 have two internally fixed thresholds, while the ADM13305-4 and ADM13305-5 offer one internally fixed threshold and one externally programmable threshold via a resistor string. See the Ordering Guide for a list of all available options.

## INPUT CONFIGURATION

The ADM13305 is powered through $V_{\text {DD }}$. To increase noise immunity in noisy applications, place a $0.1 \mu \mathrm{~F}$ capacitor between the $V_{D D}$ input and ground.
The SENSEv inputs are resistant to short power supply glitches. Do not allow an unused SENSEv input to float or to be grounded, instead connect it to a supply voltage greater than its specified threshold voltage.
Typically, the threshold voltage at each adjustable SENSEv input is 0.6 V . To monitor a voltage greater than 0.6 V , connect a resistor divider network to the device as depicted in Figure 13, where,

$$
V_{\text {MONITERED }}=0.6 \mathrm{~V}\left(\frac{R 1+R 2}{R 2}\right)
$$

Figure 13. Setting the Adjustable Monitor

## RESET OUTPUT

The reset outputs are guaranteed to be in the correct state for $\mathrm{V}_{\mathrm{DD}}$ down to 1.1 V. During power-up, $\overline{\mathrm{RESET}}$ is asserted when the supply voltage becomes greater than 1.1 V .

Figure 14. Reset Timing Diagram
Once the supplies monitored at the SENSEv pins rise above their associated threshold level, the $\overline{\mathrm{RESET}}$ signal remains low for the reset timeout period before deasserting. Subsequently, if either of the supplies monitored by the SENSEv pins falls below its associated threshold the $\overline{\mathrm{RESET}}$ output reasserts.

The ADM13305 features both an active-low, push-pull $\overline{\text { RESET }}$ output and an active-high, push-pull RESET output.

## WATCHDOG TIMER

The ADM13305 features a watchdog timer that monitors microprocessor activity. A timer circuit is cleared with every low-to-high or high-to-low logic transition on the watchdog input pin (WDI). If the timer counts through the preset watchdog timeout period of $1.6 \mathrm{sec}, \overline{\mathrm{RESET}}$ is asserted, as shown in Figure 15.
The microprocessor is required to toggle the WDI pin to avoid being reset. Therefore, failure of the microprocessor to toggle WDI within the timeout period indicates a code execution error and the reset pulse generated restarts the microprocessor in a known state. The watchdog timer can be disabled by leaving WDI floating.

Figure 15. Watchdog Timing Diagram

## MANUAL RESET ( $\overline{\mathbf{M R}}$ )

The ADM13305 features a manual reset input, which when driven low, asserts the reset output, as shown in Figure 16. When $\overline{M R}$ transitions from low to high, reset remains asserted for the duration of the reset active timeout period before deasserting. An external push-button switch can be connected between $\overline{M R}$ and ground to allow the user to generate a reset.
