## PROGRAMMABLE 3-PLL CLOCK SYNTHESIZER / MULTIPLIER / DIVIDER

## FEATURES

- High Performance 3:6 PLL based Clock Synthesizer / Multiplier / Divider
- User Programmable PLL Frequencies
- EEPROM Programming Without the Need to Apply High Programming Voltage
- Easy In-Circuit Programming via SMBus Data Interface
- Wide PLL Divider Ratio Allows 0-ppm Output Clock Error
- Generates Precise Video ( 27 MHz or 54 MHz ) and Audio System Clocks from Multiple Sampling Frequencies ( $f_{S}=16,22.05,24,32$, 44.1, 48, 96 kHz)
- Clock Inputs Accept a Crystal or a Single-Ended LVCMOS or a Differential Input Signal
- Accepts Crystal Frequencies from 8 MHz up to 54 MHz
- Accepts LVCMOS or Differential Input Frequencies up to 167 MHz
- Two Programmable Control Inputs [S0/S1, A0/A1] for User Defined Control Signals
- Six LVCMOS Outputs with Output Frequencies up to 167 MHz
- LVCMOS Outputs can be Programmed for Complementary Signals
- Free Selectable Output Frequency via Programmable Output Switching Matrix [6x6] Including 7-Bit Post-Divider for Each Output
- PLL Loop Filter Components Integrated
- Low Period Jitter (Typ 60 ps)
- Features Spread Spectrum Clocking (SSC) for Lowering System EMI
- Programmable Center Spread SSC Modulation ( $\pm 0.1 \%, \pm 0.25 \%$, and $\pm 0.4 \%$ ) with a Mean Phase Equal to the Phase of the Non-Modulated Frequency
- Programmable Down Spread SSC Modulation (1\%, 1.5\%, 2\%, and 3\%)
- Programmable Output Slew-Rate Control (SRC) for Lowering System EMI
- 3.3-V Device Power Supply
- Commercial Temperature Range $0^{\circ} \mathrm{C}$ to $70^{\circ} \mathrm{C}$
- Development and Programming Kit for Easy PLL Design and Programming (TI Pro-Clock ${ }^{\text {TM }}$ )
- Packaged in 20-Pin TSSOP

## DESCRIPTION

The CDCE906 is one of the smallest and powerful PLL synthesizer / multiplier / divider available today. Despite its small physical outlines, the CDCE906 is flexible. It has the capability to produce an almost independent output frequency from a given input frequency.
The input frequency can be derived from a LVCMOS, differential input clock, or a single crystal. The appropriate input waveform can be selected via the SMBus data interface controller.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

## DESCRIPTION (CONTINUED)

To achieve an independent output frequency the reference divider $M$ and the feedback divider $N$ for each PLL can be set to values from 1 up to 511 for the M-Divider and from 1 up to 4095 for the N-Divider. The PLL-VCO (voltage controlled oscillator) frequency than is routed to the free programmable output switching matrix to any of the six outputs. The switching matrix includes an additional 7 -bit post-divider (1-to-127) and an inverting logic for each output.
The deep $\mathrm{M} / \mathrm{N}$ divider ratio allows the generation of zero ppm clocks from any reference input frequency (e.g., a 27 MHz ).
The CDCE906 includes three PLLs of those one supports SSC (spread-spectrum clocking). PLL1, PLL2, and PLL3 are designed for frequencies up to 167 MHz and optimized for zero-ppm applications with wide divider factors.
PLL2 also supports center-spread and down-spread spectrum clocking (SSC). This is a common technique to reduce electro-magnetic interference. Also, the slew-rate controllable (SRC) output edges minimize EMI noise.

Based on the PLL frequency and the divider settings, the internal loop filter components will be automatically adjusted to achieve high stability and optimized jitter transfer characteristic of the PLL.
The device supports non-volatile EEPROM programming for easy-customized application. It is preprogrammed with a factory default configuration (see Figure 13) and can be reprogrammed to a different application configuration before it goes onto the PCB or reprogrammed by in-system programming. A different device setting is programmed via the serial SMBus interface.
Two free programmable inputs, S0 and S1, can be used to control for each application the most demanding logic control settings (outputs disable to low, outputs 3 -state, power down, PLL bypass, etc).

The CDCE906 has three power supply pins, $\mathrm{V}_{\mathrm{CC}}, \mathrm{V}_{\mathrm{CCOUT} 1}$ and $\mathrm{V}_{\mathrm{CCOUT} 2} . \mathrm{V}_{\mathrm{CC}}$ is the power supply for the device. It operates from a single $3.3-\mathrm{V}$ supply voltage. $\mathrm{V}_{\text {ccout }}$ and $\mathrm{V}_{\text {ccout }}$ are the power supply pins for the outputs. $\mathrm{V}_{\text {Ccout1 }}$ supplies the outputs Y 0 and Y 1 and $\mathrm{V}_{\text {Ccout2 }}$ supplies the outputs $\mathrm{Y} 2, \mathrm{Y} 3, \mathrm{Y} 4$, and Y . Both outputs supplies can be 2.3 V to 3.6 V . At output voltages lower than 3.3 V , the output drive current is limited.
The CDCE906 is characterized for operation from $0^{\circ} \mathrm{C}$ to $70^{\circ} \mathrm{C}$.

FUNCTIONAL BLOCK DIAGRAM

TERMINAL FUNCTIONS

| TERMINAL |  | 1/0 | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| NAME | $\begin{aligned} & \text { TSSOP20 } \\ & \text { NO. } \end{aligned}$ |  |  |
| Y0 to Y5 | $\begin{aligned} & 11,12,15, \\ & 16,19,20 \end{aligned}$ | 0 | LVCMOS outputs |
| CLK_INO | 5 | I | Dependent on SMBus settings, CLK_IN0 is the crystal oscillator input and can also be used as LVCMOS input or as positive differential signal inputs. |
| CLK_IN1 | 6 | I/O | Dependent on SMBus settings, CLK_IN1 is serving as the crystal oscillator output or can be the second LVCMOS input or the negative differential signal input. |
| $\mathrm{V}_{\text {CC }}$ | 3, 7 | Power | 3.3-V power supply for the device. |
| $\mathrm{V}_{\text {CCOUT1 }}$ | 14 | Power | Power supply for outputs Y0, Y1. |
| $\mathrm{V}_{\text {CCOUT2 }}$ | 18 | Power | Power supply for outputs Y2, Y3, Y4, Y5. |
| GND | 4, 8, 13, 17 | Ground | Ground |
| S0, A0, CLK_SEL | 1 | 1 | User programmable control input S0 (PLL bypass or power-down mode) or AO (address bit 0), or CLK_SEL (selects one of two LVCMOS clock inputs), dependent on the SMBus settings; LVCMOS inputs; internal pullup $150 \mathrm{k} \Omega$. |
| S1, A1 | 2 | 1 | User programmable control input S1 (output enable/disable or all output low), A1 (address bit 1), dependent on the SMBus settings; LVCMOS inputs; internal pullup $150 \mathrm{k} \Omega$ |
| SDATA | 9 | 1/O | Serial control data input/output for SMBus controller; LVCMOS input |
| SCLOCK | 10 | I | Serial control clock input for SMBus controller; LVCMOS input |

## ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range (unless otherwise noted) ${ }^{(1)}$

|  |  | VALUE | UNIT |
| :--- | :--- | :---: | :---: |
| $\mathrm{V}_{\mathrm{CC}}$ | Supply voltage range | -0.5 to 4.6 | V |
| $\mathrm{~V}_{\mathrm{I}}$ | Input voltage range ${ }^{(2)}$ | -0.5 to $\mathrm{V}_{\mathrm{CC}}+0.5$ | V |
| $\mathrm{~V}_{\mathrm{O}}$ | Output voltage range ${ }^{(2)}$ | -0.5 to $\mathrm{V}_{\mathrm{CC}}+0.5$ | V |
| $\mathrm{I}_{\mathrm{I}}$ | Input current $\left(\mathrm{V}_{1}<0, \mathrm{~V}_{1}>\mathrm{V}_{\mathrm{CC}}\right)$ | $\pm 20$ | mA |
| $\mathrm{I}_{\mathrm{O}}$ | Continuous output current | $\pm 50$ | mA |
| $\mathrm{~T}_{\text {stg }}$ | Storage temperature range | -65 to 150 | ${ }^{\circ} \mathrm{C}$ |
| $\mathrm{T}_{\mathrm{J}}$ | Maximum junction temperature | 125 | ${ }^{\circ} \mathrm{C}$ |

(1) Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under recommended operating conditions is not implied. Exposure to absolute maximum rated conditions for extended periods may affect device reliability.
(2) The input and output negative voltage ratings may be exceeded if the input and output clamp-current ratings are observed.

## PACKAGE THERMAL RESISTANCE

## for TSSOP20 (PW) Package ${ }^{(1)}$

|  | PARAMETER | AIRFLOW (LFM) | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| :---: | :---: | :---: | :---: |
| $\theta_{\mathrm{JA}}$ | Thermal resistance junction-to-ambient | 0 | 66.3 |
|  |  | 150 | 59.3 |
|  |  | 250 | 56.3 |
|  |  | 500 | 51.9 |
| $\theta_{\text {Jc }}$ | Thermal resistance junction-to-case |  | 19.7 |

(1) The package thermal impedance is calculated in accordance with JESD 51 and JEDEC2S2P (high-k board).

## RECOMMENDED OPERATING CONDITIONS

over operating free-air temperature range (unless otherwise noted)

|  |  | MIN | NOM | MAX | UNIT |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{V}_{\mathrm{CC}}$ | Device supply voltage | 3 | 3.3 | 3.6 | V |
| $\mathrm{V}_{\text {CCouti }}{ }^{(1)}$ | Output Y0, Y1 supply voltage | 2.3 |  | 3.6 | V |
| $\mathrm{V}_{\text {CCOUT2 }}{ }^{(1)}$ | Output Y2, Y3, Y4, Y5 supply voltage | 2.3 |  | 3.6 | V |
| $\mathrm{V}_{\mathrm{IL}}$ | Low level input voltage LVCMOS |  |  | 0.3 V CC | V |
| $\mathrm{V}_{1 \mathrm{H}}$ | High level input voltage LVCMOS | $0.7 \mathrm{~V}_{\mathrm{CC}}$ |  |  | V |
| $\mathrm{V}_{\text {lthresh }}$ | Input voltage threshold LVCMOS |  | 5 V CC |  | V |
| $\mathrm{V}_{1}$ | Input voltage range LVCMOS | 0 |  | 3.6 | V |
| $\left\|\mathrm{V}_{\text {ID }}\right\|$ | Differential input voltage | 0.1 |  |  | V |
| $V_{\text {IC }}$ | Common-mode for differential input voltage | 0.2 |  | $\mathrm{V}_{\mathrm{cc}}-0.6$ | V |
| $\mathrm{lOH}^{\text {/ }} \mathrm{l}$ OL | Output current (3.3 V) |  |  | $\pm 6$ | mA |
| $\mathrm{IOH}^{\text {/ }} \mathrm{l} \mathrm{OL}$ | Output current (2.5 V) |  |  | $\pm 4$ | mA |
| $\mathrm{C}_{\mathrm{L}}$ | Output load LVCMOS |  |  | 25 | pF |
| $\mathrm{T}_{\mathrm{A}}$ | Operating free-air temperature | 0 |  | 70 | ${ }^{\circ} \mathrm{C}$ |

(1) The minimum output voltage can be down to 1.8 V . See the application note for more information.

## RECOMMENDED CRYSTAL SPECIFICATIONS

|  |  | MIN | NOM | MAX |
| :--- | :--- | ---: | ---: | :---: |
| $f_{\text {Xtal }}$ | Crystal input frequency range (fundamental mode) | 8 | 27 | 54 |
| ESR | Effective series resistance ${ }^{(1)(2)}$ | 15 | MHz |  |
| $\mathrm{C}_{\text {IN }}$ | Input capacitance CLK_INO and CLK_IN1 |  | 30 | $\Omega$ |

(1) For crystal frequencies above 50 MHz the effective series resistor should not exceed $50 \Omega$ to assure stable start-up condition.
(2) Maximum Power Handling (Drive Level) see Figure 16.

## EEPROM SPECIFICATION

|  |  | MIN | TYP | MAX |
| :--- | :--- | ---: | ---: | :---: |
| UNIT |  |  |  |  |
| EEcyc | Programming cycles of EEPROM | 100 | 1000 | Cycles |
| EEret | Data retention | 10 |  | Years |

## TIMING REQUIREMENTS

over recommended ranges of supply voltage, load, and operating-free air temperature

|  |  |  | MIN | NOM MAX | UNIT |
| :---: | :---: | :---: | :---: | :---: | :---: |
| CLK_IN | UIREMENTS |  |  |  |  |
|  |  | PLL mode | 1 | 167 |  |
| fCLK_IN | CLK_IN clock input frequency (LVCMOS or Differential) | PLL bypass mode | 0 | 167 | MHz |
| $\mathrm{tr}_{\mathrm{r}} / \mathrm{t}_{\mathrm{f}}$ | Rise and fall time CLK_IN signal ( $20 \%$ to 80\%) |  |  | 4 | ns |
| duty $_{\text {REF }}$ | Duty cycle CLK_IN at V $\mathrm{CC}^{\text {/ } 2}$ |  | 40\% | 60\% |  |
| SMBus T | NG REQUIREMENTS (see Figure 11) |  |  |  |  |
| $\mathrm{f}_{\text {SCLK }}$ | SCLK frequency |  |  | 100 | kHz |
| $\mathrm{t}_{\text {(START }}$ | START hold time |  | 4 |  | $\mu \mathrm{s}$ |
| $\mathrm{t}_{\mathrm{w}(\mathrm{SCLL})}$ | SCLK low-pulse duration |  | 4.7 |  | $\mu \mathrm{s}$ |
| $\mathrm{t}_{\mathrm{w}(\mathrm{SCLH})}$ | SCLK high-pulse duration |  | 4 | 50 | $\mu \mathrm{s}$ |
| $\mathrm{t}_{\text {su (START) }}$ | START setup time |  | 0.6 |  | $\mu \mathrm{s}$ |
| $\mathrm{t}_{\text {(SDATA) }}$ | SDATA hold time |  | 0.3 |  | $\mu \mathrm{s}$ |
| $\mathrm{t}_{\text {su(SDATA) }}$ | SDATA setup time |  | 0.25 |  | $\mu \mathrm{s}$ |
| $\mathrm{t}_{\mathrm{r}}$ | SCLK / SDATA input rise time |  |  | 1000 | ns |
| $\mathrm{t}_{\mathrm{f}}$ | SCLK / SDATA input fall time |  |  | 300 | ns |

## TIMING REQUIREMENTS (continued)

over recommended ranges of supply voltage, load, and operating-free air temperature

|  |  | MIN | NOM |
| :--- | ---: | ---: | :---: |
| $\mathrm{t}_{\text {su(STOP) }}$ | MTOP setup time | 4 |  |
| $\mathrm{t}_{\text {BUS }}$ | Bus free time | 4.7 | $\mu \mathrm{~s}$ |
| $\mathrm{t}_{\text {POR }}$ | Time in which the device must be operational after power-on reset |  | $\mu \mathrm{s}$ |

## DEVICE CHARACTERISTICS

over recommended operating free-air temperature range and test load (unless otherwise noted), see Figure 1

|  | PARAMETER | TEST CONDITIONS |  | MIN | TYP ${ }^{(1)}$ | MAX | UNIT |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| OVERALL PARAMETER |  |  |  |  |  |  |  |
| Icc | Supply current ${ }^{(2)}$ | All PLLs on, all outputs on,$\begin{aligned} & \mathrm{f}_{\text {out }}=80 \mathrm{MHz}, \mathrm{f}_{\text {CLK }} \_\mathrm{N}=27 \mathrm{MHz}, \\ & \mathrm{f}_{\mathrm{vco}}=160 \mathrm{MHz} \end{aligned}$ |  |  | 90 | 115 | mA |
| ICCPD | Power down current. Every circuit powered down except SMBus | $\mathrm{f}_{\mathrm{IN}}=0 \mathrm{MHz}, \mathrm{V}_{\mathrm{CC}}=3.6 \mathrm{~V}$ |  | 50 |  |  | $\mu \mathrm{A}$ |

| 1 | LVCMOS input current (CLK_INO / CLK_IN1) | $\mathrm{V}_{\mathrm{I}}=0 \mathrm{~V}$ or $\mathrm{V}_{\mathrm{CC}}, \mathrm{V}_{\mathrm{CC}}=3.6 \mathrm{~V}$ |  |  |  | $\pm 5$ | $\mu \mathrm{A}$ |
| $\mathrm{I}_{\mathbf{H}}$ | LVCMOS input current (For S1/S0) | $\mathrm{V}_{1}=\mathrm{V}_{\mathrm{CC}}, \mathrm{V}_{\mathrm{CC}}=3.6 \mathrm{~V}$ |  |  |  | 5 | $\mu \mathrm{A}$ |
| $\mathrm{IIL}^{\text {L }}$ | LVCMOS input current (For S1/S0) | $\mathrm{V}_{\mathrm{I}}=0 \mathrm{~V}, \mathrm{~V}_{\mathrm{CC}}=3.6 \mathrm{~V}$ |  | -35 |  | -10 | $\mu \mathrm{A}$ |
| $\mathrm{C}_{1}$ | Input capacitance at CLK_INO and CLK IN1 | $\mathrm{V}_{1}=0 \mathrm{~V}$ or $\mathrm{V}_{\text {CC }}$ |  |  | 3 |  | pF |

## LVCMOS PARAMETER FOR $\mathrm{V}_{\text {ccout }}=3.3-\mathrm{V}$ Mode

| $\mathrm{V}_{\mathrm{OH}}$ | LVCMOS high-level output voltage | $\mathrm{V}_{\text {ccout }}=3 \mathrm{~V}, \mathrm{I}_{\mathrm{OH}}=-0.1 \mathrm{~mA}$ | 2.9 |  |  | V |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | $\mathrm{V}_{\text {ccout }}=3 \mathrm{~V}, \mathrm{I}_{\mathrm{OH}}=-4 \mathrm{~mA}$ | 2.4 |  |  |  |
|  |  | $\mathrm{V}_{\text {ccout }}=3 \mathrm{~V}, \mathrm{I}_{\mathrm{OH}}=-6 \mathrm{~mA}$ | 2.1 |  |  |  |
| VoL | LVCMOS low-level output voltage | $\mathrm{V}_{\text {ccout }}=3 \mathrm{~V}, \mathrm{I}_{\mathrm{OL}}=0.1 \mathrm{~mA}$ |  |  | 0.1 | V |
|  |  | $\mathrm{V}_{\text {ccout }}=3 \mathrm{~V}, \mathrm{I}_{\mathrm{OL}}=4 \mathrm{~mA}$ |  |  | 0.5 |  |
|  |  | $\mathrm{V}_{\text {ccout }}=3 \mathrm{~V}, \mathrm{I}_{\mathrm{OL}}=6 \mathrm{~mA}$ |  |  | 0.85 |  |
| $\begin{aligned} & \mathrm{t} \mathrm{t}_{\mathrm{PLH}}, \\ & \mathrm{t}_{\mathrm{PH}} \end{aligned}$ | Propagation delay | All PLL bypass | 9 |  |  | ns |
|  |  | VCO bypass |  | 11 |  |  |
| $\mathrm{tr}_{\mathrm{o}} / \mathrm{t}_{\mathrm{f}}$ | Rise and fall time for output slew rate 0 | $\mathrm{V}_{\text {ccout }}=3.3 \mathrm{~V}(20 \%-80 \%)$ | 1.7 | 3.3 | 4.8 | ns |
| $\mathrm{tr}_{\mathrm{r} 1} / \mathrm{t}_{\mathrm{f} 1}$ | Rise and fall time for output slew rate 1 | $\mathrm{V}_{\text {ccout }}=3.3 \mathrm{~V}(20 \%-80 \%)$ | 1.5 | 2.5 | 3.2 | ns |
| $\mathrm{t}_{\mathrm{r} 2} / \mathrm{t}_{\mathrm{t}}$ | Rise and fall time for output slew rate 2 | $\mathrm{V}_{\text {ccout }}=3.3 \mathrm{~V}(20 \%-80 \%)$ | 1.2 | 1.6 | 2.1 | ns |
| $\mathrm{t}_{\mathrm{r} 3} / \mathrm{t}_{\mathrm{i}}$ | Rise and fall time for output slew rate 3 (Default Configuration) | $\mathrm{V}_{\text {ccout }}=3.3 \mathrm{~V}(20 \%-80 \%)$ | 0.4 | 0.6 | 1 | ns |

(1) All typical values are at respective nominal $\mathrm{V}_{\mathrm{CC}}$.
(2) For calculating total supply current, add the current from Figure 2 Figure 3, and Figure 4. Using high-speed mode of the VCO reduces the current consumption significantly. See Figure 3
(3) Normal-speed mode or high-speed mode must be selected by the VCO frequency selection bit in Byte 6, Bit [7:5]. The min fvco can be lower but impacts jitter-performance.
(4) The maximum output frequency may be exceeded, but specifications under the Recommended Operating Condition may change and are no longer assured. Do not exceed the maximum power dissipation of the 20-pin TSSOP package ( 600 mW at no air flow).

CDCE906
www.ti.com

## DEVICE CHARACTERISTICS (continued)

over recommended operating free-air temperature range and test load (unless otherwise noted), see Figure 1

(5) 50000 cycles.
(6) Jitter depends on configuration. Jitter data is for normal $\mathrm{t}_{\mathrm{r}} / \mathrm{t}_{\mathrm{f}}$, input frequency $=27 \mathrm{MHz}, \mathrm{f}_{\mathrm{vco}}=147 \mathrm{MHz}$ output.
(7) The $\mathrm{t}_{\text {sk(0) }}$ specification is only valid for equal loading of all outputs.
(8) odc depends on output rise and fall time ( $\mathrm{t}_{\mathrm{r}} / \mathrm{t}_{\mathrm{t}}$ ); above limits are for normal $\mathrm{t}_{\mathrm{r}} / \mathrm{t}_{\mathrm{f}}$.
(9) There is a limited drive capability at output supply voltage of 2.5 V . For proper termination, see application report SCAA080.
(10) 50000 cycles.
(11) Jitter depends on configuration. Jitter data is for normal $\mathrm{t}_{\mathrm{r}} / \mathrm{t}_{\mathrm{f}}$, input frequency $=27 \mathrm{MHz}, \mathrm{f}_{\mathrm{vco}}=147 \mathrm{MHz}$ output.
(12) The $\mathrm{t}_{\text {sk(o) }}$ specification is only valid for equal loading of all outputs.
(13) odc depends on output rise and fall time ( $\mathrm{t}_{\mathrm{r}} / \mathrm{t}_{\mathrm{t}}$ ); above limits are for normal $\mathrm{t}_{\mathrm{r}} / \mathrm{t}_{\mathrm{f}}$.

## APPLICATION INFORMATION

## SMBus Data Interface

To enhance the flexibility and function of the clock synthesizer, a two-signal serial interface is provided. It follows the SMBus specification Version 2.0, which is based upon the principals of operation of $I^{2} \mathrm{C}$. More details of the SMBus specification can be found at http://www.smbus.org.
Through the SMBus, various device functions, such as individual clock output buffers, can be individually enabled or disabled. The registers associated with the SMBus data interface initialize to their default setting upon power-up, and therefore using this interface is optional. The clock device register changes are normally made upon system initialization, if any are required.

## Data Protocol

The clock driver serial protocol accepts Byte Write, Byte Read, Block Write, and Block Read operations from the controller.

For Block Write/Read operations, the bytes must be accessed in sequential order from lowest to highest byte (most significant bit first) with the ability to stop after any complete byte has been transferred. For Byte Write and Byte Read operations, the system controller can access individually addressed bytes.
Once a byte has been sent, it will be written into the internal register and effective immediately. With the rising edge of the ACK bit, this applies to each transferred byte, independent of whether this is a Byte Write or a Block Write sequence.
If the EEPROM write cycle is initiated, the data of the internal SMBus register is written into the EEPROM. During EEPROM write, no data is allowed to be sent to the device via the SMBus until the programming sequence is completed. Data, however, can be readout during the programming sequence (byte read or block read). The programming status can be monitored by EEPIP, byte 24 bit 7 .
The offset of the indexed byte is encoded in the command code, as described in Table 1.
The Block Write and Block Read protocol is outlined in Figure 9 and Figure 10, while Figure 7 and Figure 8 outlines the corresponding Byte Write and Byte Read protocol.

## SMBus Hardware Interface

The following diagram shows how the CDCE906 clock synthesizer is connected to the SMBus. Note that the current through the pullup resistors ( $\mathrm{R}_{\mathrm{p}}$ ) must meet the SMBus specifications ( $\min 100 \mu \mathrm{~A}$, max $350 \mu \mathrm{~A}$ ). If the CDCE906 is not connected to the SMBus, then SDATA and SCLK inputs have to be connected with $10-\mathrm{k} \Omega$ pullup resistors to $\mathrm{V}_{\mathrm{CC}}$ to avoid floating input conditions.

## Default Device Setting

The internal EEPROM of CDCE906 is pre-programmed with a factory default configuration as shown below. This puts the device in an operating mode without the need to program it first. The default setting appears after power is switched on or after a power-down/up sequence until it is re-programmed by the user to a different application configuration. A new register setting is programmed via the serial SMBUS Interface.

A different default setting can be programmed upon customer request. Contact a Texas Instruments sales or marketing representative for more information.

CDCE906
INSTRUMENTS
www.ti.com

NOTE: All outputs are enabled and in non-inverting mode. S0, S1, and SSC comply according the default setting described in Byte 10 and Byte 25 respectively.

Figure 13. Default Device Setting
The output frequency can be calculated:

$$
\begin{equation*}
\text { fout }=\frac{f i n \times N}{M \times P} \text {, i.e. fout }=\frac{27 M H z \times 8}{(1 \times 8)}=27 \mathrm{MHz} \tag{1}
\end{equation*}
$$

## Functional Description of the Logic

All Bytes are read-/write-able, unless otherwise expressly mentioned.

|  |  | cati |  |  |  |  |  |  |

(1) By selecting the PLL divider factors, $\mathrm{M} \leq \mathrm{N}$ and $80 \mathrm{MHz} \leq f v c o \leq 300 \mathrm{MHz}$.
(2) Unless customer specific setting.
(3) Default setting of divider N for PLL1 $=8$, for PLL2 $=250$ and for PLL3 $=3136$.

Byte 3 Bit [7:5]: PLL (VCO) Bypass Multiplexer

| PLLxMUX | PLL (VCO) MUX Output | Default $^{(1)}$ |
| :---: | :---: | :---: |
| 0 | PLLX | Yes |
| 1 | VCO bypass |  |

(1) Unless customer specific setting.

Byte 6 Bit [7:5]: VCO Frequency Selection Mode for each PLL ${ }^{(1)}$

| PLLxFVCO | VCO Frequency Range | Default ${ }^{(2)}$ |
| :---: | :---: | :---: |
| 0 | $80-200 \mathrm{MHz}$ |  |
| 1 | $180-300 \mathrm{MHz}$ | Yes |

(1) This bit selects the normal-speed mode or the high-speed mode for the dedicated VCO in PLL1, PLL2 or PLL3. At power-up, the
high-speed mode is selected, $\mathrm{f}_{\mathrm{Vco}}$ is $180-300 \mathrm{MHz}$. In case of higher $\mathrm{f}_{\mathrm{V} \text { co, }}$ this bit has to be set to [1].
(2) Unless customer specific setting.

CDCE906

| 1 | 0 | 1 | Reserved |  |  |  |
| 1 | 1 | 0 | Reserved |  |  |  |
| 1 | 1 | 1 | Reserved |  |  |  |

(1) Unless customer specific setting.
(2) PLL2 has a SSC output and non-SSC output. If SSC bypass is selected (see Byte 25, Bit [6:4]), the SSC circuitry of PLL2 is powered-down and the SSC output is reset to logic low. The non-SSC output of PLL2 is not affected by this mode and can still be used.

| Byte 10, Bit [1:0]: Configuration Settings of Input S0/A0/CLK_SEL |  |  |  |
| :---: | :---: | :---: | :---: |
| S01 | S00 | Function | Default ${ }^{(1)}$ |
| 0 | 0 | If SO is low, the PLLs and the clock-input stage are going into power-down mode, outputs are in 3 -state, all actual register settings will be maintained, SMBus stays active ${ }^{(2)}$ | Yes |
| 0 | 1 | If SO is low, the PLL and all dividers (M-Div and P-Div) are bypassed and PLL is in power-down, all outputs are active (inv. or non-inv.), actual register settings will be maintained, SMBus stays active; this mode is useful for production test; |  |
| 1 | 0 | CLK_SEL (input clock selection - overwrites the CLK_SEL setting in Byte 10, Bit [4]) ${ }^{(3)}$ <br> - CLK_SEL is set low selects CLK_IN_IN0 <br> - CLK_SEL is set high selects CLK_IN_IN1 |  |
| 1 | 1 | In this mode, the control input SO is interpreted as address bit A0 of the slave receiver address byte ${ }^{(4)}$ |  |

(1) Unless customer specific setting.
(2) Power-down mode overwrites 3-state or low-state of S1 setting in Byte 10, Bit [3:2].
(3) If the clock input (CLK_INO/CLK_IN1) is selected as crystal input or differential clock input (Byte 11, Bit [7:6]) then this setting is not relevant.
(4) To use this pin as Slave Receiver Address Bit A0, an Initialization pattern needs to be sent to CDCE906. When S00/S01 is set to be 1, the SO input pin will be interpreted in the next read or write cycle as the Address Bit AO of the Slave Receiver Address Byte. Note that right after the Byte 10 (S00/S01) has been written, A0 (via S0-pin) will immediately be active (also when Byte 10 is sent within a block write sequence). After the Initialization each CDCE906 has its own S0 dependent Slave Receiver Address and can be addressed accordingly to their new valid address.

| Byte 10, Bit [3:2]: Configuration Settings of Input S1/A1 |  |  |  |  |  |  |  |
| :---: | :---: | :--- | :---: | :---: | :---: | :---: | :---: |
| S11 | $\mathbf{S 1 0}$ | Function | Default ${ }^{(\mathbf{1 )}}$ |  |  |  |  |
| 0 | 0 | If S1 is set low, all outputs are switched to a low-state (non-inv.) or high-state (inv.); | Yes |  |  |  |  |
| 0 | 1 | If S1 is set low, all outputs are switched to a 3-state |  |  |  |  |  |
| 1 | 0 | Reserved | In this mode, the control input S1 is interpreted as Address Bit A1 of the Slave Receiver Address <br> Byte |  |  |  |  |
| 1 | 1 | $(2)$ |  |  |  |  |  |

(1) Unless customer specific setting.
(2) To use this pin as Slave Receiver Address Bit A1, an Initialization pattern needs to be sent to CDCE906. When S10/S11 is set to be 1, the S1 input pin will be interpreted in the next read or write cycle as the Address Bit A1 of the Slave Receiver Address Byte. Note that right after the Byte 10 (S10/S11) has been written, A1 (via S1-pin) will immediately be active (also when Byte 10 is sent within a block write sequence). After the Initialization each CDCE906 has its own S1 dependent Slave Receiver Address and can be addressed accordingly to their new valid address.
Byte 10, Bit [4]: Input Clock Selection ${ }^{(1)}$

| CLKSEL | Input Clock | Default $^{(2)}$ |
| :---: | :---: | :---: |
| 0 | CLK_IN0 | Yes |
| 1 | CLK_IN1 |  |

(1) This bit is not relevant, if crystal input or differential clock input is selected, Byte 11, Bit [7:6].
(2) Unless customer specific setting.

Byte 11, Bit [7:6]: Input Signal Source ${ }^{(1)}$

| IS1 | ISO | Function | Default ${ }^{(2)}$ |
| :---: | :---: | :--- | :---: |
| 0 | 0 | CLK_IN0 is Crystal Oscillator Input and CLK_IN1 is serving as Crystal Oscillator Output. | Yes |
| 0 | 1 | CLK_IN0 and CLK_IN1 are two LVCMOS Inputs. CLK_IN0 or CLK_IN1 are selectable via <br> CLK_SEL control pin. |  |
| 1 | 0 | CLK_IN0 and CLK_IN1 serve as differential signal inputs. |  |
| 1 | 1 | Reserved |  |

(1) In case the crystal input or differential clock input is selected, the input clock selection, Byte 10, Bit [4], is not relevant.
(2) Unless customer specific setting.

Byte 12, Bit [6]: Power-Down Mode (except SMBus)

| PD | Power-Down Mode | Default $^{(1)}$ |
| :---: | :---: | :---: |
| 0 | Normal Device Operation | Yes |
| 1 | Power Down ${ }^{(2)}$ |  |

(1) Unless customer specific setting.
(2) In power down, all PLLs and the Clock-Input-Stage are going into power-down mode, all outputs are in 3-State, all actual register settings will be maintained and SMBus stays active. Power-Down Mode overwrites 3-State or Low-State of S0 and S1 setting in Byte 10.

| Byte $\mathbf{1 3}$ to 18, Bit [6:0]: Outputs Switch Matrix - 6x7-Bit Divider P0-P5 |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

(1) The PLL has to be bypassed (turned off) when changing SSC Modulation Frequency Factor on-the-fly. This can be done by following programming sequence: bypass PLL2 (Byte 3, Bit $6=1$ ); write new Modulation Factor (Byte 25); re-activate PLL2 (Byte 3, Bit $6=0$ ).
(2) Unless customer specific setting.

SCAS814H-NOVEMBER 2005-REVISED DECEMBER 2007

| Byte 25, Bit [6:4]: SSC Modulation Amount ${ }^{(1)}$ |  |  |  |  |
| :---: | :---: | :---: | :--- | :--- |
| SSC2 | SSC1 | SSC0 | Function | Default ${ }^{(2)}$ |
| 0 | 0 | 0 | SSC Modulation Amount 0\% = SSC bypass for PLL ${ }^{(3)}$ |  |
| 0 | 0 | 1 | SSC Modulation Amount $\pm 0.1 \%$ (center spread) |  |
| 0 | 1 | 0 | SSC Modulation Amount $\pm 0.25 \%$ (center spread) |  |
| 0 | 1 | 1 | SSC Modulation Amount $\pm 0.4 \%$ (center spread) |  |
| 1 | 0 | 0 | SSC Modulation Amount $1 \%$ (down spread) |  |
| 1 | 0 | 1 | SSC Modulation Amount $1.5 \%$ (down spread) |  |
| 1 | 1 | 0 | SSC Modulation Amount 2\% (down spread) |  |
| 1 | 1 | SSC Modulation Amount 3\% (down spread) |  |  |

(1) The PLL has to be bypassed (turned off) when changing SSC Modulation Amount on-the-fly. This can be done by following programming sequence: bypass PLL2 (Byte 3, Bit $6=1$ ); write new Modulation Amount (Byte 25); re-activate PLL2 (Byte 3 , Bit $6=0$ ).
(2) Unless customer specific setting.
(3) If SSC bypass is selected, SSC circuitry of PLL2 is powered-down and the SSC output is reset to logic low. The non-SSC output of PLL2 is not affected by this mode and can still be used.

## Byte 25, Bit [7]: Permanently Lock EEPROM-Data

| EELOCK | Permanently Lock EEPROM (1) | Default ${ }^{(2)}$ |
| :---: | :---: | :---: |
| 0 | No | Yes |
| 1 | Yes |  |

(1) If this bit is set, the actual data in the EEPROM will be permanently locked. There is no further programming possible, even this bit is set low. Data, however can still be written via SMBUS to the internal register to change device function on the fly. But new data no longer can be stored into the EEPROM.
(2) Unless customer specific setting.

| Byte 26, Bit [6:0]: Byte Count ${ }^{(1)}$ |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## FUNCTIONAL DESCRIPTION

## Zero ppm Audio and Video System Clock Generation and Divider Setting

The CDCE906 is ideally suited for audio and video applications. It consists of a triple PLL clock generator which generates up to six audio, video and system clocks from i.e. a $27-\mathrm{MHz}$ master clock. The output frequencies are programmable to meet different application requirements. The master clock can be either a crystal oscillator or an external input clock signal. The CDCE906 provides a very low jitter, high accuracy clock with zero ppm for the common audio and video clocks. The following table shows the system clocks versus the standard sampling frequency and the corresponding divider settings.

| Audio Rate [kHz] | fs $\times 256$ [MHz] | Divider |  |  | Error ppm | fs $\times 384$ [MHz] | Divider |  |  | Error ppm |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | M | N | P |  |  | M | N | P |  |
| 16 | 4.096 | 375 | 2048 | 36 | 0 | 6.144 | 125 | 768 | 27 | 0 |
| 22.05 | 5.6448 | 75 | 392 | 25 | 0 | 8.4672 | 125 | 588 | 15 | 0 |
| 24 | 6.144 | 125 | 768 | 27 | 0 | 9.216 | 125 | 768 | 18 | 0 |
| 32 | 8.192 | 375 | 2048 | 18 | 0 | 12.288 | 375 | 2048 | 12 | 0 |
| 44.1 | 11.2896 | 375 | 1568 | 10 | 0 | 16.9344 | 125 | 784 | 10 | 0 |
| 48 | 12.288 | 375 | 2048 | 12 | 0 | 18.432 | 125 | 768 | 9 | 0 |
| 96 | 24.576 | 375 | 2048 | 6 | 0 | 36.864 | 375 | 2048 | 4 | 0 |

| 27 | 54 | 1 | 8 | 4 | 0 | 27 | - | - | 1 | 0 | 13.5 | - | - | 2 | 0 |

Typical applications for the CDCE906 are digital HDTV systems, gaming consoles, DVD players, DVD add-on cards for multimedia PCs, and step-top boxes.
i.e. audio rate: $\mathbf{4 4 . 1 \text { kHz }}$

Figure 14. CDCE906 System Application Block Diagram

## Clock Inputs (CLK_INO and CLK_IN1)

The CDCE906 features two clock inputs which can be used as:

- Crystal oscillator input (default setting)
- Two independent single-ended LVCMOS inputs
- Differential signal input

The dedicated clock input can be selected by the input signal source Bit [7:6] of Byte 11.

## Crystal Oscillator Inputs

The input frequency range in crystal mode is 8 MHz to 54 MHz . The CDCE906 uses a Pierce-type oscillator circuitry with included feedback resistance for the inverting amplifier. The user, however, has to add external capacitors $\mathrm{C}_{\mathrm{xo}_{0}}, \mathrm{C}_{\mathrm{x}_{1}}$ ) to match the input load capacitor from the crystal (see Figure 15). The required values can be calculated:

$$
\mathrm{C}_{\mathrm{X} 0}=\mathrm{C}_{\mathrm{X} 1}=2 \times \mathrm{C}_{\mathrm{L}}-\mathrm{C}_{\mathrm{ICB}},
$$

where $C_{L}$ is the crystal load capacitor as specified for the crystal unit and $\mathrm{C}_{I C B}$ is the input capacitance of the device including the board capacitance (stray capacitance of PCB).
For example, for a fundamental $27-\mathrm{MHz}$ crystal with $\mathrm{C}_{\mathrm{L}}$ of 9 pF and $\mathrm{C}_{\mathrm{ICB}}$ of 4 pF ,

$$
C_{X 0}=C_{X 1}=(2 \times 9 p F)-3 p F=15 p F .
$$

It is important to use a short PCB trace from the device to the crystal unit to keep the stray capacitance of the oscillator loop to a minimum.

Figure 15. Crystal Input Circuitry

CDCE906
www.ti.com

In order to ensure a stable oscillating, a certain drive power must be applied. The CDCE906 features an input oscillator with adaptive gain control which relieves the user to manually program the gain. The drive level is the amount of power dissipated by the oscillating crystal unit and is usually specified in terms of power dissipated by the resonator (equivalent series resistance (ESR)). Figure 16 gives the resulting drive level vs crystal frequency and ESR.

Figure 16. Crystal Drive Power
For example, if a $27-\mathrm{MHz}$ crystal with ESR of $50 \Omega$ is used and $2 \times \mathrm{C}_{\mathrm{L}}$ is 18 pF , the drive power is $21 \mu \mathrm{~W}$. Drive level should be held to a minimum to avoid over driving the crystal. The maximum power dissipation is specified for each type of crystal in the oscillator specifications, i.e., $100 \mu \mathrm{~W}$ for the example above.

## Single-Ended LVCMOS Clock Inputs

When selecting the LVCMOS clock mode, CLK_IN0 and CLK_IN1 act as regular clock inputs pins and can be driven up to 167 MHz . Both clock inputs circuitry are equal in design and can be used independently to each other (see Figure 177). The internal clock select bit, Byte 10, Bit [4], selects one of the two input clocks. CLK_INO is the default selection. There is also the option to program the external control pin S0/A0/CLK_SEL as clock select pin, Byte 10, Bit [1:0].
The two clock inputs can be used for redundancy switching, i.e. to switch between a primary clock and secondary clock. Note a phase difference between the clock inputs may require PLL correction. Also in case of different frequencies between the primary and secondary clock, the PLL has to re-lock to the new frequency.

A. CLK_SEL is optional and can be configured by EEPROM setting.

Figure 17. LVCMOS Clock Input Circuitry

## Differential Clock Inputs

The CDCE906 supports differential signaling as well. In this mode, CLK_IN0 and CLK_IN1 pin serve as differential signal inputs and can be driven up to 167 MHz .

The minimum magnitude of the differential input voltage is 100 mV over a differential common-mode input voltage range of 200 mV to $\mathrm{V}_{\mathrm{CC}}-0.6$. If LVDS or LVPECL signal levels are applied, ac-coupling and a biasing structure is recommended to adjust the different physical layers (see Figure 18). The capacitor removes the dc component of the signal (common-mode voltage), while the ac component (voltage swing) is passed on. A resistor pull-up and/or pull-down network represents the biasing structure used to set the common-mode voltage on the receiver side of the ac-coupling capacitor. DC coupling is also possible.

Figure 18. Differential Clock Input Circuitry

## PLL Configuration and Setting

The CDCE906 includes three PLLs which are equal in function and performance. Except PLL2 which in addition supports spread spectrum clocking (SSC) generation. Figure 19 shows the block diagram of the PLL.

Figure 19. PLL Architecture
All three PLLs are designed for easiest configuration. The user just has to define the input and output frequencies or the divider ( $\mathrm{M}, \mathrm{N}, \mathrm{P}$ ) setting respectively. All other parameters, such as charge-pump current, filter components, phase margin, or loop bandwidth are controlled and set by the device itself. This assures optimized jitter attenuation and loop stability.

The PLL support normal-speed mode ( $80 \mathrm{MHz} \leq \mathrm{f}_{\mathrm{vco}} \leq 200 \mathrm{MHz}$ ) and high-speed mode ( $180 \mathrm{MHz} \leq \mathrm{f}_{\mathrm{vco}} \leq 300$ MHz ) which can be selected by PLLxFVCO (Bit [7:5] of Byte 6). The respective speed option assures stable operation and lowest jitter.
The divider M and divider N operates internally as fractional divider for $\mathrm{f}_{\mathrm{vco}}$ up to 250 MHz . This allows fractional divider ratio for zero ppm output clock error.
In case of $f_{v c o}>250 \mathrm{MHz}$, it is recommended that integer factors of $\mathrm{N} / \mathrm{M}$ are used only.
For optimized jitter performance, keep divider M as small as possible. Also, the fractional divider concept requires a PLL divider configuration, $\mathrm{M} \leq \mathrm{N}$ (or $\mathrm{N} / \mathrm{M} \geq 1$ ).

Additionally, each PLL supports two bypass options:

- PLL Bypass and
- VCO Bypass

In PLL bypass mode, the PLL completely is bypassed, so that the input clock is switched directly to the Output-Switch-A (SWAPxx of Byte 9 to12). In the VCO bypass mode, only the VCO of the respective PLL is bypassed by setting PLLxMUX to 1 (Bit [7:5] of Byte 3). But the divider $M$ still is useable and expands the output divider by additional 9-bits. This gives a total divider range of M $\times P=511 \times 127=64897$. In VCO bypass mode the respective PLL block is powered down and minimizes current consumption.

Table 3. Example for Divide, Multiplication, and Bypass Operation

| Function | Equation ${ }^{(1)}$ | $\begin{gathered} \mathbf{f}_{\mathbb{N}} \\ {[\mathrm{MHz}]} \end{gathered}$ | fout-desired [MHz] | fout-actual [MHz] | Divider |  |  |  | $\mathrm{f}_{\mathrm{vco}}$ [MHz] |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  | M | N | P | N/M |  |
| Fractional ${ }^{(2)}$ | $\mathrm{f}_{\text {OUT }}=\mathrm{f}_{\text {IN }} \times(\mathrm{N} / \mathrm{M}) / \mathrm{P}$ | 30.72 | 155.52 | 155.52 | 16 | 81 | 1 | 5.0625 | 155.52 |
| Integer Factor ${ }^{(3)}$ | $\mathrm{f}_{\text {OUT }}=\mathrm{f}_{\text {IN }} \times(\mathrm{N} / \mathrm{M}) / \mathrm{P}$ | 27 | 162 | 162 | 1 | 6 | 1 | 6 | 162 |
| VCO bypass | $\mathrm{f}_{\text {Out }}=\mathrm{f}_{\mathrm{IN}} /(\mathrm{M} \times \mathrm{P})$ | 30.72 | 0.06 | 0.06 | 8 | - | 64 | - | - |

(1) P-divider of Output-Switch-Matrix is included in the calculation.
(2) Fractional operation for $\mathrm{fvco}^{\leq} \leq 250 \mathrm{MHz}$.
(3) Integer operation for $f_{v c o}>250 \mathrm{MHz}$.

## Spread Spectrum Clocking and EMI Reduction

In addition to the basic PLL function, PLL2 supports spread spectrum clocking (SSC) as well. Thus, PLL 2 features two outputs, a SSC output and a non-SSC output. Both outputs can be used in parallel. The mean phase of the Center Spread SSC modulated signal is equal to the phase of the non-modulated input frequency. SSC is selected by Output-Switch-A (SWAPxx of Byte 9 to 12).
SSC also is bypass-able (Byte 25, Bit [6:4]), which powers-down the SSC output and set it to logic low state. The non-SSC output of PLL2 is not affected by this mode and can still be used.
SSC is an effective method to reduce electro-magnetic interference (EMI) noise in high-speed applications. It reduces the RF energy peak of the clock signal by modulating the frequency and spread the energy of the signal to a broader frequency range. Because the energy of the clock signal remains constant, a varying frequency that broadens the overtones necessarily lowers their amplitudes. Figure 20 shows the effect of SSC on a $54-\mathrm{MHz}$ clock signal for DSP

Down Spread 3\%
9th Harmonic, $\mathbf{f m}=60 \mathrm{kHz}$

$$
\text { Center Spread } \pm 0.4 \%
$$

9th Harmonic, $\mathbf{f m}=60 \mathrm{kHz}$

Figure 20. Spread Spectrum Clocking With Center Spread and Down Spread
The peak amplitude of the modulated clock is 11.3 dB lower than the non-modulated carrier frequency for down spread and radiated less electro-magnetic energy.

In SSC mode, the user can select the SSC modulation amount and SSC modulation frequency. The modulation amount is the frequency deviation based to the carrier ( $\mathrm{min} / \mathrm{max}$ frequency), whereas the modulation frequency determines the speed of the frequency variation. In SSC mode, the maximum VCO frequency is limited to 167 MHz .

## SSC Modulation Amount

The CDCE906 supports center spread modulation and down spread modulation. In center spread, the clock is symmetrically shifted around the carrier frequency and can be $\pm 0.1 \%, \pm 0.25 \%$, and $\pm 0.4 \%$. At down spread, the clock frequency is always lower than the carrier frequency and can be $1 \%, 1.5 \%, 2 \%$, and $3 \%$. The down spread is preferred if a system can not tolerate an operating frequency higher than the nominal frequency (over-clocking problem).
Example:

| Modulation Type | Minimum <br> Frequency | Center <br> Frequency | Maximum <br> Frequency |  |
| :---: | :--- | :---: | :---: | :---: |
| A | $\pm 0.25 \%$ center spread | 53.865 MHz | 54 MHz | 54.135 MHz |
| B | $1 \%$ down spread | 53.46 MHz | - | 54 MHz |
| C | $0.5 \%$ down spread ${ }^{(1)}$ | 53.73 MHz | 53.865 MHz | 54 MHz |

(1) A down spread of $0.5 \%$ of a $54-\mathrm{MHz}$ carrier is equivalent to 59.865 MHz at a center spread of $\pm 0.25 \%$.

## SSC Modulation Frequency

The modulation frequency (sweep rate) can be selected between 30 kHz and 60 kHz . It is also based on the VCO frequency as shown in the SSC Modulation Frequency Selection as shown on page 19. As shown in Figure 21, the damping increases with higher modulation frequencies. It may be limited by the tracking skew of a downstream PLL. The CDCE906 uses a triangle modulation profile which is one of the common profiles for SSC.

Figure 21. EMI Reduction vs $f_{\text {Modulation }}$ and $f_{\text {Amount }}$

## Further EMI Reduction

The optimum damping is a combination of modulation amount, modulation frequency and the harmonics which are considered. Note that higher order harmonic frequencies results in stronger EMI reduction because of respective higher frequency deviation.
As seen in Figure 22 and Figure 23, a slower output slew rate and/or smaller output signal amplitude helps to reduce EMI emission even more. Both measures reduce the RF energy of clock harmonics. The CDCE906 allows slew rate control in four steps between 0.6 ns and 3.3 ns (Byte 19-24, Bit [5:4]). The output amplitude is set by the two independent output supply voltage pins, $\mathrm{V}_{\text {Ccout1 }}$ and $\mathrm{V}_{\text {Ccout2 }}$, and can vary from 2.3 V to 3.6 V . Even a lower output supply voltage down to 1.8 V works, but the maximum frequency has to be considered.

Figure 22. EMI Reduction vs Slew-Rate and $\mathrm{V}_{\text {ccout }}$

Figure 23. EMI Reduction vs $\mathrm{V}_{\text {ccout }}$

## Multi-Function Control Inputs S0 and S1

The CDCE906 features two user definable inputs pins which can be used as external control pins or address pins. When programmed as control pins, they can function as clock select pin, enable/disable pin or device power-down pin. If both pins used as address-bits, up to four devices can be connected to the same SMBus. The respective function is set in Byte 10; Bit [3:0]. Table 4 shows the possible setting for the different output conditions, clock select and device addresses.

Table 4. Configuration Setting of Control Inputs

| Configuration Bits |  |  |  | External Control Pins |  | Device Function |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte 10, <br> Bit [3:2] |  | $\begin{aligned} & \text { Byte 10, } \\ & \text { Bit [1:0] } \end{aligned}$ |  |  |  |  |  |  |  |
| S11 | S10 | S01 | S00 | $\begin{gathered} \text { S1 } \\ \text { (Pin 2) } \end{gathered}$ | $\begin{gathered} \text { S0 } \\ (\text { Pin 1) } \end{gathered}$ | Yx Outputs | Power Down | Pin 2 | Pin 1 |
| 0 | X | 0 | X | 1 | 1 | Active | No | Output ctrl | Output ctrl |
| 0 | 0 | 0 | X | 0 | 1 | Low/High ${ }^{(1)}$ | No | Output ctrl | Output ctrl |
| 0 | 1 | 0 | X | 0 | 1 | 3-State | Outputs only | Output ctrl | Output ctrl |
| 0 | X | 0 | 0 | X | 0 | 3-State | PLL, inputs and outputs | Output ctrl | Output ctrl and pd |
| 0 | X | 0 | 1 | 0 | 0 | $\begin{gathered} \text { S10=0: low/high }{ }^{(1)} \\ \text { S10=1:3-State } \end{gathered}$ | PLL only | Output ctrl | PLL and Div bypass |
| 0 | X | 0 | 1 | 1 | 0 | Active | PLL only | Output ctrl | PLL and Div bypass |
| 0 | X | 1 | 0 | 0 | $0 / 1^{(2)}$ | $\begin{gathered} \text { S10=0: Low/High }{ }^{(1)} \\ \text { S10=1: 3-State } \end{gathered}$ | No | Output ctrl | CLK_SEL |
| 0 | X | 1 | 0 | 1 | $0 / 1^{(2)}$ | Active | No | Output ctrl | CLK_SEL |
| 1 | 1 | 1 | 1 | X | X | Active | No | $\mathrm{A} 1^{(3)}$ | $A 0^{(3)}$ |

(1) A non-inverting output will be set to low and an inverting output will be set to high.
(2) If $S 0$ is $0, C L K \_I N 0$ is selected; if $S 0$ is $1, C L K \_I N 1$ is selected.
(3) S0 and S1 are interpreted as Address Bit A0 and A1 of the Slave Receiver Address Byte.

As shown in Table 4, there is a specific order of the different output condition: Power-down mode overwrites 3 -state, 3 -state overwrites low-state, and low-state overwrites active-state.

Output Switching Matrix
The flexible architecture of the output switch matrix allows the user to switch any of the internal clock signal sources via a free-selectable post-divider to any of the six outputs.
As shown in Figure 24, the CDCE906 is based on two banks of switches and six post-dividers. Switch A comprises six 5-Input-Muxes which selects one of the four PLL clock outputs or directly selects the input clock and feed it to one of the 7 -bit post-divider ( P -Divider). Switch B is made up of six 6 -Input-Muxes which takes any post-divider and feeds it to one of the six outputs, Yx.
Switch B was added to the output switch matrix to ensure that outputs frequencies derive from one P -divider are $100 \%$ phase aligned. Also, the P-divider is built in a way that every divide factor is automatically duty-cycle corrected. Changing the divider value on the fly may cause a glitch on the output.

Figure 24. CDCE906 Output Switch Matrix
In addition, the outputs can be switched active, low or 3 -state and/or 180 degree phase shifted. Also the outputs slew-rate and the output-voltage is user selectable.

## LVCMOS Output Configuration

The output stage of the CDCE906 supports all common output setting, such as enable, disable, low-state and signal inversion ( 180 degree phase shift). It further features slew-rate control ( 0.6 ns to 3.3 ns ) and variable output supply voltage ( 2.3 V to 3.6 V ).

Figure 25. Block Diagram of Output Architecture

Figure 26. Example for Output Waveforms

All output settings are programmable via SMBus:

- enable, disable, low-state via external control pins S0 and S1 $\rightarrow$ Byte 10, Bit[3:0]
- enable or disable-to-low $\rightarrow$ Byte 19 to 24, Bit[3]
- inverting/non-inverting $\rightarrow$ Byte 19 to 24, Bit[6]
- slew-rate control $\rightarrow$ Byte 19 to 24, Bit[5:4]
- output swing $\rightarrow$ external pins $\mathrm{V}_{\text {Ccout } 1}$ (Pin 14) and $\mathrm{V}_{\text {Ccout2 }}$ (Pin 18)

## Performance Data: Output Skew, Jitter, Cross Coupling, Noise Rejection (Spur-Suppression), and Phase Noise

## Output Skew

Skew is an important parameter for clock distribution circuits. It is defined as the time difference between outputs that are driven by the same input clock. Table 5 shows the output skew ( $\mathrm{t}_{\mathrm{sk}(\mathrm{o})}$ ) of the CDCE906 for high-to-low and low-to-high transitions over the entire range of supply voltages, operating temperature and output voltage swing.

Table 5. Output Skew

| PARAMETER | $\mathbf{V}_{\text {ccout }}$ | TYP | MAX | UNIT |
| :---: | :---: | :---: | :---: | :---: |
| $\mathrm{t}_{\mathrm{sk}(0)}$ | 2.5 V | 130 | 250 | ps |
|  | 3.3 V | 130 | 200 | ps |

## Jitter Performance

Jitter is a major parameter for PLL-based clock driver circuits. This becomes important as speed increases and timing budget decreases. The PLL and internal circuits of CDCE906 are designed for lowest jitter. The peak-to-peak period jitter is only 60 ps (typical). Table 6 gives the peak-to-peak and rms deviation of cycle-to-cycle jitter, period jitter and phase jitter as taken during characterization.

Table 6. Jitter Performance of CDCE906

| PARAMETER | $\mathrm{f}_{\text {out }}$ | TYP ${ }^{(1)}$ |  | MAX ${ }^{(1)}$ |  | UNIT |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Peak-Peak | $\begin{gathered} \text { rms } \\ \text { (one sigma) } \end{gathered}$ | Peak-Peak | rms (one sigma) |  |
| $\mathrm{t}_{\mathrm{jit}(\mathrm{cc})}$ | 50 MHz | 55 | - | 75 | - | ps |
|  | 133 MHz | 50 | - | 85 | - |  |
| $\mathrm{t}_{\mathrm{jit}(\text { (per })}$ | 50 MHz | 60 | 4 | 76 | 7 | ps |
|  | 133 MHz | 55 | 5 | 84 | 11 |  |
| $\mathrm{t}_{\mathrm{jit}(\text { phase) }}$ | 50 MHz | 730 | 90 | 840 | 115 | ps |
|  | 133 MHz | 930 | 130 | 1310 | 175 |  |

(1) All typical and maximum values are at $\mathrm{V}_{\mathrm{CC}}=3.3 \mathrm{~V}$, temperature $=25^{\circ} \mathrm{C}, \mathrm{V}_{\text {ccout }}=3.3 \mathrm{~V}$; one output is switching, data taken over several 10000 cycles.

Figure 27, Figure 28, and Figure 29 show the relationship between cycle-to-cycle jitter, period jitter, and phase jitter over 10000 samples. The jitter varies with a smaller or wider sample window. The cycle-to-cycle jitter and period jitter show the measured value whereas the phase jitter is the accumulated period jitter.
Cycle-to-Cycle jitter ( $\mathrm{t}_{\mathrm{jit} \text { (ccc) }}$ ) is the variation in cycle time of a clock signal between adjacent cycles, over a random sample of adjacent cycle pairs. Cycle-to-cycle jitter will never be greater than the period jitter. It is also known as adjacent cycle jitter.

Figure 27. Snapshot of Cycle-to-Cycle Jitter
Period jitter ( $\mathrm{t}_{\mathrm{jit}}(\mathrm{per})$ ) is the deviation in cycle time of a clock signal with respect to the ideal period ( $1 / \mathrm{fo}$ ) over a random sample of cycles. In reference to a PLL, period jitter is the worst-case period deviation from the ideal that would ever occur on the PLLs outputs. This is also referred to as short-term jitter.

Figure 28. Snapshot of Period Jitter

Phase jitter ( $\mathrm{t}_{\mathrm{jit}(\text { phase })}$ ) is the long-term variation of the clock signal. It is the cumulative deviation in $\mathrm{t}(\Theta)$ for a controlled edge with respect to a $t(\Theta)$ mean in a random sample of cycles. Phase jitter, Time Interval Error (TIE), or Wander are used in literature to describe long-term variation in frequency. As of ITU-T: G.810, wander is defined as phase variation at rates less than 10 Hz while jitter is defined as phase variation greater than 10 Hz . The measurement interval must be long enough to gain a meaningful result. Wander can be caused by temperature drift, aging, supply voltage drift, etc.

Figure 29. Snapshot of Phase Jitter
Jitter also depends on the VCO frequency (fvco) of the PLL. A higher fvco results in better jitter performance compared to a lower fyco. The VCO frequency can be defined via the M- and N -divider of the PLL.
As the CDCE906 supports a pretty wide frequency range, the device offers a VCO Frequency Selection Bit, Bit [7:5] of Byte 6. This bit defines the jitter-optimized frequency range of each PLL. The user can select between the normal-speed mode ( 80 MHz to 200 MHz ) and the high-speed mode ( 180 MHz to 300 MHz ). Figure 30 shows the jitter performance over foco for the two frequency ranges.

Figure 30. Period Jitter vs $\mathrm{f}_{\mathrm{vco}}$ for Normal-Speed Mode and High-Speed Mode
The TI Pro Clock software automatically calculates the PLL parameter for jitter-optimized performance.

## Cross Coupling, Spur Suppression, and Noise Rejection

Cross-Coupling in ICs occurs through interactions between several parts of the chip such as between output stages, metal lines, bond wires, substrate, etc. The coupling can be capacitive, inductive and resistive (ohmic) induced by output switching, leakage current, ground bouncing, power supply transients, etc.
The CDCE906 is designed using the RFSiGe process technology. This process gives excellent performance in linearity, low power consumption, best-in-class noise performance and good isolation characteristics between the on-chip components.
The good isolation is a major benefit of the RFSiGe process because it minimizes the coupling effect. Even if all three PLLs are active and all outputs are on, the noise suppression is well above 50 dB . Figure 31] and Figure 32 show an example of noise coupling, spur-suppression, and power supply noise rejection of CDCE906. Die respective measurement conditions are shown in Figure 31 and Figure 32.

Figure 31. Noise Coupling and Spur Suppression

Figure 32. Power Supply Noise Rejection

## Phase Noise Characteristic

In high-speed communication systems, the phase noise characteristic of the PLL frequency synthesizer is of high interest. Phase noise describes the stability of the clock signal in the frequency domain, similar to the jitter specification in the time domain.
Phase noise is a result of random and discrete noise causing a broad slope and spurious peaks. The discrete spurious components could be caused by known clock frequencies in the signal source, power line interference, and mixer products. The broadening caused by random noise fluctuation is due to phase noise. It can be the result of thermal noise, shot noise and/or flicker noise in active and passive devices.
Important factor for PLL synthesizer is the loop bandwidth ( -3 dB cut-off frequency) - large loop bandwidth (LBW) results in fast transient response but have less reference spur attenuation. The LBW of the CDCE906 is about 100 kHz to 250 kHz , dependent on selected PLL parameter.

For the CDCE906, two phase noise characteristics are of interest: The phase noise of the crystal-input stage and the phase noise of the internal PLL (VCO). The following Figure shows the respective phase noise characteristic.

Figure 33. Phase Noise Characteristic

## PLL Lock-Time

Some applications use frequency switching, i.e. to change frequency in TV application (switching between channels) or change the PCI-X frequency in computers. The time spent by the PLL in achieving the new frequency is of main interest. The lock time is the time it takes to jump from one specified frequency to another specified frequency within a given frequency tolerance (Figure 34). It should be low, because a long lock time impacts the data rate of the system.
The PLL Lock Time depends on the device configuration and can be changed by the VCO frequency, i.e. by changing the $\mathrm{M} / \mathrm{N}$ divider values. Table 7 gives the typical lock times of the CDCE906 and Figure 34 shows a snapshot of a frequency switch.

Table 7. CDCE906 PLL Lock-Times

| Description | Lock Time (Typical) | Unit |
| :--- | :---: | :---: |
| Frequency change via reprogramming of N/M counter | 100 | $\mu \mathrm{~s}$ |
| Frequency change via CLK_SEL pin (switching between CLK_IN0 and CLK_IN1) | 100 | $\mu \mathrm{~s}$ |
| Power-up lock time with system clock | $\mu \mathrm{s}$ |  |
| Power-up lock time with 27-MHz Crystal at CLK_IN0 and CLK_IN1 | $\mu \mathrm{s}$ |  |

(1) Is the result of crystal power up (200 $\mu \mathrm{s}$ ) and PLL Lock Time ( $100 \mu \mathrm{~s}$ ).

Figure 34. Snapshot of the PLL Lock-Time

## Power Supply Sequence

The CDCE906 includes the following three power supply pins: $\mathrm{V}_{\mathrm{CC}}, \mathrm{V}_{\text {CCOUT1 }}$, and $\mathrm{V}_{\text {CCout2 }}$. There are no power supply sequencing requirements, as the three power nodes are separated from each other. So, power can be supplied in any order to the three nodes.
Also, the part has a power-up circuitry which switches the device on if $\mathrm{V}_{\mathrm{Cc}}$ exceeds 2.1 V (typ) and switches the device off at $\mathrm{V}_{\mathrm{CC}}<1.7 \mathrm{~V}$ (typ). In power-down mode, all outputs and clock inputs are switched off.

## Device Behavior during Supply Voltage Drops

The CDCE906 has a Power-Up-Circuit, which activates the device function at $\mathrm{V}_{\text {puc_on }}$ (typical 2.1 V ). At the same time, the EEPROM information is loaded into the register. This mechanism ensures that there is a pre-defined default after Power-Up and no need to reprogram the CDCE906 in the application.

In the event of a supply-voltage-drop, the Power-Up-Circuit assures that there is always a defined setup within the register. Figure 35 shows possible voltage drops with different amplitudes.

Figure 35. Different Voltage Drops on $\mathrm{V}_{\mathrm{cc}}$ During Operation

The CDCE906 Power-Up-Circuit has an inbuilt hysteresis. If the voltage stays above $\mathrm{V}_{\text {Puc off, }}$, which is typically at 1.7 V , the register content stays unchanged. If the voltage drops below $\mathrm{V}_{\text {PUC OFF }}$, the internal register is reloaded by the EEPROM after $\mathrm{V}_{\text {Puc_on }}$ is crossed again. $\mathrm{V}_{\text {Puc_on }}$ is typically 2.1 V . Table 8 show the content of the EEPROM and the Register after àbove voltage drops scenarios.

Table 8. EEPROM and Register Content After $\mathrm{V}_{\mathrm{CC}}$ Drop

| Power Drop | EEPROM Content | Register Content |
| :---: | :---: | :---: |
| A | Unchanged | Unchanged |
| B | Unchanged | Unchanged |
| C | Unchanged | Reloaded from EEPROM |
| D | Unchanged | Reloaded from EEPROM |

## EVM and Programming SW

The CDCE906 EVM is a development kit consisting of a performance evaluation module, the TI Pro Clock software, and the User's Guide. Contact Texas Instruments sales or marketing representative for more information.

## PACKAGING INFORMATION

| Orderable Device | Status (1) | Package Type | Package Drawing | Pins | Package Qty | Eco Plan <br> (2) | Lead/Ball Finish <br> (6) | MSL Peak Temp <br> (3) | Op Temp ( ${ }^{\circ} \mathrm{C}$ ) | Device Marking <br> (4/5) | Samples |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| CDCE906PW | ACTIVE | TSSOP | PW | 20 | 70 | Green (RoHS \& no $\mathrm{Sb} / \mathrm{Br}$ ) | CU NIPDAU | Level-1-260C-UNLIM | 0 to 70 | CDCE906 | Samples |
| CDCE906PWG4 | ACTIVE | TSSOP | PW | 20 | 70 | Green (RoHS \& no $\mathrm{Sb} / \mathrm{Br}$ ) | CU NIPDAU | Level-1-260C-UNLIM | 0 to 70 | CDCE906 | Samples |
| CDCE906PWR | ACTIVE | TSSOP | PW | 20 | 2000 | Green (RoHS \& no Sb/Br) | CU NIPDAU | Level-1-260C-UNLIM | 0 to 70 | CDCE906 | Samples |

${ }^{(1)}$ The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.
${ }^{(2)}$ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS \& no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined
Pb -Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed $0.1 \%$ by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes. Pb -Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS \& no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants ( Br or Sb do not exceed $0.1 \%$ by weight in homogeneous material)
${ }^{(3)}$ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
${ }^{(4)}$ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
${ }^{(5)}$ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a " $\sim$ " will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
${ }^{(6)}$ Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and
continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

PW (R-PDSO-G20)

NOTES: A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
B. This drawing is subject to change without notice.

C Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shal not exceed 0,15 each side
D Body width does not include interlead flash. Interlead flash shall not exceed 0,25 each side.
E. Falls within JEDEC MO-153

| $P W$ (R-PDSO-G20) | PLASTIC SMALL OUTLINE |
| :---: | :---: |
| Example Board Layout | Based on a stencil thickness of .127 mm (.005inch). |

NOTES: A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Publication IPC-7351 is recommended for alternate design.
D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

## IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

Tl's published terms of sale for semiconductor products (http://www.ti.com/sc/docs/stdterms.htm) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.
Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.
Tl's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate Tl products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.
Tl's provision of TI Resources does not expand or otherwise alter Tl's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such Tl Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI .
TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.
Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.
TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify Tl and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's noncompliance with the terms and provisions of this Notice.

[^0]:    ${ }^{(1)}$ Data Byte 0 is reserved for revision code and vendor identification. However, this byte is used for internal test. Do not write into it other than 00000001.

[^1]:    (1) The EEPROM WRITE cycle is initiated with the rising edge of the EEWRITE-Bit. A static level high does not trigger an EEPROM WRITE cycle. This bit stays high until the user reset it to low (it will not automatically be reset after the programming has been completed).
    Therefore, to initiate an EEPROM WRITE cycle, it is recommended to send a zero-one sequence to the EEWRITE bit in Byte 26.
    During EEPROM programming, no data are allowed to be sent to the device via the SMBus until the programming sequence has been completed. Data, however, can be readout during the programming sequence (Byte Read or Block Read). The programming status can be monitored by readout EEPIP, Byte 24-Bit 7. If EELOCK is set, no EEPROM programming will be possible.
    (2) Unless customer specific setting.
