WARNUNG

Measuring circuit and remote potentiometer not galvanically separated. The voltage on on measuring circuit i, k / PE has connection to the remote potentiometer. The remote potentiometer has to be connected volt- and ground-free.

Your Advantages
- Preventive maintenance
- For better productivity
- Quicker fault locating
- Precise and reliable

Features
- According to IEC/EN 60 255-1, IEC/EN 60 947-1
- to: monitor DC and AC
- BA 9053 with measuring ranges from 2 mA to 25 A
- BA 9053 optionally with 3 measuring ranges 0.1 up to 25 A
- MK 9053N with measuring ranges from 2 mA up to 10 A
- High overload possible
- Input frequency up to 5 kHz
- Galvanic separation between auxiliary circuit - measuring ciruit
- Auxiliary supply AC/DC; BA 9053 with AC
- BA 9053 optionally with start-up delay (MK = standard)
- with time delay, up to max. 100 sec
- BA 9053 optionally with safe separation to IEC/EN 61140
- MK 9053N optionally with remote potentiometer
- As option with manual reset
- Option with fixed settings possible
- LED indicators for operation and contact position
- MK 9053N as option with pluggable terminal blocks for easy exchange of devices
  - with screw terminals
  - or with cage clamp terminals
- Width BA 9053: 45 mm
  Width MK 9053N: 22.5 mm

Applications

- Monitoring current in AC or DC systems
- For industrial and railway applications

Function

The relays measure the arithmetic mean value of the rectified measuring current. The AC units are adjusted to the r.m.s value. They have settings for response value and hysteresis. The units work as overcurrent relays but can also be used for undercurrent detection. The hysteresis is dependent on the response value.

2 time delays are possible in different variants:
The start up delay t_a operates only when connecting the auxiliary supply. It disables tripping e.g. caused by an increased starting current of a motor. The response delay t_v is active after exceeding a response value. On overcurrent relays the delay is active when the current goes over the tripping value, on undercurrent relays when the current drops below the hysteresis value.

Indicators

green LED: on, when auxiliary supply connected
yellow LED: on, when output relay acitvated

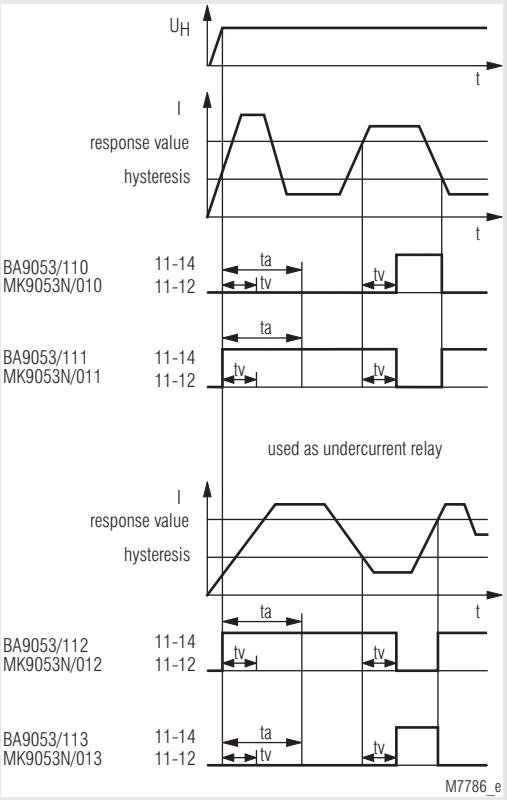
Function Diagram with Start-up Delay



On model BA 9053/6_ _ with manual reset the contacts remain in the fault state after detecting a fault or after to has elapsed. The contacts are reset by disconnecting the supply voltage.

Extending of measuring range: For DC-current higher then the highest measuring range the current relay BA 9053 or MK 9053N measuring range 15 ... 150 mV or 6 ... 60 mV can be used with external Shunt. For AC current higher then the highest measuring range can be used a current transformer e. g. with secondary winding of 1 A or 5 A togehter with BA 9053 or MK 9053N. The nominal load of the CT should be ≥ 0.5 VA.

Measuring principle: arithmetic mean value

Setting

Example:
Current relay BA 9053 / MK 9053N AC 0.5 ... 5 A

AC according to type plate:
i.e. the unit is calibrated for AC
0.5 ... 5 A = measuring range

Response value AC 3 A
Hysteresis AC 1.5 A

Settings:

upper potentiometer:	0.6	(0.6 x 5 A = 3 A)
lower potentiometer:	0.5	(0.5 x 3 A = 1.5 A)

The AC - devices can also monitor DC current. The scale offset in this case is: $\overline{I} = 0.90 \times I_{eff}$

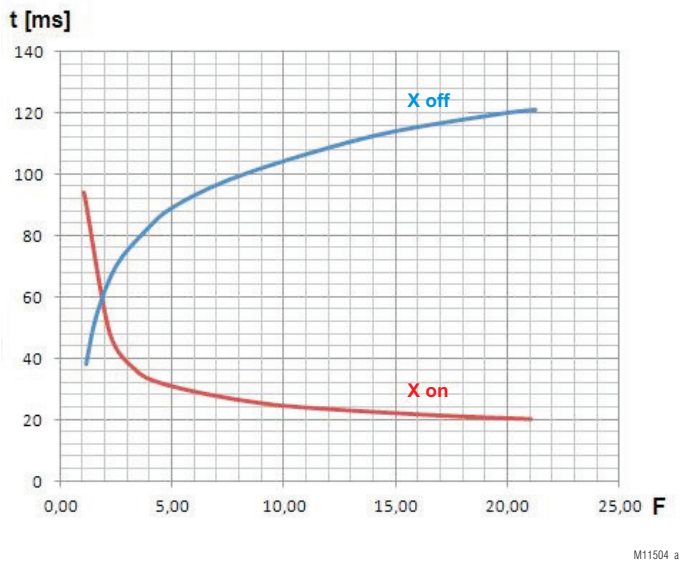
AC 0.5 ... 5 A is equivalent to DC 0.45 ... 4.5 A

Response value DC 3 A
Hysteresis DC 1.5 A

Settings:

upper potentiometer:	0.66	(0.66 x 4.5 A = 3 A)
lower potentiometer:	0.5	(0.5 x 3 A = 1.5 A)

Characteristic



Time delay of measuring circuit

X on: Measured value rise $F = \frac{\text{Measured value (after rise of measured value)}}{\text{Setting value}}$

X off: Measured value drops $F = \frac{\text{Mesaured value (befor measured value drops)}}{\text{Setting value (hysteresis)}}$

The diagram shows the typical delay of a standard devices depending on the measured values "X on and X off" at sudden rise or drop of the signal. At slow change of the measured value the delay is shorter.
The total reaction time of the device results from the adjustable delay t_v and the delay created by the measuring circuit.

The diagram shows an average delay. The delay times could differ on the different variants.

Example for "X on" (overcurrent detection with BA9053/010):
Adjusted setting value X on = 2 A.
Due to a stalled motor the current rises suddenly to 10 A.

$$F = \frac{\text{Measured value (after rise of measured value)}}{\text{Setting value}} = \frac{10\ \text{A}}{2\ \text{A}} = 5$$

Reading from the diagram:
The output relay switches on after 31 ms at a setting t_v=0.

Example for "X off" (undercurrent detection with BA9053/012):
Adjusted hysteresis setting value is 10 A.
The current drops suddenly from 23 A to 0 A.

$$F = \frac{\text{Mesaured value (befor measured value drops)}}{\text{Setting value (hysteresis)}} = \frac{23\ \text{A}}{10\ \text{A}} = 2.3$$

Reading from the diagram:
The output relay switches off after 70 ms at a setting t_v=0.
