## Warnings

Due to technical requirements, components may contain dangerous substances. For information on the types in question, please contact the nearest Infineon Technologies Office.
Infineon Technologies components may be used in life-support devices or systems only with the express written approval of Infineon Technologies, if a failure of such components can reasonably be expected to cause the failure of that life-support device or system or to affect the safety or effectiveness of that device or system. Life support devices or systems are intended to be implanted in the human body or to support and/or maintain and sustain and/or protect human life. If they fail, it is reasonable to assume that the health of the user or other persons may be endangered.

## About this Document

This Data Sheet is addressed to embedded hardware and software developers. It provides the reader with detailed descriptions about the ordering designations, available features, electrical and physical characteristics of the XMC4500 series devices.
The document describes the characteristics of a superset of the XMC4500 series devices. For simplicity, the various device types are referred to by the collective term XMC4500 throughout this manual.

## XMC4000 Family User Documentation

The set of user documentation includes:

- Reference Manual
- decribes the functionality of the superset of devices.
- Data Sheets
- list the complete ordering designations, available features and electrical characteristics of derivative devices.
- Errata Sheets
- list deviations from the specifications given in the related Reference Manual or Data Sheets. Errata Sheets are provided for the superset of devices.

## Attention: Please consult all parts of the documentation set to attain consolidated knowledge about your device.

Application related guidance is provided by Users Guides and Application Notes.
Please refer to http://www.infineon.com/xmc4000 to get access to the latest versions of those documents.

## Summary of Features

## 1 Summary of Features

The XMC4500 devices are members of the XMC4000 Family of microcontrollers based on the ARM Cortex-M4 processor core. The XMC4000 is a family of high performance and energy efficient microcontrollers optimized for Industrial Connectivity, Industrial Control, Power Conversion, Sense \& Control.

Figure $1 \quad$ System Block Diagram

## CPU Subsystem

- CPU Core
- High Performance 32-bit ARM Cortex-M4 CPU
- 16-bit and 32-bit Thumb2 instruction set
- DSP/MAC instructions
- System timer (SysTick) for Operating System support
- Floating Point Unit
- Memory Protection Unit
- Nested Vectored Interrupt Controller
- Two General Purpose DMA with up-to 12 channels
- Event Request Unit (ERU) for programmable processing of external and internal service requests

XMC4500
XMC4000 Family
Summary of Features

- Flexible CRC Engine (FCE) for multiple bit error detection

## On-Chip Memories

- 16 KB on-chip boot ROM
- 64 KB on-chip high-speed program memory
- 64 KB on-chip high speed data memory
- 32 KB on-chip high-speed communication
- 1024 KB on-chip Flash Memory with 4 KB instruction cache

## Communication Peripherals

- Ethernet MAC module capable of $10 / 100 \mathrm{Mbit} / \mathrm{s}$ transfer rates
- Universal Serial Bus, USB 2.0 host, Full-Speed OTG, with integrated PHY
- Controller Area Network interface (MultiCAN), Full-CAN/Basic-CAN with 3 nodes, 64 message objects (MO), data rate up to $1 \mathrm{MBit} / \mathrm{s}$
- Six Universal Serial Interface Channels (USIC),providing 6 serial channels, usable as UART, double-SPI, quad-SPI, IIC, IIS and LIN interfaces
- LED and Touch-Sense Controller (LEDTS) for Human-Machine interface
- SD and Multi-Media Card interface (SDMMC) for data storage memory cards
- External Bus Interface Unit (EBU) enabling communication with external memories and off-chip peripherals

## Analog Frontend Peripherals

- Four Analog-Digital Converters (VADC) of 12-bit resolution, 8 channels each, with input out-of-range comparators
- Delta Sigma Demodulator with four channels, digital input stage for A/D signal conversion
- Digital-Analogue Converter (DAC) with two channels of 12 -bit resolution

## Industrial Control Peripherals

- Two Capture/Compare Units 8 (CCU8) for motor control and power conversion
- Four Capture/Compare Units 4 (CCU4) for use as general purpose timers
- Two Position Interfaces (POSIF) for servo motor positioning
- Window Watchdog Timer (WDT) for safety sensitive applications
- Die Temperature Sensor (DTS)
- Real Time Clock module with alarm support
- System Control Unit (SCU) for system configuration and control

## Input/Output Lines

- Programmable port driver control module (PORTS)
- Individual bit addressability
- Tri-stated in input mode
- Push/pull or open drain output mode
- Boundary scan test support over JTAG interface

## On-Chip Debug Support

- Full support for debug features: 8 breakpoints, CoreSight, trace
- Various interfaces: ARM-JTAG, SWD, single wire trace

### 1.1 Ordering Information

The ordering code for an Infineon microcontroller provides an exact reference to a specific product. The code "XMC4<DDD>-<Z><PPP><T><FFFF>" identifies:

- <DDD> the derivatives function set
- <Z> the package variant
- E: LFBGA
- F: LQFP
- Q: VQFN
- <PPP> package pin count
- <T> the temperature range:
- F: $-40^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$
- X: $-40^{\circ} \mathrm{C}$ to $105^{\circ} \mathrm{C}$
- K: $-40^{\circ} \mathrm{C}$ to $125^{\circ} \mathrm{C}$
- <FFFF> the Flash memory size.

For ordering codes for the XMC4500 please contact your sales representative or local distributor.
This document describes several derivatives of the XMC4500 series, some descriptions may not apply to a specific product.
For simplicity the term XMC4500 is used for all derivatives throughout this document.

### 2.2.1 Package Pin Summary

The following general scheme is used to describe each pin:
Table $8 \quad$ Package Pin Mapping Description

| Function | Package A | Package B | $\ldots$ | Pad <br> Type | Notes |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Name | N | Ax | $\ldots$ | A2 |  |

The table is sorted by the "Function" column, starting with the regular Port pins (Px.y), followed by the dedicated pins (i.e. $\overline{\text { PORST }}$ ) and supply pins.
The following columns, titled with the supported package variants, lists the package pin number to which the respective function is mapped in that package.
The "Pad Type" indicates the employed pad type (A1, A1+, A2, special=special pad, In=input pad, AN/DIG_IN=analog and digital input, Power=power supply). Details about the pad properties are defined in the Electrical Parameters.
In the "Notes", special information to the respective pin/function is given, i.e. deviations from the default configuration after reset. Per default the regular Port pins are configured as direct input with no internal pull device active.

### 2.2.2 Port I/O Functions

The following general scheme is used to describe each Port pin:

Table 10 Port I/O Function Description

| Function | Outputs |  |  | Inputs |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
|  | ALT1 | ALTn | HWO0 | HWI0 | Input | Input |
| P0.0 |  | MODA.OUT | MODB.OUT | MODB.INA | MODC.INA |  |
| Pn.y | MODA.OUT |  |  |  | MODA.INA | MODC.INB |

Figure 8 Simplified Port Structure
Pn.y is the port pin name, defining the control and data bits/registers associated with it. As GPIO, the port is under software control. Its input value is read via Pn_IN.y, Pn_OUT defines the output value.
Up to four alternate output functions (ALT1/2/3/4) can be mapped to a single port pin, selected by Pn_IOCR.PC. The output value is directly driven by the respective module, with the pin characteristics controlled by the port registers (within the limits of the connected pad).
The port pin input can be connected to multiple peripherals. Most peripherals have an input multiplexer to select between different possible input sources.
The input path is also active while the pin is configured as output. This allows to feedback an output to on-chip resources without wasting an additional external pin.
By Pn_HWSEL it is possible to select between different hardware "masters" (HWO0/HWIO, HWO1/HWI1). The selected peripheral can take control of the pin(s). Hardware control overrules settings in the respective port pin registers.

### 2.3 Power Connection Scheme

Figure 9. shows a reference power connection scheme for the XMC4500.

Figure 9 Power Connection Scheme
Every power supply pin needs to be connected. Different pins of the same supply need also to be externally connected. As example, all $V_{\text {DDP }}$ pins must be connected externally to one $V_{\mathrm{DDP}}$ net. In this reference scheme one 100 nF capacitor is connected at each supply pin against $V_{\text {SS }}$. An additional $10 \mu \mathrm{~F}$ capacitor is connected to the $V_{\mathrm{DDP}}$ nets and an additional 10 uF capacitor to the $V_{\mathrm{DDC}}$ nets.

The XMC4500 has a common ground concept, all $V_{\mathrm{SS}}, V_{\mathrm{SSA}}$ and $V_{\mathrm{SSO}}$ pins share the same ground potential. In packages with an exposed die pad it must be connected to the common ground as well.
$V_{\text {AGND }}$ is the low potential to the analog reference $V_{\text {AREF }}$. Depending on the application it can share the common ground or have a different potential.
When $V_{\text {DDP }}$ is supplied, $V_{\text {BAT }}$ must be supplied as well. If no other supply source (e.g. battery) is connected to $V_{\mathrm{BAT}}$, the $V_{\text {BAT }}$ pin can also be connected directly to $V_{\mathrm{DDP}}$.

## 3 Electrical Parameters

### 3.1 General Parameters

### 3.1.1 Parameter Interpretation

The parameters listed in this section partly represent the characteristics of the XMC4500 and partly its requirements on the system. To aid interpreting the parameters easily when evaluating them for a design, they are marked with a two-letter abbreviation in column "Symbol":

- CC

Such parameters indicate Controller Characteristics, which are a distinctive feature of the XMC4500 and must be regarded for system design.

- SR

Such parameters indicate System Requirements, which must be provided by the application system in which the XMC4500 is designed in.

### 3.1.2 Absolute Maximum Ratings

Stresses above the values listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions may affect device reliability.

Table 12 Absolute Maximum Rating Parameters

| Parameter | Symbol | Values |  |  | Unit | Note I <br> Test Con <br> dition |  |

1) The port groups are defined in Table 16.

Figure 10 explains the input voltage ranges of $V_{\text {IN }}$ and $V_{\text {AIN }}$ and its dependency to the supply level of $V_{\mathrm{DDP}}$. The input voltage must not exceed 4.3 V , and it must not be more than 1.0 V above $V_{\mathrm{DDP}}$. For the range up to $V_{\mathrm{DDP}}+1.0 \mathrm{~V}$ also see the definition of the overload conditions in Section 3.1.3.

| :---: |

Figure 10 Absolute Maximum Input Voltage Ranges

### 3.1.3 Pin Reliability in Overload

When receiving signals from higher voltage devices, low-voltage devices experience overload currents and voltages that go beyond their own IO power supplies specification.
Table 13 defines overload conditions that will not cause any negative reliability impact if all the following conditions are met:

- full operation life-time is not exceeded
- Operating Conditions are met for
- pad supply levels ( $V_{\text {DDP }}$ or $V_{\text {DDA }}$ )
- temperature

If a pin current is outside of the Operating Conditions but within the overload conditions, then the parameters of this pin as stated in the Operating Conditions can no longer be guaranteed. Operation is still possible in most cases but with relaxed parameters.
Note: An overload condition on one or more pins does not require a reset.
Note: A series resistor at the pin to limit the current to the maximum permitted overload current is sufficient to handle failure situations like short to battery.

Table 14 and Table 15 list input voltages that can be reached under overload conditions. Note that the absolute maximum input voltages as defined in the Absolute Maximum Ratings must not be exceeded during overload.

### 3.1.5 Operating Conditions

The following operating conditions must not be exceeded in order to ensure correct operation and reliability of the XMC4500. All parameters specified in the following sections refer to these operating conditions, unless noted otherwise.

1) See also the Supply Monitoring thresholds, Section 3.3.2
2) Voltage overshoot to 4.0 V is permissible at Power-Up and $\overline{\text { PORST }}$ low, provided the pulse duration is less than $100 \mu \mathrm{~s}$ and the cumulated sum of the pulses does not exceed 1 h over lifetime.
3) To start the hibernate domain it is required that $V_{B A T} \geq 2.1 \mathrm{~V}$, for a reliable start of the oscillation of RTC_XTAL in crystal mode it is required that $V_{\mathrm{BAT}} \geq 3.0 \mathrm{~V}$.
4) The port groups are defined in Table 16.

### 3.2 DC Parameters

### 3.2.1 Input/Output Pins

The digital input stage of the shared analog/digital input pins is identical to the input stage of the standard digital input/output pins.
The Pull-up on the PORST pin is identical to the Pull-up on the standard digital input/output pins.
Note: These parameters are not subject to production test, but verified by design and/or characterization.

1) Current required to override the pull device with the opposite logic level ("force current"). With active pull device, at load currents between force and keep current the input state is undefined.
2) Load current at which the pull device still maintains the valid logic level ("keep current").

With active pull device, at load currents between force and keep current the input state is undefined.
3) Hysteresis is implemented to avoid metastable states and switching due to internal ground bounce. It can not be guaranteed that it suppresses switching due to external system noise.

Figure 13 Pull Device Input Characteristics
Figure 13 visualizes the input characteristics with an active internal pull device:

- in the cases "A" the internal pull device is overridden by a strong external driver;
- in the cases " B " the internal pull device defines the input logical state against a weak external load.

1) A running conversion may become imprecise in case the normal conditions are violated (voltage overshoot).
2) If the analog reference voltage is below $V_{D D A}$, then the ADC converter errors increase. If the reference voltage is reduced by the factor $k(k<1)$, TUE, DNL, INL, Gain, and Offset errors increase also by the factor $1 / k$.
3) The leakage current definition is a continuous function, as shown in figure ADCx Analog Inputs Leakage. The numerical values defined determine the characteristic points of the given continuous linear approximation they do not define step function (see Figure 16).
4) The sampling capacity of the conversion C-network is pre-charged to $V_{\text {AREF }} / 2$ before the sampling moment. Because of the parasitic elements, the voltage measured at AINx can deviate from $V_{\text {AREF }} / 2$.
5) Applies to AINx, when used as alternate reference input.
6) This represents an equivalent switched capacitance. This capacitance is not switched to the reference voltage at once. Instead, smaller capacitances are successively switched to the reference voltage.
7) For 10 -bit conversions, the errors are reduced to $1 / 4$; for 8 -bit conversions, the errors are reduced to $1 / 16$. Never less than $\pm 1$ LSB.
8) The sum of DNL/INL/GAIN/OFF errors does not exceed the related total unadjusted error TUE.
9) The resulting current for a conversion can be calculated with $I_{\text {AREF }}=Q_{\text {CONV }} / t_{\mathrm{c}}$. The fastest 12-bit post-calibrated conversion of $t_{\mathrm{c}}=550 \mathrm{~ns}$ results in a typical average current of $I_{\text {AREF }}=54.5 \mu \mathrm{~A}$.

## Conversion Time

Table 24 Conversion Time (Operating Conditions apply)

| Parameter | Symbol | Values | Unit | Note |
| :--- | :--- | :--- | :--- | :--- |
| Conversion | $t_{\mathrm{C}} \quad \mathrm{CC}$ | $2 \times T_{\mathrm{ADC}}+$ | $\mu \mathrm{S}$ | $\mathrm{N}=8,10,12$ for |
| time |  | $(2+\mathrm{N}+\mathrm{STC}+\mathrm{PC}+\mathrm{DM}) \times T_{\mathrm{ADCI}}$ |  | N -bit conversion |
|  |  |  |  | $T_{\mathrm{ADC}}=1 / f_{\text {PERIPH }}$ |
|  |  |  | $T_{\mathrm{ADCI}}=1 / f_{\mathrm{ADCI}}$ |  |

- STC defines additional clock cycles to extend the sample time
- PC adds two cycles if post-calibration is enabled
- DM adds one cycle for an extended conversion time of the MSB

## Conversion Time Examples

System assumptions:
$f_{\mathrm{ADC}}=120 \mathrm{MHz}$ i.e. $t_{\mathrm{ADC}}=8.33 \mathrm{~ns}$, DIVA $=3, f_{\mathrm{ADCI}}=30 \mathrm{MHz}$ i.e. $t_{\mathrm{ADCI}}=33.3 \mathrm{~ns}$
According to the given formulas the following minimum conversion times can be achieved (STC = 0, DM = 0):
12-bit post-calibrated conversion ( $\mathrm{PC}=2$ ):
$t_{\mathrm{CN} 12 \mathrm{C}}=(2+12+2) \times t_{\mathrm{ADCI}}+2 \times t_{\mathrm{ADC}}=16 \times 33.3 \mathrm{~ns}+2 \times 8.33 \mathrm{~ns}=550 \mathrm{~ns}$
12-bit uncalibrated conversion:
$t_{\mathrm{CN} 12}=(2+12) \times t_{\mathrm{ADCI}}+2 \times t_{\mathrm{ADC}}=14 \times 33.3 \mathrm{~ns}+2 \times 8.33 \mathrm{~ns}=483 \mathrm{~ns}$
10-bit uncalibrated conversion:
$t_{\mathrm{CN} 10}=(2+10) \times t_{\mathrm{ADCI}}+2 \times t_{\mathrm{ADC}}=12 \times 33.3 \mathrm{~ns}+2 \times 8.33 \mathrm{~ns}=417 \mathrm{~ns}$
8 -bit uncalibrated:
$t_{\mathrm{CN} 8}=(2+8) \times t_{\mathrm{ADCI}}+2 \times t_{\mathrm{ADC}}=10 \times 33.3 \mathrm{~ns}+2 \times 8.33 \mathrm{~ns}=350 \mathrm{~ns}$

### 3.2.4 Out-of-Range Comparator (ORC)

The Out-of-Range Comparator (ORC) triggers on analog input voltages ( $V_{\text {AIN }}$ ) above the analog reference ${ }^{1)}$ ( $V_{\text {AREF }}$ ) on selected input pins (GxORCy) and generates a service request trigger (GxORCOUTy).
Note: These parameters are not subject to production test, but verified by design and/or characterization.

The parameters in Table 26 apply for the maximum reference voltage $V_{\text {AREF }}=V_{\mathrm{DDA}}+50 \mathrm{mV}$.

### 3.2.5 Die Temperature Sensor

The Die Temperature Sensor (DTS) measures the junction temperature $T_{J}$.
Note: These parameters are not subject to production test, but verified by design and/or characterization.

| Start-up time after reset <br> inactive | $t_{\mathrm{TSST}} \mathrm{SR}$ | - | - | 10 | $\mu \mathrm{~S}$ |  |

1) At $V_{\text {DDP_max }}=3.63 \mathrm{~V}$ the typical offset error increases by an additional $\Delta T_{\text {OE }}= \pm 1^{\circ} \mathrm{C}$.

The following formula calculates the temperature measured by the DTS in $\left[{ }^{\circ} \mathrm{C}\right]$ from the RESULT bit field of the DTSSTAT register.

Temperature $T_{\text {DTS }}=($ RESULT -605$) / 2.05\left[{ }^{\circ} \mathrm{C}\right]$

This formula and the values defined in Table 27 apply with the following calibration values:

- DTSCON.BGTRIM $=8_{\text {H }}$
- DTSCON.REFTRIM $=4_{H}$

### 3.2.6 USB OTG Interface DC Characteristics

The Universal Serial Bus (USB) Interface is compliant to the USB Rev. 2.0 Specification and the OTG Specification Rev. 1.3. High-Speed Mode is not supported.
Note: These parameters are not subject to production test, but verified by design and/or characterization.

### 3.2.7 Oscillator Pins

Note: It is strongly recommended to measure the oscillation allowance (negative resistance) in the final target system (layout) to determine the optimal parameters for the oscillator operation. Please refer to the limits specified by the crystal or ceramic resonator supplier.

Note: These parameters are not subject to production test, but verified by design and/or characterization.

The oscillator pins can be operated with an external crystal (see Figure 20) or in direct input mode (see Figure 21).

1) $t_{\text {OSCS }}$ is defined from the moment the oscillator is enabled by the user with SCU_OSCULCTRL.MODE until the oscillations reach an amplitude at RTC_XTAL1 of 400 mV .
2) The external oscillator circuitry must be optimized by the customer and checked for negative resistance and amplitude as recommended and specified by crystal suppliers.
3) For a reliable start of the oscillation in crystal mode it is required that $V_{\mathrm{BAT}} \geq 3.0 \mathrm{~V}$. A running oscillation is maintained across the full $V_{\mathrm{BAT}}$ voltage range.
4) If the shaper unit is enabled and not bypassed.
5) If the shaper unit is bypassed, dedicated DC-thresholds have to be met.
6) Hysteresis is implemented to avoid metastable states and switching due to internal ground bounce. It can not be guaranteed that it suppresses switching due to external system noise.

### 3.2.8 Power Supply Current

The total power supply current defined below consists of a leakage and a switching component.
Application relevant values are typically lower than those given in the following tables, and depend on the customer's system operating conditions (e.g. thermal connection or used application configurations).
Note: These parameters are not subject to production test, but verified by design and/or characterization.

If not stated otherwise, the operating conditions for the parameters in the following table are:
$V_{\text {DDP }}=3.3 \mathrm{~V}, T_{\mathrm{A}}=25^{\circ} \mathrm{C}$

### 3.3.3 Power Sequencing

While starting up and shutting down as well as when switching power modes of the system it is important to limit the current load steps. A typical cause for such load steps is changing the CPU frequency $f_{\text {CPU }}$. Load steps exceeding the below defined values may cause a power on reset triggered by the supply monitor.

### 3.3.9 Peripheral Timing

### 3.3.9.1 Delta-Sigma Demodulator Digital Interface Timing

The following parameters are applicable for the digital interface of the Delta-Sigma Demodulator (DSD).
The data timing is relative to the active clock edge. Depending on the operation mode of the connected modulator that can be the rising and falling clock edge.
Note: These parameters are not subject to production test, but verified by design and/or characterization.

## Full-Speed Output Path (Write)

Figure 37 Full-Speed Output Path

## Full-Speed Write Meeting Setup (Maximum Delay)

The following equations show how to calculate the allowed skew range between the SD_CLK and SD_DAT/CMD signals on the PCB.

No clock delay:

$$
\begin{equation*}
\mathrm{t}_{\mathrm{ODLY} Y_{-} \mathrm{F}}+\mathrm{t}_{\text {DATA_DELAY }}+\mathrm{t}_{\text {TAP_DELAY }}+\mathrm{t}_{\mathrm{ISU}}<\mathrm{t}_{\mathrm{WL}} \tag{1}
\end{equation*}
$$

With clock delay:

$$
\begin{equation*}
\mathrm{t}_{\text {ODLY_F }}+\mathrm{t}_{\text {DATA_DELAY }}+\mathrm{t}_{\text {TAP_DELAY }}+\mathrm{t}_{\mathrm{ISU}}<\mathrm{t}_{\mathrm{WL}}+\mathrm{t}_{\text {CLK_DELAY }} \tag{2}
\end{equation*}
$$

$$
\begin{gather*}
\mathrm{t}_{\text {DATA_DELAY }}+\mathrm{t}_{\text {TAP_DELAY }}+\mathrm{t}_{\mathrm{WL}}<\mathrm{t}_{\text {Pp }}+\mathrm{t}_{\text {CLK_DELAY }}-\mathrm{t}_{\text {ISU }}-\mathrm{t}_{\text {ODLY_F }}  \tag{3}\\
\mathrm{t}_{\text {DATA_DELAY }}+\mathrm{t}_{\text {TAP_DELAY }}+20<40+\mathrm{t}_{\text {CLK_DELAY }}-5-10 \\
\mathrm{t}_{\text {DATA_DELAY }}<5+\mathrm{t}_{\text {CLK_DELAY }}-\mathrm{t}_{\text {TAP_DELAY }}
\end{gather*}
$$

The data can be delayed versus clock up to 5 ns in ideal case of $t_{\mathrm{wL}}=20 \mathrm{~ns}$.

## Full-Speed Write Meeting Hold (Minimum Delay)

The following equations show how to calculate the allowed skew range between the SD_CLK and SD_DAT/CMD signals on the PCB.

$$
\begin{gather*}
\mathrm{t}_{\mathrm{CLK} \text { _DELAY }}<\mathrm{t}_{\mathrm{WL}}+\mathrm{t}_{\mathrm{OH} \_\mathrm{F}}+\mathrm{t}_{\text {DATA_DELAY }}+\mathrm{t}_{\text {TAP_DELAY }}-\mathrm{t}_{\mathrm{IH}}  \tag{4}\\
\mathrm{t}_{\text {CLK_DELAY }}<20+\mathrm{t}_{\text {DATA_DELAY }}+\mathrm{t}_{\text {TAP_DELAY }}-5 \\
\mathrm{t}_{\text {DATA_DELAY }}<15+\mathrm{t}_{\text {CLK_DELAY }}+\mathrm{t}_{\text {TAP_DELAY }}
\end{gather*}
$$

The clock can be delayed versus data up to 18.2 ns (external delay line) in ideal case of $t_{\mathrm{WL}}=20 \mathrm{~ns}$, with maximum $t_{\text {TAP_DELAY }}=3.2 \mathrm{~ns}$ programmed.

## Full-Speed Input Path (Read)

Figure 38 Full-Speed Input Path

## Full-Speed Read Meeting Setup (Maximum Delay)

The following equations show how to calculate the allowed combined propagation delay range of the SD_CLK and SD_DAT/CMD signals on the PCB.

$$
\begin{gather*}
\mathrm{t}_{\text {CLK_DELAY }}+\mathrm{t}_{\text {DATA_DELAY }}+\mathrm{t}_{\text {TAP_DELAY }}+\mathrm{t}_{\text {ODLY }}+\mathrm{t}_{\text {ISU_F }}<0,5 \times \mathrm{t}_{\text {Pp }}  \tag{5}\\
\mathrm{t}_{\text {CLK_DELAY }}+\mathrm{t}_{\text {DATA_DELAY }}<0,5 \times \mathrm{t}_{\text {pp }}-\mathrm{t}_{\text {ODLY }}-\mathrm{t}_{\text {ISU_F }}-\mathrm{t}_{\text {TAP_DELAY }} \\
\mathrm{t}_{\text {CLK_DELAY }}+\mathrm{t}_{\text {DATA_DELAY }}<20-14-2-\mathrm{t}_{\text {TAP_DELAY }} \\
\mathrm{t}_{\text {CLK_DELAY }}+\mathrm{t}_{\text {DATA_DELAY }}<4-\mathrm{t}_{\text {TAP_DELAY }}
\end{gather*}
$$

The data + clock delay can be up to 4 ns for a 40 ns clock cycle.

## Full-Speed Read Meeting Hold (Minimum Delay)

The following equations show how to calculate the allowed combined propagation delay range of the SD_CLK and SD_DAT/CMD signals on the PCB.

$$
\begin{align*}
& \mathrm{t}_{\mathrm{CLK} \_ \text {DELAY }}+\mathrm{t}_{\mathrm{OH}}+\mathrm{t}_{\text {DATA_DELAY }}+\mathrm{t}_{\text {TAP_DELAY }}>\mathrm{t}_{\mathrm{IH} \_\mathrm{F}}  \tag{6}\\
& \mathrm{t}_{\text {CLK_DELAY }}+\mathrm{t}_{\text {DATA_DELAY }}>\mathrm{t}_{\mathrm{IH} \_\mathrm{F}}-\mathrm{t}_{\mathrm{OH}}-\mathrm{t}_{\text {TAP_DELAY }}
\end{align*}
$$

$$
\mathrm{t}_{\text {CLK_DELAY }}+\mathrm{t}_{\text {DATA_DELAY }}>2-\mathrm{t}_{\text {TAP_DELAY }}
$$

The data + clock delay must be greater than 2 ns if $t_{\text {TAP_DELAY }}$ is not used.
If the $t_{\text {TAP_DELAY }}$ is programmed to at least 2 ns , the data + clock delay must be greater than 0 ns (or less). This is always fulfilled.

1) An active edge can be a rising or falling edge, depending on the settings of bits BFCON.EBSE / ECSE and the clock divider ratio.
Negative minimum values for these parameters mean that the last data read during a burst may be corrupted. However, with clock feedback enabled, this value is an oversampling not required for the internal bus transaction, and will be discarded.
2) This parameter is valid for BUSCONx.EBSE $=1$ and BUSAPx.EXTCLK $=00_{B}$.

For BUSCONx.EBSE = 1 and other values of BUSAPx.EXTCLK, ADV and BAA will be delayed by $1 / 2$ of the internal bus clock period $T_{\text {CPU }}=1 / f_{\text {CPU }}$.
For BUSCONx. EBSE $=0$ and BUSAPx.EXTCLK $=11_{B}$, add 2 internal bus clock periods.
For BUSCONx. EBSE $=0$ and other values of BUSAPx.EXTCLK, add 1 internal bus clock period.

## Electrical Parameters

3) If the clock feedback is not enabled, the input signals are latched using the internal clock in the same way as for asynchronous access. Thus, $\mathrm{t}_{5}, \mathrm{t}_{6}, \mathrm{t}_{7}$ and $\mathrm{t}_{8}$ from the asynchronous timing apply.

Package and Reliability

## $4 \quad$ Package and Reliability

The XMC4500 is a member of the XMC4000 Family of microcontrollers. It is also compatible to a certain extent with members of similar families or subfamilies.
Each package is optimized for the device it houses. Therefore, there may be slight differences between packages of the same pin-count but for different device types. In particular, the size of the Exposed Die Pad may vary.
If different device types are considered or planned for an application, it must be ensured that the board layout fits all packages under consideration.

### 4.1 Package Parameters

Table 64 provides the thermal characteristics of the packages used in XMC4500.

## Table 64 Thermal Characteristics of the Packages

1) Device mounted on a 4-layer JEDEC board (JESD 51-7) with thermal vias; exposed pad soldered.

Note: For electrical reasons, it is required to connect the exposed pad to the board ground $V_{S S}$, independent of EMC and thermal requirements.

### 4.1.1 Thermal Considerations

When operating the XMC4500 in a system, the total heat generated in the chip must be dissipated to the ambient environment to prevent overheating and the resulting thermal damage.
The maximum heat that can be dissipated depends on the package and its integration into the target board. The "Thermal resistance $R_{\Theta J A}$ " quantifies these parameters. The

## Package and Reliability

power dissipation must be limited so that the average junction temperature does not exceed $150^{\circ} \mathrm{C}$.

The difference between junction temperature and ambient temperature is determined by $\Delta \mathrm{T}=\left(P_{\text {INT }}+P_{\text {IOSTAT }}+P_{\text {IODYN }}\right) \times R_{\text {©JA }}$
The internal power consumption is defined as
$P_{\text {INT }}=V_{\mathrm{DDP}} \times I_{\mathrm{DDP}}$ (switching current and leakage current).
The static external power consumption caused by the output drivers is defined as
$P_{\text {IOSTAT }}=\Sigma\left(\left(V_{\mathrm{DDP}}-V_{\mathrm{OH}}\right) \times I_{\mathrm{OH}}\right)+\Sigma\left(V_{\mathrm{OL}} \times I_{\mathrm{OL}}\right)$
The dynamic external power consumption caused by the output drivers $\left(P_{\text {IODYN }}\right)$ depends on the capacitive load connected to the respective pins and their switching frequencies.
If the total power dissipation for a given system configuration exceeds the defined limit, countermeasures must be taken to ensure proper system operation:

- Reduce $V_{\text {DDP }}$, if possible in the system
- Reduce the system frequency
- Reduce the number of output pins
- Reduce the load on active output drivers
