MC100LVEL56

3.3 V ECL Dual Differential 2:1 Multiplexer

Description

The MC100LVEL56 is a dual, fully differential 2:1 multiplexer. The differential data path makes the device ideal for multiplexing low skew clock or other skew sensitive signals.

The device features both individual and common select inputs to address both data path and random logic applications.

The differential inputs have special circuitry which ensures device stability under open input conditions. When both differential inputs are left open the D input will pull down to V_{EE}, The $\overline{D}$ input will bias around $V_{CC}/2$ forcing the Q output LOW.

The V_{BB} pin, an internally generated voltage supply, is available to this device only. For single-ended input conditions, the unused differential input is connected to V_{BB} as a switching reference voltage. V_{BB} may also rebias AC coupled inputs. When used, decouple V_{BB} and V_{CC} via a 0.01 μF capacitor and limit current sourcing or sinking to 0.5 mA. When not used, V_{BB} should be left open.

Features

- 580 ps Typical Propagation Delays
- Separate and Common Select
- The 100 Series Contains Temperature Compensation
- PECL Mode Operating Range:
  $V_{CC} = 3.0$ V to 3.8 V with $V_{EE} = 0$ V
- NECL Mode Operating Range:
  $V_{CC} = 0$ V with $V_{EE} = -3.0$ V to −3.8 V
- Internal Input Pulldown Resistors on D(s), SEL(s), and COM_SEL
- Q Output will Default LOW with Inputs Open or at V_{EE}
- These Devices are Pb-Free, Halogen Free and are RoHS Compliant

NOTE: Device will meet the specifications after thermal equilibrium has been established when mounted in a test socket or printed circuit board with maintained transverse airflow greater than 500 lfpm. Electrical parameters are guaranteed only over the declared operating temperature range. Functional operation of the device exceeding these conditions is not implied. Device specification limit values are applied individually under normal operating conditions and not valid simultaneously.

1. Input and output parameters vary 1:1 with V_{CC}. V_{EE} can vary ±0.3 V.
2. Outputs are terminated through a 50 Ω resistor to V_{CC} − 2.0 V.
3. V_{IHCMR} min varies 1:1 with V_{EE}, max varies 1:1 with V_{CC}. The V_{IHCMR} range is referenced to the most positive side of the differential input signal. Normal operation is obtained if the HIGH level falls within the specified range and the peak-to-peak voltage lies between V_{PP}(min) and 1 V.

1. V_{EE} can vary ±0.3 V.
2. Within-device skew is defined as identical transitions on similar paths through a device.
3. Duty cycle skew is defined only for differential operation when the delays are measured from the cross point of the inputs to the cross point of the outputs.
4. V_{PP}(min) is minimum input swing for which AC parameters are guaranteed.
