

Description

This document describes the specifications for the F1792 Wideband, Gain-Settable, Zero-Distortion™ Flat-Noise™, RF to IF Downconverting Mixer.

The F1792 offers very low power consumption with excellent linearity. In addition to this the F1792 has four dynamically adjustable gain settings. The F1792 performance is exceptional across an extremely broad range of RF and IF frequencies. All of this makes it ideal for a myriad of applications including:

- 2G/3G/4G/5G/Multimode Remote Radio Units
- Point to Point μ Wave Backhaul systems
- Broadband Repeaters
- Public Safety Infrastructure
- Any radio system operating between 400MHz and 4000MHz

Competitive Advantage

F1792 offers maximum performance and flexibility at minimum power consumption. The unique and patented settable-gain feature allows it to be used in a very wide variety of radio card applications, even allowing for dynamic adjustment of gain to maximize performance on the fly. The extremely wide RF and IF bandwidths are achieved using a fixed BOM, all RF matching is internal to the device. The F1792 can function with as little as -6 dBm LO power. It also features a channel shutdown mode for ease of integration into high order TDD systems.

Features

- RF range: 400MHz to 3800MHz
- LO range: 400MHz to 3600MHz
- IF Range: 50MHz to 600MHz
- 4 Gain Settings; 11dB, 8dB, 5dB, 2dB
- 2 bit gain step control
- Ideal for Multi-Carrier Systems
- +35dBm OIP3
- Low Noise Figure at any gain setting via Renesas' FlatNoise™ technology
- Z = 200 Ω IF balanced, 50 Ω RF, 50 Ω LO single-ended
- All internally matched. Single BOM for all RF, LO and IF frequencies
- 4 x 4 mm, 24-VFQFPN package
- Independent Path Standby mode
- 75 nsec settling for gain adjustment
- VCC = 3.3V, 462mW, 373mW (low power mode)

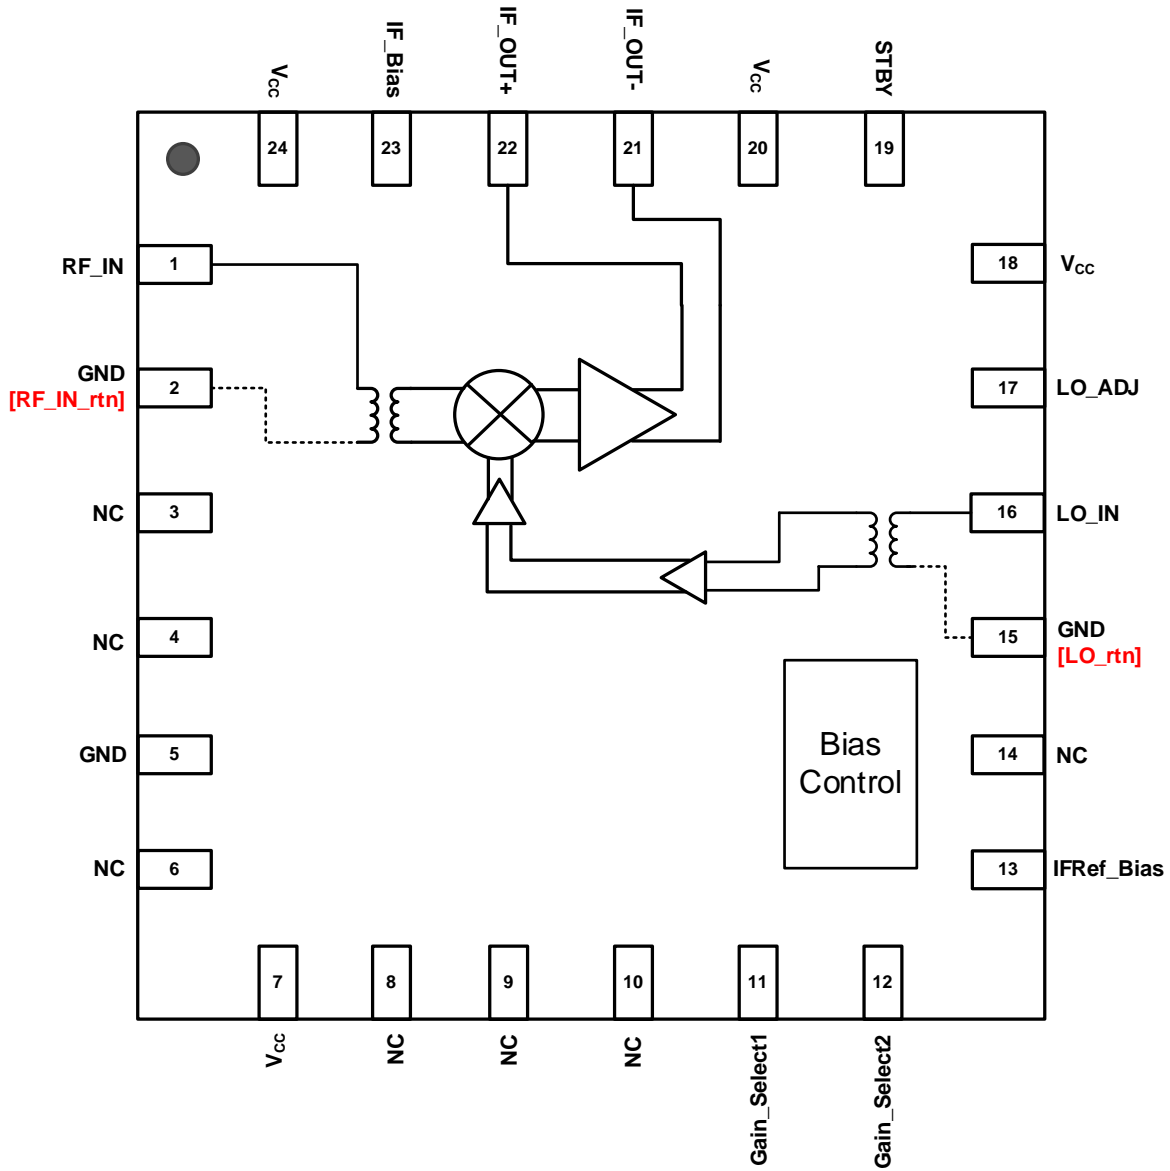

Band Performance Summary

RF Frequency (MHz)	900	1900	2600	3500
Gain (dB, max G11 setting)	11.0	10.8	10.3	9.0
Gain (dB, min G2 setting)	2.5	2.3	1.8	0.5

Pin Descriptions

Table 1. F1792 Pin Descriptions

Number	Name	Description
1	RF_IN	RF input. Matched to 50 ohms. DO NOT apply DC to this pin.
2	RF_IN_rtn	RF input transformer ground return. Ground this pin.
3, 4, 6, 8, 9, 10, 14	NC	Not connected.
5	GND	Ground this pin.
7, 18, 20, 24	VCC	Power Supply. Bypass to ground with appropriate capacitors as close as possible to pin
11	Gain_Select1	Gain select control pin, includes internal pull-down resistor. See gain select truth table for desired setting
12	Gain_Select2	Gain select control pin, includes internal pull-down resistor. See gain select truth table for desired setting
13	IFRef_Bias	Connect recommended resistor value from this pin to ground to set the IF amplifier reference current
15	LO_IN_rtn	LO input transformer ground return. Ground this pin.
16	LO_IN	Local Oscillator (LO) input. Matched to 50 ohms. DO NOT apply DC to this pin.
17	LO_ADJ	Connect zero ohm resistor to ground here for best performance
19	STBY	Standby Input (Low/Open = Power ON, High = Power OFF). Includes internal pull-down resistor
21, 22	IF_OUT-, IF_OUT+	Mixer Differential IF Output. Connect pull-up inductors from each of these pins to VCC (see the Typical Application Circuit)
23	IF_Bias	Connect the specified resistor from this pin to ground to set the bias for the Main IF amplifier
	— EP	Exposed Pad. Internally connected to GND. Solder this exposed pad to a PCB pad that uses multiple ground vias to provide heat transfer out of the device into the PCB ground planes. These multiple via grounds are also required to achieve the specified RF performance

Power Supplies

A common VCC power supply should be used for all pins requiring DC power. All supply pins should be bypassed with external capacitors to minimize noise and fast transients. Supply noise can degrade noise figure and fast transients can trigger ESD clamps and cause them to fail. Supply voltage change or transients should have a slew rate smaller than 1V/20µs. In addition, all control pins should remain at 0V (±0.3V) while the supply voltage ramps or while it returns to zero.

Control Pin Interface

If control signal integrity is a concern and clean signals cannot be guaranteed due to overshoot, undershoot, ringing, etc., provisions for an R-C circuit at the input of each control pin is recommended. This applies to pins 11, 12, and 19 as shown below.

Gain Select

F1792 provides a gain select feature requiring 2 pins for logic control. The following table summarizes the required pin logic to achieve the desired gain setting. Internal pull down resistors are included requiring no control to set both channels to maximum gain.

Desired Power Gain (dB)	Gain Select1 (Pin 11) #	Gain Select2 (Pin 12)
11	0	0
8	0	1
5	1	0
2	1	1

Default Start-up

Upon start-up, the device gain will be whatever the gain select pins are set for as defined in the table above.

Revision History

Revision Date	Description of Change
February 9, 2022	Rebranded to Renesas.
December 13, 2019	<ul style="list-style-type: none"> Corrected a typo in logic current unit in Table 4. Updated the package outline drawings; however, no mechanical changes
April 5, 2016	First release (Rev O) of the F1792 datasheet.

NOTES:

1. DIMENSIONING AND TOLERANCING CONFORME TO ASME Y14.5M-1994.
2. ALL DIMENSIONS ARE IN MILLIMETERS.

RECOMMENDED LAND PATTERN DIMENSION

NOTES:

1. ALL DIMENSIONS ARE IN MM. ANGLES IN DEGREES.
2. TOP DOWN VIEW, AS VIEWED ON PCB.
3. LAND PATTERN RECOMMENDATION PER IPC-7351B GENERIC REQUIREMENT FOR SURFACE MOUNT DESIGN AND LAND PATTERN.
