

## FEATURES

- 1.5  $\Omega$  on resistance
- 0.3  $\Omega$  on-resistance flatness
- 0.1  $\Omega$  on-resistance match between channels
- Up to 400 mA continuous current
- Fully specified at +12 V,  $\pm 15$  V, and  $\pm 5$  V
- No  $V_L$  supply required
- 3 V logic-compatible inputs
- Rail-to-rail operation
- 14-lead TSSOP and 4 mm  $\times$  4 mm, 16-lead LFCSP

## APPLICATIONS

- Automatic test equipment
- Data acquisition systems
- Battery-powered systems
- Sample-and-hold systems
- Audio signal routing
- Communication systems
- Relay replacement

## GENERAL DESCRIPTION

The ADG1404 is a complementary metal-oxide semiconductor (CMOS) analog multiplexer, comprising four single channels designed on an *i*CMOS<sup>®</sup> process. *i*CMOS (industrial CMOS) is a modular manufacturing process that combines high voltage CMOS and bipolar technologies. It enables the development of a wide range of high performance analog ICs capable of 33 V operation in a footprint that no previous generation of high voltage devices achieve. Unlike analog ICs using conventional CMOS processes, *i*CMOS components can tolerate high supply voltages while providing increased performance, dramatically lower power consumption, and reduced package size.

The on-resistance profile is very flat over the full analog input range, ensuring excellent linearity and low distortion when switching audio signals.

*i*CMOS construction ensures ultralow power dissipation, making the device ideally suited for portable and battery-powered instruments.

## FUNCTIONAL BLOCK DIAGRAM

Figure 1.

06816-001

The ADG1404 switches one of four inputs to a common output, D, as determined by the 3-bit binary address lines, A0, A1, and EN. Logic 0 on the EN pin disables the device. Each switch conducts equally well in both directions when on and has an input signal range that extends to the supplies. In the off condition, signal levels up to the supplies are blocked. All switches exhibit break-before-make switching action. Inherent in the design is low charge injection for minimum transients when switching the digital inputs.

## PRODUCT HIGHLIGHTS

1. 2.6  $\Omega$  maximum on resistance over temperature.
2. Minimum distortion.
3. Ultralow power dissipation:  $<0.03 \mu\text{W}$ .
4. 14-lead TSSOP and 16-lead, 4 mm  $\times$  4 mm LFCSP package.

## ABSOLUTE MAXIMUM RATINGS

$T_A = 25^\circ\text{C}$ , unless otherwise noted.

Table 5.

Parameter	Rating
$V_{DD}$ to $V_{SS}$	35 V
$V_{DD}$ to GND	-0.3 V to +25 V
$V_{SS}$ to GND	+0.3 V to -25 V
Analog Inputs <sup>1</sup>	$V_{SS} - 0.3\text{ V}$ to $V_{DD} + 0.3\text{ V}$ or 30 mA, whichever occurs first
Digital Inputs	GND - 0.3 V to $V_{DD} + 0.3\text{ V}$ or 30 mA, whichever occurs first
Peak Current, S or D	600 mA (pulsed at 1 ms, 10% duty cycle maximum)
Continuous Current, S or D <sup>2</sup>	Data + 15%
Operating Temperature Range	
Automotive (Y Version)	-40°C to +125°C
Storage Temperature Range	-65°C to +150°C
Junction Temperature	150°C
14-Lead TSSOP, $\theta_{JA}$ Thermal Impedance (4-layer board)	112°C/W
16-Lead LFCSOP, $\theta_{JA}$ Thermal Impedance	30.4°C/W
Reflow Soldering Peak Temperature, Pb free	260(+0/-5)°C

<sup>1</sup> Overvoltages at IN, S, and D are clamped by internal diodes. Current must be limited to the maximum ratings given.

<sup>2</sup> See data given in Table 4.

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

Only one absolute maximum rating can be applied at any one time.

### ESD CAUTION

**ESD (electrostatic discharge) sensitive device.** Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATIONS AND FUNCTION DESCRIPTIONS

Figure 2. TSSOP Pin Configuration

NOTES  
 1. EXPOSED PAD TIED TO SUBSTRATE, V<sub>SS</sub>.  
 2. NC = NO CONNECT.

Figure 3. LFCSP Pin Configuration

Table 6. Pin Function Descriptions

Pin No.		Mnemonic	Description
TSSOP	LFCSP		
1	15	A0	Logic Control Input.
2	16	EN	Active High Digital Input. When this pin is low, the device is disabled and all switches are off. When this pin is high, the Ax logic inputs determine the on switches.
3	1	V <sub>SS</sub>	Most Negative Power Supply Potential.
4	3	S1	Source Terminal. Can be an input or an output.
5	4	S2	Source Terminal. Can be an input or an output.
6	6	D	Drain Terminal. Can be an input or an output.
7 to 9	2, 5, 7, 8, 13	NC	No Connection.
10	9	S4	Source Terminal. Can be an input or an output.
11	10	S3	Source Terminal. Can be an input or an output.
12	11	V <sub>DD</sub>	Most Positive Power Supply Potential.
13	12	GND	Ground (0 V) Reference.
14	14	A1	Logic Control Input.

## TERMINOLOGY

### $I_{DD}$

The positive supply current.

### $I_{SS}$

The negative supply current.

### $V_D$ (Vs)

The analog voltage on Terminal D and Terminal S.

### $R_{ON}$

The ohmic resistance between Terminal D and Terminal S.

### $R_{FLAT(ON)}$

Flatness that is defined as the difference between the maximum and minimum value of on resistance measured over the specified analog signal range.

### $I_S$ (Off)

The source leakage current with the switch off.

### $I_D$ (Off)

The drain leakage current with the switch off.

### $I_D, I_S$ (On)

The channel leakage current with the switch on.

### $V_{INL}$

The maximum input voltage for Logic 0.

### $V_{INH}$

The minimum input voltage for Logic 1.

### $I_{INL}$ ( $I_{INH}$ )

The input current of the digital input.

### $C_S$ (Off)

The off switch source capacitance, which is measured with reference to ground.

### $C_D$ (Off)

The off switch drain capacitance, which is measured with reference to ground.

### $C_D, C_S$ (On)

The on switch capacitance, which is measured with reference to ground.

### $C_{IN}$

The digital input capacitance.

### $t_{TRANSITION}$

The delay time between the 50% and 90% points of the digital input and switch on condition when switching from one address state to another.

### $t_{ON}$ (EN)

The delay between applying the digital control input and the output switching on. See Figure 29, Test Circuit 4.

### $t_{OFF}$ (EN)

The delay between applying the digital control input and the output switching off.

### Charge Injection

A measure of the glitch impulse transferred from the digital input to the analog output during switching.

### Off Isolation

A measure of unwanted signal coupling through an off switch.

### Crosstalk

A measure of unwanted signal that is coupled through from one channel to another as a result of parasitic capacitance.

### Bandwidth

The frequency at which the output is attenuated by 3 dB.

### On Response

The frequency response of the on switch.

### Insertion Loss

The loss due to the on resistance of the switch.

### THD + N

The ratio of the harmonic amplitude plus noise of the signal to the fundamental.

### ACPSRR (AC Power Supply Rejection Ratio)

The ratio of the amplitude of signal on the output to the amplitude of the modulation. This is a measure of the ability of the device to avoid coupling noise and spurious signals that appear on the supply voltage pin to the output of the switch. The dc voltage on the device is modulated by a sine wave of 0.62 V p-p.
