Membrane Air Dryer

SMC

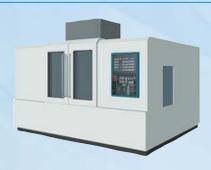

Dehumidification Principle

The membrane air dryer uses hollow fibers composed of a macro molecular membrane through which moisture passes easily, but is difficult for air (oxygen and nitrogen) to pass through.

When humid, compressed air is supplied to the inside of the hollow fibers, only moisture permeates the membrane and moves to the outside due to the pressure difference between the moisture inside and outside of the fibers. The compressed air becomes dry air and continues out of the dryer. Part of the dry air from the outlet side is passed through a very small orifice to reduce the pressure and purge the outside of the hollow fibers. The moisture which permeated to the outside of the hollow fibers is discharged to the atmosphere by this purge air. In this way, the partial pressure outside of the hollow fibers remains low and dehumidification is continuously performed.

Machine Tool

Powder Coating

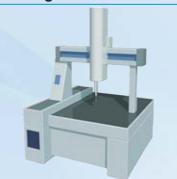

Others

Dental equipment
Chemical analysis equipment

Application Examples

Measuring Machine

Food Machinery

- Ozonizers, Hydrogen gas generating equipment
 Printed circuit board IC
- mounting machines
- Fine particle drying, Transfer equipment
 Drying and cleaning of precision parts

Semiconductor-related Manufacturing Equipment

Packaging Machine (sealing of film and paper package)

- Condensation prevention
 in control panels
- General pneumatic equipment
 and pneumatic tools

Series Variations

Meets a wide variety of flow rates (10 to 1000 L/min [ANR]) and dew points (Atmospheric pressure dew point: -15°C to -60°C). Single Unit Type

Note 3) Includes 1 L/min [ANR] of purge air flow (Inlet air pressure at 0.7 MPa) for the dew point indicator.

Conditions: Inlet air temperature 25°C (saturated air), Ambient temperature 25°C, P1: Inlet air pressure, Tube for purge air discharge (semi-standard: P): None Note: Correcting outlet air flow rate is required depending on inlet air temperature. Refer to page 31 or after for details. For model with fitting for purge air discharge (semi-standard: P), the outlet air atmospheric pressure dew point may become higher depending on the tube length for purge air discharge. For other models, when the tube length is 5 meters or less, a rise of the outlet air atmospheric pressure dew point will be 1°C or less.

• For the inlet air temperature at 25°C and outlet air flow rate at 45 (L/min)

Model 1: The outlet air atmospheric pressure dew point at P1 = 0.7 MPa: -25 (°C).

• For the inlet air temperature at 45°C and outlet air flow rate at 45 (L/min)

Example) Outlet air flow rate correction factor: 0.75 (The correction factor differs depending on the model. Refer to page 31 or after for details.)

Corrected outlet air flow rate: $45 \div 0.75 = 60$ (L/min). Model 1: Performing corresponding to the outlet air atmospheric pressure dew point -20 (°C) at P1 = 0.7 MPa.

45 60

P1 = 0.5 MPa

P1 = 0.7 MPa

Model 2: P1 = 0.7 MPa

Clogging Indication

(The tip of the indicator is just visible.)

When the differential air is 0.05 MPa or less When the differential air is 0.1 MPa or more (The indicator is completely up to the top.)

The element service indicator is shipped mounted to the micro mist separator with pre-filter, and cannot be retrofitted or used individually.

Replace the element when the element service indicator's red indication reaches completely to the top.

The top of the indication window shows differential pressure of approximately 0.1 MPa. Replace the element after two years of use, even if the element service indicator's red indication does not reach the top.

Note 1) For flow-rate characteristics and pressure characteristics of regulator, refer to the Best Pneumatics No. 5.

Note 2) It will come with Option E (With square-shaped, embedded type of a pressure regulator). Refer to our website www.smc.eu for details of regulators such as set pressure range etc.

Note 3) No freezing

Note 4) Refer to the Piping Precautions (Piping material for low dew point air) on page 46.

Note 5) "ANR" indicates the flow rate converted to the value at 20°C, under the atmospheric pressure and the state of relative humidity 65%.

Note 6) Includes 1 L/min [ANR] of purge air flow (Inlet air pressure at 0.7 MPa) for the dew point indicator.

Note 7) When highly purified air is required, refer to the Design 3. on page 45.

Model Selection

Made to Order

Specific Product Precautions

Series IDG A/IDG Model Selection

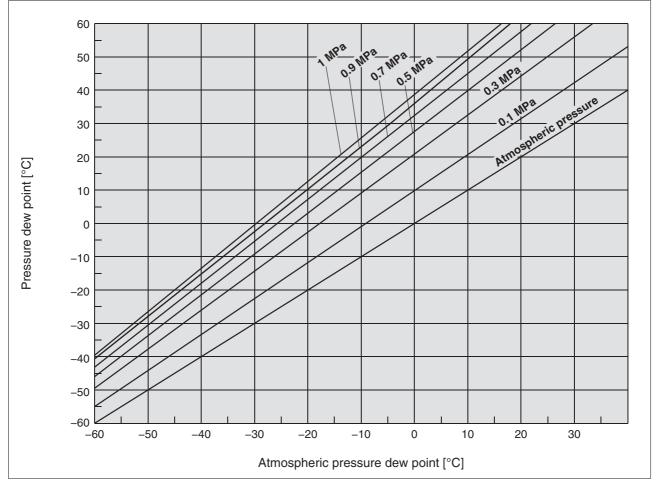

Step 1 Check the operating conditions.

Outlet air flow rate [L/min [ANR]] Outlet air atmospheric pressure dew point [°C] (When it is necessary to convert from the pressurized dew point, refer to the conversion chart for dew point temperature below.) Inlet air pressure [MPa] Inlet air temperature [°C] Allowable pressure drop ΔP [MPa] Compressed air supply capacity **Q** [L/min [ANR]]

Dew Point Temperature Conversion Chart

[Example] Outlet air flow rate Outlet air atmospheric pressure dew point Inlet air pressure Inlet air temperature Allowable pressure drop Compressed air supply capacity

150 L/min[ANR] -15 °C 0.5 MPa 35 °C 0.03 MPa 300 L/min [ANR]

Model Selection Series IDG A/IDG

Step 2 Correction of the outlet air flow rate influenced Step 5 Calculate the inlet air flow rate Q1, and check the by the inlet air temperature compressed air supply capacity. (When the inlet air temperature is 25°C, proceed to Step 4) Inlet air flow rate Q1 [L/min [ANR]] = When the inlet air temperature is not the same temperature (25°C) Outlet air flow rate [L/min [ANR]] + Purge air flow rate [L/min [ANR]] on the performance charts, calculate the correction factor for the outlet air flow rate from the table below to compensate the outlet air flow rate. Example: Assuming that the IDG30A is chosen Inlet air flow rate Q1 = 150 + 45 = 195 L/min [ANR] by Step 4 Example: From the table below (Inlet Air Temperature Outlet air flow rate 150 L/min [ANR] - Correction Factor for Outlet Air Flow Rate). Purge air flow rate 45 L/min [ANR] Inlet air temperature 35°C correction factors for outlet air flow rate are as follows. Series IDG A: 0.86 Compressed air supply capacity Q Series IDG: 0.40 300 L/min [ANR] Therefore corrected outlet air flow rate can be determined. Outlet air flow rate 150 L/min [ANR] [Series IDG□A] 150 ÷ 0.86 = 175 L/min [ANR] NO Compressed [Series IDG] 150 ÷ 0.4 = 375 L/min [ANR] Step 1 air supply capacity Inlet Air Temperature — Correction Factor for Outlet Air Flow Rate $\mathbf{Q} \ge \mathbf{Q}_1$ Review the operating conditions Inlet air temperature Series IDG Series IDG [°C] YES 300 ≥ 195, therefore 1.35 10 3.00 proceed to Step 6 15 1.22 2.17 Step 6 20 1.10 1.52 Step 6 Check the pressure drop ΔP_1 [MPa]. 25 1.00 1.00 30 0.92 0.65 Single Unit (Refer to pages 7 and 8.) 35 0.86 0.40 (Refer to pages 21 and 22.) Unit 40 0.80 0.25 45 0.75 0.19 Example: Selected model: IDG30A Single Unit: IDG30A 0.70 0.14 Inlet air pressure 0.5 MPa Based on the flow-rate characteristics (page 7), 50 ∆**P**1 = 0.006 MPa Inlet air flow rate 195 L/min [ANR] Note) Correction factors between Series IDG A and Series Allowable pressure drop ΔP Unit: IDG30AM4 IDG are different from each other, because the mem-0.03 MPa △P1 = 0.01 MPa (Element initial state) brane module characteristics are different. Step 3 Model selection based on corrected outlet air flow rate Step 1 NO $\Delta \mathbf{P} \ge \Delta \mathbf{P}_1$ or Based on the corrected outlet air flow rate calculated by Step 2 Step 2 select a model from the performance charts on pages 5 and 6. Review the operating conditions or increase With the conditions of the corrected outlet air flow Example YES For the IDG30A and IDG30AM4 size. rate and the inlet air pressure mentioned to the left, Corrected outlet air flow rate 175 L/min [ANR] (element initial state), when selecting a model which satisfies the [Series IDG A] $\Delta \mathbf{P} \geq \Delta \mathbf{P}_1$, therefore proceed to specifications that the outlet air atmospheric Corrected outlet air flow rate 375 L/min [ANR] pressure dew point -15°C or less, Step 7 [Series IDG] Inlet air pressure . 0.5 MPa [Series IDG□A] IDG30A, IDG50HA Consider the drain discharge method (in the case of Unit), Outlet air atmospheric pressure dew point -15°C [Series IDG] IDG60 Step 7 accessory and semi-standard specification. Example: Step 4 Check the purge air flow rate. Single Unit (Refer to pages 1 and 2.) For the IDG30A Accessory: With bracket (Refer to pages 15 and 16.) Unit Read out from the purge air flow-rate characteristics on page 9. Semi-standard: None For the IDG30AM4 Refer to Selection in the Drain discharge method: Specific Product Precautions 1 on page 45. Example: N.O. auto-drain Inlet air pressure 0.5 MPa Semi-standard: None Selected model IDG30A For the IDG30A 45 L/min [ANR] IDG50HA For the IDG50HA 38 L/min [ANR]

For the IDG60

1 With Element Service Indicator

An element service indicator is mounted on the micro mist separator with pre-filter (Series AMH) to allow visual management of the element's clogging life. In addition, combination with a micro mist separator with pre-filter also provides a spatially compact design.

Specific Product Precautions

Single Unit Type

Μ

Unit Type

Model Selection

Made to Order

Series IDG A/IDG Specific Product Precautions 1

Be sure to read before handling. Refer to back cover for Safety Instructions and "Handling Precautions for SMC Products" (M-E03-3) for Air Preparation Equipment Precautions.

Design

A Warning

- Depending on the model and operating conditions, the oxygen ratio of the outlet air may drop.
 Do not use standard dew point -40°C (symbol: L) type, standard dew point -60°C (symbol: S) type and IDG30A, 50A, 30HA, 50HA for dehumidifying breathing air. Do not use only outlet air (dry air) in a closed room.
- **2. Do not exert intermittent pressure on this product.** (Example: Frequently operating solenoid valves installed on the primary side) Intermittent pressure damages the product.

A Caution

1. Install a regulator on the outlet side of the membrane air dryer.

If it is installed on the inlet side, dehumidification performance will be reduced.

2. Devise a layout which considers the position of purge air discharge ports.

Purge air is humid air. Devise a layout in which purge air will not cause trouble such as corrosion or malfunction of peripheral equipment.

3. When highly purified air is required

(Supply to air bearings, blowing of semiconductor parts, etc.) Install a micro mist separator or super mist separator on the outlet side (end terminal) of the membrane air dryer (unit). Grease is applied inside a regulator used in the unit (Type V). When highly purified air is required, please either mount the above separator on the outlet side or use a made-to-order product (refer to pages 37 and 38), which is provided with a micro mist separator (Series AWD) instead of a regulator.

4. Time to reach the standard dew point

A certain amount of time is required to achieve the standard dew point after the air begins flowing into the membrane air dryer. Using the times below as a guide, begin operating outlet side equipment after the standard dew point is achieved.

Standard dew point -20°C, -15	5°C : about 10 minutes
Standard dew point -40°C	: about 30 minutes st
Standard dew point –60°C	: about 60 minutes st

- * This time can be shortened as described below.
 - 1) Provide a valve on the outlet side of the membrane air dryer.
 - 2) Supply air with the valve closed. Only purge air flows into the membrane air dryer.
 - 3) After 15 minutes or more, open the valve and let air flow to the outlet side equipment.
- 5. Dehumidification performance when inlet air temperature changes

Performance chart shows the case at an inlet air temperature of 25° C. In other cases, refer to "Model Selection" (page 31) for proper selection.

6. Do not use for applications such as repeatedly bending or stretching (IDG1). This may cause damage to the product.

Selection

A Caution

1. Consider the purge air flow rate.

Find the purge air flow rate from the charts and calculate the "required outlet air flow rate + purge air flow rate". The air supply capacity must be at least equal to the calculated flow or the required outlet air flow rate cannot be obtained.

- 2. Selection for a compressed air line in which a mist separator or micro mist separator is already installed Verify the operating air flow rate and air pressure, and select a membrane air dryer in accordance with "Model Selection" (page 31). If a membrane air dryer is selected using the port size of the equipment that is already installed as a reference, it could result in the selection of a model that is too small and has an insufficient dehumidification capacity.
- **3. With fitting for purge air discharge (Semi-standard: P)** The dehumidification capacity decreases in proportion to the length of the tube for discharging purge air. Use a tube of the specified size and keep its length within 5 meters. For the outlet air atmospheric pressure dew point in relation to the length of the tube for discharging purge air, refer to the table "regarding the outlet air atmospheric dew point in relation to the tube length for purge air discharge" on page 8.

4. Auto-drain selection for the unit type

When the compressor in use is for 2.2 kW (300 L/min [ANR]) or less, use an N.C. auto-drain (symbol: C). If an N.O. auto-drain (symbol: D) is used when the compressor is for 2.2 kW or less, pressure inside the mist separator may not increase and remain in the state of blowing off. Auto-drain with differential pressure type can be used in 2.2 kW or less.

Mounting

∧ Caution

1. Do not obstruct the purge air discharge ports.

The product may be damaged. And if purge air back pressure becomes too high or purge air stops flowing, dehumidification performance will decrease or may become impossible.

2. Be sure to install a mist separator and micro mist separator or a micro mist separator with pre-filter on the inlet side of the membrane air dryer.

If the inlet air contains oil, performance will be reduced. (A mist separator and micro mist separator or a micro mist separator with pre-filter are already installed on the unit types.)

3. Remove water droplets from the inlet air.

Water droplets in the air can lower performance and cause malfunction.

4. Large quantities of dust (solid foreign matter) are contained in the supply air.

When there are large quantities of dust (solid foreign matter), install an air filter or main line filter to the inlet side of the mist separator in addition to 2 above.

5. Take sufficient care in handling. There is a danger of damage if dropped.

6. When using a fixture, fix it on the metal part of the product. Using a fixture on the resin part may cause damage to the product.

Series IDG A/IDG Specific Product Precautions 2

Be sure to read before handling. Refer to back cover for Safety Instructions and "Handling Precautions for SMC Products" (M-E03-3) for Air Preparation Equipment Precautions.

Piping

A Warning

1. Check for locking of case and body.

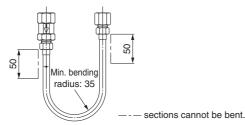

When using in a unit, be sure to set the air pressure to zero before using a mist separator or micro mist separator with modular connections. Also, confirm that the body and case are locked together with a click before starting the flow of compressed air.

2. Check for tightening of the holder. (for IDG30A to IDG100, IDG30HA to IDG100H, IDG30LA to IDG100LA, IDG60SA to IDG100SA)

Before starting the flow of compressed air, turn the membrane air dryer's holder in its tightening direction, confirming that it is completely tightened and that the case will not come off.

3. Minimum bending radius (for IDG1)

Maintain a minimum bending radius of 35 mm or more and do not bend the sections that are within 50 mm from the nuts. Furthermore, do not twist the product.

4. With fitting for purge air discharge (Semi-standard: P)

The piping of purge air for dehumidification and for the dew point indicator can be combined, but do not combine it with compressed air lines or drain piping or merge the purge air with exhaust air from other equipment. As this can cause damage.

A Caution

1. Use of tools

Hold the upper portion of the body (aluminium die-casted section) with a wrench or adjustable angle wrench. Do not turn it while holding the case section.

2. Drain piping for separators

When installing drain piping for mist separators or micro mist separators, use a tube of the prescribed size and keep the length within 5 meters. Also, be sure that the tube does not rise up or become folded over.

3. Piping materials for low dew point air

If air of a low dew point (-40°C or less) is required, do not use a nylon tube piping and resin fittings (except fluoropolymer) for the outlet side of the membrane air dryer. Due to the nature of the nylon tube, it could be affected by the ambient air, and it might not be possible to achieve the prescribed low dew point at the end of the tube. Therefore, for low dew point air, use a stainless steel or fluoropolymer piping. Piping

Caution

4. With fitting for purge air discharge (Semi-standard: P) (for IDG60 to IDG100, IDG60H to IDG100H, IDG60LA to IDG100LA, IDG60SA to IDG100SA)

To install piping for dehumidification purge air discharge, attach tubing of the prescribed size to the hose nipple section and then secure it with tubing bands.

5. Before piping is connected, flush the piping.

Be sure to remove chips, cutting oil and other debris. If they get into the product, unexpected malfunction or damage to the product may occur.

Air Supply

Caution Compressed air supply capacity

An air source that has a supply capacity that is larger than the "required outlet air flow rate (dry air flow rate) + purge air flow rate" is required. Verify the purge air flow rate in "Purge Air Flow-rate Characteristics." (page 9)

2. Chemicals with a negative effect on this product

Chemicals listed in the table below in the compressed air can lower performance and damage the element. Do not use the product in environments including these chemicals.

Category	Chemicals not to be included				
Solvents	Acetone, benzene, phenol, toluene, trichloroethylene, xylene, cresol, thinner, aniline, chloroform, chlorobenzene, trichloroethane, ethylbenzene, ethyl alcohol, methyl				
Acids	Sulfuric acid, nitric acid, hydrochloric acid, acetic acid, lactic acid, chromic acid, and others				
Gases	Chlorine gas, sulfurous acid gas, hydrogen chloride, bromine, ozone, ammonia, and others				
Oils	Phosphoric-ester hydraulic oil, fuel oil, water soluble cutting oil (alkaline), kerosene, and others				
Strong bases	Lithium hydroxide, sodium hydroxide, potassium hydroxide, calcium hydroxide, and others				
Others	Anaerobic adhesive, anaerobic sealant, and others				

Single Unit Type

Series IDG A/IDG Specific Product Precautions 3

Be sure to read before handling. Refer to back cover for Safety Instructions and "Handling Precautions for SMC Products" (M-E03-3) for Air Preparation Equipment Precautions.

Operating Environment

A Caution

1. Do not use at temperatures (fluid or ambient temperatures) higher than the prescribed operating conditions.

Resin is used in the membrane module, and it can be damaged by operation at high temperatures. Especially when installed immediately after a reciprocating type air compressor, confirm that the fluid temperature does not exceed the range of operating conditions during use.

2. Keep the inlet air temperature lower than the ambient temperature.

If the membrane air dryer body is cooled by the surrounding air, water drops may accumulate inside and reduce its dehumidification capacity.

Maintenance

Warning

1. Do not remove the parts or piping when in a pressurised state.

Never remove them while under pressure, as this could cause dangerous situations.

A Caution

1. Check the dehumidification function with the dew point indicator.

Observe the colour of the dew point indicator to confirm whether the membrane air dryer is functioning normally.

[When dew point indicator colour is blue: Functioning normally] [When dew point indicator colour is pink: Dew point temperature is high. (Outlet air is humid.) Note: Atmospheric pressure dew point approximately -10° C minimum]

Performance state	Colour of the dew point indicator	Note
Initial state	White/Pink	There are both white and pink grains.
Normal operating	Blue	
Decrease in	White/Pink	Air flow rate etc. can be outside of the specifications.
performance	Brown/Black	Contained oils can lower the performance.

If humid air flowing in turns the colour pink, and then if dry air enters, the colour turns back to blue.

It takes about 1 hour from the start of air flow for the dew point indicator colour to change.

2. Dew point indicator replacement period

The absorbent is used in the dew point indicator. It absorbs the gasified oil in the compressed air and/or the gaseous elements other than the air, and then may turn brown.

When it turned brown, replace the dew point indicator. Besides, in the event of replacing them periodically, carry out after two-year operation as a guideline. (For the part number of the dew point indicator, refer to pages 10 and 11.)

Maintenance

A Caution

3. Element replacement period

Refer to the following guide when replacing the elements in the mist separator and in the micro mist separator, or micro mist separator with prefilter that are installed on the inlet side of the membrane air dryer.

- 1) When two years have passed since installation.
- When the unit's pressure drop reaches 0.2 MPa, even before the two year period is reached.
- When the red portion of the element service indicator reaches the upper limit. (With micro mist separator with pre-filter) [IDG60M to IDG100M, IDG60HM to IDG100HM, IDG60V to IDG100V, IDG60HV to IDG100HV] Note)
 - Note) For other models as well, they are available with the element service indicator under made-to-order. Refer to pages 33 and 34.

4. Membrane module replacement period

Replace the membrane module when the colour of the dew point indicator turns white or pink.

As a guideline, unit should be replaced after approximately 10 years of use (10 hours/day operation). Replace it when the colour of the dew point indicator turns white or pink, even if it is within the period.

5. Tightening torque for installing the membrane module and the case (for IDG5, 10, 20, 5H, 10H, 20H)

Use caution not to tighten excessively.

It may result in a breakdown of membrane module, case and mounting screws or insufficient sealing.

(Check the tightening torque range in the Operation Manual.)

6. Installing a pressure gauge

A pressure gauge should be installed on the inlet and outlet sides of the membrane air dryer (unit) for the maintenance and inspection purposes.

Metrology (Measurement) Law

\land Caution

1. SMC products are not intended for use as instruments for legal metrology.

Measurement instruments that SMC manufactures or sells have not been qualified by type approval tests relevant to the metrology (measurement) laws of each country.

Therefore, SMC products cannot be used for business or certification ordained by the metrology (measurement) laws of each country.

SMC

▲ Safety Instructions

These safety instructions are intended to prevent hazardous situations and/or equipment damage. These instructions indicate the level of potential hazard with the labels of "**Caution**," "**Warning**" or "**Danger**." They are all important notes for safety and must be followed in addition to International Standards (ISO/IEC)^{*1}, and other safety regulations.

Safety Instructions Be sure to read "Handling Precautions for SMC Products" (M-E03-3) before using.
