TECHNICAL DETAILS

DESCRIPTION

This electret capsule microphone is the same one we use in our great microphone amplifier board. It contains a small vibrating element that will output a few millivolts peak-to-peak. You will need an op-amp to amplify the signal, some chips are designed with the amplifier built in in which case you can wire it up directly.

This is an "omnidirectional" microphone, with -44dB sensitivity, and has 20-20KHz frequency response. You can plug it into a breadboard or perfboard or solder wires to the little wires sticking out the back.

Check out [OpenMusicLab's great tutorial on Electret Microphones](#) for a deeper look at how these sensors work. If you need an amplifier board, [see our fully-assembled and tested mic amp board with adjustable gain](#).
