## Middle Power LED Series

 3030
## LM301A <br> CRI 80

## Features \& Benefits

- Superior mid power LED with wide over-drive range up to 1.5 W
- Mold resin for high reliability
- Standard form factor for design flexibility $(3.0 \times 3.0 \mathrm{~mm})$

## Note:

"沵" can be "0" (Whole bin), "M" (Quarter bin) or "K" (Kitting bin) of the color binning
" $\star$ " can be " 0 " (Whole bin) or "K" (Kitting bin) of the color binning
b) Kitting rule

1) Kitting bin Concept
1. Under agreement between customer and SAMSUNG ELECTRONICS, SAMSUNG can supply kitting bin (VF, Color, Im).
2. A forward voltage (VF) of kitting bin is combined by a pair of same VF rank such as (AY+AY), (AZ+AZ), (A1+A1), (A2+A2) or (A3+A3).
3. A Chromaticity Coordinates of kitting bin is mixed by kitting procedure.(below kitting simulation)
[Kitting example]

[Binning Information]

|  | Bin \#1 | Bin \#2 |
| :---: | :---: | :---: |
| VF | AY | AY |
|  | AZ | AZ |
|  | A1 | A1 |
|  | A2 | A2 |
|  | A3 | A3 |
| CIE | $\mathrm{W}(1,2,5 \mathrm{bin})$ | Z (C, F, G bin) |
|  | V ( $6,7, \mathrm{~A}, \mathrm{~B}$ bin) | V (6, 7, A, B bin) |
|  | $\mathrm{X}(3,4,8 \mathrm{bin})$ | Y (9, D, E bin ) |
| IV | SD | SD |
|  | SE | SE |
|  | SF | SF |

Each of $\mathrm{V}, \mathrm{W}, \mathrm{X}, \mathrm{Y}$ and Z can be one bin without details division.

[RECOMMENDED PCB SOLDER PAD]

- Measurement unit: mm
- Tolerance : $\pm 0.1 \mathrm{~mm}$
- Do not place pressure on the encapsulation resin @

## Notes:

1) This LED has built-in ESD protection device(s) connected in parallel to LED chip(s)
2) $T_{s}$ point and measurement method:
(1) Measure one point at the cathode pad, if necessary remove PSR of PCB to reach $T_{s}$ point.
(2) All pads must be soldered to the PCB to dissipate heat properly, otherwise the LED can be damaged.

## Precautions:

1) Pressure on the LEDs will influence to the reliability of the LEDs. Precautions should be taken to avoid strong pressure on the LEDs. Do not put stress on the LEDs during heating.
2) Re-soldering should not be done after the LEDs have been soldered. If re-soldering is unavoidable, LED`s characteristics should be carefully checked before and after such repair.
3) Do not stack assembled PCBs together. Since materials of LEDs is soft, abrasion between two PCB assembled with LED might cause catastrophic failure of the LEDs.

## . Important

This Al Zipper bag is designed to protect the enclosed products from moisture and ESD. Once opened, the products should be soldered onto the printed circuit board immediately. When not in use, please do not leave the products unprotected by the Al Zipper Bag. To repack unused products., please ensure the zip-lock is completely sealed with the dry pack left inside.

## 10. Precautions in Handling \& Use

1) For over-current protection, users are recommended to apply resistors connected in series with the LEDs to mitigate sudden change of the forward current caused by shift of forward voltage.
2) This device should not be used in any type of fluid such as water, oil, organic solvent, etc. When cleaning is required, IPA is recommended as the cleaning agent. Some solvent-based cleaning agent may damage the silicone resins used in the device.
3) When the device is in operation, the forward current should be carefully determined considering the maximum ambient temperature and corresponding junction temperature.
4) LEDs must be stored in a clean environment. If the LEDs are to be stored for three months or more after being shipped from Samsung, they should be packed with a nitrogen-filled container (shelf life of sealed bags is 12 months at temperature $\left.0 \sim 40^{\circ} \mathrm{C}, 0 \sim 90 \% \mathrm{RH}\right)$.
5) After storage bag is opened, device subjected to soldering, solder reflow, or other high temperature processes must be:
a. Mounted within 672 hours (28 days) at an assembly line with a condition of no more than $30^{\circ} \mathrm{C} / 60 \% \mathrm{RH}$, or
b. Stored at <10 \% RH
6) Repack unused devices with anti-moisture packing, fold to close any opening and then store in a dry place.
7) Devices require baking before mounting, if humidity card reading is $>60 \%$ at $23 \pm 5^{\circ} \mathrm{C}$.
8) Devices must be baked for 1 hour at $60 \pm 5^{\circ} \mathrm{C}$, if baking is required.
9) The LEDs are sensitive to the static electricity and surge current. It is recommended to use a wrist band or antielectrostatic glove when handling the LEDs. If voltage exceeding the absolute maximum rating is applied to LEDs, it may cause damage or even destruction to LED devices. Damaged LEDs may show some unusual characteristics such as increase in leakage current, lowered turn-on voltage, or abnormal lighting of LEDs at low current.
10) VOCs (Volatile Organic Compounds) can be generated from adhesives, flux, hardener or organic additives used in luminaires (fixtures). Transparent LED silicone encapsulant is permeable to those chemicals and they may lead to a discoloration of encapsulant when they exposed to heat or light. This phenomenon can cause a significant loss of light emitted (output) from the luminaires. In order to prevent these problems, we recommend users to know the physical properties of materials used in luminaires and they must be carefully selected.
11) Risk of sulfurization (or tarnishing)

The LED from Samsung uses a silver-plated lead frame and its surface color may change to black (or dark colored) when it is exposed to sulfur (S), chlorine (CI) or other halogen compound. Sulfurization of lead frame may cause intensity degradation, change of chromaticity coordinates and, in extreme cases, open circuit. It requires caution. Due to possible sulfurization of lead frame, LED should not be used and stored together with oxidizing substances made of materials such as rubber, plain paper, lead solder cream, etc.
