

## ISO76x1 Low-Power Triple and Quad-Channels Digital Isolators

### 1 Features

- Signaling Rate: 150 Mbps (M-Grade), 25 Mbps (C-Grade)
- Robust Design with Integrated Noise Filter (C-Grade)
- Low Power Consumption, Typical  $I_{CC}$  per Channel (3.3-V Supplies):
  - ISO7631FM: 2 mA at 10 Mbps
  - ISO7631FC: 1.5 mA at 10 Mbps
  - ISO7641FC: 1.3 mA at 10 Mbps
- Extremely-Low  $I_{CC\_disable}$  (C-Grade)
- Low Propagation Delay: 7 ns Typical (M-Grade)
- Output Defaults to Low-State in Fail-Safe Mode
- Wide Temperature Range:  $-40^{\circ}\text{C}$  to  $125^{\circ}\text{C}$
- 50 KV/ $\mu\text{s}$  Transient Immunity, Typical
- Long Life With  $\text{SiO}_2$  Isolation Barrier
- Operates From 2.7-V (M-Grade), 3.3-V and 5-V Supply and Logic Levels
- 2.7-V (M-Grade), 3.3-V and 5-V Level Translation
- Wide Body SOIC-16 Package
- Safety and Regulatory Approvals
  - 2500  $V_{RMS}$  Isolation for 1 Minute per UL 1577
  - 4242  $V_{PK}$  Basic Insulation per DIN V VDE V 0884-10 and DIN EN 61010-1
  - CSA Component Acceptance Notice 5A, IEC 60950-1 and IEC 61010-1 End Equipment Standards
  - CQC Certification per GB4943.1-2011
  - TUV 3000  $V_{RMS}$  Reinforced Insulation according to EN/UL/CSA 60950-1 and EN/UL/CSA 61010-1

### 2 Applications

- Optocoupler Replacement in:
  - Industrial Fieldbus
    - Profibus
    - Modbus
    - DeviceNet™ Data Buses
  - Servo Control Interface
  - Motor Control
  - Power Supplies
  - Battery Packs

### 3 Description

The ISO7631F and ISO7641F devices provide galvanic isolation up to 4242  $V_{PK}$  per VDE. The ISO7631F device has three channels, two of which operate in the forward direction and one which operates in the reverse direction. The ISO7641F device has 4 channels, three of which operate in the forward direction and one of which operates in the reverse direction. Suffix F indicates that output defaults to low-state in fail-safe conditions (see ). M-Grade devices are high-speed isolators capable of up to 150-Mbps data rates with fast propagation delays, whereas C-Grade devices are capable of up to 25-Mbps data rates with low power consumption and integrated filters for noise-prone applications. C-Grade devices are recommended for lower-speed applications where input noise pulses of less than 6 ns duration must be suppressed, or when low-power consumption is critical.

Each isolation channel has a logic input and output buffer separated by a silicon dioxide ( $\text{SiO}_2$ ) insulation barrier. Used in conjunction with isolated power supplies, these devices prevent noise currents on a data bus or other circuits from entering the local ground and interfering with or damaging sensitive circuitry. The devices have TTL input thresholds and can operate from 2.7-V (M-Grade), 3.3-V and 5-V supplies. All inputs are 5-V tolerant when supplied from 3.3-V or 2.7-V supplies.

## 4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

### Changes from Revision E (August 2015) to Revision F Page

- Changed the ISO7631 pin image in the *Pin Configuration and Functions* section ..... **4**

### Changes from Revision D (September 2013) to Revision E Page

- Added *Pin Configuration and Functions* section, *ESD Ratings* table, *Feature Description* section, *Device Functional Modes*, *Application and Implementation* section, *Power Supply Recommendations* section, *Layout* section, *Device and Documentation Support* section, and *Mechanical, Packaging, and Orderable Information* section. .... **1**
- Added 2.7-V (M-Grade), 3.3-V and 5-V Level Translation to *Features* section ..... **1**
- Deleted *marked as* column from *Available Options* table..... **4**
- Added Footnote 3 to *Absolute Maximum Ratings* table..... **5**
- Changed thermal metric values in the *Thermal Information* table. .... **6**
- Changed  $V_{CCX}$  to  $V_{CC0}$  in *Electrical Characteristics:  $V_{CC1}$  and  $V_{CC2}$  at 5 V  $\pm$  10%* table. .... **6**
- Added cross-reference to  $V_I = V_{CC1}$  in the *Electrical Characteristics:  $V_{CC1}$  and  $V_{CC2}$  at 5 V  $\pm$  10%* table. .... **6**
- Changed Footnote 1 of the *Electrical Characteristics:  $V_{CC1}$  and  $V_{CC2}$  at 5 V  $\pm$  10%* table for clarification. .... **6**

• Added cross-reference to $V_I = V_{CCI}$ in the <i>Electrical Characteristics: VCC1 at 5 V ± 10% and VCC2 at 3.3 V ± 10%</i> table. ....	6
• Added footnote to the <i>Electrical Characteristics: VCC1 at 3.3 V ± 10% and VCC2 at 5 V ± 10%</i> table. ....	7
• Changed $V_{CCX}$ to $V_{CCO}$ in the <i>Electrical Characteristics: VCC1 and VCC2 at 3.3 V ± 10%</i> table. ....	7
• Changed footnote 1 in the <i>Electrical Characteristics: VCC1 and VCC2 at 3.3 V ± 10%</i> table for clarification. ....	7
• Changed $V_{CCX}$ to $V_{CCO}$ in the <i>Electrical Characteristics: VCC1 and VCC2 at 2.7 V</i> table. ....	7
• Deleted <i>IEC and for DW-16 Package</i> from <i>IEC Package Insulation and Safety-Related Specifications for DW-16 Package</i> section. ....	20
• Changed L(IO1) MIN from 8.3 mm to 8 mm, L(IO2) MIN from 8.1 mm to 8 mm, and DIN IEC 60112 / VDE 0303 Part 1 to DIN EN 60112 (VDE 0303-11); IEC 60112 in the <i>Package Insulation and Safety-Related Specifications</i> table. ....	20
• Deleted footnote 2 from <i>Package Insulation and Safety-Related Specifications IEC and for DW-16 Package</i> from <i>IEC Package Insulation and Safety-Related Specifications for DW-16 Package</i> section. ....	20
• Changed VDE Standard to DIN V VDE V 0884-10 (VDE V 0084-10): 2006-12. ....	21
• Changed the value for $\theta_{JA}$ from 72 °C/W to 77.5 °C/W for the Test Conditions and the values for Safety input, output, or supply current max from 316, 482, and 643 to 293, 448 and 597 in the <i>Safety Limiting Values</i> table. ....	22
• Changed <i>safety temperature</i> to <i>case temperature</i> in <i>Safety Limiting Values</i> . ....	22
• Changed name of <i>DW-16 <math>\theta_{JC}</math> Thermal Derating Curve per IEC 64747-5-2</i> to <i>Thermal Derating Curve for Safety Limiting Current per VDE</i> . ....	22
• Changed <a href="#">Figure 22</a> in the <i>Safety Limiting Values</i> section. ....	22
• Changed I/O schematics figure in <i>Feature Description</i> section. ....	23

**Changes from Revision C (August 2013) to Revision D**
**Page**

• Deleted 2500 $V_{RMS}$ from Rated Isolation Data .....	4
• Changed the <a href="#">Table 3</a> , TUV column From: Certificate Number: U8V 13 07 77311 009 To: Certificate Number: U8V 13 09 77311 010. ....	21

**Changes from Revision B (April 2013) to Revision C**
**Page**

• Changed the Description .....	1
• Deleted ISO7640FC from the Available Options table .....	4
• Changed The ISO7631FC Rated Isolation values in the Available Options table .....	4
• Deleted Graph ISO7640FC Supply Current Per Channel vs Data Rate .....	14
• Deleted Graph ISO7640FC Supply Current For All Channels vs Data Rate .....	14
• Added the TUV column to <a href="#">Table 3</a> .....	21
• Deleted ISO7640FC from the TYPICAL SUPPLY CURRENT EQUATIONS section .....	25
• Deleted the ISO7640 circuit from the APPLICATION INFORMATION section .....	27

**Changes from Revision A (September 2012) to Revision B**
**Page**

• Changed the $V_{IOTM}$ SPECIFICATION From: 4000 $V_{PEAK}$ to 4242 $V_{PEAK}$ .....	21
• Changed <a href="#">Table 3</a> : 4242 $V_{PK}$ To: 4000 $V_{PK}$ .....	21

**Changes from Original (September 2012) to Revision A**
**Page**

• Changed Description text From: "applications where input noise pulses of less than 10 ns duration..." To: "applications where input noise pulses of less than 6 ns duration..." .....	1
• Added note <i>Product Preview</i> to ISO7640FC in the Available Options table .....	4
• Changed Input PU in the Function table From: Z To: 'Undetermined' .....	23

## 7 Specifications

### 7.1 Absolute Maximum Ratings

 See <sup>(1)</sup>

		MIN	MAX	UNIT
$V_{CC1}$ $V_{CC2}$ <sup>(2)</sup>	Supply voltage	-0.5	6	V
	Voltage	INx, OUTx, ENx	6 <sup>(3)</sup>	V
$I_O$	Output current		±15	mA
$T_J$	Maximum junction temperature		150	°C
$T_{STG}$	Storage temperature	-65	150	°C

- (1) Stresses beyond those listed under *absolute maximum ratings* may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values except differential I/O bus voltages are with respect to the local ground terminal (GND1 or GND2) and are peak voltage values.
- (3) Maximum voltage must not exceed 6 V.

### 7.2 ESD Ratings

		VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±4000
		Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	±1500
		Machine model (MM), JEDEC JESD22-A115-A	±200

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 7.3 Recommended Operating Conditions

		MIN	NOM	MAX	UNIT
$V_{CC1}, V_{CC2}$	Supply voltage	M-Grade	2.7	5.5	V

$I_{OH}$	High-level output current	-4			mA
$I_{OL}$	Low-level output current			4	mA
$V_{IH}$	High-level input voltage	2		5.5	V
$V_{IL}$	Low-level input voltage	0		0.8	V
$t_{ui}$	Input pulse duration	M-Grade: ≥3-V Operation	6.67		ns
		M-Grade: <3-V Operation	10		
		C-Grade: ≥3-V Operation	40		
$1 / t_{ui}$	Signaling rate	M-Grade: ≥3-V Operation	0	150	Mbps
		M-Grade: <3-V Operation	0	100	
		C-Grade: ≥3-V Operation	0	25	
$T_J$	Junction temperature	-40		136	°C
$T_A$	Ambient temperature	-40	25	125	°C

## 7.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		ISO76x1Fx	UNIT

## 9 Detailed Description

### 9.1 Overview

The isolator in Figure 20 is based on a capacitive, isolation-barrier technique. The I/O channel of the device consists of two internal data channels, a high-frequency channel (HF) with a bandwidth from 100 kbps up to 150 Mbps, and a low-frequency channel (LF) covering the range from 100 kbps down to DC. In principle, a single-ended input signal entering the HF-channel is split into a differential signal via the inverter gate at the input. The following capacitor-resistor networks differentiate the signal into transients, which then are converted into differential pulses by two comparators. The comparator outputs drive a NOR-gate flip-flop whose output feeds an output multiplexer. A decision logic (DCL) at the driving output of the flip-flop measures the durations between signal transients. If the duration between two consecutive transients exceeds a certain time limit, (as in the case of a low-frequency signal), the DCL forces the output-multiplexer to switch from the high- to the low-frequency channel.

Because low-frequency input signals require the internal capacitors to assume prohibitively large values, these signals are pulse-width modulated (PWM) with the carrier frequency of an internal oscillator, thus creating a sufficiently high frequency signal, capable of passing the capacitive barrier. As the input is modulated, a low-pass filter (LPF) is needed to remove the high-frequency carrier from the actual data before passing it on to the output multiplexer.

**NOTE**

Creepage and clearance requirements should be applied according to the specific equipment isolation standards of an application. Care should be taken to maintain the creepage and clearance distance of a board design to ensure that the mounting pads of the isolator on the printed circuit board do not reduce this distance.

Creepage and clearance on a printed circuit board become equal according to the measurement techniques shown in the Isolation Glossary. Techniques such as inserting grooves and/or ribs on a printed circuit board are used to help increase these specifications.

### 9.3.1.1 Safety Limiting Values

Safety limiting intends to prevent potential damage to the isolation barrier upon failure of input or output circuitry. A failure of the IO can allow low resistance to ground or the supply and, without current limiting, dissipate sufficient power to overheat the die and damage the isolation barrier potentially leading to secondary system failures.

PARAMETER		TEST CONDITIONS			MIN	TYP	MAX	UNIT	
I <sub>S</sub>	Safety input, output, or supply current	DW-16	θ <sub>JA</sub> = 77.5 °C/W, V <sub>I</sub> = 5.5V, T <sub>J</sub> = 150°C, T <sub>A</sub> = 25°C					293	mA
			θ <sub>JA</sub> = 77.5 °C/W, V <sub>I</sub> = 3.6V, T <sub>J</sub> = 150°C, T <sub>A</sub> = 25°C					448	
			θ <sub>JA</sub> = 77.5 °C/W, V <sub>I</sub> = 2.7V, T <sub>J</sub> = 150°C, T <sub>A</sub> = 25°C					597	
T <sub>S</sub>	Maximum safety temperature						150	°C	

The safety-limiting constraint is the absolute maximum junction temperature specified in the absolute maximum ratings table. The power dissipation and junction-to-air thermal impedance of the device installed in the application hardware determines the junction temperature. The assumed junction-to-air thermal resistance in the *Thermal Information* table is that of a device installed on a High-K Test Board for Leaded Surface Mount Packages. The power is the recommended maximum input voltage times the current. The junction temperature is then the ambient temperature plus the power times the junction-to-air thermal resistance.

## 10 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 10.1 Application Information

ISO7641FC uses single-ended TTL-logic switching technology. It has a supply voltage range from 3 V to 5.5 V for both supplies,  $V_{CC1}$  and  $V_{CC2}$ . When designing with digital isolators, it is important to note that due to the single-ended design structure, digital isolators do not conform to any specific interface standard and are only intended for isolating single-ended CMOS or TTL digital signal lines. The isolator is typically placed between the data controller (that is,  $\mu\text{C}$  or UART), and a data converter or a line transceiver, regardless of the interface type or standard.

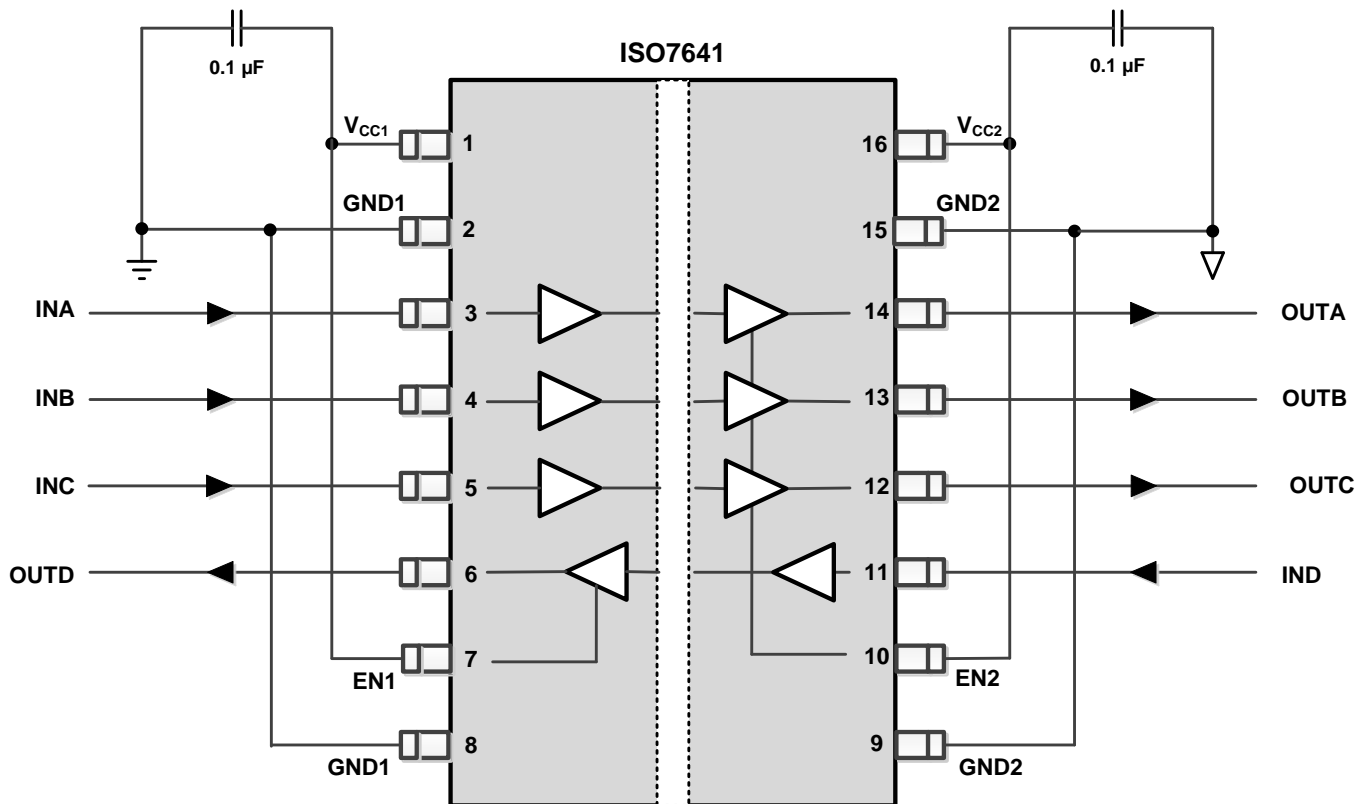

**Figure 24. Isolated Data Acquisition System for Process Control**

#### 10.2.1 Design Requirements

Unlike optocouplers, which require external components to improve performance, provide bias, or limit current, the ISO76xx device only requires two external bypass capacitors to operate.

## 11 Power Supply Recommendations

To ensure reliable operation at all data rates and supply voltages, a 0.1- $\mu$ F bypass capacitor is recommended at input and output supply pins ( $V_{CC1}$  and  $V_{CC2}$ ). The capacitors should be placed as close to the supply pins as possible. If only a single primary-side power supply is available in an application, isolated power can be generated for the secondary-side with the help of a transformer driver such as Texas Instruments' [SN6501](#). For such applications, detailed power supply design and transformer selection recommendations are available in [SN6501](#) data sheet ([SLLSEA0](#)).

## 12 Layout

### 12.1 Layout Guidelines

A minimum of four layers is required to accomplish a low EMI PCB design (see [Figure 30](#)). Layer stacking should be in the following order (top-to-bottom): high-speed signal layer, ground plane, power plane and low-frequency signal layer.

- Routing the high-speed traces on the top layer avoids the use of vias (and the introduction of their inductances) and allows for clean interconnects between the isolator and the transmitter and receiver circuits of the data link.
- Placing a solid ground plane next to the high-speed signal layer establishes controlled impedance for transmission line interconnects and provides an excellent low-inductance path for the return current flow.
- Placing the power plane next to the ground plane creates additional high-frequency bypass capacitance of approximately 100 pF/in<sup>2</sup>.
- Routing the slower speed control signals on the bottom layer allows for greater flexibility as these signal links usually have margin to tolerate discontinuities such as vias.

If an additional supply voltage plane or signal layer is needed, add a second power and ground plane system to the stack to keep it symmetrical. This makes the stack mechanically stable and prevents it from warping. Also the power and ground plane of each power system can be placed closer together, thus increasing the high-frequency bypass capacitance significantly.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

<sup>(6)</sup> Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.
