

## FEATURES

Triaxis digital gyroscope with digital range scaling

$\pm 75^\circ/\text{sec}$ ,  $\pm 150^\circ/\text{sec}$ ,  $\pm 300^\circ/\text{sec}$  settings

Tight orthogonal alignment:  $<0.05^\circ$

Triaxis digital accelerometer:  $\pm 5 g$

Autonomous operation and data collection

No external configuration commands required

Start-up time: 180 ms

Sleep mode recovery time: 4 ms

Factory-calibrated sensitivity, bias, and axial alignment

Calibration temperature range:  $-20^\circ\text{C}$  to  $+70^\circ\text{C}$

SPI-compatible serial interface

Wide bandwidth: 330 Hz

Embedded temperature sensor

Programmable operation and control

Automatic and manual bias correction controls

Bartlett window, FIR filter length, number of taps

Digital I/O: data ready, alarm indicator, general-purpose

Alarms for condition monitoring

Sleep mode for power management

DAC output voltage

Enable external sample clock input: up to 1.2 kHz

Single-command self-test

Single-supply operation: 4.75 V to 5.25 V

2000 g shock survivability

Operating temperature range:  $-40^\circ\text{C}$  to  $+105^\circ\text{C}$

## APPLICATIONS

Medical instrumentation

Robotics

Platform controls

Navigation

## GENERAL DESCRIPTION

The ADIS16364 *iSensor*® is a complete inertial system that includes a triaxis gyroscope and triaxis accelerometer. Each sensor in the ADIS16364 combines industry-leading *iMEMS*® technology with signal conditioning that optimizes dynamic performance. The factory calibration characterizes each sensor for sensitivity, bias, alignment, and linear acceleration (gyro bias). As a result, each sensor has its own dynamic compensation formulas that provide accurate sensor measurements over a temperature range of  $-20^\circ\text{C}$  to  $+70^\circ\text{C}$ .

The ADIS16364 provides a simple, cost-effective method for integrating accurate, multi-axis inertial sensing into industrial systems, especially when compared with the complexity and investment associated with discrete designs. All necessary motion testing and calibration are part of the production process at the factory, greatly reducing system integration time. Tight orthogonal alignment simplifies inertial frame alignment in navigation systems. An improved SPI interface and register structure provide faster data collection and configuration control.

The ADIS16364 uses a compatible pinout and the same package as the ADIS1635x family. Therefore, systems that currently use the ADIS1635x family can upgrade their performance with minor firmware adjustments in their processor designs.

This compact module is approximately  $23\text{ mm} \times 23\text{ mm} \times 23\text{ mm}$  and provides a flexible connector interface that enables multiple mounting orientation options.

Flash Memory Test Time	Normal mode, SMPL_PRD $\leq$ 0x09		17		ms
	Low power mode, SMPL_PRD $\geq$ 0x0A		90		ms
Automatic Self-Test Time	SMPL_PRD = 0x0001		12		ms
CONVERSION RATE	SMPL_PRD = 0x0001 to 0x00FF	0.413		819.2	SPS
Clock Accuracy				$\pm 3$	%
Sync Input Clock <sup>6</sup>		0.8		1.2	kHz
POWER SUPPLY	Operating voltage range, VCC	4.75	5.0	5.25	V
Power Supply Current	Low power mode		24		mA
	Normal mode		49		mA
	Sleep mode		500		$\mu$ A

<sup>1</sup> X-ray exposure may degrade this performance metric.

<sup>2</sup> The digital I/O signals are driven by an internal 3.3 V supply, and the inputs are 5 V tolerant.

<sup>3</sup> Endurance is qualified as per JEDEC Standard 22, Method A117, and measured at  $-40^{\circ}\text{C}$ ,  $+25^{\circ}\text{C}$ ,  $+85^{\circ}\text{C}$ , and  $+125^{\circ}\text{C}$ .

<sup>3</sup> The data retention lifetime equivalent is at a junction temperature (T<sub>J</sub>) of 85°C as per JEDEC Standard 22, Method A117. Data retention lifetime decreases with junction temperature.

<sup>5</sup> These times do not include thermal settling and internal filter response times (330 Hz bandwidth), which may affect overall accuracy.

<sup>6</sup> The sync input clock functions below the specified minimum value, at reduced performance levels.

**TIMING SPECIFICATIONS**

T<sub>A</sub> = 25°C, VCC = 5 V, unless otherwise noted.

Table 2.

Parameter	Description	Normal Mode (SMPL_PRD ≤ 0x09)			Low Power Mode (SMPL_PRD ≥ 0x0A)			Burst Read			Unit
		Min <sup>1</sup>	Typ	Max	Min <sup>1</sup>	Typ	Max	Min <sup>1</sup>	Typ	Max	
f <sub>SCLK</sub>	Serial clock	0.01		2.0	0.01		0.3	0.01		1.0	MHz

Figure 3. Stall Time and Data Rate

Figure 4. Input Clock Timing Diagram

## ABSOLUTE MAXIMUM RATINGS

Table 3.

Parameter	Rating
Acceleration	
Any Axis, Unpowered	2000 g
Any Axis, Powered	2000 g
VCC to GND	-0.3 V to +6.0 V
Digital Input Voltage to GND	-0.3 V to +5.3 V
Digital Output Voltage to GND	-0.3 V to VCC + 0.3 V
Analog Input to GND	-0.3 V to +3.6 V
Operating Temperature Range	-40°C to +105°C
Storage Temperature Range	-65°C to +125°C <sup>1, 2</sup>

<sup>1</sup> Extended exposure to temperatures outside the specified temperature range of -40°C to +105°C can adversely affect the accuracy of the factory calibration. For best accuracy, store the parts within the specified operating range of -40°C to +105°C.

<sup>2</sup> Although the device is capable of withstanding short-term exposure to 150°C, long-term exposure threatens internal mechanical integrity.

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

Table 4. Package Characteristics

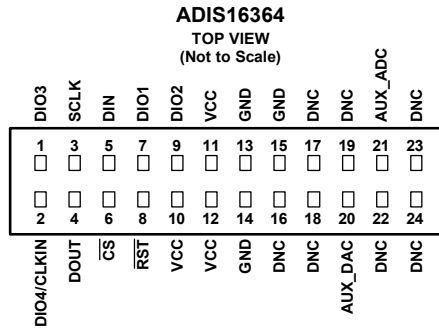

Package Type	$\theta_{JA}$	$\theta_{JC}$	Device Weight
24-Lead Module (ML-24-2)	39.8°C/W	14.2°C/W	16 grams

### ESD CAUTION

**ESD (electrostatic discharge) sensitive device.** Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

Figure 8. Accelerometer Allan Variance

# THEORY OF OPERATION

## BASIC OPERATION

The ADIS16364 is an autonomous sensor system that starts up after it has a valid power supply voltage and begins producing inertial measurement data at the factory default sample rate setting of 819.2 SPS. After each sample cycle, the sensor data is loaded into the output registers, and DIO1 pulses high, which provides a new data ready control signal for driving system-level interrupt service routines. In a typical system, a master processor accesses the output data registers through the SPI interface, using the connection diagram shown in Figure 9. Table 6 provides a generic functional description for each pin on the master processor. Table 7 describes the typical master processor settings that are normally found in a configuration register and used for communicating with the ADIS16364.

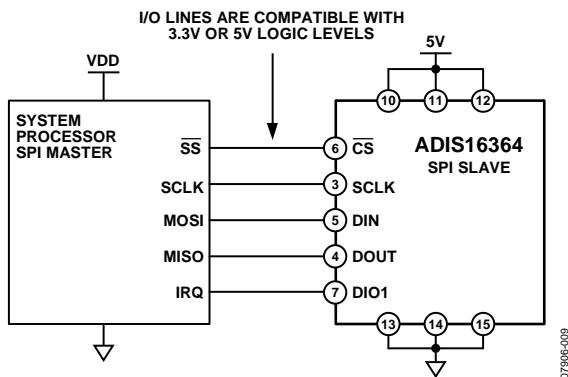

Figure 9. Electrical Connection Diagram

Table 6. Generic Master Processor Pin Names and Functions

Pin Name	Function
$\overline{SS}$	Slave select
SCLK	Serial clock
MOSI	Master output, slave input
MISO	Master input, slave output
IRQ	Interrupt request

Table 7. Generic Master Processor SPI Settings

Processor Setting	Description
Master	The ADIS16364 operates as a slave
SCLK Rate $\leq 2$ MHz <sup>1</sup>	Normal mode, SMPL_PRD[7:0] $\leq 0x09$
SPI Mode 3	CPOL = 1 (polarity), CPHA = 1 (phase)
MSB First Mode	Bit sequence
16-Bit Mode	Shift register/data length

<sup>1</sup> For burst read, SCLK rate  $\leq 1$  MHz. For low power mode, SCLK rate  $\leq 300$  kHz.

The user registers provide addressing for all input/output operations on the SPI interface. Each 16-bit register has two 7-bit addresses: one for its upper byte and one for its lower byte. Table 8 lists the lower byte address for each register, and Figure 10 shows the generic bit assignments.

Figure 10. Generic Register Bit Assignments

## READING SENSOR DATA

Although the ADIS16364 produces data independently, it operates as a SPI slave device that communicates with system (master) processors using the 16-bit segments displayed in Figure 11. Individual register reads require two of these 16-bit sequences. The first 16-bit sequence contains the read command bit ( $\overline{R/W} = 0$ ) and the target register address (A6 to A0); the last eight bits are “don’t care” bits when requesting a read. The second 16-bit sequence transmits the register contents (D15 to D0) on the DOUT line. For example, if DIN = 0x0A00, the contents of the XACCL\_OUT register are shifted out on the DOUT line during the next 16-bit sequence.

The SPI operates in full-duplex mode, which means that the master processor can read the output data from DOUT while using the same SCLK pulses to transmit the next target address on DIN.

## DEVICE CONFIGURATION

The user register memory map (see Table 8) identifies configuration registers as either read/write or write only. Configuration commands also use the bit sequence shown in Figure 11. If the MSB = 1, the last eight bits (DC7 to DC0) in the DIN sequence are loaded into the memory address associated with the address bits (A6 to A0). For example, if DIN = 0xA11F, 0x1F is loaded into Address 0x21 (XACCL\_OFF, upper byte) at the conclusion of the data frame.

The master processor initiates the backup function by setting GLOB\_CMD[3] = 1 (DIN = 0xBE08). This command copies the user registers into their assigned flash memory locations and requires the power supply to stay within its normal operating range for the entire 50 ms process. The FLASH\_CNT register provides a running count of these events for monitoring the long-term reliability of the flash memory.

NOTES

1. THE DOUT BIT PATTERN REFLECTS THE ENTIRE CONTENTS OF THE REGISTER IDENTIFIED BY [A6:A0] IN THE PREVIOUS 16-BIT DIN SEQUENCE WHEN  $\overline{R/W} = 0$ .
2. IF  $\overline{R/W} = 1$  DURING THE PREVIOUS SEQUENCE, DOUT IS NOT DEFINED.

Figure 11. SPI Communication Bit Sequence

## MEMORY MAP

SERIAL_NUM	Read only	Yes	0x58	N/A	Serial number	See Table 32

<sup>1</sup> Each register contains two bytes. The address of the lower byte is displayed. The address of the upper byte is equal to the address of the lower byte plus 1.

**BURST READ DATA COLLECTION**

Burst read data collection is a process-efficient method for collecting data from the ADIS16364. In a burst read, all output data registers are clocked out on DOUT, 16 bits at a time, in sequential data cycles (each separated by one SCLK period). To start a burst read sequence, set DIN = 0x3E00. The contents of each output data register are then shifted out on DOUT, starting with SUPPLY\_OUT and ending with AUX\_ADC (see Figure 13) in order by address (see Table 8).

**OUTPUT DATA REGISTERS**

Each output data register uses the format in Figure 12 and Table 9. Figure 6 shows the positive direction for each inertial sensor. The ND bit is equal to 1 when the register contains unread data. The EA bit is high when any error/alarm flag in the DIAG\_STAT register is equal to 1.

Figure 12. Output Data Register Bit Assignments

**Table 9. Output Data Register Formats**

Register	Bits	Scale	Reference
SUPPLY_OUT	12	2.418 mV	See Table 10
XGYRO_OUT <sup>1</sup>	14	0.05°/sec	See Table 11
YGYRO_OUT <sup>1</sup>	14	0.05°/sec	See Table 11
ZGYRO_OUT <sup>1</sup>	14	0.05°/sec	See Table 11
XACCL_OUT	14	1 mg	See Table 12
YACCL_OUT	14	1 mg	See Table 12
ZACCL_OUT	14	1 mg	See Table 12
XTEMP_OUT <sup>2</sup>	12	0.136°C	See Table 13
YTEMP_OUT <sup>2</sup>	12	0.136°C	See Table 13
ZTEMP_OUT <sup>2</sup>	12	0.136°C	See Table 13
AUX_ADC	12	805.8 μV	See Table 14

<sup>1</sup> Assumes that the scaling is set to ±300°/sec. This factor scales with the range.  
<sup>2</sup> 0x0000 = 25°C (±5°C).

**NOTES**  
 1. THE DOUT LINE HAS BEEN SIMPLIFIED FOR SPACE CONSTRAINTS BUT, IDEALLY, SHOULD INCLUDE ALL REGISTERS FROM SUPPLY\_OUT THROUGH AUX\_ADC.

Figure 13. Burst Read Sequence

## CALIBRATION

### Manual Bias Calibration

The bias offset registers in Table 15 and Table 16 provide a manual adjustment function for the output of each sensor. For example, if XGYRO\_OFF = 0x1FF6 (DIN = 0x9B1F, 0x9AF6), the XGYRO\_OUT offset shifts by -10 LSBs, or -0.125°/sec.

**Table 15. XGYRO\_OFF, YGYRO\_OFF, ZGYRO\_OFF Bit Descriptions**

Bits	Description (Default = 0x0000)
[15:13]	Not used.
[12:0]	Data bits. Twos complement, 0.0125°/sec per LSB. Typical adjustment range = ±50°/sec.

**Table 16. XACCL\_OFF, YACCL\_OFF, ZACCL\_OFF Bit Descriptions**

Bits	Description (Default = 0x0000)
[15:12]	Not used.
[11:0]	Data bits. Twos complement, 1 mg/LSB. Typical adjustment range = ±2 g.

### Gyroscope Automatic Bias Null Calibration

Set GLOB\_CMD[0] = 1 (DIN = 0xBE01) to execute the automatic bias null calibration function. This function measures all three gyroscope output registers and then loads each gyroscope offset register with the opposite value to provide a quick bias calibration. All sensor data is then reset to 0, and the flash memory is updated automatically within 50 ms (see Table 17).

### Gyroscope Precision Automatic Bias Null Calibration

Set GLOB\_CMD[4] = 1 (DIN = 0xBE10) to execute the precision automatic bias null calibration function. This function takes the sensor offline for 30 sec while it collects a set of data and calculates more accurate bias correction factors for each gyroscope. After this function is executed, the newly calculated correction factor is loaded into the gyroscope offset registers, all sensor data is reset to 0, and the flash memory is updated automatically within 50 ms (see Table 17).

### Restoring Factory Calibration

Set GLOB\_CMD[1] = 1 (DIN = 0xBE02) to execute the factory calibration restore function. This function resets each user calibration register to 0x0000 (see Table 15 and Table 16), resets all sensor data to 0, and automatically updates the flash memory within 50 ms (see Table 17).

### Linear Acceleration Bias Compensation (Gyroscope)

Set MSC\_CTRL[7] = 1 (DIN = 0xB486) to enable correction for low frequency acceleration influences on gyroscope bias. The DIN sequence also preserves the factory default condition for the data ready function (see Table 22).

## OPERATIONAL CONTROL

### Global Commands

The GLOB\_CMD register provides trigger bits for several useful functions. Setting the assigned bit to 1 starts each operation, which returns the bit to 0 after completion. For example, set GLOB\_CMD[7] = 1 (DIN = 0xBE80) to execute a software reset, which stops the sensor operation and runs the device through its start-up sequence. This sequence includes loading the control registers with the data in their respective flash memory locations prior to producing new data. Reading the GLOB\_CMD register (DIN = 0x3E00) starts the burst read sequence.

**Table 17. GLOB\_CMD Bit Descriptions**

Bits	Description (Default = 0x0000)
[15:8]	Not used
[7]	Software reset command
[6:5]	Not used
[4]	Precision autonull command
[3]	Flash update command (see the Device Configuration section)
[2]	Auxiliary DAC data latch (see the Auxiliary DAC section)
[1]	Factory calibration restore command
[0]	Autonull command

### Internal Sample Rate

The SMPL\_PRD register provides discrete sample period settings using the bit assignments in Table 18 and the following equation:

$$t_s = t_B \times (N_s + 1)$$

To calculate the internal sample rate, divide 1 by the sample period ( $t_s$ ). For example, when SMPL\_PRD[7:0] = 0x0A, the sample rate is 149 SPS.

**Table 18. SMPL\_PRD Bit Descriptions**

Bits	Description (Default = 0x0001)
[15:8]	Not used
[7]	Time base ( $t_B$ ) 0 = 0.61035 ms, 1 = 18.921 ms
[6:0]	Increment setting ( $N_s$ ) Internal sample period = $t_s = t_B \times (N_s + 1)$

The default sample rate setting of 819.2 SPS preserves the sensor bandwidth and provides optimal performance. For systems that value slower sample rates, keep the internal sample rate at 819.2 SPS. Use the programmable filter (SENS\_AVG) to reduce the bandwidth, which helps to prevent aliasing. The data ready function (MSC\_CTRL) can drive an interrupt routine that uses a counter to help ensure data coherence at the reduced rates.

**Power Management**

Setting  $SMPL\_PRD \geq 0x0A$  also sets the sensor to low power mode. For systems that require lower power dissipation, in-system characterization helps users to quantify the associated performance trade-offs. In addition to sensor performance, this mode affects SPI data rates (see Table 2). Set  $SLP\_CNT[8] = 1$  ( $DIN = 0xBB01$ ) to start the indefinite sleep mode, which requires a  $\overline{CS}$  assertion (high to low), reset, or power cycle to wake up. Use  $SLP\_CNT[7:0]$  to put the device into sleep mode for a specified period. For example,  $SLP\_CNT[7:0] = 0x64$  ( $DIN = 0xBA64$ ) puts the ADIS16364 to sleep for 50 sec.

**Table 19. SLP\_CNT Bit Descriptions**

Bits	Description (Default = 0x0000)
[15:9]	Not used
[8]	Indefinite sleep mode; set to 1
[7:0]	Programmable sleep time bits, 0.5 sec/LSB

**Sensor Bandwidth**

The signal chain for each MEMS sensor has several filter stages, which shape their frequency response. Figure 14 provides a block diagram for both gyroscope and accelerometer signal paths. Table 20 provides additional information for digital filter configuration.

Figure 14. MEMS Analog and Digital Filters

**Digital Filtering**

The N blocks in Figure 14 are part of the programmable low-pass filter, which provides additional noise reduction on the inertial sensor outputs. This filter contains two cascaded averaging filters that provide a Bartlett window, FIR filter response (see Figure 15). For example, set  $SENS\_AVG[2:0] = 100$  ( $DIN = 0xB804$ ) to set each stage to 16 taps. When used with the default sample rate of 819.2 SPS, this value reduces the sensor bandwidth to approximately 16 Hz.

Figure 15. Bartlett Window, FIR Filter Frequency Response (Phase Delay = N Samples)

**Dynamic Range**

The  $SENS\_AVG[10:8]$  bits provide three dynamic range settings for this gyroscope. The lower dynamic range settings ( $\pm 75^\circ/sec$  and  $\pm 150^\circ/sec$ ) limit the minimum filter tap sizes to maintain resolution. For example, set  $SENS\_AVG[10:8] = 010$  ( $DIN = 0xB902$ ) for a measurement range of  $\pm 150^\circ/sec$ . Because this setting can influence the filter settings, program  $SENS\_AVG[10:8]$  and then  $SENS\_AVG[2:0]$  if more filtering is required.

**Table 20. SENS\_AVG Bit Descriptions**

Bits	Description (Default = 0x0402)
[15:11]	Not used
[10:8]	Measurement range (sensitivity) selection 100 = $\pm 300^\circ/sec$ (default condition) 010 = $\pm 150^\circ/sec$ , filter taps $\geq 4$ ( $Bits[2:0] \geq 0x02$ ) 001 = $\pm 75^\circ/sec$ , filter taps $\geq 16$ ( $Bits[2:0] \geq 0x04$ )
[7:3]	Not used
[2:0]	Number of taps in each stage; value of m in $N = 2^m$

## INPUT/OUTPUT FUNCTIONS

### General-Purpose I/O

DIO1, DIO2, DIO3, and DIO4 are configurable, general-purpose I/O lines that serve multiple purposes according to the following control register priority: MSC\_CTRL, ALM\_CTRL, and GPIO\_CTRL. For example, set GPIO\_CTRL = 0x080C (DIN = 0xB308, and then 0xB20C) to configure DIO1 and DIO2 as inputs and DIO3 and DIO4 as outputs, with DIO3 set low and DIO4 set high.

In this configuration, read GPIO\_CTRL (DIN = 0x3200). The digital state of DIO1 and DIO2 is in GPIO\_CTRL[9:8].

**Table 21. GPIO\_CTRL Bit Descriptions**

Bits	Description (Default = 0x0000)
[15:12]	Not used
[11]	General-Purpose I/O Line 4 (DIO4) data level
[10]	General-Purpose I/O Line 3 (DIO3) data level
[9]	General-Purpose I/O Line 2 (DIO2) data level
[8]	General-Purpose I/O Line 1 (DIO1) data level
[7:4]	Not used
[3]	General-Purpose I/O Line 4 (DIO4) direction control (1 = output, 0 = input)
[2]	General-Purpose I/O Line 3 (DIO3) direction control (1 = output, 0 = input)
[1]	General-Purpose I/O Line 2 (DIO2) direction control (1 = output, 0 = input)
[0]	General-Purpose I/O Line 1 (DIO1) direction control (1 = output, 0 = input)

### Input Clock Configuration

The input clock function allows for external control of sampling in the ADIS16364. Set GPIO\_CTRL[3] = 0 (DIN = 0xB200) and SMPL\_PRD[7:0] = 0x00 (DIN = 0xB600) to enable this function. See Table 2 and Figure 4 for timing information.

### Data Ready I/O Indicator

The factory default sets DIO1 as a positive data ready indicator signal. The MSC\_CTRL[2:0] bits provide configuration options for changing the default. For example, set MSC\_CTRL[2:0] = 100 (DIN = 0xB404) to change the polarity of the data ready signal on DIO1 for interrupt inputs that require negative logic inputs for activation. The pulse width is between 100  $\mu$ s and 200  $\mu$ s over all conditions.

**Table 22. MSC\_CTRL Bit Descriptions**

Bits	Description (Default = 0x0006)
[15:12]	Not used
[11]	Memory test (cleared upon completion) (1 = enabled, 0 = disabled)
[10]	Internal self-test enable (cleared upon completion) (1 = enabled, 0 = disabled)
[9]	Manual self-test, negative stimulus (1 = enabled, 0 = disabled)
[8]	Manual self-test, positive stimulus (1 = enabled, 0 = disabled)
[7]	Linear acceleration bias compensation for gyroscopes (1 = enabled, 0 = disabled)
[6]	Linear accelerometer origin alignment (1 = enabled, 0 = disabled)
[5:3]	Not used
[2]	Data ready enable (1 = enabled, 0 = disabled)
[1]	Data ready polarity (1 = active high, 0 = active low)
[0]	Data ready line select (1 = DIO2, 0 = DIO1)

### Auxiliary DAC

The 12-bit AUX\_DAC line can drive its output to within 5 mV of the ground reference when it is not sinking current. As the output approaches 0 V, the linearity begins to degrade (~100 LSB starting point). As the sink current increases, the nonlinear range increases. The DAC latch command moves the values of the AUX\_DAC register into the DAC input register, enabling both bytes to take effect at the same time.

**Table 23. AUX\_DAC Bit Descriptions**

Bits	Description (Default = 0x0000)
[15:12]	Not used
[11:0]	Data bits, scale factor = 0.8059 mV/LSB Offset binary format, 0 V = 0 LSB

**Table 24. Setting AUX\_DAC = 1 V**

DIN	Description
0xB0D9	AUX_DAC[7:0] = 0xD9 (217 LSB).
0xB104	AUX_DAC[15:8] = 0x04 (1024 LSB).
0xBE04	GLOB_CMD[2] = 1. Move values into the DAC input register, resulting in a 1 V output level.

## DIAGNOSTICS

### Self-Test

The self-test function allows the user to verify the mechanical integrity of each MEMS sensor. It applies an electrostatic force to each sensor element, which results in mechanical displacement that simulates a response to actual motion. Table 1 lists the expected response for each sensor and provides pass/fail criteria.

Set MSC\_CTRL[10] = 1 (DIN = 0xB504) to run the internal self-test routine, which exercises all inertial sensors, measures each response, makes pass/fail decisions, and reports them to error flags in the DIAG\_STAT register. MSC\_CTRL[10] resets itself to 0 after completing the routine. The MSC\_CTRL[9:8] bits provide manual control over the self-test function for investigation of potential failures. Table 25 outlines an example test flow for using this option to verify the x-axis gyroscope function.

**Table 25. Manual Self-Test Example Sequence**

DIN	Description
0xB601	SMPL_PRD[7:0] = 0x01, sample rate = 819.2 SPS.
0xB904	SENS_AVG[15:8] = 0x04, gyro range = $\pm 300^\circ/\text{sec}$ .
0xB802	SENS_AVG[7:0] = 0x02, four-tap averaging filter. Delay = 50 ms.
0x0400	Read XGYRO_OUT.
0xB502	MSC_CTRL[9:8] = 10, gyroscope negative self-test. Delay = 50 ms.
0x0400	Read XGYRO_OUT. Determine whether the bias in the gyroscope output changed according to the self-test response specified in Table 1.
0xB501	MSC_CTRL[9:8] = 01, gyroscope/accelerometer positive self-test. Delay = 50 ms.
0x0400	Read XGYRO_OUT. Determine whether the bias in the gyroscope output changed according to the self-test response specified in Table 1.
0xB500	MSC_CTRL[15:8] = 0x00.

Zero motion provides results that are more reliable. The settings in Table 25 are flexible and allow for optimization around speed and noise influence. For example, using fewer filtering taps decreases delay times but increases the possibility of noise influence.

### Memory Test

Setting MSC\_CTRL[11] = 1 (DIN = 0xB508) performs a checksum verification of the flash memory locations. The pass/fail result is loaded into DIAG\_STAT[6].

### Status

The error flags provide indicator functions for common system level issues. All of the flags are cleared (set to 0) after each DIAG\_STAT register read cycle. If an error condition remains, the error flag returns to 1 during the next sample cycle. The DIAG\_STAT[1:0] bits do not require a read of this register to return to 0. If the power supply voltage goes back into range, these two flags are cleared automatically.

**Table 26. DIAG\_STAT Bit Descriptions**

Bits	Description (Default = 0x0000)
[15]	Z-axis accelerometer self-test failure (1 = fail, 0 = pass)
[14]	Y-axis accelerometer self-test failure (1 = fail, 0 = pass)
[13]	X-axis accelerometer self-test failure (1 = fail, 0 = pass)
[12]	Z-axis gyroscope self-test failure (1 = fail, 0 = pass)
[11]	Y-axis gyroscope self-test failure (1 = fail, 0 = pass)
[10]	X-axis gyroscope self-test failure (1 = fail, 0 = pass)
[9]	Alarm 2 status (1 = active, 0 = inactive)
[8]	Alarm 1 status (1 = active, 0 = inactive)
[7]	Not used
[6]	Flash test, checksum flag (1 = fail, 0 = pass)
[5]	Self-test diagnostic error flag (1 = fail, 0 = pass)
[4]	Sensor overrange (1 = fail, 0 = pass)
[3]	SPI communication failure (1 = fail, 0 = pass)
[2]	Flash update failure (1 = fail, 0 = pass)
[1]	Power supply > 5.25 V 1 = power supply > 5.25 V, 0 = power supply $\leq$ 5.25 V
[0]	Power supply < 4.75 V 1 = power supply < 4.75 V, 0 = power supply $\geq$ 4.75 V

### Alarm Registers

The alarm function provides monitoring for two independent conditions. The ALM\_CTRL register provides control inputs for data source, data filtering (prior to comparison), static comparison, dynamic rate-of-change comparison, and output indicator configurations. The ALM\_MAGx registers establish the trigger threshold and polarity configurations. Table 30 gives an example of how to configure a static alarm. The ALM\_SMPLx registers provide the number of samples to use in the dynamic rate-of-change configuration. The period equals the number in the ALM\_SMPLx register multiplied by the sample period time, which is established by the SMPL\_PRD register. See Table 31 for an example of how to configure the sensor for this type of function.

**Table 27. ALM\_MAG1, ALM\_MAG2 Bit Descriptions**

Bits	Description (Default = 0x0000)
[15]	Comparison polarity (1 = greater than, 0 = less than)
[14]	Not used
[13:0]	Data bits that match the format of the trigger source selection

**Table 28. ALM\_SMPL1, ALM\_SMPL2 Bit Descriptions**

Bits	Description (Default = 0x0000)
[15:8]	Not used
[7:0]	Data bits: number of samples (both 0x00 and 0x01 = 1)

**Table 29. ALM\_CTRL Bit Descriptions**

Bits	Description (Default = 0x0000)
[15:12]	Alarm 2 source selection 0000 = disable 0001 = power supply output 0010 = x-axis gyroscope output 0011 = y-axis gyroscope output 0100 = z-axis gyroscope output 0101 = x-axis accelerometer output 0110 = y-axis accelerometer output 0111 = z-axis accelerometer output 1000 = x-axis gyroscope temperature output 1001 = y-axis gyroscope temperature output 1010 = z-axis gyroscope temperature output 1011 = auxiliary ADC input
[11:8]	Alarm 1 source selection (same as Alarm 2)
[7]	Rate-of-change enable for Alarm 2 (1 = rate of change, 0 = static level)
[6]	Rate-of-change enable for Alarm 1 (1 = rate of change, 0 = static level)
[5]	Not used
[4]	Comparison data filter setting (1 = filtered data, 0 = unfiltered data)
[3]	Not used
[2]	Alarm output enable (1 = enabled, 0 = disabled)
[1]	Alarm output polarity (1 = active high, 0 = active low)
[0]	Alarm output line select (1 = DIO2, 0 = DIO1)

**Table 30. Alarm Configuration Example 1**

DIN	Description
0xAF55, 0xAE17	ALM_CTRL = 0x5517. Alarm 1 input = XACCL_OUT. Alarm 2 input = XACCL_OUT. Static level comparison, filtered data. DIO2 output indicator, positive polarity.
0xA701, 0xA6F4	ALM_MAG1 = 0x81F4. Alarm 1 is true if XACCL_OUT > +0.5 g.
0xA93E, 0xA803	ALM_MAG2 = 0x3E0C. Alarm 2 is true if XACCL_OUT < -0.5 g.

**Table 31. Alarm Configuration Example 2**

DIN	Description
0xAF76, 0xAEC7	ALM_CTRL = 0x76C7. Alarm 1 input = YACCL_OUT. Alarm 2 input = ZACCL_OUT. Rate-of-change comparison, unfiltered data. DIO2 output indicator, positive polarity.
0xB601	SMPL_PRD = 0x0001. Sample rate = 819.2 SPS.
0xAA08	ALM_SMPL1 = 0x0008. Alarm 1 rate-of-change period = 9.77 ms.
0xAC50	ALM_SMPL2 = 0x0050. Alarm 2 rate-of-change period = 97.7 ms.
0xA701, 0xA6F4	ALM_MAG1 = 0x81F4. Alarm 1 is true if YACCL_OUT increases by more than 0.5 g in 9.77 ms.
0xA93E, 0xA803	ALM_MAG2 = 0x3E03. Alarm 2 is true if ZACCL_OUT decreases by more than 0.5 g in 97.7 ms.

### PRODUCT IDENTIFICATION

Table 32 provides a summary of the registers that identify the product: PROD\_ID, which identifies the product type; LOT\_ID1 and LOT\_ID2, the 32-bit lot identification code; and SERIAL\_NUM, which displays the 12-bit serial number. All four registers are two bytes in length. When using the SERIAL\_NUM value to calculate the serial number, mask off the upper four bits and convert the remaining 12 bits to a decimal number.

**Table 32. Identification Registers**

Register Name	Address	Description
LOT_ID1	0x52	Lot Identification Code 1
LOT_ID2	0x54	Lot Identification Code 2
PROD_ID	0x56	Product identification = 0x3FEC (hexadecimal number for 16,364)
SERIAL_NUM	0x58	Serial number

## APPLICATIONS INFORMATION

### INSTALLATION/HANDLING

For ADIS16364 installation, use the following two-step process:

1. Secure the baseplate using machine screws.
2. Press the connector into its mate.

For removal,

1. Gently pry the connector from its mate using a small slot screwdriver.
2. Remove the screws and lift the part up.

Never attempt to unplug the connector by pulling on the plastic case or baseplate. Although the flexible connector is very reliable in normal operation, it can break when subjected to unreasonable handling. When broken, the flexible connector cannot be repaired. The [AN-1041](#) Application Note, *iSensor® IMU Quick Start Guide and Bias Optimization Tips*, provides more information about developing an appropriate mechanical interface design.

### GYROSCOPE BIAS OPTIMIZATION

The factory calibration addresses initial bias errors along with temperature-dependent bias behaviors. Installation and certain environmental conditions can introduce modest bias errors. The precision autonull command (GLOB\_CMD[4]) provides a simple predeployment method for correcting these errors to an accuracy of approximately 0.008°/sec, using an average of 30 sec. Averaging the sensor output data for 100 sec can provide incremental performance gains, as well. Controlling device rotation, power supply, and temperature during these averaging times helps to ensure optimal accuracy during this process. Refer to the [AN-1041](#) Application Note for more information about optimizing performance.

### INPUT ADC CHANNEL

The AUX\_ADC register provides access to the auxiliary ADC input channel. The ADC is a 12-bit successive approximation converter that has an input circuit equivalent to the one shown in Figure 16. The maximum input is 3.3 V. The ESD protection diodes can handle 10 mA without causing irreversible damage. The on resistance (R1) of the switch has a typical value of 100 Ω. The sampling capacitor, C2, has a typical value of 16 pF.

(Conversion Phase: Switch Open,  
Track Phase: Switch Closed)

### ADIS16IMU2/PCBZ

The [ADIS16IMU2/PCBZ](#) accessories provide a simplified method for connecting the [ADIS16364](#) to an embedded processor platform or to the [EVAL-ADIS2](#) evaluation system.

Figure 17 provides the pin assignments for J1 on the [ADIS16IMU2/PCBZ](#) breakout board.

Figure 17. J1 Pin Assignments for the [ADIS16IMU2/PCBZ](#)

The C1 and C2 locations on the [ADIS16IMU2/PCBZ](#) provide users with the pads to install capacitance across VDD and GND, which Figure 9 recommends for best performance.

### PC-BASED EVALUATION TOOLS

The [EVAL-ADIS2](#) supports PC-based evaluation of the [ADIS16364](#). Refer to the [EVAL-ADIS2 Evaluation System Wiki Guide](#) for more information on connecting the [ADIS16364](#) to the [EVAL-ADIS2](#) system.

### X-RAY SENSITIVITY

Exposure to high dose rate X-rays, such as those in production systems that inspect solder joints in electronic assemblies, may affect accelerometer bias errors. For optimal performance, avoid exposing the [ADIS16364](#) to this type of inspection.
